He was influential in securing the nomination of John C. Fremont, 1856, and of Abraham Lincoln in 1860. After Lincoln's re-election in 1864 Blair thought that his former close personal relations with the Confederate leaders might aid in bringing peace, and with Lincoln's consent he went unofficially to Richmond and induced President Jefferson Davis to appoint commissioners to confer with representatives of the United States. This resulted in the futile "Hampton Roads Conference" of Feb. 3, 1865 (see LINCOLN, ABRAHAM). After the Civil War, Blair became a supporter of President Johnson's reconstruction policy, and eventually rejoined the Democratic Party. He died at Silver Spring, Md., on Oct. 18, 1876.

His son, MONTGOMERY BLAIR (1813-83), politician and lawyer, was born in Franklin county, Ky., on May 10, 1813. He graduated at West Point in 1835, but after a year's service in the Seminole War, left the army, studied law, and began practice at St. Louis, Mo. After serving as U.S. district attorney (1839-43), as Mayor of St. Louis (1842-43), and as judge of the court of common pleas (1843-49), he removed to Maryland (1852), and devoted himself to law practice, principally in the Federal Supreme Court. He was U.S. solicitor in the court of claims from 1855 until 1858, and was associated with George T. Curtis as counsel for the plaintiff in the Dred Scott case in 1857. In 1860 he took an active part in the presidential campaign on behalf of Lincoln, in whose cabinet he was postmaster-general from 1861 until Sept. 1864, when he resigned as a result of the hostility of the Radical Republican faction, who stipulated that Blair's retirement should follow the withdrawal of Fremont's name as a candidate for the presidential nomination in that year. Under his administration the establishment of free city delivery, the adoption of a money order system and the use of railway mail cars were instituted. Differing from the Republican Party on the reconstruction policy, Blair gave his adherence to the Democratic Party after the Civil War. He died at Silver Spring, Md., on July 27, 1883.

Another son, FRANCIS PRESTON BLAIR, JR. (1821-75), soldier and political leader, was born at Lexington, Ky., on Feb. 19, 1821. After graduating from Princeton in 1841 he practised law in St. Louis, and later served in the Mexican War. He served from 1852 to 1856 in the Missouri legislature as a Free Soil Democrat, in 1856 joined the Republican Party and in 1857-62 was a member of Congress. Immediately after South Carolina's secession, Blair, believing that the Southern leaders were planning to carry Missouri into the movement, worked actively and successfully to prevent it. Blair was promoted to the rank of brigadier-general of volunteers in Aug. 1862, and a major-general in Nov. 1862. In Congress as chairman of the important military affairs committee his services were of the greatest value. He commanded a division in the Vicksburg campaign and in the fighting about Chattanooga, and was one of Sherman's corps commanders in the final campaigns in Georgia and the Carolinas. In 1866, like his father and brother, he opposed the Congressional reconstruction policy, and on that issue left the Republican Party. In 1868, he was the Democratic candidate for vice-president on the ticket with Horatio Seymour. In 1871-73, he was a U.S. senator from Missouri. He died in St. Louis on July 8, 1875.

Library of Congress).

BLAIR, HUGH (1718-1800), Scottish Presbyterian divine, was born on April 7, 1718, at Edinburgh, and educated at the university there. After holding various preferments he became pastor of the High Church, Edinburgh, the most important charge

in Scotland. In 1762 he became the first occupant of the chair of rhetoric and belles-lettres in Edinburgh university, with a salary of £70 a year. He published in 1763 a laudatory *Dissertation* on Macpherson's *Ossian*. His *Sermons* (1777-1801) were praised by Samuel Johnson, and were translated into almost every language of Europe. In 1780 George III. conferred upon Blair a pension of £200 a year. In 1783 he retired from his professorship and published his *Lectures on Rhetoric*, which have been frequently reprinted. He died on Dec. 27, 1800.

See J. Hall, *Account of Life and Writings of Hugh Blair* (1807).

BLAIR, ROBERT (1699-1746), Scottish poet, was educated at Edinburgh university and in Holland, and in 1731 was appointed to the living of Athelstaneford in East Lothian. He died at Athelstaneford Feb. 4 1746. His only considerable work, *The Grave* (1743), is a poem written in blank verse, and is much less conventional than its gloomy subject might lead one to expect. It inspired William Blake to undertake a series of 12 illustrative designs, which were engraved by Louis Schiavonetti, and published in 1808.

See the biographical introduction prefixed to his *Poetical Works*, by Dr. Robert Anderson, in his *Poets of Great Britain*, vol. viii. (1794).

BLAIR ATHOLL (Gael *blair*, a plain), village and parish, Perthshire, Scotland, 3½m. N.W. of Perth by the L.M.S. railway, at the confluence of Tilt and Garry. Pop. (1921) 1,824. The oldest part of Blair castle, a seat of the duke of Atholl, dates from 1269; it was restored and enlarged in 1869-72. It was occupied by the marquess of Montrose prior to the battle of Tippermuir in 1644, stormed by the Cromwellians in 1653, and garrisoned on behalf of James II. in 1680. The Young Pretender stayed here in 1745, and the duke of Cumberland in 1746. The body of viscount Dundee, conveyed hither from the battlefield of Killiecrankie, was buried in the church of Old Blair, in which a monument was erected to his memory in 1889 by the 7th duke of Atholl. Every September a great display of Highland games is held. The fine falls of Bruar are 4m. W. of Blair Atholl.

BLAIRGOWRIE, police burgh, Perthshire, Scotland, on the Ericht, terminus of a branch line of the L.M.S. from Coupar Angus, 4½m. distant, 16m. N. by E. of Perth by road. Pop. (1921) 3,072. The town is modern, and owes its progress to the water-power supplied by the Ericht for flax-spinning works. Strawberries, raspberries and other fruits are largely grown in the neighbourhood. On the opposite bank of the Ericht is the town and police burgh of Rattray with flax and jute mills. Four miles west of Blairgowrie, on the road to Dunkeld, lies Loch Clunie, and on a crannog in the lake are the ruins of a small castle supposed to be the home of James ("the Admirable") Crichton; the large mound near the loch was the site of the castle in which Edward I. lodged.

BLAKE, EDWARD (1833-1912), Irish-Canadian statesman, whose father, W. H. Blake, chancellor of Ontario, settled in Canada in 1832, was born on Oct. 13 1833 at Adelaide, Ontario. Blake was called to the bar in 1856, and in 1867 became a member, both of the Dominion parliament and of the legislature of Ontario. He was Liberal prime minister of Ontario in 1873, also a member of Alexander Mackenzie's Dominion cabinet, though without portfolio. In 1875 he became minister of justice and took the chief part in drafting the constitution of the Canadian supreme court. From 1880-87 he led the Liberal Opposition. He was then succeeded by Sir Wilfred Laurier. After his resignation he returned to Ireland, to take an active part in Irish politics. In fact, he did very little, although he sat for Longford as a Nationalist in the British House of Commons. Blake returned to Canada and died at Toronto on March 1, 1912.

BLAKE, ROBERT (1599-1657), English parliamentarian and admiral, was born at Bridgwater, Somersetshire, the eldest son of a well-to-do merchant, and was educated at Bridgwater grammar school and at Oxford, where he was entered at St. Alban's hall, but afterwards removed to Wadham college. He remained at the university till 1625. Nothing is known of his life with certainty for the next fifteen years. An anonymous Dutch writer in the *Hollandische Mercurius* (1652) represents

him as saying that he had lived in Schiedam "for five or six years" in his youth. He was elected to represent his native borough in the "Short Parliament" of 1640. At the outbreak of the Civil War, Blake declared for the Parliament, and served under Sir John Horner. He was one of the defenders of Bristol (1643) against Prince Rupert, and in 1644 he gained high distinction by the resolute defence of Lyme. The siege was raised on May 23, and on July 8 Blake took Taunton by surprise, and held the town for the Parliament against two sieges by the Royalists until July 1645, when it was relieved by Fairfax. In 1645 he re-entered parliament as member for Taunton.

In Feb. 1649 he was appointed, with Colonels Dean and Popham, to the command of the fleet, under the title of general of the sea. In April he was sent against Prince Rupert's fleet at Kinsale. There he blockaded the prince for six months; and when Rupert slipped through the blockade and reached the Tagus Blake followed him and again blockaded him for some months. The king of Portugal refusing permission for Blake to attack his enemy, the latter made reprisals by falling on the Portuguese fleet, richly laden, returning from Brazil. He captured 17 ships, burnt three, and brought his prizes home without molestation. After revictualing his fleet, he sailed again, captured a French man-o-war, and then pursued Prince Rupert, who had been asked to go away by the Portuguese and had entered the Mediterranean. In Nov. 1650 Blake destroyed the bulk of the Royalist squadron near Cartagena. The thanks of parliament were voted to Blake, and he received a grant of £1,000. He was continued in his office of admiral and general of the sea; and in May following he took, in conjunction with Ayscue, the Scilly Islands. He was soon after made a member of the council of state.

In 1652 war broke out with the Dutch, and in March command of the fleet was given to Blake for nine months. In the middle of May the Dutch fleet of 45 ships, led by their great admiral Tromp, appeared in the Downs. Blake, who had only 20 ships, sailed to meet them, and the battle took place off Dover on May 10. The Dutch were defeated in an engagement of four or five hours, lost two ships, and withdrew under cover of darkness. Attempts at accommodation were made by the States, but they failed. Early in July war was formally declared, and in the same month Blake captured a large part of the Dutch fishery-fleet and the 12 men-of-war that formed their convoy. On Sept. 28 Blake and Penn again encountered the Dutch fleet, now commanded by De Ruyter and De Witt, off the Kentish Knock, defeated it, and chased it for two days. The Dutch took refuge in Goree. A third battle was fought near the end of November. By this time the ships under Blake's command had been reduced in number to 40, and nearly half of these were useless for want of seamen. Tromp, who had been reinstated in command, appeared in the Downs, with a fleet of 80 ships besides ten fire-ships. Blake, nevertheless, risked a battle off Dungeness, but was defeated and withdrew into the Thames. The English fleet having been refitted, put to sea again in Feb. 1653; and on the 18th Blake, at the head of 80 ships, encountered Tromp in the channel. The Dutch force, according to Clarendon, numbered 100 ships of war, but according to the official reports of the Dutch, only 70. The battle lasted three days; the Dutch then retreated and took refuge in the shallow waters off the French coast. In this action Blake was severely wounded. The three English admirals put to sea again in May; and on June 3 and 4 another battle was fought near the North Foreland. On the first day Dean and Monk were repulsed by Tromp; but on the second day the scales were turned by the arrival of Blake, and the Dutch retreated to the Texel.

Ill health now compelled Blake to retire from the service for a time, and he did not appear again on the seas for about 18 months; meanwhile he sat as a member of the Little Parliament (Barebones'). In Nov. 1654 he was selected by Cromwell to conduct a fleet to the Mediterranean to exact compensation from the duke of Tuscany, the knights of Malta, and the piratical states of North Africa, for wrongs done to English merchants. This mission he executed with his accustomed spirit and with complete success. Tunis alone dared to resist his demands, and

Tunis paid the penalty of the destruction of its two fortresses by English guns. In the winter of 1655-56, war being declared against Spain, Blake was sent to cruise off Cadiz and the neighbouring coasts, to intercept the Spanish shipping. One of his captains captured a part of the Plate fleet in Sept. 1656. In April 1657 Blake, then in very ill health, suffering from dropsy and scurvy, heard that the Plate fleet lay at anchor in the bay of Santa Cruz, in the island of Teneriffe. The position was a very strong one, defended by a castle and several forts with guns. Under the shelter of these lay a fleet of 16 ships drawn up in crescent order. Captain Stayner was ordered to enter the bay and fall on the fleet. This he did. Blake followed him. Broad-sides were poured into the castle and the forts at the same time, and soon nothing was left but ruined walls and charred fragments of burnt ships. The wind was blowing hard into the bay; but suddenly, and fortunately for Blake, it shifted and carried him safely out to sea. "The whole action," says Clarendon, "was so incredible that all men who knew the place wondered that any sober man, with what courage soever endowed, would ever have undertaken it; and they could hardly persuade themselves to believe what they had done; while the Spaniards comforted themselves with the belief that they were devils and not men who had destroyed them in such a manner." The English lost one ship and 200 men killed and wounded.

After again cruising for a time off Cadiz, his health failing more and more, he was compelled to make homewards before the summer was over. He died at sea, but within sight of Plymouth, on Aug. 17 1657. His body was brought to London and embalmed, and after lying in state at Greenwich House was interred with great pomp and solemnity in Westminster Abbey. In 1661 Charles II. ordered the exhumation of Blake's body, with those of the mother and daughter of Cromwell and several others. They were cast out of the Abbey, and were reburied in the churchyard of St. Margaret's. "But that regard," says Johnson, "which was denied his body has been paid to his better remains, his name and his memory. Nor has any writer dared to deny him the praise of intrepidity, honesty, contempt of wealth, and love of his country." Clarendon bears the following testimony to his excellence as a commander: "He was the first man that declined the old track, and made it apparent that the science might be attained in less time than was imagined. He was the first man that brought ships to contemn castles on the shore, which had ever been thought very formidable, but were discovered by him to make a noise only, and to fright those who could be rarely hurt by them."

BIBLIOGRAPHY.—A life of Blake is included in the work entitled *Lives, English and Foreign*. Dr. Johnson wrote a short life of him, and in 1852 appeared Hepworth Dixon's fuller narrative, *Robert Blake, Admiral and General at Sea*. See also *Letters and Papers Relating to the First Dutch War*, edited by S. R. Gardiner for the Navy Records Society (1808-90); C. R. B. Barrett, *The Missing Fifteen Years (1625-1640) in the life of Robert Blake* (1917).

BLAKE, WILLIAM (1757-1827), English mystic, poet and artist, born in London, Nov. 28, 1757. His father, James Blake, of whose family and origin nothing is known, was a hosier, living at 28 Broad Street, Golden Square. His mother's maiden name has not been recorded. The family consisted of four sons and a daughter. William was the second son, and the only one to achieve distinction. The eldest, James, succeeded his father in the hosiery business. The third, John, died young, after a life of dissipation. The youngest, Robert, who shewed considerable capabilities as an artist, was greatly loved by his brother William, and was nursed by him through the illness of which he died at the age of 25.

William began to show his artistic leanings at an early age. His father wisely decided to encourage this side of his nature, and sent him at the age of ten to Par's drawing school in the Strand. He also gave him casts to draw from and allowed him to buy prints after the old masters at the sale rooms. In 1771 he was apprenticed to Basire the engraver and served his time faithfully in learning the conventional style of engraving. He also made drawings of the monuments in Westminster Abbey and these were engraved for Gough's *Sepulchral Monuments*. His mind was profoundly influenced by the surroundings in which he worked, and

the Gothic style was to him the ideal, the "living form," for ever after. At the same time he was cultivating his mind in other ways and is known to have read Burke, Locke, Bacon and Fuseli's translation of Winckelmann. His creative faculty found its outlet in these early years in poetry, some of which has survived in the thin volume of *Poetical Sketches*, printed for Blake by his friends in 1783. These pieces were composed between his twelfth and

THE DAY OF JUDGMENT, A DRAWING BY BLAKE PUBLISHED IN 1813
This is one of an enormous series of drawings by Blake, to illustrate his mystical philosophy. Each figure has an especial significance which, however, even today probably escapes the majority of his admirers

twentieth years. Although they show the influence of contemporary poetry, notably Ossian, they owe something too, to the Elizabethans and the poets of the later seventeenth century; yet they have a pure strain of lyrical inspiration which sets them apart as a landmark in English literature. They remained unknown and so had no influence on the poetry of their time, but nevertheless were the forerunners of the freer age in poetry which began some twenty years later.

In 1778 Blake had completed his apprenticeship, and at the age of twenty-one set out to earn his living as a professional engraver. He executed many commissions for the booksellers and publishers, and during the next twenty years supported himself largely by this means. His circle of friends about the year 1780 included Stothard, Flaxman and Fuseli, all of whom played a large part in the course of his later life. In this year he first exhibited pictures at the Royal Academy, where they gained the admiration of Romney.

In 1781 he met his future wife, Catherine Boucher, the daughter of a Battersea market-gardener. They were married in August 1782, and lodged at first at 23 Green Street, Leicester Fields. The name of Catherine Blake will go down to posterity as that of an almost perfect wife. She learnt to draw and paint well enough to be able to help Blake in his work. She remained childless, and survived her husband only four years, dying in 1831.

During the years 1783-87 Blake met a number of distinguished people at the house of a Mr. Mathews, who had helped him to print the *Poetical Sketches*; but this society soon disgusted him, and he ridiculed it in a crude satire, now known as *An Island in the Moon*, which was written about 1787. The chief interest of

the ms. now lies in the fact that it contains early drafts of three of the *Songs of Innocence*. In 1784 Blake had started a print shop in partnership with a former fellow apprentice, Parker, at 27 Broad Street, but this did not succeed and was soon abandoned. Meanwhile he was earning a livelihood by engraving ordinary copper-plates for the publishers, and about 1787 he began to experiment with a new method of printing from etched copper-plates. It is related that the secret of this process was revealed to him in a vision by the spirit of his brother Robert. More probably he had received a hint of it some time before from his friend, George Cumberland of Bristol, who had been working on it as early as 1784. Both words and decorations were drawn on the copper-plate with an impervious medium, and the copper was then etched with acid. Text and design remained in relief and could be printed in any tint that pleased the artist. The print could then be left plain or be coloured by hand with water colours or some other medium. The first results of this process were the small dogmatic works, *There is No Natural Religion*, and *All Religions are One*. It developed further with the production of the poetical volume, *Songs of Innocence*, which consisted of lyrical poems etched on copper with decorations coloured by hand. The volume was finished in 1789 and was sold for a few shillings. This was the prelude to the remarkable series of books in "illuminated printing" which occupied Blake in some degree for the remainder of his life. Blake was now living in Hercules Road, Lambeth, and here he completed the works entitled *The Book of Thel*, 1789, *The Marriage of Heaven and Hell*, 1793, *Songs of Experience*, 1794 (a companion volume to *Songs of Innocence*), *America*, 1793, *Visions of the Daughters of Albion*, 1793, *Europe*, 1794, *Urizen*, 1794, *The Book of Los*, 1795, *The Book of Ahania*, 1795, and *The Song of Los*, 1795. In these books his lyrical impulse gradually gave way before a strong mystical tendency which ultimately became the dominant note in his life. In *Songs of Innocence* and *Songs of Experience* the lyrical and mystical elements were intimately mingled. This book had been preceded by *Thel*, and by a prose work, *The Marriage of Heaven and Hell*, in which mysticism and philosophy began to gain the upper hand. In the succeeding works Blake's visionary powers overwhelmed him, and they were wholly devoted to an elaboration of his mystical and metaphysical systems, which have proved a stumbling block to most of his readers up to the present time. They are written in an irregular verse form which entitles Blake to be regarded as the forerunner of the *vers libre* of recent times.

Meanwhile Blake's output as an artist was very large. About the year 1795 he produced his stupendous series of large colour-prints, which can scarcely be matched in the whole history of art for imaginative content and magnificence of colouring. These include "Nebuchadnezzar," "The Elohim creating Adam," and "Newton." By 1797 he had completed his series of 537 water-colour designs for Young's *Night Thoughts*. He had also made numerous separate water-colour paintings, and engraved copper-plates for the publishers.

Blake's circle of friends had widened somewhat, and now included Captain Butts, Muster-master General, who was for thirty years Blake's faithful admirer and customer. It was chiefly Butts' patronage which enabled Blake to earn a livelihood while expending much time and energy on his mystical works, which never produced any adequate return by their sales. He even laboured at a long mystical poem which never was, and was never intended to be, published in its original form. This was *Vala* or *The Four Zoas*, a poem of the greatest significance for the understanding of Blake, though the manuscript was not properly transcribed and edited until 1925, nearly a century after the author's death. The poem was begun about 1795 and was elaborately revised five years later. Some passages from it were used in later works, but none of the drawings in it were ever used again.

During the seven years 1793 to 1800 his creative output was almost greater than can be believed. Periods of mental and physical exhaustion were the inevitable result, and it was probably a very fortunate event that in 1800 introduced Blake to the notice of William Hayley in order that he might execute copper-plates for various works on which Hayley was engaged. As a result of

this introduction, brought about by Flaxman, Blake paid a visit in the early part of 1800 to Hayley at Felpham in Sussex, and later in the year he rented a cottage in the village, so that he might work under Hayley's eye at the engravings for the projected *Life of Cowper*. Blake removed to Felpham with his wife and sister, intending to stay there for an indefinite period. Three years later he returned with a great sense of relief to London. At first he had been able to work happily enough at Felpham, but as time passed he became increasingly irritated by Hayley's patronizing ways and lack of understanding, and his feelings found relief in the scurrilous doggerel and epigrams scribbled in his notebook. At length he realized that the best way of keeping Hayley's friendship was to leave his company, so he returned to London. Part of the three years at Felpham were charged with spiritual discomfort. Blake obtained no respite from the visions which crowded ceaselessly upon him. He was forced to lead a double life, pandering on the surface to Hayley's vanities and forced to develop in secret his own mystical and visionary faculties. The Felpham period saw therefore a strangely mixed output of second-rate engravings for Hayley, of fine water-colour paintings, and of mystical poetry of great power, which was mostly embodied in the poem *Milton*. Thomas Butts bought most of Blake's paintings, and to this faithful friend he confided his difficulties in his letters. An additional trouble was the well known incident which resulted in his trial at Chichester sessions for treason. This was owing to a misunderstanding with a soldier, John Scofield, whom Blake forcibly turned out of the garden of his cottage. Scofield afterwards fabricated evidence against Blake, accusing him of using treasonable words against the King. He was triumphantly acquitted of this charge in Jan. 1804.

After his return to London he lived at 17 South Molton Street, determined to devote his life to art without further hindrance from the outside. He believed that he had learned from Hayley the way to obtain worldly success and riches as a publisher of his own works, but in this he was disappointed, and he found the means of livelihood more precarious than ever. Butts continued to buy his pictures and he was given some work as an engraver, but for his own books he was unable to find a market. He refused, however, to be for long discouraged, and in 1805 he entered with zest into a scheme with the engraver Cromeck for the production of a series of engravings for Blair's *Grave*. Here he was again deceived. Cromeck paid him a small sum for the designs, and then contrary to his agreement employed another to engrave them. The book containing them was published in 1808. Blake, already embittered by neglect, became still more embittered by incidents such as this, and suffered from fits of depression. He reacted, however, about 1808 when he decided to hold an exhibition of his works at the house of his brother James in Broad Street, Golden Square. Sixteen pictures only were exhibited, including his large painting of Chaucer's Canterbury Pilgrims, and each visitor to the house received for his entrance fee of 2/6 a copy of the now celebrated *Descriptive Catalogue*. The exhibition was opened in May 1809, and attracted very little notice, the only criticism of it, which appeared in Leigh Hunt's *Examiner*, being spiteful and unfair. The few visitors included Henry Crabb Robinson, barrister and diarist, who has left a valuable account of his acquaintanceship with Blake during his later years. Blake was again disappointed of the recognition which he knew he merited, and was further ruffled by what he believed to be dishonesty on Stothard's part concerning his picture of the Canterbury Pilgrims. Probably the knavery was Cromeck's, who, having seen Blake's design, suggested the idea to Stothard and so made him an innocent plagiarist. Stothard's commonplace picture was a popular success, and Blake could scarcely recover from this cruel blow to his pride.

During the years following his exhibition Blake sank into an obscurity from which it has been difficult to disinter the bare facts of his existence. For the years 1810-1817 only a few scattered references remain, and it is uncertain how he found the means of earning his living. It has even been suggested that for part of this time he was confined in an asylum. Recent researches, however, have shown that there is no foundation for this rumour. Some of Blake's acquaintances, such as Robert Southey, who had

visited him in 1811, certainly did regard him as insane. But the testimony of his more intimate friends is of greater value, and they have repeatedly stated their conviction that he was anything but mad. Samuel Palmer, a close friend of his later years, wrote of him as "the most practically sane, steady, frugal and industrious" man he ever knew. Moreover there are facts enough to show that Blake was living from 1810 to 1817 merely in retirement, having accepted his fate like the wise man that he was. Throughout this period he was occasionally selling copies of his illuminated books. In 1812 he showed several pictures at the last exhibition of the Associated Artists in Water Colour. In 1815 he called on the Rev. Thomas Dibdin, probably in connection with some illustrations to Milton which he had made. During most of these years he was still executing engravings for various employers, and these included a number of plates for Josiah Wedgwood the younger. Finally it was in the years 1808-1818 that he was engaged upon the hundred etched plates of his greatest symbolical poem, *Jerusalem*. This magnificent work can have brought him very little financial return, as only six copies issued by him are known to exist, and the only one of these that he coloured was still in his possession in 1827.

In the year 1818 Blake entered upon the last phase of his life, and until his death in 1827 was probably happier in his friends and in his work than he had been at any other period. This was due primarily to his friendship with John Linnell, portrait and landscape painter, to whom he was introduced by his old friend, George Cumberland. Blake was still living in South Molton Street, and under Linnell's guidance began to move more freely in society. He was enabled to obtain more work, and became the centre of a circle of young artists who regarded him with affection and veneration. The chief of these were Palmer, Calvert, Richmond, Finch, Walter and Tatham, some of whose names are still well known. Frederick Tatham is of little note as an artist, but is remembered as the author of a short life of Blake, and as the owner of most, perhaps also the destroyer of some, of his effects after the death of Mrs. Blake in 1831. Another friend introduced by Linnell, was John Varley, the water colourist. He was greatly interested in astrology, and at his instigation Blake drew his Visionary Heads of historical personages, an occupation which was clearly much less serious to him than to Varley.

In 1821 Blake moved from South Molton Street to 3 Fountain Court, Strand, and here he executed his greatest work in creative art, the illustrations to the Book of Job. He had previously made twenty water-colour paintings which had been bought by Thomas Butts. Linnell commissioned a duplicate set, and later suggested that he should make engravings of these subjects. The initial expense was borne by Linnell, and the copper-plates were engraved in the years 1823-1825, the book of twenty-one prints being published in March 1826. Though superficially illustrations of the Bible story, the engravings actually form one of the most important of Blake's symbolical books. This has been realized only in recent years, and their mystical content has not prevented the designs from being the most widely known and generally appreciated of Blake's works. From about 1824 Blake had been suffering from symptoms of the gallstones which eventually caused his death. He was a frequent visitor at Linnell's country home at Hampstead, but as time passed he found it increasingly difficult to make the journey thither. He was still, however, to make one more stupendous effort in his art. In October 1825, Linnell commissioned him to make illustrations to Dante's *Divine Comedy*, and to engrave them. He completed a hundred water-colour designs, of which seven were engraved, and was still at work upon these when he died on Aug. 12, 1827. He was buried in an unmarked grave in Bunhill Fields, the approximate place being now indicated by a tablet which was placed there on Aug. 12, 1927.

Blake had lived for nearly seventy years and for more than fifty had worked unremittingly as creative artist and as journeyman engraver. His position in the history of the art of this country is peculiar owing to his double achievement as poet and as painter. It is moreover impossible to determine his place in either poetry or painting separately, the two being interdependent both in his own mind and in the forms he used for their expression. His im-

pulse as a lyrical poet had shown itself before the age of 14 and was not quite exhausted until more than thirty years later. It is seen at its best in the volume of *Poetical Sketches*, printed in 1783, in the *Songs of Innocence* and *Songs of Experience*, published in the years 1789 to 1794, and in some of the later poems from manuscripts and letters, and this part of his writings has justly been the chief source of his present popularity. Gradually this faculty gave way, as his mind developed, before a rising tide of mysticism which strove to find expression through an increasingly complex system of symbolism. In the *Songs* some symbolism and simple pictorial designs were added to lyrical poetry. In his latest poems, *Milton* and *Jerusalem*, the symbolism became predominant and its pictorial representation more elaborate. As a painter he was entirely uninterested in realism, his favourite subjects being taken from the Bible or from writers such as Shakespeare and Milton. He sought to express in a picture the things of the mind as much as in a poem, and it is to the mind of the observer that they appeal. It is useless therefore to look in Blake's pictures for accuracy of detail. He laid great store by firmness of outline, but abhorred copying Nature. His pictures live by their qualities of design, colouring and imaginative content, and his mystical poetry by the vigour of the intellect which produced it.

It cannot be disputed that Blake suffered from the defects of his qualities. His mind was never systematically cultivated, just as his hand was never intensively trained to draw from the living model. He was therefore apt to be intolerant through ignorance, and inaccurate through lack of observation. It is doubtful, however, whether he would have achieved more or have had a greater influence at the present time if he had possessed the academic virtues. His qualities isolated him from his contemporaries and drove his mind in upon itself, so that the precise interpretation of his message to mankind has become a matter of great uncertainty. But through all his mental turmoil and difficulties in dealings with his fellow men he kept his intellectual integrity, and he never prostituted his art. Throughout his life he sought to exalt the things of the mind, and for him the imagination was man's highest faculty. Ceaselessly he fought against materialism and attempted to gain his own spiritual regeneration through struggles against self. He was deeply religious, though in no conventional sense. In his later years Christ became identified in his mind with Art, and this fact provides many clues for the understanding of his doctrines. In his symbolical writings his own mental experiences were described without regard to the difficulties of his readers. Late in his life he made some attempt to embody his view of Christianity in more direct language, but his poem *The Everlasting Gospel*, written about 1818, was never finished, and exists now only in disconnected fragments. Perhaps the most illuminating revelation of his mind for most readers are the aphorisms and didactic statements which he engraved about the year 1820 around a representation of the Laocöon Group.

It is not surprising therefore that Blake was incomprehensible to his contemporaries. He influenced them as little as he was influenced by them, and for many years after his death his name was unknown. His first full biography, written by Alexander Gilchrist, was published in 1863, and was reprinted under the supervision of D. G. Rossetti in 1880. Since that time his power and originality, have gained fuller recognition, and he now holds a position as one of the greatest figures in English poetry and art.

BLAKELOCK, RALPH ALBERT (1847-1919), American painter, was born in New York city on Oct. 15, 1847. He graduated at the College of the City of New York in 1867. In art he was self-taught, original and, until ill-health necessitated the abandonment of his profession, a prolific worker. His subjects included pictures of North American Indian life, and landscapes—notably such canvases as "The Indian Fisherman"; "Tawo-koka, or Circle Dance"; "Silvery Moonlight"; "A Waterfall by Moonlight"; "Solitude"; and "Moonlight on Long Island Sound." In 1916 the Toledo Art Museum paid \$20,000 for his "Brook by Moonlight." Because of insanity he was kept under restraint during the last 18 years of his life. He died near Elizabethtown (N.Y.), in the Adirondacks, on Aug. 9, 1919.

BLAKENEY, WILLIAM BLAKENEY, BARON (1672-1761), British soldier, was born at Mount Blakeney in Limerick in 1672. In 1747 George II. made him lieutenant-general and lieutenant-governor of Minorca. The governor of that island never set foot in it, and Blakeney was left in command for ten years. In 1756 the Seven Years' War was preluded by a swift descent of the French on Minorca. Fifteen thousand troops under marshal the duc de Richelieu, escorted by a strong squadron under the marquis de la Gallissonnière, landed on the island on April 18, and at once began the siege of Fort St. Philip, where Blakeney commanded at most some 5,000 soldiers and workmen. The defence, in spite of crumbling walls and rotted gun platforms, had already lasted a month when a British fleet under vice-admiral the Hon John Byng appeared. La Gallissonnière and Byng fought, on May 20, an indecisive battle, after which the relieving squadron sailed away and Blakeney was left to his fate. A second expedition subsequently appeared off Minorca, but it was then too late, for after a heroic resistance of 71 days the old general had been compelled to surrender the fort to Richelieu (April 18-June 28 1756). Only the ruined fortifications were the prize of the victors. Blakeney and his little garrison were transported to Gibraltar with absolute liberty to serve again. Byng was tried and executed; Blakeney, on his return to England, found himself the hero of the nation, and received a peerage. He died Sept. 20 1761.

See *Memoirs of General William Blakeney* (anon., 1757).

BLAMIRE, SUSANNA (1747-1794), English poet, daughter of a Cumberland yeoman, was born at Cardew Hall, near Dalton and led an uneventful life in her native county. Her poems were published in 1842 by Henry Lonsdale as *The Poetical Works of Miss Susanna Blamire*, "the Muse of Cumberland," with a memoir by Mr. Patrick Maxwell. Some of her songs rank among the best of north-country lyrics. "And ye shall walk in silk attire" and "What ails this heart o' mine" are well known, and were included in Johnson's *Scots' Musical Museum*.

BLANC (JEAN JOSEPH CHARLES) LOUIS (1811-1882), French politician and historian, was born on Oct. 29 1811, at Madrid, where his father held the post of inspector-general of finance under Joseph Bonaparte. Failing to receive aid from Pozzo di Borgo, his mother's uncle, Louis Blanc studied law in Paris, living in poverty, and became a contributor to various journals. In the *Revue du progrès*, which he founded, he published in 1839 his study on *L'Organisation du travail*. The principles laid down in this famous essay form the key to Louis Blanc's whole political career. He attributes all the evils that afflict society to the pressure of competition, whereby the weaker are driven to the wall. He demanded the equalization of wages, and the merging of personal interests in the common good—"à chacun selon ses besoins, de chacun selon ses facultés." This was to be effected by the establishment of "social workshops," a sort of combined co-operative society and trade-union, where the workmen in each trade were to unite their efforts for their common benefit. In 1841 he published his *Histoire de dix ans, 1830-1840*, an attack upon the monarchy of July. It ran through four editions in four years.

In 1847 he published the two first volumes of his *Histoire de la Révolution Française* (finished 1862). Its publication was interrupted by the revolution of 1848, when Louis Blanc became a member of the provisional government. On his motion, on Feb.

25, the government undertook "to guarantee the livelihood of the workers by work"; and, though his demand for the establishment of a ministry of labour was refused, he was authorized to call together an assembly of Paris workers' delegates (the famous *Commission du Luxembourg*) to prepare a plan for the permanent elimination of unemployment. This body, in form an anticipation of the Russian Soviet, became an arbiter in trade disputes and a centre of Socialist propaganda. The alarm and indignation of the employing class was intense and, on the meeting of the National Assembly at the beginning of May, Blanc was not re-elected to his post in the Government, and the plan of the Luxembourg Commission was ignored. Furthermore, the Government had already set up as a rival organization the "National workshops" (*q.v.*) conducted on a parody of Blanc's principles, intended to fail, and under the supervision of Marie, one of his political enemies. Blanc was forced to fly to England after the defeat of the workers in the revolt of June 1848, and did not return till after the fall of the empire in 1871. He was elected deputy, and, though he did not join the Communards, in Jan. 1879 introduced into the chamber a proposal for their amnesty, which was carried. He died at Cannes on Dec. 6 1882.

Louis Blanc possessed a picturesque and vivid style and considerable power of research; his political and social ideas have had a great influence on the development of Socialism in France. His *Discours politiques* (1847-81) was published in 1882. His most important works, besides those already mentioned, are *Lettres sur l'Angleterre* (1866-67); *Histoire de la Révolution de 1848* (1870-80); *Dix années de l'histoire de l'Angleterre* (1870-81); and *Questions d'aujourd'hui et de demain* (1873-84).

BLANC, MONT, the culminating point (15,782 ft) of the mountain range of the same name, lying within French, Swiss and Italian territory. The summit is wholly French and is the loftiest peak in the Alps, and in Europe also, if certain peaks in the Caucasus be excluded. It divides the valley of Chamonix from that of Courmayeur. Among the great glaciers which radiate from this centre are those of Bossons, and Taconnaz (northern slope) and of Brenva and Miage (southern slope). The first ascent was made in 1786 by two Chamonix men, Jacques Balmat and Dr. Michel Paccard, and the second in 1787 by Balmat with two local men. Later in 1787 H. B. de Saussure made the third ascent, and was followed a week later by Col. Beaufoy, the first Englishman to gain the top. These ascents were all made from Chamonix, but since then routes have been forced up the peak from nearly every side, those on the Italian side being much steeper than that from Chamonix. The ascent from Chamonix is now frequently made in summer (rarely in winter also), but, owing to the great height of the mountain, the view is unsatisfactory, though very extensive (Lyons is visible). There is an inn at the Grands Mulets (9,009 ft). In 1890 M. Vallot built an observatory and shelter hut (14,312 ft.) on the Bosses du Dromadaire (north-west ridge of the mountain), and in 1893 T. J. C. Janssen constructed an observatory just below the very summit. Both no longer exist.

See C. E. Mathews, *The Annals of Mont Blanc* (1898); L. Kurz and X. Imfeld, *Carte de la chaîne du Mont Blanc* (1896, new ed. 1905); Ch. Vallot, L. W. Collet, J. Vallot, *Guide du Massif du Mont Blanc* (1924).

BLANCHARD, SAMUEL LAMAN (1804-45), British author and journalist, was born at Great Yarmouth May 15 1804. In 1828 he published *Lyric Offerings*, dedicated to Charles Lamb. He had a very varied journalistic experience, and from 1841 till his death he was connected with the *Examiner*. In 1846 Bulwer-Lytton collected a number of his prose essays under the title *Sketches of Life*, to which a memoir of the author was prefixed. His verse was collected in 1876 by Blanchard Jerrold. He died by his own hand Feb. 15 1845.

BLANCHARD, THOMAS (1788-1864), an American inventor, was born in Sutton, Mass., on June 24, 1788. At 18 he contrived a machine for making tacks. Later he made one for

turning and finishing gun-barrels in a single operation, an invention which has been developed to produce a great variety of irregular shapes. He interested himself also in steam-power and invented a trackless locomotive, as well as various improvements for railroads; his steamboats, designed for use in swift river-currents, were put into service in various parts of the United States. Timber-bending, mortising and envelope-making devices were among his other achievements as an inventor. He died in Boston on April 16, 1864.

See D. Goddard, *Eminent Engineers* (1906) and G. Iles, *Leading American Inventors* (1912).

BLANCHE, JACQUES ÉMILE (1861–), French painter, born in Paris. He acquired a great reputation as a portrait painter; his art is derived from French and English sources, refined, sometimes super-elegant, but full of character. Among his chief works are his portraits of his father, of Pierre Louÿs, the Thaulow family, Aubrey Beardsley, Yvette Guilbert and Thomas Hardy.

BLANCHE OF CASTILE (1188–1252), wife of Louis VIII. of France, third daughter of Alphonso VIII., king of Castile, and of Eleanor of England, daughter of Henry II., was born at Valencia. In consequence of a treaty between Philip Augustus and John of England, she was betrothed to the former's son, Louis, and was brought to France, in the spring of 1200, by John's mother, Eleanor. On May 22, 1200, the treaty was finally signed, John ceding with his niece the fiefs of Issoudun and Graçay, together with those that André de Chavigny, lord of Châteauroux, held in Berry, of the English crown. The marriage was celebrated the next day, at Portmort, on the right bank of the Seine, in John's domains, as those of Philip lay under an interdict.

Blanche first displayed her great qualities in 1216, when Louis, who on the death of John claimed the English crown in her right, invaded England, only to find a united nation against him. Philip Augustus refused to help his son, and Blanche was his sole support. The queen established herself at Calais and organized two fleets, one of which was commanded by Eustace the Monk, and an army under Robert of Courtenay; but all her resolution and energy were in vain. Although it would seem that her masterful temper exercised a sensible influence upon her husband's gentler character, her rôle during his reign (1223–26) is not well known. Upon his death he left Blanche regent and guardian of his children. Of her 12 or 13 children, six had died, and Louis, the heir—afterwards Saint Louis—was but 12 years old. Blanche had to bear the whole burden of affairs alone, to break up a league of the barons (1226), and to repel the attack of the king of England (1230). But her energy and firmness overcame all dangers. She gained over one of the confederate nobles, Thibaut, comte de Champagne, protected him from the attacks of his former allies, and when he inherited the throne of Navarre, obtained from him the counties of Blois, Chartres and Saucerre. By judicious marriage treaties she secured to the royal house Toulouse and Provence. Saint Louis owed his realm to his mother, but he himself always remained somewhat under the spell of her imperious personality. After he came of age (1236) her influence upon him may still be traced. In 1248 she again became regent, during Louis IX.'s absence on the crusade, a project which she had strongly opposed. In the disasters which followed she maintained peace, while draining the land of men and money to aid her son in the East. She fell ill at Melun in Nov. 1252, and was taken to Paris, but lived only a few days.

Besides the works of Joinville and William of Nangis, see Élie Berger, "Histoire de Blanche de Castille, reine de France," in *Bibliothèque des écoles françaises d'Athènes et de Rome*, vol. lxx. (1895); Le Nain de Tillemont, "Vie de Saint Louis," ed. by J. de Gaulle for the *Société de l'Histoire de France* (1847–51); and Paulin Paris, "Nouvelles recherches sur les mœurs de la reine Blanche et de Thibaut," in *Cabinet historique* (1858).

BLANCH FEE or **BLANCH HOLDING**, an ancient tenure in Scottish land law, the duty payable being in silver or white money in contradistinction to gold. The phrase was afterwards applied to any holding of which the quit-rent was merely nominal.

BLANDFORD or **BLANDFORD FORUM**, municipal borough, Dorset, England, on the river Stour, where the ancient

road from Salisbury to Dorchester crosses the road and rail routes following the river from north-west to south-east. Population (1921) 3,193. The town is an old foundation, but was almost wholly destroyed by fire in the 18th century, a fate that has overcome other settlements in this region of thatched houses and wooden barns. The town thus has a singularly uniform appearance. Remnants of a 14th century mansion, Damory Court, are to be seen in a farmhouse. The chalk hills of the neighbourhood are rich in prehistoric remains of various kinds. The municipal borough is governed by a mayor, four aldermen and 12 councillors. Area 145 acres. It is in the northern parliamentary division of the county.

BLANDRATA or **BIANDRATA, GIORGIO** (c. 1515–1588), Italian physician and polemic, was born at Saluzzo. He studied at Montpellier in 1533, and specialized in the functional and nervous disorders of women. He attended the English wife (Jane Stafford) of Count Celso Massimiliano Martinengo, preacher of the Italian church at Geneva, and fostered anti-trinitarian opinions in that church. In 1558 he found it expedient to remove to Poland, where he became a leader of the heretical party at the synods of Pinczów (1558) and Ksionzh (1560 and 1562). His point was the suppression of extremes of opinion, on the basis of a confession literally drawn from Scripture. He obtained the position of court physician to the queen dowager, the Milanese Bona Sforza. In 1563 Blandrata transferred his services to the Transylvanian court. He revisited Poland (1576) in the train of Stephen Báthory, whose tolerance permitted the propagation of heresies; and when (1579) Christopher Báthory introduced the Jesuits into Transylvania, Blandrata found means of conciliating them. In Transylvania, Blandrata co-operated with Francis Dávid (d. 1579), the anti-trinitarian bishop, but in 1578 two circumstances broke the connection. Blandrata was charged with "Italian vice." Dávid renounced the worship of Christ. To influence Dávid, Blandrata sent for Faustus Socinus from Basle. Socinus was Dávid's guest, but the discussion between them led to no result. At the instance of Blandrata, Dávid was tried and condemned to prison at Déva (in which he died) on the charge of innovation. Having amassed a fortune, Blandrata returned to the communion of Rome. His end is obscure. According to the Jesuit, Jacob Wujek, he was strangled by a nephew (Giorgio, son of Alphonso) in May 1588. He published polemical writings, some in conjunction with Dávid.

See Malacarne *Commentario delle Opere e delle Vicende di G. Blandrata* (Padova, 1814); Wallace *Anti-trinitarian Biography*, vol. ii. (1850). (A. Go.)

BLAND-SUTTON, SIR JOHN (1855–), British surgeon, was born at Enfield Highway, Middlesex, in 1855. He studied medicine and surgery at Middlesex hospital from 1878 onwards, and from 1881–86 made systematic examinations of animals dying in the gardens of the Zoological Society, London. This work formed the substance of a series of lectures delivered at the Royal College of Surgeons 1886–91. He subsequently carried out much valuable work on hysterectomy and the diseases of women. He was president of the Medical Society of London in 1914, of the Royal Society of Medicine 1921–22, of the Royal College of Surgeons in 1923, and was also consulting surgeon to Middlesex hospital. He was the recipient of many British honours, being knighted in 1912 and made a baronet in 1925.

His published works, include *Ligaments, their Nature and Morphology* (1887); *Evolution and Disease* (1890); *Surgical Diseases of the Ovaries, etc.* (1891); *Tumours, Innocent and Malignant* (1893); *Diseases of Women* (1897); *Surgery of Pregnancy and Labour, complicated with Tumours* (1901); *Gall Stones and Diseases of the Bile Ducts* (1907); *Man and Beast in Eastern Ethiopia* (1911); *Fibroids of the Uterus* (1913); *Selected Lectures and Essays* (1920); *Orations and Addresses* (1924).

BLANE, SIR GILBERT (1749–1834), Scottish physician, was born at Blanefield, Ayrshire, on Aug. 29, 1749. He was educated at Edinburgh university, and shortly after his removal to London became private physician to Lord Rodney, whom he accompanied to the West Indies in 1779. He improved the health of the fleet by attention to the diet of the sailors and by enforcing due sanitary precautions, and it was largely through him that in 1795 the use of lime-juice was made obligatory throughout the

navy as a preventative of scurvy. He was made a baronet in 1812 in reward for the services he rendered in connection with the return of the Walcheren expedition. He died in London on June 26, 1834. His works include *Observations on the Diseases of Seamen* (1795); *Elements of Medical Logic* (1819).

BLANFORD, WILLIAM THOMAS (1832-1905), English geologist and naturalist, was born in London. He was on the staff of the Geological Survey of India and was later engaged in the coalfield near Talchir, where boulders considered to have been ice-borne were found in the Talchir strata—a discovery confirmed by subsequent observations of other geologists.

Biography, with bibliography and portrait, in *Geological Magazine*, Jan. 1905.

BLANK, a word used in various senses based on that of "left white," i.e., requiring something to be filled in (Fr. *blanc*, white); thus a "blank cheque" requires the amount to be inserted, an insurance policy in blank lacks the name of the beneficiary, "blank verse" (*q.v.*) is unrhymed verse, a "blank cartridge" contains only powder and no ball or shot. The word is also used for a ticket in a lottery or sweepstake which does not carry a number or the name of a horse running, or for an unstamped metal disc in coining.

BLANKENBERGHE, seaside resort, west Flanders, Belgium, 12m. N.E. of Ostend. Pop. (1925) 6,823. There is a small fishing port and a considerable fishing fleet. Zeebrugge (*q.v.*) lies 2m. north.

BLANKENBURG, a town and health resort of Germany, in the free State of Brunswick, at the northern foot of the Harz mountains, 12m. S.W. of Halberstadt. Pop. (1925), 12,062. It has been in large part rebuilt since a fire in 1836, and possesses a castle, a museum of antiquities, an old town hall and churches. In the vicinity is a cliff called Teufelsmauer (Devil's wall), from which fine views are obtained across the plain and into the deep gorges of the Harz mountains.

BLANKENESE, a town on the Elbe in the Prussian province of Schleswig-Holstein, west of and almost suburban to Altona. Pop. (1925) 13,652. Boatbuilding is carried on.

BLANKETEERS, the nickname given to some 5,000 operatives who on March 10 1817, met in St. Peter's Field, near Manchester, to march to London, each carrying blankets or rugs. Their object was to see the Prince Regent and lay their grievances before him. The Habeas Corpus act was suspended, and the leaders were seized and imprisoned. The few stragglers who persisted in the march were intercepted by troops and treated with considerable severity.

BLANK INDORSEMENT or **INDORSEMENT IN BLANK**: see **INDORSEMENT**.

BLANK VERSE, the unrhymed measure of iambic decasyllable in five beats which is usually adopted in English epic and dramatic poetry. The epithet is due to the absence of the rhyme the ear expects at the end of successive lines. In the beginning of the 16th century, however, certain Italian poets made the experiment of writing decasyllables without rhyme. The tragedy of *Sofonisba* (1515) by Trissino (1478-1550) was the earliest work completed in this form; it was followed in 1525 by the didactic poem *Le Api* (The Bees), of Giovanni Rucellai (1475-1525), who announced his intention of writing "*Con verso Etrusco dalle rime sciolto*," in consequence of which expression this kind of metre was called *versi sciolti* or blank verse. In a very short time this form was largely adopted in Italian dramatic poetry, and the comedies of Ariosto, the *Aminta* of Tasso and the *Pastor Fido* of Guarini are composed in it. The iambic blank verse of Italy was mainly hendecasyllabic, not decasyllabic, and under French influences the habit of rhyme soon returned.

Before the close of Trissino's life, however, his invention had been introduced into another literature, where it was destined to enjoy a longer and more glorious existence. Towards the close of the reign of Henry VIII., Henry Howard, earl of Surrey, translated two books of the *Aeneid* into English rhymeless verse, "drawing" them "into a strange metre." Surrey soon found an imitator in Nicholas Grimoald, and in 1562 blank verse was first applied to English dramatic poetry in the *Gorboduc* of Sackville

and Norton. By the year 1585 it had come into almost universal use for theatrical purposes. In Lyly's *The Woman in the Moon* and Peele's *Arraignment of Paris* (both of 1584) we find blank verse struggling with rhymed verse and successfully holding its own. The earliest play written entirely in blank verse is supposed to be *The Misfortunes of Arthur* (1587) of Thomas Hughes. Marlowe now immediately followed, with the magnificent movement of his *Tamburlaine* (1589), which was mocked by satirical critics as "the swelling bombast of bragging blank verse" (Nash) and "the spacious volubility of a drumming decasyllable" (Greene), but which introduced a great new music into English poetry. Except, however, when he is stirred by a particularly vivid emotion, the blank verse of Marlowe continues to be monotonous and uniform.

Shakespeare, after having returned to rhyme in his earliest dramas, particularly in *The Two Gentlemen of Verona*, adopted blank verse conclusively about the time that the career of Marlowe was closing, and he carried it to the greatest perfection in variety, suppleness and fullness. He released it from the excessive bondage that it had hitherto endured; as Robert Bridges has said, "Shakespeare, whose early verse may be described as syllabic, gradually came to write a verse dependent on stress." In comparison with that of his predecessors and successors, the blank verse of Shakespeare is essentially regular, and his prosody marks the admirable mean between the stiffness of his dramatic fore-runners and the laxity of those who followed him. The ease and fluidity of his prosody were abused by his successors, particularly by Beaumont and Fletcher, who employed the soft feminine ending to excess; in Massinger dramatic blank verse came too near to prose, and in Heywood and Shirley it was relaxed to the point of losing all nervous vigour.

The later dramatists gradually abandoned that rigorous difference which should always be preserved between the cadence of verse and prose, and the example of Ford, who endeavoured to revive the old severity of blank verse, was not followed. But just as the form was sinking into dramatic desuetude, it took new life in the direction of epic, and found its noblest proficient in the person of John Milton. The most intricate and therefore the most interesting blank verse which has been written is that of Milton in the great poems of his later life. He reduced the elisions, which had been frequent in the Elizabethan poets, to law; he admitted an extraordinary variety in the number of stresses; he deliberately inverted the rhythm in order to produce particular effects; and he multiplied at will the caesurae or breaks in a line. *Paradise Lost* is full of instances of Milton's exquisite art in ringing changes upon the metrical type of ten syllables, five stresses and a rising rhythm, so as to make the whole texture of the verse respond to his poetical thought. Writing many years later in *Paradise Regained* and in *Samson Agonistes*, Milton retained his system of blank verse in its general characteristics, but he treated it with increased dryness and with a certain harshness of effect.

After the Restoration, and after a brief period of experiment with rhymed plays, the dramatists returned to the use of blank verse, and in the hands of Otway, Lee and Dryden, it recovered much of its magnificence. In the 18th century, Thomson and others made use of a very regular and somewhat monotonous form of blank verse for descriptive and didactic poems, of which the *Night Thoughts* of Young is, from a metrical point of view, the most interesting. With these poets the form is little open to licence, while inversions and breaks are avoided as much as possible. Since the 18th century, blank verse has been subjected to constant revision in the hands of Wordsworth, Coleridge, Shelley, Keats, Tennyson, the Brownings and Swinburne, but no radical changes, of a nature unknown to Shakespeare and Milton, have been introduced into it.

BLANQUI, JEROME ADOLPHE (1798-1854), French economist, brother of L. A. Blanqui, the revolutionary, was born

at Nice. He was a pupil of J. B. Say, whom he succeeded in the chair of political economy at the Conservatoire des Arts et Métiers in 1833. He was, from 1830 to his death, head of the École de Commerce in Paris. Blanqui practically devoted the whole of his life to an examination of the condition of the working classes in different countries. His *Histoire de l'économie politique en Europe, depuis les anciens jusqu'à nos jours* (1838, 1842, and 1845), was translated into several languages.

BLANQUI, LOUIS AUGUSTE (1805–1881), French revolutionary, was born on Feb. 1 1805, at Puget Théniers, where his father was sub-prefect. He studied both law and medicine, but early became interested in politics. He fought in the revolution of 1830, receiving a decoration for his services. He was rapidly disillusioned by the conduct of the new Government of Louis Philippe, and was active in the formation and direction of secret Republican societies. He was twice imprisoned, but in 1838 organized a new "Society of the Seasons" with Armand Barbès and Martin Bernard as colleagues. Its attempt at insurrection on May 12, 1839, was a fiasco, and Blanqui, with his colleagues, was arrested and sentenced to death commuted to imprisonment for life. He was later granted a formal pardon on the belief that he was dying, but he was not able to leave the prison hospital until just before the revolution of Feb. 1848. He now found himself the chief Republican club-leader, and continually pressed the Government to follow a more Socialist and Jacobin policy. As the most skilled tactician, he might have momentarily succeeded in this object had not Barbès ruined his influence by sponsoring a baseless charge of treachery. He was unable to prevent the senseless attack on the assembly on May 15, but suffered its consequences, being sentenced to ten years' imprisonment. During these years he thought out his political philosophy, becoming a Socialist and the first public advocate of the dictatorship of the proletariat (exercised through Paris) as the only means of achieving Communism. He resumed his organization of secret societies on his release in 1850, but after a second imprisonment directed operations from Belgium. By 1870 he was at the head of a secret armed and drilled force of about 4,000 men in Paris; he also had many adherents who were not included in his army. On the news of the disaster of Sedan the Blanquist army formed the "hard centre" which directed the energies of the indignant crowd, so that the downfall of the Empire was secured. It was not, however, able to influence the composition of the new Government except by forcing the inclusion of Henri Rochefort.

Blanqui, who was ardently patriotic, was infuriated by the slackness of the Government left behind in Paris by Gambetta to conduct the war. He believed, possibly truly, that it was more hostile to the "red" battalions of the National Guard than to the Prussians. On Oct. 31 1870, the battalions which followed his lead came into conflict with the orthodox regiments, and for a few hours Blanqui was at the head of a provisional Government: he came, however, to an arrangement with the expelled Government and withdrew. On the signing by Thiers of the armistice of Jan. 27 1871, Blanqui retired to the department of the Lot to recover his health, broken by exertion and disappointment. Here he was arrested by order of Thiers on the eve (March 17) of the latter's *coup d'état manqué*, which led to the Commune (q.v.). Though elected to a seat on this body, which was chiefly led by his followers, he was held a close prisoner until, after its defeat, when he was again sentenced to imprisonment for life. As a result of considerable agitation, culminating in his election as deputy for Bordeaux, he was released in 1879, and ended his life in peaceful propaganda. The Blanquist Party was absorbed in the French Unified Socialist Party by negotiation in 1904–05.

BLANTYRE, a town in Nyasaland, Africa, 15° 47' S., 35° 3' E., and about 3,500 ft. above sea-level in the Shire Highlands, 300 m. by river and rail from the Chinde mouth of the Zambezi. Pop. about 6,000 natives, 250 whites. Blantyre is the principal commercial centre of Nyasaland, and is the present railhead. Though Zomba is the administrative capital, Blantyre is the headquarters of the missionary societies. The chief building is the Church of Scotland church, built by native labour. The town has the Queen Victoria memorial hall for social functions and a subscription library.

BLANTYRE (Gaelic, "the warm retreat"), parish, Lanarkshire, Scotland, south-east of Glasgow, and containing High Blantyre, Blantyre Works (or Low Blantyre), Stonefield and several villages. Pop. (1921), 18,153. The whole district is rich in coal. Blantyre Works was the birthplace of David Livingstone (1813–73) and his brother Charles (1821–73), who as lads were both employed as piecers in a local cotton-mill. The village has decayed since the closing of the dye-works. Scanty remains of Blantyre Priory (13th century), stand on the left bank of the Clyde, almost opposite the beautiful ruins of Bothwell Castle. High Blantyre and Blantyre Works are connected with Glasgow by the L.M.S. railway. Stonefield, the most populous place in the parish, entirely occupied with mining, lies between High Blantyre and Blantyre Works. Calderwood Castle on Rotten Calder Water, near High Blantyre, is picturesque.

BLARNEY, a castle and town in County Cork, Ireland, 5 m. north-west of the City of Cork on the Great Southern railway. Pop. (1921) 778. It manufactures tweed. The castle, built, c. 1446, by Cormac McCarthy, has walls as much as 18 ft. thick. The "Blarney Stone" in the castle is reputed to confer eloquence on those who kiss it; and the fame of the castle is also bound up with the civil history of the county and the War of the Great Rebellion.

BLASCO-IBÁÑEZ: see IBÁÑEZ, VICENTE BLASCO.

BLASHFIELD, EDWIN HOWLAND (1848–), American artist, was born Dec. 15, 1848 in New York city. He was a pupil of Bonnat in Paris, and became (1888) a member of the National Academy of Design in New York. For some years a genre painter, he later turned to decorative work, marked by rare delicacy and beauty of colouring. He painted mural decorations for a dome in the manufacturers' building at the Chicago exposition of 1893; for the dome of the Congressional library, Washington; for the capitols at St. Paul (Minn.), and Madison (Wis.); for the Baltimore court-house; in New York city for the Appellate court-house; the grand ballroom of the Waldorf-Astoria hotel; the Lawyers' club; and the residences of W. K. Vanderbilt and Collis P. Huntington; and in Philadelphia for the residence of George W. Drexel; and for the chancel of St. Saviour's. With his wife he wrote *Italian Cities* (1900), edited Vasari's *Lives of the Painters* (1896), published *Mural Painting in America* (1913), and was well known as a lecturer and writer on art. He became president of the society of mural painters, and of the society of American artists, and in 1915–16 was president of the national institute of arts and letters. He has served as vice-president of the American federation of arts, and president of the national academy of design. For his mural work in the court-house at Youngstown (O.) and in the State capitol of South Dakota, he received (1911) the gold medal of the architectural league.

BLASIUS or **BLAISE, SAINT**, bishop of Sebaste or Sivas in Asia Minor, martyred under Diocletian on Feb. 3, 316. The Roman Catholic Church keeps his festival on Feb. 3, the Orthodox Feb. 11. He is said to have been torn with woolcombers' irons before he was beheaded, and this seems to be the reason for his becoming the patron saint of woolcombers. In England St. Blaise was popular, and the council of Oxford in 1222 forbade all work on his festival. Owing to a miracle which he is alleged to have worked on a child suffering from a throat affection, St. Blaise's aid was held sovereign against throat and lung diseases.

See William Hone, *Every Day Book*, i. 210.

BLASPHEMY, literally, defamation or evil speaking, but more peculiarly restricted to an indignity offered to the Deity

by words or writing. By the Mosaic law death by stoning was the punishment for blasphemy (Lev. xxiv. 16). The 77th Novel of Justinian assigned death as the penalty, as did also the Capitularies.

In England before the Restoration blasphemy, in common with atheism and heresy, was cognizable in the Ecclesiastical Courts only, unless it was in any way political; and since it was not easy to distinguish scurrilous language against religion from heretical opinions, the blasphemer not seldom went to the stake. The last burnings *pro salute animae* were in 1612, and it was not until 1677 that the writ of *de haeretico comburendo* with all process thereon and all punishment of death was swept away by 29 Car. 2. C. 9. Blasphemy as distinguished from false doctrines, however, remained cognizable by the Ecclesiastical Courts, but spiritual censures had lost their sting, and since the Star Chamber and Court of High Commission, which formerly dealt with blasphemy on the political side, were extinct, the King's Bench claimed jurisdiction. The common law doctrine was first laid down by Hale C. J. in *Taylor's Case* in 1675, where the indictment was for words only (1 Vent. 298). "Although," said the Chief Justice, "such words were of ecclesiastical cognisance, yet the allegation that religion is a cheat tends to the dissolution of all government, and such kind of wicked and blasphemous words were not only an offense against God and religion but a crime against the law, State and Government and therefore punishable in this court. An indictment lay for saying the Protestant religion was a cheat, for [by] taking away religion all obligations to Government by oaths, etc., ceaseth, and Christian religion is part of the law itself." Taylor was found guilty and, as part of his punishment, stood in the pillory in Westminster Palace yard with a paper on his head inscribed with the charge, "For blasphemous words tending to the subversion of all government" *Woolston's Case* (1 Fitzg. 64) in 1728 completes the doctrine. "We do not," said Lord Raymond, "meddle with any difference of opinion, we interfere only where the very root of Christianity is itself struck at." This view was confirmed by Lord Mansfield in *Evans v. Chamberlain of London* (1762) (2 Burn's Ecc. Law. 207), when he said: "The common law of England knows no prosecution for mere opinions," and by Mr. Justice Erskine in *Shore v. Wilson* (1842) (9 Cl and Fin. 534), when he said: "It is indeed still blasphemy, punishable at common law, scoffing or irreverently to ridicule or impugn the doctrine of the Christian faith; yet any man may, without subjecting himself to any penal consequences, soberly and reverently examine and question the truth of those doctrines which have been essential to it." In his directions to the jury in *Reg v. Bradlaugh and Reg. v. Ramsay and Foote* (1883) (15 Cox C. C. 217 and 230), Lord Coleridge C. J. declared that it is no longer true to say that "Christianity is part of the law of the land." To maintain that merely the denial of the truth of Christianity is indictable is absolutely untrue. If the decencies of controversy are observed, even the fundamentals of religion may be attacked without a person being guilty of blasphemous libel. He was followed by Phillimore J. in *R. v. Boulter* (1908) (72 J P 189) who said: "A man is free to speak and to teach what he pleases as to religious matters, though not as to morals, . . . but if, not for the sake of argument, he were to make a scurrilous attack on doctrines which the majority of people hold to be true, in a public place where passers-by may have their ears offended, and where young persons may come, he will render himself liable to the law of blasphemous libel." Here the defendant had become a public nuisance. In *Bowman v. Secular Society Ltd* (1917), A.C. 406, Lord Sumner in an exhaustive review of the law doubted whether the maxim that Christianity is part of the law of the land was ever regarded to such an extent as to make any attack upon it, apart from scurrility, a criminal offence. It was held by the House of Lords that assuming the objects of the defendants to involve a denial of Christianity, (1) they were not criminal, inasmuch as the propagation of anti-Christian doctrines, apart from scurrility or profanity, did not constitute the offence of blasphemy; and (2) they were not illegal in the sense of rendering the Society incapable of acquiring property by gift, which was accordingly valid.

Profane cursing and swearing is made punishable by the Pro-

fane Oaths Act 1745, which directs the offender to be brought before a justice of the peace, and fined 5s., 2s., or 1s., according as he is a gentleman, below the rank of gentleman, or a common labourer, soldier, etc.

By the law of Scotland the penalty for blasphemy was death, but by an Act of 1825, amended in 1837, blasphemy was made punishable by fine or imprisonment or both.

In the United States the statutes of the several States on blasphemy did not abrogate the common law in all cases, but provided for particular proceedings and punishment. (H. H. L. B.)

BLASS, FRIEDRICH (1843-1907), German classical scholar, was professor at Kiel 1876-92, and at Halle 1892-1907.

Blass is chiefly known for his works in connection with the study of Greek oratory: *Die griechische Beredsamkeit von Alexander bis auf Augustus* (1865); *Die attische Beredsamkeit* (1868-80; 2nd ed., 1887-98), his greatest work; editions for the Teubner series of Andocides (1880), Antiphon (1881), Hyperides (1881, 1894), Demosthenes (Dindorf's ed. 1885), Isocrates (1886), Deinarchus (1888), Demosthenes (Rehdantz's ed., 1893), Aeschines (1896), Lycurgus, *Leocrates* (1902); *Die Rhythmen der attischen Kunstprosa* (1901); *Die Rhythmen der asianischen und römischen Kunstprosa* (1905). Among his other works are editions of Eudoxus of Cnidus (1887), the *Ἀθηναίων πολιτεία* (4th ed., 1903), a work of great importance and Bacchylides (3rd ed., 1904); *Grammatik des neustamentlichen Griechisch* (1902; Eng. trans. by H. St. John Thackeray, 1905); *Hermeneutik und Kritik und Palaographie, Buchwesen, und Handschriftenkunde* (vol. i. of Muller's *Handbuch der klassischen Altertumswissenschaft*, 1891); *Über die Aussprache des Griechischen* (1888; Eng. trans. by W. J. Purton, 1890); *Die Interpolationen in der Odyssee* (1904); contributions to Collitz's *Sammlung der griechischen Dialektinschriften*; editions of the texts of certain portions of the New Testament (Gospels and Acts). His last work was an edition of the *Choephori* (1906). See notices in the *Academy*, March 16, 1907 (J. P. Mahaffy); *Classical Review*, May 1907 (J. E. Sandys), which contains also a review of *Die Rhythmen der asianischen und römischen Kunstprosa*.

BLAST FURNACE. The discovery that metallic iron can be reduced from the natural iron mineral with the aid of carbon and heat is lost in the mists of antiquity. In the middle ages iron was made in furnaces of relatively small size, in which pure ore was reduced to a pasty mass by means of charcoal, and this was subsequently hammered to get rid of the impurities. About the 15th century the type of furnace was altered by the addition of an upper portion, or stack, in which primary preparation of the materials took place. This revision made possible the melting of the metallic product, so freeing it from earthly impurities and giving a material, pig-iron, altogether different from the forged metal formerly made. Thus the blast furnace first came into use.

Up to the 18th century charcoal only had been used as the furnace fuel, but the depletion of the forests began to give cause for grave alarm. The difficulty was overcome by employing coke in place of charcoal, and the former is now used almost exclusively. The exact date of the introduction of coke is uncertain, as also is the name of the pioneer who first used it, but there is no doubt that Darby had established coke-smelting of iron in England on a commercial scale as early as 1700. Progress since then has been continuous, but slow, until the dawn of the 20th century. During the subsequent period the increase in number of furnaces and in the producing capacity of the units has been rapid. The outputs of the six principal iron producing countries and the world total are given below.

	1924 tons	1925 tons
United States	31,406,000	36,700,566
Germany	7,707,000	9,927,000
France	7,569,000	8,336,000
British Isles	7,307,000	6,262,000
Belgium	2,798,000	2,502,000
Luxembourg	2,123,000	2,425,000
World total	66,690,000	75,081,000

Theory of the Process.—Iron ores are distributed widely in nature in various forms, the principal being the oxides, ferrous oxide (FeO), the magnetic or black oxide (Fe₃O₄) and ferric oxide (Fe₂O₃). The bulk of the ore used is ferric oxide which is composed of two atoms of iron combined with three atoms of oxygen. Means therefore have to be provided to abstract the oxygen, thus leaving the metallic iron. The reducing agent

Examples of Furnace Operation in Various Parts of the World

is carbon, used under suitable temperature conditions. These conditions are readily ensured because the combination of carbon and oxygen, the ordinary process of combustion, results in the liberation of ample heat. Iron oxide, however, is never found in a pure state in nature. The ore always contains a proportion of gangue composed of silica, lime, alumina, magnesia, etc., which have to be removed in the process. At sufficiently high temperatures lime and silica combine along with the other earthy materials, and form a liquid slag which is lighter than the liquid iron. The slag therefore separates from the metal and floats on the top.

Pig-iron is by no means pure iron, the latter representing only about 91.0% of the total. With the iron are combined varying amounts of carbon, silicon, manganese, sulphur, and phosphorus, each constituent having an important effect on the quality of the pig-iron. In order that the product should be the quality required it is evident that the mass of material, or "burden" as it is called technically, from which the pig-iron is made must contain, in addition to iron, the requisite proportions of the other constituents mentioned. There is charged into the furnace therefore, (a) The burden which includes the ironstone, fluxes for forming the slag, and any other additions, e.g., manganese ore or phosphoric rock, needed to give the proper manganese and phosphorus contents; (b) The fuel, which is generally coke, though charcoal is still employed for making special quality iron; (c) The air blast, which is injected above the hearth of the furnace to burn the fuel and maintain a sufficiently high temperature to render both metal and slag freely molten.

The section of a modern furnace is shown in fig. 1, the parts of the interior known as the stack, bosh and hearth respectively being indicated. The solid materials are charged into the top of the furnace whilst the air blast is blown through tuyeres into the hearth where the highest temperature (about 3,200° F) is generated. The oxygen of the air combines with the carbon of the coke, momentarily forming carbon dioxide, but as the hearth is full of incandescent coke, a reverse reaction rapidly takes place, the carbon dioxide being converted into carbon monoxide which is a powerful reducing agent. The hot gases composed of the carbon monoxide and the nitrogen of the air, along with some hydrogen derived from the dissociation of the moisture carried in the air, pass upwards through the column of solid materials, their temperature being progressively reduced as a result of direct contact and chemical reaction, until they leave the top at about 460° F. The constituents of the burden pass through the furnace in 14 to 18 hours. When charged they immediately come in contact with the hot gases and any moisture is quickly driven off. As they slowly descend the stack, the temperature increases and the carbon monoxide in the gases combines with the oxygen of the iron oxide to form carbon dioxide, leaving metallic iron in a finely divided form, or as iron sponge. The non-ferrous materials are mixed intimately with the reduced iron, and separation does not take place until near the top of the bosh, where both the iron and the slag begin to melt. The coke passes through the furnace with little change, except a constant increase in temperature, until it reaches the tuyere zone, where intense combustion takes place with the oxygen of the air blast. The bosh and hearth however are filled with coke and, as the slag and iron melt, the liquids trickle down until they reach the well formed in the bottom of the hearth, where they slowly accumulate and separate, the slag layer being on the top. The iron and slag are tapped from the furnace through separate tap boiler at intervals timed in accordance with the capacity of the furnace. The difference in the nature of the slag as compared with iron is apparent to experienced operators who skim the slag from the liquid stream into ladles placed to receive it. A large volume of gases, sufficiently rich in combustibles to be of value, is produced during the process. The combustible gases are the carbon monoxide and hydrogen, but the major volume is composed of the non-combustibles, nitrogen and carbon dioxide.

Furnace Construction.—The furnace shown is composed of a firebrick lining encased in a steel shell. Everything is of a substantial nature since it has to withstand strenuous work. The weight of the materials in the furnace may approach 400 tons

BLAST FURNACE

703

FIG 1—DIAGRAMMATICAL SKETCH OF A SECTION OF A MODERN BLAST FURNACE

FIG 2—DIAGRAM OF A BLAST FURNACE PLANT, SHOWING FLOW OF AIR BLAST, WATER AND GASES. ORE, FLUX AND COKE (FUEL) ARE CHARGED INTO FURNACE (1) FROM TOP, UP TO STOCK LEVEL. AS THE BURDEN DESCENDS THERMAL AND CHEMICAL INTERCHANGE TAKES PLACE WITH ASCENDING GASES UNTIL THEY ARRIVE AT HEARTH IN A REDUCED FORM. METAL AND SLAG ARE MELTED BY COMBUSTION (TEMP. ABOUT 3,200° F) OF COKE BURNT WITH PREHEATED AIR (TEMP. ABOUT 1,400° F) SUPPLIED BY STOVES (15 AND 16) WHICH ARE HEATED BY BURNING BLAST-FURNACE GAS. THE STOVES ARE ON GAS AND AIR BLAST ALTERNATELY; AND A STEADY SUPPLY OF AIR PASSES THROUGH A HEATED STOVE TO THE TUYERES OF FURNACE. THE MOLTEN METAL (TEMP. ABOUT 2,650° F) AND SLAG (TEMP. ABOUT 2,770° F) TRICKLE DOWN TO FURNACE HEARTH WHERE THEY SEPARATE NATURALLY, THE SLAG BEING ON TOP. THEY ARE TAPPED OUT THROUGH SUITABLE HOLES

whilst that of the lining and structure is about 1,200 tons. Those parts of the furnace which are subjected to high temperatures are protected by water cooling. The life of a furnace lining is about five years, during which a quantity of iron up to one million tons may be made. The raw materials are discharged from trucks into bins, from which they are drawn as required into a scale car. After weighing they are emptied into a skip which is hoisted electrically on an inclined track to the top of the furnace, where it is automatically tipped and stopped. The

materials are received on a bell which is capable of being mechanically revolved to any point in the complete circle, and after moving to the proper position are lowered on to a second and larger bell. When the latter is fully loaded by a series of deliveries from the upper bell, it is lowered and the materials slide into the furnace. The level of the solids is about eight feet below the large bell, and the intention of the arrangement described is to distribute the incoming charge evenly over the stock line without allowing any gases to escape to atmosphere through

AND TROUGHS INTO LADLES (2 AND 3) MEANWHILE GASES (TEMP ABOUT 450° F) FORMED BY COMBUSTION OF THE COKE, AFTER PASSING THROUGH AND INTERACTING WITH THE BURDEN, LEAVE THE FURNACE INTO A GRAVITY DUSTCATCHER (4), THENCE INTO WASHER (5), WHERE THEY ARE CLEANED WITH WATER, AND ULTIMATELY INTO DRYER (6) A PORTION OF THE CLEAN GAS (TEMP ABOUT 80° F) IS USED FOR FIRING BOILERS (7) IN WHICH IS GENERATED STEAM FOR TURBO-BLOWER (11) THE BLOWER WHICH MAY BE A STEAM-DRIVEN RECIPROCATING ENGINE, A STEAM-DRIVEN TURBO-BLOWER OR A GAS-DRIVEN RECIPROCATING ENGINE, WHICH FORCES AIR AT A SUITABLE PRESSURE TO HEATING STOVES, WHILST EXHAUST STEAM FROM THE TURBINE IS CONDENSED AND RETURNED TO BOILER. A PART OF THE REMAINING FURNACE GAS IS USED IN HEATING STOVES WHILST SURPLUS IS AVAILABLE FOR USE IN OTHER PROCESSES

the furnace top. Air blast at the pressure requisite for the circumstances is provided by a blower, which may be a steam-driven reciprocating engine, a steam-driven turbo-blower, or a gas-driven reciprocating engine. In any case the blast furnace gases are used as the source of motive power.

Neilson in 1829 discovered that increasing the temperature of the air blast before entry into the furnace resulted in a marked fuel economy, and air blast temperatures up to 1,800° F are now employed. Cowper stoves are used for heating the air blast, and

each unit is composed of a mass of brickwork, arranged as chequer work, contained in a steel casing. The temperature of the brickwork is raised to the required intensity by the combustion of blast furnace gases. The gases are then shut off and the air blast allowed to pass through the stove on its way to the furnace. Two or more stoves are therefore required in order that the process may be continuous. The gases leaving the furnace are passed through primary dust-catchers and ultimately through towers where they are washed with water before use in the Cowper

stoves. The remainder of the gases are utilized in raising steam, or as direct fuel in blast furnace gas-driven engines. The distribution of the available gases is approximately as follows:—

Cowper stoves	=	27%
Power for air blast	=	15
Wastage	=	3
Available for other purposes	=	55
		100%

The diagram in fig. 2 shows a skeleton arrangement of a blast furnace plant and the data for typical practice are indicated.

Furnace Operation.—Many different qualities of pig-iron are made, representative examples being as follows.—

Class of iron.	Grade	Analysis %				
		Total carbon	Silicon	Sulphur.	Phosphorus.	Manganese

Johnson junr., *The Principles, Operation and Products of the Blast Furnace* (1918); Fred Clements, *Blast Furnace Practice* (1928). (F. C.)

BLASTING, the process of rending or breaking apart a solid body, such as rock, by exploding within it or in contact with it some explosive substance. The explosion is accompanied by the sudden development of gas at a high temperature and under a tension sufficiently great to overcome the resistance of the enclosing body, which is thus shattered and disintegrated. Before the introduction of explosives, rock was laboriously excavated by hammer and chisel, or by the ancient process of "fire-setting," i.e., building a fire against the rock, which, on cooling, splits and flakes off. To hasten disintegration, water was often applied to the heated rock, the loosened portion being afterwards removed by pick or hammer and wedge. In modern times blasting has become a necessity for the excavation of rock and other hard material, as in open surface cuts, quarrying, tunnelling, shaft-sinking and mining operations in general.

For blasting, a hole is generally drilled to receive the charge of explosive. The depth and diameter of the hole and the quantity of explosive used are all variable, depending on the character of the rock and of the explosive, the shape of the mass to be blasted, the presence or absence of cracks or fissures, and the position of the hole with respect to the free surface of the rock. The shock of a blast produces impulsive waves acting radially in all directions, the force being greatest at the centre of explosion and varying inversely as the square of the distance from the charge. This is evidenced by the observed facts. Immediately surrounding the explosive, the rock is often finely splintered and crushed. Beyond this is a zone in which it is completely broken and displaced or projected, leaving an enveloping mass of more or less ragged fractured rock only partially loosened. Lastly, the diminishing waves produce vibrations which are transmitted to considerable distances. Theoretically, if a charge of explosive be fired in a solid material of perfectly homogeneous texture and at a proper distance from the free surface, a conical mass will be blown out to the full depth of the drill hole, leaving a funnel-shaped cavity. No rock, however, is of uniform mineralogical and physical character, so that in practice there is only a rough approximation to the conical crater, even under the most favourable conditions. Generally, the shape of the mass blasted out is extremely irregular, because of the variable texture of the rock and the presence of cracks, fissures and cleavage planes. The ultimate or resultant useful effect of the explosion of a confined charge is in the direction where the least resistance is presented. In the actual work of rock excavation it is only by trial, or by deductions, based on experience, that the behaviour of a given rock can be determined and the quantity of explosive required properly proportioned.

Blasting, as usually carried on, comprises several operations: (1) drilling holes in the rock to be blasted; (2) placing in each

hole the charge of explosive, with its fuse; (3) tamping the charge, i.e., compacting it and filling the remainder of the hole with clay or fine rock cuttings, to prevent the charge from blowing out without breaking the rock; (4) igniting or detonating the charge; (5) clearing away the broken material. Drill holes ordinarily vary in diameter from 1 to 3 in., and in depth from a few inches up to 15 or 20 ft. or more. The deeper holes are made only in surface excavation of rock, the shallower, to a maximum depth of say 12 ft., being suitable for tunnelling and underground mining.

Hand Drilling.—The work is either "single-hand" or "double-hand." In single-hand drilling, the miner welds the hammer with one hand, and with the other holds the drill or "bit,"

FIG. 1—MINER'S DRILL. OCTAGONAL IN CROSS-SECTION

rotating it slightly after every blow in order to keep the hole round and prevent the drill from wedging fast; in double-hand work, one man strikes, while the other holds and rotates the drill. For large and deep holes, two hammer men are sometimes employed.

A miner's drill is a steel bar, occasionally round but generally of octagonal cross-section, one end of which is forged out to a cutting edge (fig. 1). The edge of the drill is made either straight, like that of a chisel, or with a convex curve, the latter shape being best for very hard rock. For hard rock the cutting edge should be rather thicker and blunter, and therefore stronger, than for soft rock. Drills are made of high grade steel, as they must be tempered accurately and uniformly. The diameter of drill steel for hand work is usually from $\frac{1}{4}$ to 1 in., and the length of cutting edge, or gauge, of the drill is always greater than the diameter of the shank, in the proportion of from 7:4 to 4:3. Holes over 10 or 12 in. deep generally require the use of a set of drills of different lengths and depending in number on the depth required. The shortest drill, for starting the hole, has the widest cutting edge, the edges of the others being successively narrower and graduated to follow each other properly, as drill

FIG. 2—MINER'S SLEDGE-HAMMER

after drill is dulled in deepening the hole. Thus the hole decreases in diameter as it is made deeper. The miner's hammer (fig. 2) ranges in weight from 3½ to 4½ lb for single-hand drilling, up to 8 or 10 lb. for double-hand. If the hole is directed downward, a little water is poured into it at intervals, to keep the cutting edge of the drill cool and make a thin mud of the cuttings. From time to time the hole is cleaned out by the "scraper" or "spoon," a long slender iron bar, forged in the shape of a hollow semi-cylinder, with one end flattened and turned over at right angles. If the hole is directed steeply upward and the rock is dry, the cuttings will run out continuously during the drilling; otherwise the scraper is necessary, or a small pipe with a plunger like a syringe is used for washing out the cuttings. The "jumper" is a long steel bar, with cutting edges on one or both ends, which is alternately raised and dropped in the hole by one or two men. In rock work the jumper is rarely used except for holes directed steeply downward, though for coal or soft shale or slate it may be employed for drilling holes horizontally or even upward. Other tools used for rock-drilling are the pick and gad.

Holes drilled by hand usually vary in depth from say 18 to 36 in., according to the nature of the rock and purpose of the work; though deeper holes are often made. For soft rock, single-hand drilling is from 20 to 30% cheaper than double-hand, but this difference does not hold good for the harder rocks. For these double-hand drilling is preferable, and may even be essential, to secure a reasonable speed of work.

Machine Drills.—The introduction of machine drills in the latter part of the 19th century exerted an important influence on the work of rock excavation in general, and especially on the art of mining. By their use many great tunnels and other works

involving rock excavation under adverse conditions have been rapidly and successfully carried out. Before the invention of machine drills such work progressed slowly and with difficulty.

General Classification.—(1) e.g., Compressed-air reciprocating or piston drills; (2) hammer drills; (3) electric auger drills; (4) electric reciprocating drills; (5) hydraulic drills. Type (1) has become nearly obsolete having been almost entirely supplanted by type (2). Type (3) is largely used in coal mining. The others are of minor importance.

Although **PISTON DRILLS** (fig. 3) are now rarely listed by makers, some are still in service, and a brief description of them will lead to a better understanding of the hammer drill. They are operated by compressed air (or, for surface excavation, often by steam). The drill bit is firmly clamped to the piston rod and delivers a rapid succession of strong blows (300-400 per min.) on the bottom of the hole. The force of the blow is the resultant of the weight of the reciprocating parts, the length of stroke (both depending on the size of the drill cylinder), and the air pressure. These factors, together with the speed of stroke, determine the rate of advance, or drilling speed. Air pressures are commonly from 70 to 100 lb. per sq. in. Practice has tended toward the higher pressures; but, though faster drilling may be done in some rocks by pressures above 90 lb., the life of the drill is shortened and the repair cost increased. The softer rocks do not require pressure above, say, 80 lb. Piston-drill cylinders are usually from 2½ to 3½ in. diameter, though they have been made in smaller and larger sizes; normal length of stroke, 4 to 6 in. The admission of compressed air, and therefore the speed and force of the blow, are controlled by a hand valve in the air pipe, close to the valve-chest of the drill. The piston works in a cylinder, provided with a valve motion somewhat similar to that of a steam-engine, together with a rifle-bar, working in the rear end of the piston, for producing the necessary rotation of the drill bit, to keep the hole round and prevent the bit from wedging.

FIG. 3.—PISTON DRILL

The drill bit is rotated automatically. The piston is actuated by compressed air

head. Thus, by regulating the feed, the force of the blow is varied to suit the conditions. When starting a hole, the stroke should be short, until the bit has adjusted itself to the shape of the bottom of the hole. For hard rock, a short, rapid stroke, is best; a longer stroke for soft or tough rock. The cutting edge of the bit is usually cross or X-shaped.

Hammer Drills.—These first appeared about 1890, but were little used until the beginning of the 20th century. Since about 1910 they have almost entirely replaced piston or reciprocating drills for both surface and underground rock excavation, and are made in a great variety of forms and sizes. They weigh less, are more mobile and drill faster than reciprocating drills. Their principle was first applied in pneumatic riveters, and tools for chipping and other machine-shop work. They are best adapted to drilling holes directed steeply upward or downward, but can be used also for tunnelling and similar horizontal work.

Classification of Hammer Drills.—(1) Drills designed for tripod or column mounting (fig. 4), usually of the larger sizes, and comparable in their field of work to the old reciprocating machines; (2) drills with either a cross or D shaped handle (fig. 5), chiefly for holes directed steeply downward, the weight of the drill resting on the bit itself; (3) drills supported by an

FROM PEELE, "MINING ENGINEERS' HANDBOOK"

FIG. 4—MOUNTED HAMMER DRILL, CLASS 1, IN WHICH THE DRILL IS FED FORWARD BY A HAND-OPERATED FEED SCREW

automatic air-feed standard, primarily for holes directed upwards. They may be used for holes on the horizontal (fig. 6)

Details.—The bit of the hammer drill does not reciprocate; its shank projects into the forward end of the cylinder, where it is held loosely, and is struck a rapid succession of blows by the piston-like hammer. The cutting edge of the bit is in constant contact with the bottom of the hole, except during the slight rebound caused by each blow of the hammer. In machines of class (1) rotation of the bit is automatic, as in the old reciprocating drills. In classes (2) and (3) the bit is rotated by turning the drill on its axis by hand; though, in many of the later designs, a rifle-bar produces automatic rotation, as in class (1). To aid in keeping the hole round and true, the bit is commonly of the star or rosette shape, with six or eight radial cutting edges. As the bit does not reciprocate, it is evident that, for holes

FROM PEELE, "MINING ENGINEERS' HANDBOOK"

FIG. 5—D-HANDLE HAMMER DRILL, CLASS 2

This type needs no mechanical feed. The weight of the drill rests on the bit in down holes; for holes in other directions the drill is pushed forward by the operator

directed downwards, some automatic means must be provided for removing the drill dust or sludge; for, if the bottom of the hole is not kept clean, the useful effect of the hammer blows is decreased. To accomplish this a hollow bit is generally used, having a small-diameter hole longitudinally through its centre. By injecting through this hole a jet of water, the drillings are displaced and the bit is kept cool. The water, supplied from a small tank, in which water is kept under pressure by admitting compressed air from the air pipe, is delivered to the hollow bit by a small tube, passing through the rifle-bar and hammer, in the axis of the drill. When an air jet is used, it passes through a similar axial tube, the rear end of which is connected with the air supply; or, compressed air may be led directly to the bit from the valve chest. Details of the valve motion, for causing movements of the hammer, are too varied and technical to be described here (see Peele's *Compressed Air Plant*, 4th ed., 1925).

As regards the feed of hammer drills, class (1) drills (fig. 4) are fed forward as the hole is deepened by a hand-operated feed screw, as in reciprocating drills (fig. 3). Class (2) drills (fig. 5) require no mechanical feed; the weight of the drill rests on the bit in down holes, and, for holes in other directions, the drill is simply pushed forward by the operator. Class (3) drills (fig. 6), chiefly for holes directed steeply upward, are supported by a long

telescopic air-feed standard, to which compressed air is admitted, thus automatically forcing the bit against the bottom of the hole.

Electric-driven Drills.—Referring again to the general classification of drills, electric auger drills (type 3) are useful in collieries, for boring in coal or soft shale. A twist bit, resembling a carpenter's wood auger, is driven by a diminutive electric motor, the whole being usually mounted on a light bar, set firmly between the roof and floor of the mine working. Electric

FIG. 6.—HAMMER DRILL WITH AIR-FEED STANDARD. CLASS 3. USED CHIEFLY FOR HOLES DIRECTED STEEPLY UPWARDS

percussion drills, although they have been on the market for many years, are not yet entirely successful in competition with compressed-air machines. The oldest, working on the solenoid principle, is difficult to lubricate, owing to the heat generated in the wire coils. Others, in which the reciprocations are produced mechanically by a small motor, have generally exhibited structural weakness, causing short life and high repair cost.

Hydraulic Drills.—These drills (type 5 of the general classification) are now represented by only one machine, the Brandt drill, which has been successfully used in Europe for driving several important railway tunnels. The pressure water is supplied by a pump to a pair of small hydraulic cylinders, which rotate slowly (at 6–8 revolutions per min.) a hollow bit having a serrated cutting edge. Under a pressure of 800 to 1,000 lb. per sq. in., the bit is forced against the bottom of the hole, thus crushing and grinding the rock, instead of chipping it. The hole is kept clean and the bit cooled by a stream of water through the hollow bit shank. Owing to its size and weight, this machine is not suitable for ordinary rock excavation, nor for mine work.

Whatever may be the method of drilling, after the hole has been completed to the depth required, it is finally cleaned out by a scraper or swab; or, when compressed-air drills are used, by a jet of air directed into the hole by a short piece of pipe connected through a flexible hose with the compressed-air supply pipe. The hole is then ready for the charge.

Location and Arrangement of Holes.

For hand drilling in mining the position of the holes is determined largely by the character and shape of the face of rock to be blasted. The miner observes the joints and cracks of the rock, placing the holes to take advantage of them and so obtain the best result from the blast. In driving a tunnel or drift, as in figs. 7 and 8, the rock joints can be made of material assistance by beginning with hole No. 1 and following in succession by Nos. 2, 3 and 4. Frequently the ore, or vein matter, is separated from the wall-rock by a thin and soft layer of clay (fig. 8). This would act almost as a free face, and the first holes of the round would be directed at an angle towards it, for blasting out a wedge; after which the positions of the other holes would be chosen.

When machine drills are employed, less attention is given to natural cracks or joints, chiefly because when the drill is once

FIG. 7.—POSITIONS OF HOLES IN HAND-DRILLING
The holes are drilled in the succession of 1, 2, 3, 4

set up several holes at different angles can be drilled in succession by merely swinging the cylinder of the machine into a new position with respect to its mounting. According to one method, the holes are placed with some degree of symmetry, in roughly concentric rings, as shown by figs. 9 and 10. The centre holes are blasted first, and are followed by others in one or more volleys as indicated by the dotted lines. Another method is the "centre-cut," in which the holes are drilled in parallel rows on each side of the centre line of the tunnel, drift or shaft. Those in the two rows nearest the middle are directed towards each other, and enclose a prism of rock, which is first blasted out by heavy charges, after which the rows of side holes will break with relatively light charges.

FIG. 8.—A CASE OF HAND-DRILLING IN WHICH THE ORE IS SEPARATED FROM THE WALL-ROCK BY A THIN LAYER OF CLAY

Explosives.—Up to 1864, gunpowder was the only available explosive, but in that year Alfred Nobel first used nitroglycerin for blasting, and in 1867 invented dynamite. This name was originally applied to his mixture of nitroglycerin with kieselguhr, but now includes also other mechanical mixtures or chemical compounds which develop a high explosive force as compared with gunpowder. Besides the dynamites there are flameless or safety explosives, used in dusty collieries or where inflammable gases are given off from the coal.

Gunpowder, or black powder, is seldom used for rock-blasting, except in quarrying building-stone, where a slow explosive of relatively low power is desirable to avoid shattering the stone, and in such collieries as do not require the use of safety explosives. Black powder is exploded by deflagration, by means of a fuse, and exerts a comparatively slow and rending force. The high explosives, on the other hand, are exploded by detonation, through the agency of a fuse and fulminating cap, exerting a quick, shattering, rather than a rending force. Dynamites and flameless explosives are made in a variety of strengths, and are packed in waterproofed cartridges of different sizes. The grades of dynamite most commonly employed are "straight" dynamites, which contain from 35 to 60% of nitroglycerin, and the gelatins, containing a maximum of about 93% of nitroglycerin gelatin. The stronger grades are used for tough rock or deep holes, or for holes unfavourably placed in narrow mine workings, as sometimes in shaft-sinking or tunnelling. When of good quality high explosives are safer to handle than black powder as they cannot be ignited by sparks and are not so easily exploded. The ordinary dynamites used in mining are about four times as powerful as black powder.

Nitroglycerin in its liquid form is rarely used for blasting,

FIGS. 9 AND 10.—SHOWING THE METHOD OF DRILLING FOR BLASTING IN CONCENTRIC RINGS, THE CENTRAL HOLE BEING BLASTED FIRST

partly because its full strength is not often necessary, but chiefly because of the difficulty and danger of transporting, handling and charging it. If employed at all, it is charged in thin tinned plate cases or rubber-cloth cartridges.

Blasting with Black Powder.—The powder is coarse-grained, usually from $\frac{1}{8}$ to $\frac{3}{16}$ in. in size, and is charged in paper cartridges, 8 to 10 in. long and of a proper diameter to fit loosely in the drill hole. A piece of fuse, long enough to reach a little beyond the mouth of the hole, is inserted in the cartridge and tied fast. For wet holes paraffined paper is used, the miner water-

proofing the joints with grease. When more than one cartridge is required for the blast, that which has the fuse attached is usually charged last. The cartridges are carefully rammed down by a wooden tamping bar and the remainder of the hole filled with tamping. This consists of finely broken rock, dry clay or other comminuted material, carefully compacted by the tamping bar on top of the charge. The fuse is a cord, having in the centre a core of gunpowder, enclosed in several layers of linen or hemp waterproofed covering. It is ignited by the miner's candle or lamp, or by a candle end so placed at the mouth of the hole that the flame must burn its way through the fuse covering. As the fuse burns slowly, at the rate of 2 or 3 ft. per minute, the miner uses a sufficient length to allow him to reach a place of safety. For blasting in coal, "squibs" instead of fuses are often used. A squib is simply a tiny paper rocket, about $\frac{1}{4}$ in. diameter by $\frac{3}{4}$ in. long, containing fine gunpowder and having a sulphur slow-match at one end. It is fired into the charge through a channel in the tamping. This channel may be formed by a piece of $\frac{1}{4}$ in. gas pipe, tamped in the hole and reaching the charge; or a "needle," a long taper iron rod, is laid longitudinally in the hole, with its point entering the charge, and after the tamping is finished, by carefully withdrawing the needle a little channel is left, through which the squib is fired. In this connection it may be noted that for breaking ground in grassy collieries several substitutes for explosives have been used to a limited extent, e.g., plugs of dry wood driven tightly into a row of drill holes, and which, on being wetted, swell and split the coal; quicklime cartridges, which expand powerfully on the application of water; simple wedges, driven by hammer into the drill holes; multiple wedges, inserted in the holes and operated by hydraulic pressure from a small hand force-pump.

Blasting with High Explosives.—High explosives are fired either by ordinary fuse and detonating cap or by electric fuse. Detonating caps of ordinary strength contain 10 to 15 grains of fulminating mixture. The cap is crimped tight on the end of the fuse, embedded in the cartridge, and on being exploded by fire from the fuse detonates the charge. The number of cartridges charged depends on the depth of hole, the length of the line of least resistance, and the toughness and other characteristics of the rock. Each cartridge should be solidly tamped, and, to avoid waste spaces in the hole, which would reduce the effect of the blast, it is customary to split the paper covering lengthwise with a knife. This allows the dynamite to spread under the pressure of the tamping bar. The cap is often placed in the cartridge preceding the last one charged, but it is better to insert it last, in a piece of cartridge called a "primer." Though the dynamites cannot be exploded by sparks, they should nevertheless always be handled carefully. It is not so essential to fill the hole completely nor so thoroughly to compact the tamping, as in charging black powder, because of the greater rapidity and shattering force of the explosion of dynamite; tamping, however, should never be omitted, as it increases the efficiency of the blast. In exploding dynamite, strong caps, containing not less than 15 grains of fulminating powder, produce the best results. Weaker caps are not economical, as they do not cause complete detonation. This is specially true if the weather be cold. Dynamite then becomes less sensitive, and the cartridges should be gently warmed before charging to a temperature of not more than 80° F. Poisonous fumes are often produced by the explosion of the nitroglycerin compounds. These are probably largely due to incomplete detonation, by which part of the nitroglycerin is vaporized or merely burned. This is most likely to occur when the dynamite is chilled, or of poor quality, or when the cap is too weak. There is generally but little inconvenience from the fumes, except in confined underground workings, where ventilation is imperfect.

Like nitroglycerin, the common dynamites freeze at a temperature of from 42° to 46° F. They are then comparatively safe, and so far as possible should be transported in the frozen state. At very low temperatures dynamite again becomes somewhat sensitive to shock. When it is frozen at ordinary temperatures even the strongest detonating caps may fail to develop the full

force. In thawing dynamite, care must be exercised. The fact that a small quantity will often burn quietly has led to the dangerously mistaken notion that mere heating will not cause explosion. It is chiefly a question of temperature. If the quantity ignited by flame be large enough to heat the entire mass to the detonating point (say 360°) before all is consumed, an explosion will result. Furthermore, dynamite, when even moderately heated, becomes extremely sensitive to shocks. There are several accepted modes of thawing dynamite: (1) In a water bath, the cartridges being placed in a vessel surrounded on the sides and bottom by warm water contained in a larger enclosing vessel. The warm water may be renewed from time to time, or the water bath placed over a candle or small lamp, *not* on a stove. (2) In two vessels, similar to the above, with the space between them occupied by air, provided the heat applied can be definitely limited, as by using a candle. (3) When large quantities of dynamite are used a supply may be kept on shelves in a wooden room or chamber, warmed by a stove, or by a coil of pipe heated by exhaust steam from an engine. Live steam should not be used, as the heat might become excessive. Thawing should always take place slowly, never before an open fire or by direct contact with a stove or steam pipes and care must be taken that the heat does not rise high enough to cause sweating or exudation of liquid nitroglycerin from the cartridges, which would be a source of danger.

For the storage of explosives at mines, etc., proper magazines must be provided, situated in a safe place, not too near other buildings, and preferably of light though fireproof construction. Masonry magazines, though safer from some points of view, may be the cause of greater damage in event of an explosion, because the brick or stones act as projectiles. Isolated and abandoned mine workings, if dry, are sometimes used as magazines.

Firing Blasts by Electricity.—This has a wide application for both surface and underground work. An electrical fuse (fig

FROM PEELE, "MINING ENGINEERS' HANDBOOK"
FIG. 11.—ELECTRIC BLASTING CAP

11) consists of a pair of fine, insulated copper wires, several feet long and about $\frac{1}{16}$ of an inch in diameter, with their bare ends inserted in a detonating cap. For firing, the fuse wires are joined to long leading wires, connected with some source of electric current. By joining the fuse wires in series or in groups, any number of holes may be fired simultaneously, according to the current available. A round of holes fired in this way, as for driving tunnels, sinking shafts, or in large surface excavations, produces better results, both in economy of explosive and effect of the blast, than when the holes are fired singly or in succession.

Also, the miners are enabled to prepare for the blast with more care and deliberation, and then to reach a place of safety before the current is transmitted. Another advantage is that there is no danger of a hole "hanging fire," which sometimes causes accidents in using ordinary powder fuses.

Hanging fire may be due to a cut, broken or damaged powder fuse, which may smoulder for some time before communicating fire to the charge "Misfires," which also are of not infrequent occurrence with both ordinary fuse and electric fuses, are cases where explosion from any cause fails to take place. After waiting a sufficient length of time before approaching the charged hole, the miner carefully removes the tamping down to within a few inches of the explosives and inserts and fires another cartridge, the concussion usually detonating the entire charge. Sometimes another hole is drilled near the one which has missed. No attempt to remove the old charge should ever be made.

Low-tension electricity is now always used. It is generated by a small, portable, hand-operated dynamo, or taken from any convenient electric circuit. High-tension machines are too fragile and the detonators are more apt to deteriorate. The end of the fuse wires in the low-tension cap are connected by a fine platinum filament (fig 11), embedded in loose fulminate on top of a compressed fulminating mixture, and explosion results from the

heat generated by the resistance opposed to the passage of the current through the filament. Blasting machines are made in several sizes, the smaller ones being capable of firing simultaneously from 10 to 20 holes. Fuses must be of uniform electrical resistance, to ensure that all the connected charges will explode simultaneously. The premature explosion of any one fuse would break the circuit.

Delay electric blasting caps are for firing groups of holes in two or three volleys, with one application of the electric current. The cap shell is extra long. Between the fulminate and the priming ignited by the current is a short piece of slow-burning ordinary powder-fuse. Hence there is an appreciable interval between the passage of the current and the detonation of the cap.

These caps cannot be used in series with ordinary electric caps. They require a special "no-delay" detonator, because first- and second-period delay-action caps are less sensitive to ignition. The entire round of holes is wired as for simultaneous firing. When current is transmitted, about one second elapses before the first-delay caps detonate, and the same interval between these and the second-delay. Delay caps are specially useful in tunnelling and shaft-sinking, as they enable the blaster to fire an entire round of holes without returning to the working place.

Electric fuse igniters serve the same purpose; they light simultaneously powder fuses of different lengths. Electric squibs, for firing black powder, are useful in coal mining. For further details of electric blasting, see Peele's *Mining Engineer's Handbook* (2nd ed., 1927).

Definite rules for the proportioning of blasting charges are rarely observed, and although the blasts made by a skilful miner seldom fail to do their work, too much, rather than too little, explosive is often used. High explosives are specially liable to be wasted, probably through lack of appreciation of their power as compared with that of black powder. Among the indications of excessive charges are the production of much finely broken rock or of crushed and splintered rock around the bottom of the hole, and excessive displacement or projection of the rock broken by the blast. In beginning any new piece of work, such waste may be avoided or reduced by making trial shots with different charges and depths of hole, and noting the results; also by letting contracts under which the workmen pay for the explosive. In surface rock excavation the location and determination of the depth of the holes and the quantity of explosive used are occasionally put in charge of one or more skilled men, who direct the work and are responsible for the results obtained.

Blasting in surface excavations and quarries is sometimes done on an immense scale—called "mammoth blasting." Shafts are sunk, or tunnels driven, in the mass of rock to be blasted, and, connected with them, a number of chambers are excavated to receive the charges of explosive. The preparation for such blasts may occupy months, and many tons of black powder or dynamite may be exploded simultaneously, breaking or dislodging thousands of tons of rock. This method is adopted for getting stone cheaply, as for building macadamized roads, dams and breakwaters, obtaining limestone for blast furnace flux, and occasionally in excavating large railway cuttings. It is also applied in submarine blasting for the removal of reefs obstructing navigation, and sometimes for loosening extensive banks of partly cemented gold-bearing gravel, preparatory to washing by hydraulic mining.

BLASTOCOELE, the name applied to the "segmentation cavity" formed in the fertilized ovum by its division into numerous cells. In the blastula (*q.v.*) the blastocoele is often large, particularly in eggs without much yolk; in heavily-yolked eggs there may be no blastocoele visible. On the formation of the gastrula (*q.v.*) the blastocoele is largely obliterated and the remains of it become filled up with mesoderm. See EMBRYOLOGY.

BLASTOMERE, the term used to denote any of the cells resulting from the segmentation of the fertilized egg (zygote, *q.v.*). See EMBRYOLOGY.

BLASTULA, the stage in the development of the fertilized egg before invagination (in-pushing of one end) or epiboly (overgrowth of one pole by the cells from the other) have produced a gastrula (*q.v.*). The blastula of lightly-yolked eggs contains a large segmentation cavity, the blastocoele (*q.v.*) See EMBRYOLOGY.

BLAVATSKY, HELENA PETROVNA (1831-1891), was born at Ekaterinoslav. She was the daughter of Col. Peter Hahn de Rottenstein-Hahn (of a noble family of Mecklenburg, settled in Russia), and, on her mother's side, was granddaughter of the Princess Helena Dolgorouki. She married, in her 17th year, a man much her senior, Councillor of State Nicephore Blavatsky, but separated from him after a few months, and for many years travelled in various parts of the world, visiting Canada, the U.S.A., Texas, Mexico, and India. In 1852 she made an unsuccessful attempt to enter Tibet, but succeeded in doing so in 1856. She afterwards returned to Russia, but in 1864 she again travelled in Europe, and was associated with the forces of Garibaldi at the battle of Mentana. In 1873 she went to New York, where she became associated with many prominent persons who were then investigating the phenomena of spiritualism. She showed them that she could herself produce many of the phenomena without the aid of the "spirits," or "spooks" as she called them. Among those who were interested in these phenomena was Col. H. S. Olcott, a U.S.A. Government official; and with his aid, and that of Wm. Q. Judge and others, Madame Blavatsky founded in New York, on Nov. 17, 1875, the Theosophical Society. In 1877 she published *Isis Unveiled*, containing startling theories concerning the evolution of humanity and of religion. This immediately attracted an enormous amount of attention and criticism.

In 1879 she and Col. Olcott went to India, and there reorganized the Theosophical Society on the basis of the three objects for which it has nominally existed: (1) to form a nucleus of the universal brotherhood of humanity, (2) to promote study of comparative religion, philosophy and science, (3) to investigate the unexplained laws of nature and the powers latent in man. The headquarters of the society were established at Adyar, a suburb of Madras, and whilst in India Madame Blavatsky exhibited many phenomena which were accepted by many, and often discredited by those who had not witnessed them; every effort was made in certain quarters to bring her work and teaching into disrepute. Notwithstanding this opposition, and a very adverse report on her phenomena by a member of the Society for Psychical Research, who went out to India to investigate, but never saw any phenomena himself, Madame Blavatsky had in 1891 nearly 100,000 acknowledged followers in all parts of the world. She died on May 8, 1891; and this day is commemorated by her followers as "White Lotus Day."

BIBLIOGRAPHY—In addition to *Isis Unveiled*, Madame Blavatsky published in exposition of her teachings *The Secret Doctrine* (1888), *The Key to Theosophy* (1889), *The Voice of the Silence* (1889), and a *Glossary of Theosophical Terms* (1890-91), besides several less important works. See A. P. Sinnett, *Incidents in the Life of Madame Blavatsky* (1913), A. L. Cleather, *H. P. Blavatsky, her Life and Work for Humanity* (Calcutta, 1922); *Letters of H. P. Blavatsky to A. P. Sinnett*, ed. A. T. Barker, (1925).

BLAYDES, FREDERICK HENRY MARVELL (1818–1908), English classical scholar, was born at Hampton Court Green, Sept. 29 1818. He was vicar of Harringworth, Northamptonshire (1843–86) and died at Southsea on Sept. 7 1908. His editions and philological papers are remarkable for bold conjectural emendations.

His works include: *Aristophanes: Comedies and Fragments*, with critical notes and commentary (1880–93), *Clouds, Knights, Frogs, Wasps* (1873–78); *Opera Omnia*, with critical notes (1886); Sophocles: *Oedipus Coloneus*, *Oedipus Tyrannus* and *Antigone* (in the *Bibliotheca Classica*, 1859); *Philoctetes* (1870), *Trachiniae* (1871), *Electra* (1873), *Ajax* (1875), *Antigone* (1905); Aeschylus: *Agamemnon* (1898), *Choephoroi* (1899), *Eumenides* (1900), *Adversaria Critica in Comicorum Graecorum Fragmenta* (1890); in *Tragicorum Graec. Frag.* (1894), in *Aeschylum* (1895), in *Varios Poetas Graecos et Latinos* (1898), in *Aristophanem* (1890), in *Sophoclem* (1890), in *Euripidem* (1901), in *Herodotum* (1901); *Analecta Comica Graeca* (1905); *Analecta Tragica Graeca* (1900).

BLAYDON, urban district, and manufacturing town, Durham, England, on the Tyne, 4m. W. of Newcastle by the L.N.E. railway. Pop. (1881) 10,687; (1921) 33,052. Its situation very frequently involved it in border warfare. Near by is the beautiful old mansion of Stella, and below it Stellaheugh, to which the victorious Scottish army crossed from Newburn, on the Northumberland bank, in 1640, afterwards occupying Newcastle. Blaydon developed with the Northumberland and Durham coal-field. At the present time half the male population is engaged in coal-mining, but a special feature of this region and of Blaydon in particular is the development of by-products based on coal. The town has extensive coke ovens, while the iron-foundries, and the manufactures of machinery, tools, fire-bricks and to some extent bottle glass, are of great importance.

BLAYE-ET-STE. LUCE, town in France, capital of an arrondissement in the department of Gironde, on the right bank of the Gironde (here over 2m wide), 35m. N. of Bordeaux by rail. Pop. (1926), 3,228. In ancient times Blaye (*Blavia*) was a port of the Santones. As a crossing-place of the Gironde the site, avoiding the double crossing of the Dordogne and Garonne, was specially important on the Pilgrim Way (*La Route St. Jacques*) from Brittany to Roncevaux and Compostella. Tradition states that the hero Roland was buried in its basilica, sacrificed with other old buildings to make room for Vauban's citadel (1685). Blaye played an important part in the wars against the English and in the Religious Wars. The citadel, on a rock near the river, includes the ruins of an old Gothic château. Fort Pâté on an island in the river and Fort Médoc on its left bank, are 17th-century fortifications. The town is the seat of a sub-prefect, and has tribunals of first instance and of commerce.

BLAZE, a fire or bright flame (A.S. *blaese*, a torch). The use of the word for the white mark on the face of a horse or cow, and the American use for a mark made on a tree by cutting off a piece of the bark is akin to the Ger. *blass*, pale or white. The word "to blaze" in the sense of to noise abroad, comes from the A.S. *blaesian*, to blow, cf. the Ger. *blasen*; in sense, if not in origin, it is confused with "blazon" in heraldry.

BLAZING STAR, the name given in North America to various plants with conspicuous flowers, especially to the button snakeroot, colic-root and devil's-bit.

BLAZON, a heraldic shield, a coat of arms properly "described" according to the rules of heraldry, hence the proper heraldic description of such a coat. The O.Fr. *blason* seems originally to have meant a shield for self defence, but this is difficult to reconcile with the generally accepted derivation from the Ger. *blasen*, to blow, proclaim; English "blaze," to noise abroad, to declare.

BLEACHERS, an American term given to the uncovered benches surrounding the outfield of a baseball diamond. The name probably originated in the fact that the seats are not protected from the sun, with the result that their occupants literally go through a bleaching process while watching a baseball game. Despite their inconveniences the bleachers are popular with the baseball fans. They are cheaper than the more sheltered seats of the boxes and covered stands, and this fact compensates for the heat and sun-burn which invariably go with them.

BLEACHING. This term implies the whitening of objects or depriving them of colour. In its industrial application, however, the term signifies not only the removal of the natural colour but other impurities from cotton, linen, wool, silk and other fibres, paper-pulp, bees' wax, and some oils. The removal of colours which have been acquired by dyeing textiles is called "stripping," and the local bleaching of parts of a coloured piece in printing silk or calico is termed "discharging." Flour, sugar, and many other substances are decolourized in the course of their preparation for the market.

The art of bleaching textile fabrics, such as linen and wool, is of great antiquity and seems to have been familiar to all the civilizations of the world. Egyptians, Phoenicians, Greeks, and Romans are known to have produced white linen goods, but little is known of the methods which they employed. Pliny refers to the use of plants and the ashes of plants, mentioning especially the "Struthium," which was probably the plant *Saponaria officinalis*. Information about bleaching in Europe was difficult to obtain until after the last of the crusades, when the Dutch established a great reputation as linen bleachers, and retained almost a monopoly of that industry down to the middle of the 18th century. Bleaching grounds are said to have existed near Manchester, England, as early as 1322, and there was a bleach-works at Southwark, near London, in the middle of the 17th century, but the bulk of the brown linen manufactured in Scotland was sent to Holland to be bleached. It was sent to the neighbourhood of Haarlem in the month of March, and was not returned till the end of October. In 1728 the Scottish Board of Manufactures accepted a proposal made by James Adair of Belfast to establish a bleachfield in Galloway, and devoted £2,000 as premiums for the establishment of bleachfields throughout the country. With the assistance of the same Board, R. Holden in 1732 set up a bleachfield at Pitkerro, near Dundee, where he used a method of bleaching with kelp.

The British bleachers (who were sometimes called whitsters) appear to have been taught, or to have copied, the methods of the Dutch, which consisted in steeping the linen in alkaline lyes for several days, washing it clean, and spreading it on the grass for some weeks. These processes, called respectively bucking and crofting, were repeated alternatively for five or six times. The cloth was then steeped in sour milk or butter milk for some days, washed clean, and again crofted. The processes were repeated until the material had acquired the requisite whiteness. In 1736 an act was passed in England which permitted cotton to enter into the composition of cloth and this gradually resulted in the manufacture of larger quantities of material, and consequently a greater demand for bleaching.

A very effective means of shortening the time of bleaching was the substitution of sour milk by dilute sulphuric acid. This method of "souring" was suggested by Dr. Francis Home, of Edinburgh, who in 1756 published a scientific work on bleaching. It was found that water acidulated with sulphuric acid would bring about an effect in 12 to 24 hours which could be obtained only after steeping for six to eight weeks in sour milk. This reduction in the time of bleaching rendered it possible for the merchant to dispose of goods so much sooner and consequently to trade with less capital.

A far reaching change in the character of the bleaching industry commenced in the year 1787. In that year chlorine, discovered in 1773 by Scheele, was used in the works of Macgregor, of Glasgow, where its application had been suggested by James Watt, who was the son-in-law of the owner. Watt had gained his information about oxygenated muriatic acid, as chlorine was then called, from Berthollet, who was the first to record the effect of the gas in bleaching the natural colour of linen. In a paper read before the Academy of Sciences at Paris, in 1785, and published in the *Journal de Physique* (vol. xxvi p. 325) Berthollet mentioned that he had found the gas to answer perfectly in the bleaching of cloth. Further work was recorded in the *Journal de Physique* (1786). Thomas Henry, of Manchester, was the first to bleach with chlorine in the Manchester district. At this period, the bleacher made his own chlorine and exposed the fabric in

chambers to the action of the gas, or steeped them in an aqueous solution. The process was inconvenient, disagreeable and, worst of all, detrimental to the health of the workers, so it was not surprising that, in spite of the rapid bleaching action, the method did not gain great favour. Considerable improvement was effected by the introduction, in 1792, of eau de Javel, which was made near Paris by absorbing chlorine in a solution of potash (one part) in water (eight parts) until effervescence began. In 1799 Charles Tennant, of Glasgow, successfully prepared bleaching powder by passing chlorine over lime and was able to supply the bleacher with a reagent in solid form, which contained up to one-third of its weight of available chlorine. The pleasant fields, where the industrious farmer could spread his cloth in the summer sun, were soon covered with buildings, and that part of the process which was formerly left to light, air, and moisture was carried out by the aid of calcium hypochlorite—the active constituent of bleaching powder solution. Attempts to replace bleaching powder have met with little success, except where cheap electrical power is available for the manufacture of sodium hypochlorite from common salt. Improvements in the bucking process were most marked about 1823, when sodium carbonate was substituted for potash. (See ALKALI MANUFACTURE.)

BLEACHING OF COTTON

Cotton is bleached in the raw state (loose cotton) as yarn (cops, hanks, or warps) and in the piece. The aim of the bleacher is to remove as far as possible all the impurities present in the cotton without injuring the fibre, and thus obtaining pure cellulose in the form of complete fibres. In the raw state, and in the form of yarn, only the natural impurities have to be considered. These include cotton wax, fatty acids, pectic substances, colouring matters, albuminoid and mineral matter, amounting together to about 5% of the weight of the material. There are also fragments of the cotton seed husk (motes). The bleaching of cloth involves, in addition to these, the removal of the sizing materials with which the manufacturer strengthens the warp before weaving. In all cases three main operations are involved: boiling (bowking), chemicking, and souring. Much depends on the condition of the material and the use to which it is subsequently to be put as to the extent to which these operations are carried out. In the case of piece bleaching they are generally supplemented by additional processes. *Loose cotton* is rarely bleached before spinning in England, but some American firms who carry all the textile processes through in one works find it convenient to do so. It is certainly never subjected to drastic treatment with boiling alkali, which would tend to cause the fibres to mat together and to remove the cotton wax which seems to be a valuable assistant in spinning. The three processes can be applied when the material is to serve for the manufacture of cotton wool, or of gun cotton, in which instances the boiling operation is very important, as it helps to remove the wax and to render the material easily wetted with water. For such purposes good wetting out is of greater importance than a particularly good white. *Cotton yarn* is first boiled with an alkali such as 3 to 4% soda ash or 2% caustic soda, with or without the addition of soap, in a boiler which is known as a "kier" working at low pressure (up to 10 lb.) for six to eight hours. The yarn is then washed in the kier and transferred to a stone cistern provided with a false bottom. Bleaching liquor 1 to 2° Tw. is drawn by means of a centrifugal pump, from a well situated below the floor line, to the top of the cistern and is showered over the yarn. The liquor falls through the goods and back again to the well and is caused to circulate in this way for about one and a half to two hours. After rinsing with water, the goods are steeped in hydrochloric or sulphuric acid of 2° Tw. in another circulating cistern, and are then washed thoroughly. If the yarn is intended for the market to be sold as white it is often tinted with a little blueing material such as a suspension of ultramarine in weak soap solution, or a very little Victoria blue 4R or acid violet. During the boiling process most of the impurities, with the exception of some of the cotton wax and the colouring matters, are removed. The removal of the wax is more

thorough if some form of soap is employed in the boiling process, and it has been shown that resin soap is very effective in this respect. In the second operation the calcium hypochlorite of the bleaching powder—to some extent by direct action, but also owing to the fact that it decomposes on coming into contact with the carbon dioxide of the air yielding chlorine (R. L. Taylor)—destroys the colouring matter by oxidation. At the same time the motes, which were swelled up by the alkali, are removed. The souring operation has for its object the removal of lime deposited by the bleaching liquor and the attack and solution of any metallic oxides.

The rinsing which follows souring is of great importance in order to ensure the removal of the acid, which would otherwise cause the yarn to become tender.

The largest bulk of cotton is bleached in the *piece*, in which condition it is necessary not only to remove the natural impurities, but also such materials as starch, paraffin wax, soap, zinc chloride, magnesium chloride, which may be present as constituents of the size, as well as dust, dirt, and mineral oil, which may have become incorporated with the fibre during the manufacture of the cloth. In bleaching for whites ("market bleaching") it is essential that the white should be as perfect as possible, and the goods are invariably blued after bleaching; but probably the most thorough process is that which is commonly employed in the case of goods intended for calico printing. The ordinary process is carried out as follows.—

The pieces are first examined for faults and marked in gas tar with distinctive letters and numbers. They are then sewn end to end with a machine in chain stitch, which is easily removed after the bleaching is complete. Unless the cloth is intended for flannelette or other raised cloth, it is usual to remove the "nap," that is, the ends of the cotton fibres which project on the surface of the cloth, by "singeing." The operations may be effected in three different ways: (1) plate singeing, (2) revolving roller singeing, (3) gas singeing. The first method (fig. 1) consists in running the cloth at full width over a couple of arched copper

FIG. 1.—SINGE-STOVE. FOR THE REMOVAL OF NAP FROM COTTON PIECES BEFORE BLEACHING. PIECES ARE PASSED IN DIRECTION OF ARROW. The first singe plate dries the pieces, and the second, heated to a higher temperature, singes the nap. The singe plates are heated over coal fuel fires

plates (a and b) heated to a full red heat by being mounted over the flues of a coal fire. As a rule one plate is considerably hotter than the other and the cloth goes over the hotter one last, where the singeing actually takes place. The first plate dries the cloth, and between the two a block (d) carrying two rails is arranged so that the pressure of the cloth on the plates can be regulated or if necessary entirely removed. This process has the disadvantage that owing to irregular heating the singeing may be uneven or "stripey" and show corresponding defects in the finished cloth.

In revolving roller singeing a cast iron cylinder is heated by causing the flame of a fire to be drawn through it. The roller in this process revolves in the reverse direction to the cloth, which passes over it.

Gas singeing (fig. 2) is more convenient, economical, and also more effective, and can be applied to figured as well as to plain goods. It consists in running the goods over a non-luminous gas flame, the breadth of which slightly exceeds that of the piece. After singeing the goods are passed through hot water or through sulphuric acid 2-3° Tw. They are allowed to lie in a pile overnight but are never allowed to dry. The operation has the effect

FIG. 2.—SECTION OF GAS SINGEING APPARATUS, USED FOR FIGURED PIECES THAT HAVE AN UNEVEN SURFACE

A gas flame removes the nap as the pieces pass the burners in direction of arrows. After singeing, pieces pass through a trough of water. This method, being cleaner, has largely replaced plate singeing

of hydrolysing starchy material. Some bleachers submit cloth to a treatment with malt extract, with the same object in view. After rinsing in water the cloth is subjected to the action of boiling alkali. For calico intended for printing it is found best to carry out the lime boil, but in recent methods of bleaching this is omitted. After saturating the goods with milk of lime in a similar machine to that used for washing they pass, in what is known as rope form, into the kier and are carefully plated down. The amount of lime (CaO) with which they are impregnated is about 4% of their weight and the rope formation is given by passing the goods through smooth porcelain rings (pot-eyes) before entering the kier.

It is of the greatest importance that the goods should be evenly packed, for, if channels or loosely-packed places are left, the liquor circulating through the kier, when boiling is subsequently in progress, will follow the line of least resistance, and the result is an uneven treatment. Of the numerous forms of kier in use, the injector kier is the one most generally adopted. This consists of an egg-ended cylindrical vessel constructed of stout boiler plate, and shown in sectional elevation in fig. 3. The kier is from 10 to 12 ft. in height and from 6 to 7 ft. in diameter, and stands on three iron legs, riveted to the sides but not shown in the figure. The bottom exit pipe E is covered with a shield-shaped false bottom of boiler plate, or (and this is more usual) the whole bottom of the kier is covered with large rounded stones from the river bed, the object in either case being simply to provide space for the accumulation of liquor and to prevent the pipe E being blocked. The cloth is evenly packed up to within about 3 to 4 ft. of the manholes M, when lime water is run in through the liquor pipe until the level of the liquid reaches within about 2 ft. of the top of the goods. The manholes are then closed, and steam is turned on at the injector J by opening the valve V. The effect of this is to suck the liquor through E and to force it up through pipe P into the top of the kier, where it dashes against the umbrella-shaped shield U and is distributed over the pieces, through which it percolates, until, on arriving at E, it is again carried to the top of the kier, a continuous circulation being thus effected. As the circulation proceeds the steam condensing in the liquor rapidly heats the latter to the boil, and as soon as, in the opinion of the foreman, all air has been expelled the blow-through tap is closed and the boiling is continued for periods varying from six to 12 hours under 20-60 lb. pressure. Steam is then turned off, and by opening the valve V the liquor, which is of a dark-brown colour, is forced out by the pressure of the steam it contains.

The pieces are then run through a continuous washing machine, which is provided with a plentiful supply of water. The machine,

which is shown in fig. 4, consists essentially of a wooden vat, over which there is a pair of heavy wooden (sycamore) bowls or squeezers. The pieces enter the machine at each end, as indicated by the arrows, and pass rapidly through the bowls down to the bottom of the vat, over a loose roller, thence between the first pair of guide pegs through the bowls again, and travel thus in a spiral direction until they arrive at the middle of the machine, when they leave at the side opposite to that on which they entered. The same type of machine is used for liming, chemicking, and souring.

The next operation is the "grey sour," in which the goods are run through a washing machine containing hydrochloric acid of 2° Tw. strength, with the object of dissolving out the lime, which

FIG. 3.—SECTIONAL ELEVATION OF HIGH-PRESSURE BLOW-THROUGH KIER. The cotton pieces, after passing through a lime wash, are packed in the kier, and lime water is added. Steam is turned on and the process, called "bowking," is continued for 6-12 hours, after which the pieces are removed and washed in a machine (see fig. 4.)

the goods retain in considerable quantity after the lime boil. The goods are then well washed and are boiled again in the ash bowking kier, which is similar in construction to the lime kier, with soda ash (3%) and a solution of resin (1½%) in caustic soda (1½%) for eight to ten hours. For white bleaching the resin soap is omitted, soda ash alone being employed.

The pieces are then washed free from alkali and the bleaching proper or "chemicking" follows. This operation may be effected in various ways, but the most efficient is to run the goods in a washing machine through bleaching powder solution at 1½-1° Tw,

and allow them to lie loosely piled over night, or in some cases for a longer period. They are then washed, run through dilute sulphuric or hydrochloric acid at 2° Tw. ("white sour") and washed again. Should the white not appear satisfactory at this stage (and this is usually the case with very heavy or dense materials), they are boiled again in soda ash, chemicked with bleaching powder at $\frac{1}{8}^{\circ}$ Tw., or even weaker, soured, and washed.

FIG. 4.—ROLLER WASHING MACHINE. CONSISTING OF A WOODEN VAT OVER WHICH THERE IS A PAN OF WOODEN ROLLERS. The pieces enter in the direction indicated and, passing through the rollers and vat in a spiral direction, emerge washed.

It is of the utmost importance that the final washing should be as thorough as possible, in order to remove the acid completely, for if only small quantities of the latter are left in the goods they are liable to become tender in the subsequent drying, through formation of hydrocellulose. The best known, and probably the most widely practised of processes which dispense with the lime boil, is one which was worked out by the late M. Horace Koechlin in conjunction with Sir William Mather, and this differs from the former process not only in the sequence of the operations but also in the construction of the kier. This consists of a horizontal egg-ended cylinder, and is shown in fig. 5.

The goods to be bleached are packed in two wagons *W* outside the kier, and when filled these are pushed home into the kier, so that the pipes *p* fit with their flanges on to the fixed pipes at the bottom of the kier. The heating is effected by means of steam pipes at the lowest extremity of the kier, while the circulation of the liquor is brought about by means of the centrifugal pump *p* which draws the liquor through the pipes *p* from beneath the false bottoms of the wagons and showers it over distributors *D* on to the goods. By this mode of working a considerable economy is effected in point of time, as the kier can be worked almost continuously, for as soon as one lot of goods has been boiled the wagons are run out and two freshly-packed wagons take their place. The following is the sequence of operations.—The goods are first steeped over-night in dilute

sulphuric acid, after which they are washed and run through old kier liquor from a previous operation. They are then packed evenly in the wagons, which are pushed into the kier, and, the door having been closed, they are boiled for about eight hours at 7–15 lb. pressure with a liquor containing soda ash, caustic soda, resin soap, and a small quantity of sulphite of soda. The rest of the operations (chemicking, souring, and washing) are the same as in the old process.

A somewhat different principle is involved in the Thies-Herzig process. In this the kier is vertical, and the circulation of the liquor is effected by means of a centrifugal or other form of pump, while the heating of the liquor is brought about outside the kier in a separate vessel between the pump and the kier by means of indirect steam. The sequence of operations is similar to that adopted in the Mather-Koechlin process, differing chiefly from the latter in the first operation, which consists in running the goods, after singeing, through very dilute boiling sulphuric or hydrochloric acid, containing in either case a small proportion of hydrofluoric acid, and then running them through a steam box, the whole operation lasting from 20 to 60 seconds.

Open Width Bleaching.—For bleaching goods which contain *effect threads*, especially when these are dyed with vat colours, or are composed of artificial silk, the process of full width bleaching has been greatly improved, and is to be recommended. After singeing the goods are run through a steaming chamber (to put out any fire) impregnated with caustic soda at 2° Tw. on a batching machine in which the cloth is wound perfectly straight on to one of the two batch rollers of the kier until the batch is 3 ft–3 ft 6 in. in diameter. The two rollers are driven into the kier on a batch carriage (fig. 6), where they are kept at a constant distance apart by means of an oscillating drum, which remains in contact with the two batches although they are continually increasing and decreasing in size as the winding proceeds. The carriage automatically couples with driving and reversing gear

FIG. 5.—DIAGRAM OF A CROSS SECTION OF THE MATHER KIER. This kier is used in most modern processes of bleaching cotton-pieces. Its use dispenses with the lime boil and a considerable economy is effected.

at the back of the kier, so that the cloth is continually wound off one roller and on to the other during the boiling process. The caustic soda liquor is entered boiling and is circulated by means of a pump. After two or three hours the cloth is removed from the kier to a special machine for chemicking. This process may also be applied with advantage in the bleaching of gauze and bandage cloths, sateens, reps, poplins, canvas, and gaberdines.

Defects.—As shown by the late Charles O'Neill, carefully bleached cotton ought to be stronger than the same cotton in the

unbleached condition. Tendering may occur through the presence of air in the kier during boiling, or by the excessive action of bleaching liquor. Cotton which has been affected in this manner is said to contain oxycellulose. Such cotton readily becomes yellow and more tender on boiling with a dilute solution of caustic soda (about 10° Tw). It also dyes lighter with a direct colour, such as chlorazol sky blue, than does ordinary cotton, but after boiling with caustic soda it dyes normally. This test distinguishes oxycellulose tendering from the tender product which is formed when dilute sulphuric acid is dried into cotton, for in the latter case light dyeing with chlorazol sky blue is observed even after boiling with caustic soda. Both kinds of tendered cotton dye darker with basic colour than does ordinary well bleached cotton. Hydrochloric acid tendered cotton does not show such differences in dyeing. Any free acid which is left in cotton can be detected by testing the aqueous extract with a drop of methyl orange, which, in the presence of acid, is turned pink.

BLEACHING OF LINEN

The bleaching of linen is a much more complicated and tedious process than the bleaching of cotton. This is due in part to the fact that in linen the impurities amount to 20% or more of the weight of the fibre, whereas in cotton they do not usually exceed 5%. Furthermore, these impurities, which include colouring matter, intracellular substances, and a peculiar wax known as "flax wax," are more difficult to attack than those which are present in cotton, and the difficulty is still further enhanced in the case of piece goods, owing to their dense or impervious character.

The methods used for bleaching of linen resemble those used in cotton bleaching, but require to be frequently repeated, while an additional operation, which is a relic of the old-fashioned process, viz., that of "grassing" or "crofting," is still essential for the production of the finest whites. Considerably more care has to be exercised in linen bleaching than is the case with cotton, and the process consequently necessitates a greater amount of manual labour. The practical result of this is that, whereas cotton pieces can be bleached and finished in less than a week, linen pieces require at least six weeks. Many attempts have naturally been made to shorten and cheapen the process, but without success. The use of stronger reagents and more drastic treatment, which would at first suggest itself, incurs the risk of injury to the fibre, not so much in respect to actual tendering as to the destruction of its characteristic gloss; while if too drastic a treatment is employed at the beginning the colouring matter is liable to become set in the fibre, and it is then almost impossible to remove it. Among the many modern improvements which have been suggested, mention may be made of the use of hypochlorite of soda in place of bleaching powder, the use of oil in the first treatment in alkali (Cross & Parkes), while de Keukelaere suggests the use of sodium sulphide for this purpose. With the object of dispensing with the operation of grassing, which, besides necessitating much manual labour, is subject to the influences of the atmospheric conditions, Siemens & Halske, of Berlin, have suggested exposure of the goods in a chamber to the action of electrolytically prepared ozone. Jardin seeks to achieve the same object by steeping the linen in dilute nitric acid.

Since the qualities of linen which are submitted to the bleacher vary considerably, the mode of treatment has to be varied accordingly. Linen is bleached in the yarn and in the piece. Special features of linen bleaching, apart from the repetition of processes, are.—Rubbing between boards with soft soap after kier boiling (scalding); exposure of the goods to air during the treatment with bleaching liquor; marking with thread dyed with Turkey red instead of stamping.

BLEACHING OF OTHER VEGETABLE FIBRES

China grass is bleached like cotton, and hemp like linen, but the latter fibre is seldom bleached. In the case of jute severe treatment with alkali is avoided, and the goods are subjected to chemicking with sodium hypochlorite and souring only. Straw is bleached by steeping in fairly strong hydrogen peroxide for

periods varying from 12 hours to several days, followed by exposure to the action of sulphurous acid. Artificial silk prepared by the viscose process is obtainable in a condition which is known as "unbleached"—this product has a cream colour resembling that of grey cotton and an opalescent lustre. This characteristic appearance is due to the presence of sulphur, for when this is removed the whiteness and silky lustre appear immediately.

BLEACHING OF WOOL

In the case of woollen goods it is not possible to obtain the degree of whiteness which is characteristic of well bleached cotton or linen, but considerable improvement in the appearance is

FIG 6—HORIZONTAL KIER WITH BATCH ON CARRIAGE USED FOR BLEACHING GOODS CONTAINING "EFFECT" THREADS, VAT COLOURS OR ARTIFICIAL SILK

effected either by treating the wool with sulphurous acid or by means of hydrogen peroxide. The first method, which is technically known as "stoving," consists in exposing the washed goods in a damp condition to the action of the fumes of burning sulphur. After being scoured yarn is hung, wetted, and slightly blued, and the cloth is passed slowly up and down over a number of rollers in a room in which the sulphur dioxide is produced. The goods are left overnight. This is the process which is generally adopted and which is also employed in bleaching many other kinds of animal hair, including bristles. In the case of wool, it is possible to obtain a bleach by steeping the goods in a fairly strong solution of bisulphite of soda. Whether sulphurous acid or bisulphite of soda is used for bleaching, the natural colour of the wool returns on washing with soap. A more permanent bleach can be obtained by the action of hydrogen peroxide (one part of a 12-volume solution being diluted with three parts of water), rendered slightly alkaline with ammonia or silicate of soda. Black or brown wool cannot be bleached white, but assumes a golden colour which is often desired in human hair.

BLEACHING OF SILK AND OTHER FABRICS

Raw silk has a comparatively dull appearance, which is due to the coating of sericine or silk gum, which is present to the extent of about 10–25%. This is removed by treating the silk with 30% of its weight of soap dissolved in water and heated to a temperature just below the boiling point for about three hours. The gum is ultimately dissolved and leaves the fibre substance (fibroin) with the characteristic lustre. The silk is then rinsed in weak soda solution and is suitable for dyeing, but if it is to be sold as white the material in the hank form is tied with tape and put into coarse linen bags and boiled in soap solution half as strong as the first. Whitening is effected by stoving, as in the case of wool, but blueing or otherwise tinting is effected after stoving. Bleaching with hydrogen peroxide is only adopted for certain kinds of spun silk and tussore.

Ornamental feathers are best bleached by steeping in hydrogen peroxide rendered alkaline with a little ammonia, and the same

treatment is applied to the bleaching of ivory. Hydrogen peroxide is a very efficient bleaching agent, and can be applied with safety to both animal and vegetable substances. It is the active constituent (or is produced in solution) of a number of preparations sold in powder form for household bleaching. The more extensive application of hydrogen peroxide is largely a matter of cost.

(E. H.)

BLEACHING POWDER. It has long been known that chlorine and certain chlorine compounds possess the property of bleaching. A solution of chlorine in water was prepared for this purpose in 1785; a solution made by passing chlorine into sodium or potassium carbonate, and known as "eau de Javelle," was put on the market in 1789; and in 1798 Charles Tennant erected a works in Glasgow to manufacture, as a bleaching agent, the product obtained by acting upon lime with chlorine. Under the name "chloride of lime" bleaching powder will be familiar to many as a disinfectant in common use. It is manufactured by the direct action of chlorine gas upon slaked lime; and although its chemical constitution is still somewhat in dispute, its composition when pure is usually represented by formula CaOCl_2 . As manufactured it always contains a certain amount of chemically combined water and an excess of lime. In manufacture the selection of the lime used is a matter that requires care; it must be of good quality and as free as possible from iron and magnesium; it must also be fairly dense to assist packing, and it must have the property of settling quickly in water to save time when the bleach is actually used. The lime is treated with the proper quantities of water and steam to convert it to hydrated (or slaked) lime and is stored some days to cool and mature. It is then, after sieving, ready to receive the chlorine.

The older method, still largely used, is to spread the slaked lime in layers of 2 or 3 inches depth on the floor of large rectangular chambers made of lead, or of concrete protected with a coating inside of tar; these chambers are from 6 to 7 ft. high, 10 to 20 ft. wide, and up to 100 ft. long. The lime is raked into ridges in order to increase the surface exposed to the gas. The chamber, or series of chambers, is then closed and chlorine admitted. The gas is readily absorbed, and if it be concentrated so much heat may be generated by the reaction that in hot climates cooling coils are necessary in the floor of the chambers to prevent decomposition of the bleaching powder. A more recent method dispenses with chambers and employs mechanical means to propel the lime through a horizontal tube or series of tubes. The gas is fed into the plant in a direction opposite to that in which the lime travels.

Bleaching powder is a somewhat unstable substance; moisture, sunlight and undue temperature all cause it to decompose rapidly; and this tends to limit its usefulness, especially in tropical countries where, as a disinfectant, it is so valuable. Attempts to produce a more stable form have engaged the attention of chemists for many years and no doubt the problem will be eventually solved. In spite of the increasing competition of liquid chlorine, which can replace bleaching powder in many respects, the world output of the latter reaches many hundreds of thousands of tons yearly. Most of it is consumed in the paper and textile industries for the purpose denoted by its name. As an alternative to the powder there are manufactured solutions of sodium and calcium hypochlorites which have advantages under certain conditions. Sodium hypochlorite, for example, is particularly suited for the bleaching of fine cotton goods, and is, incidentally, a most powerful germicide.

For the method of using bleaching powder see article BLEACHING (A. E. H.)

BLEAK (*Alburnus lucidus*), a small, slender, silvery fish of the Cyprinid family, found in the rivers of Europe. The scales are used in the manufacture of artificial pearls, especially in France.

BLEEK, FRIEDRICH (1793–1859), German biblical scholar, professor of theology at Bonn from 1829 to 1859, was born on July 4 1793, at Ahrensböök, in Holstein. He studied in Berlin from 1814 to 1817, under De Wette, Neander and Schleiermacher. From 1818–19 he was *Repetent* in theology under De Wette, and published two dissertations in Schleiermacher's and

G. C. F. Lücke's *Journal* (1819–20, 1822); one on the origin and composition of the Sibylline Oracles and another on the authorship and design of the Book of Daniel. In 1823 he received the appointment of professor extraordinarius.

In 1829 he accepted Lücke's chair in the recently founded University of Bonn. In 1843 he was raised to the office of consistorial councillor, and was selected by the university to hold the office of rector. He died of apoplexy on Feb. 27 1859.

Bleek's works belong entirely to the departments of biblical criticism and exegesis. His views on questions of Old Testament criticism were "advanced" for his own day; but with respect to the New Testament his position was conservative, and he was an opponent of the Tübingen school. His greatest work, his commentary on the epistle to the Hebrews (*Brief an die Hebräer erläutert durch Einleitung, Übersetzung, und fortlaufenden Commentar*, 3 pts. 1828–40, abridged ed. 1868) won praise from men like De Wette and Fr. Delitzsch. In 1846 he published his contributions to the criticism of the gospels (*Beiträge zur Evangelien Kritik*, pt. i) which contained his defence of St. John's gospel.

Bleek's other works include *Einleitung in das Alte Testament* (3rd ed. 1869, Eng. trans. by G. H. Venables from 2nd ed. 1866); in 1878 a new edition (the 4th) appeared under the editorship of J. Wellhausen, who made extensive alterations and additions; *Introduction to the New Testament* (3rd ed., W. Mangold, 1875, Eng. trans. from 2nd German ed. by William Urwick 1869–70); *Synoptische Erklärung der drei ersten Evangelien* (Eng. trans., 1862); *Vorlesungen über die Apokalypse* (Eng. trans. 1875); *Lectures on Colossians, Philemon and Ephesians* (1865).

See Herzog-Hauck, *Realencyklopädie*; F. Lichtenberger's *Histoire des idées religieuses en Allemagne*, vol. iii.; Diestel's *Geschichte des Alten Testaments* (1869); and T. K. Cheyne's *Founders of Old Testament Criticism* (1893).

BLEEK, WILHELM HEINRICH IMMANUEL (1827–1875), German philologist, studied at Bonn and Berlin, where he first noted the philological peculiarities of the South African languages. In his Doctor's dissertation (Bonn, 1851), *De nominum generibus linguarum Africae Australis*, he endeavoured to show that the Hottentot language was of North African descent. Towards the close of 1856 he settled at Cape Town, and in 1857 was appointed interpreter by Sir George Grey, who appointed him librarian of the Sir George Grey collection in 1860. He introduced into European philology the word Bantu.

His works are *Vocabulary of the Mozambique Language* (1856); *Handbook of African, Australian and Polynesian Philology* (Cape Town and London, 1858–63), *Comparative Grammar of the South African Languages* (vol. i., 1869); *Reynard the Fox in South Africa, or Hottentot Fables and Tales* (1864); *Origin of Language* (1869).

BLENDE or SPHALERITE, a naturally occurring zinc sulphide, ZnS , and an important ore of zinc. The name blende was used by G. Agricola in 1546, and is from the German, *blenden*, to

blind, or deceive, because the mineral resembles lead-ore in appearance but contains no lead, and was consequently often rejected as worthless. Sphalerite, introduced by E. F. Glocker in 1847 has the same meaning (Gr *σφαλερός*, deceptive), and so have the miners' terms "mock ore," "false lead" and "black jack."

SIMPLE CRYSTAL OF BLENDE OR ZINC SULPHIDE FROM THE BINN VALLEY, SWITZERLAND

Usually, crystals of blende are much more complex and difficult to decipher

Crystals of blende are cubic with inclined hemihedrism, and have no centre of symmetry. The basic form is the tetrahedron. A common form is a combination of two tetrahedra, in which the four faces of one tetrahedron are larger than the four faces of the other: further, the two sets of faces differ in surface characters: those of one set being dull and striated, while those of the other set are bright and smooth. An important character of blende is the perfect dodecahedral cleavage, there being six directions of cleavage parallel to the faces of the rhombic dodecahedron, the angles between which are 60° .

When chemically pure, which is rarely the case, blende is colourless and transparent; usually, however, the mineral is yellow, brown or black, and often opaque, the depth of colour and degree

of transparency depending on the amount of iron present. The streak, or colour of the powder is brownish or light yellow, rarely white. The lustre is resinous to adamantine, and the index of refraction high (2.369 for sodium-light). The substance is usually optically isotropic. The specific gravity is 4.0, and the hardness 4.

A few varieties of blende are distinguished by special names, these varieties depending on differences in colour and chemical composition. A pure white blende from Franklin furnace in New Jersey is known as cleiophane. Black blende containing ferrous sulphide in amounts up to 15 or 20% isomorphously replacing zinc sulphide, is known as marmatite (from Marmato in Colombia, South America) and christophite (from St. Christophe mine at Breitenbrunn in Saxony).

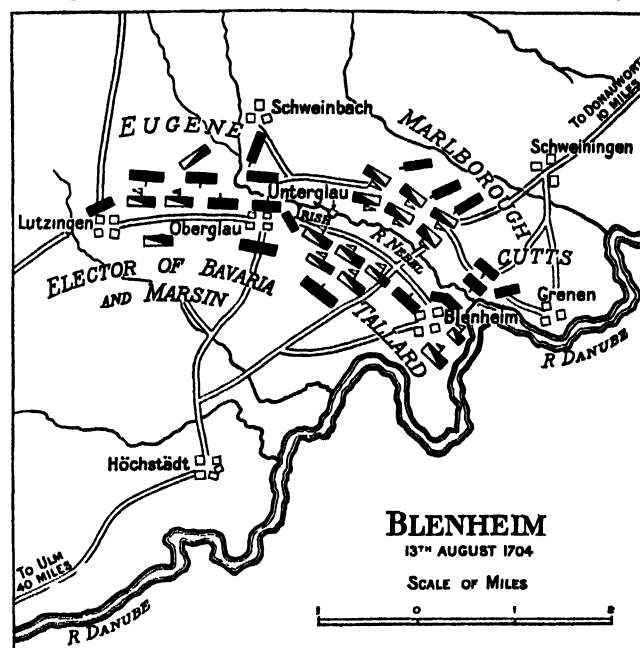

Blende occurs in metalliferous veins, often in association with galena, also with chalcopyrite, barytes, fluorspar, etc. In ore deposits containing both lead and zinc, such as those filling cavities in the limestones of the north of England and of Missouri, the galena is usually found in the upper part of the deposit, the blende not being reached until the deeper parts are worked. Blende is also found sporadically in sedimentary rocks. (L. J. S.)

BLenheim (Ger. *Blindheim*), a village of Bavaria, Germany, in the district of Swabia, on the left bank of the Danube, 30m. N.E. from Ulm by rail, a few miles below Höchstädt. Pop. 700. It was the scene of the defeat of the French and Bavarians under Marshals Tallard and Marsin, on Aug. 13, 1704, by the English and the Austrians under the duke of Marlborough and Prince Eugene. In consideration of his military services and especially his decisive victory, a princely mansion was erected by parliament for the duke of Marlborough near Woodstock in Oxfordshire, England, and was named Blenheim palace after this place.

The battle of Blenheim is also called Höchstädt, but the title accepted in England has the advantage that it distinguishes this battle from that won on the same ground a year previously, by the elector of Bavaria over the imperial general Styrum (Sept. 9-20, 1703), and from the fighting between the Austrians under Krag and the French under Moreau in June 1800 (See FRENCH REVOLUTIONARY WARS.) The battle of 1704 was the culmination of Marlborough's surprise march to the Danube. (See SPANISH SUCCESSION, WAR OF) The ground between the hills and the marshy valley of the Danube forms a defile through which the main road from Donauwörth led to Ulm; parallel streams divide the narrow plain into strips. On one of these streams, the Nebel, the French and Bavarians (somewhat superior in numbers) took up their position facing eastward, their right flank resting on the Danube at Blenheim, their left in the under-features of the hilly ground, and their front covered by the Nebel—a position of great natural strength. The imperialist army of Eugene and the allies under Marlborough (52,000 strong) encamped 5m. to the eastward along another stream, their flanks similarly protected. On Aug. 2-13, 1704, Eugene and Marlborough set their forces in motion towards the hostile camps, several streams had to be crossed on the march, and it was seven o'clock (five hours after moving off) when the British of Marlborough's left wing, next the Danube, deployed opposite Blenheim, which Tallard thereupon garrisoned with a large force of his best infantry, aided by a battery of 24-pounder guns. The French and Bavarians were taken somewhat by surprise, and were arrayed in two separate armies, each with its cavalry on the wings and its foot in the centre. Thus the centre of the combined forces consisted of the cavalry of Marsin's right and of Tallard's left.

Here was the only good ground for mounted troops, and Marlborough followed Tallard's example when forming up to attack, but it resulted from the dispositions of the French marshal that this weak point of junction of his two armies was exactly that at which decisive action was to be expected. Tallard therefore had a few horse on his right between the Danube and Blenheim, a mass of infantry in his centre at Blenheim itself, and a long line of cavalry supported by a few battalions forming his left wing in the plain, and connecting with the right of Marsin's army. This army was similarly drawn up. The cavalry right wing was in the open, the French infantry near Oberglau, which was strongly

held, the Bavarian infantry next on the left, and finally the Bavarian cavalry with a force of foot on the extreme left in the hills. The elector of Bavaria commanded his own troops in person. Marlborough and Eugene on their part were to attack respectively Tallard and Marsin. The right wing under Eugene had to make a difficult march over broken ground before it could form up for battle, and Marlborough waited, with his army in

BATTLE OF BLENHEIM, ONE OF MARLBOROUGH'S GREATEST VICTORIES
In Aug. 1704, Marlborough and Prince Eugene attacked the French and Bavarian forces in their position behind the Nebel river near Blenheim. While Eugene engaged the Bavarian left, under Marsin, Lord Cutts attacked Blenheim, and Marlborough drove through the centre. This battle broke the long sequence of French victories

order of battle between Unterglau and Blenheim, until his colleague should be ready. At 12.30 the battle opened Lord Cutts, with a detachment of Marlborough's left wing, attacked Blenheim with the utmost fury. A third of the leading brigade (British) was killed and wounded in the vain attempt to break through the strong defences of the village, and some French squadrons charged upon it as it retired, but a Hessian brigade in second line drove them back. After the repulse of these squadrons, Cutts again moved forward, using a fresh brigade. The second attack, though pressed even more fiercely, fared no better than the first, and the losses were heavier than before. The duke then ordered Cutts to observe the enemy in Blenheim, and concentrated all his attention on the centre. Here, between Unterglau and Blenheim preparations were being made, under cover of artillery, for the crossing of the Nebel, and farther up-stream a corps was sent to attack Oberglau. This attack failed completely, and it was not until Marlborough himself, with fresh battalions, drove the French back into Oberglau that the allies were free to cross the Nebel.

In the meanwhile the first line of Marlborough's infantry had crossed lower down and the first line of cavalry following them across, had been somewhat severely handled by Tallard's cavalry. The squadrons under the Prussian general Bothmar, however, made a dashing charge, and achieved considerable temporary success. Eugene was now closely engaged with the elector of Bavaria, and both sides were losing heavily. But Eugene carried out his fixing attack successfully. Marsin dared not reinforce Tallard to any extent, and the duke was preparing for the decisive stroke. His whole force, except the detachment of Cutts, was now across the Nebel, and he had formed it in several lines with the cavalry in front. Marlborough himself led the cavalry; the French squadrons received the attack at the halt, and were soon broken. Marsin's right swung back towards its own army. Those squadrons of Tallard's left which retained their order fell back towards

the Danube, and a great gap was opened in the centre of the defence through which the victorious squadrons poured. Wheeling to their left the pursuers drove hundreds of fugitives into the Danube, and Eugene was now pressing the army of Marsin towards Marlborough, who re-formed and faced northward to cut off its retreat. Tallard was already a prisoner, but in the dusk and confusion Marsin slipped through between the duke and Eugene. General Charles Churchill, Marlborough's brother, had meanwhile, with the infantry, passed through the central gap, and, swinging left, surrounded the French garrison of Blenheim. After one or two attempts to break out, 24 battalions of infantry and four regiments of dragoons, many of them the finest of the French army, surrendered.

The losses of the allies are stated at 4,500 killed and 7,500 wounded (British 670 killed and 1,500 wounded). Of the French and Bavarians 11,000 men, 100 guns and 200 colours and standards were taken; besides the killed and wounded, the numbers of which were large but uncertain—many were drowned in the Danube. Marsin's army, though it lost heavily, was drawn off in good order; Tallard's was almost annihilated. With the retreat of the French survivors first to the Rhine, and then to the Moselle, the sun began to sink on a decade-long tradition of French military triumph.

BLANNERHASSETT, HARMAN (1765–1831), Irish-American lawyer, was born on Oct. 8 1765. He was educated at Trinity college, Dublin, and in 1790 was called to the Irish bar. In 1796 he married his niece, Margaret Agnew. Ostracised by their families the couple came to America, where Blennerhassett in 1798 bought an island in the Ohio river about 2m. below Parkersburg, West Virginia. Here in 1805 he received a visit from Aaron Burr (q.v.), in whose conspiracy he became interested, furnishing funds for its support, and offering his island as a rendezvous for the gathering of supplies and the training of volunteers. When the conspiracy collapsed, Blennerhassett fled, was twice arrested and remained a prisoner until after Burr's release. He became in turn a cotton planter in Mississippi and a lawyer (1819–22) in Montreal, Canada. After returning to Ireland, he died in the island of Guernsey on Feb. 2 1831.

BIBLIOGRAPHY.—See William H. Safford, *Life of Harman Blennerhassett* (Cincinnati, 1853); W. H. Safford (editor), *The Blennerhassett Papers* (Cincinnati, 1864); and "The True Story of Harman Blennerhassett," by Therese Blennerhassett-Adams, in the *Century Magazine* for July 1901, vol. lxi.

BLENNY, a name generally given to any fish of the Blennioid group, in which the pelvic fins are jugular in position and have the rays reduced in number. The wolf-fish, like the viviparous blenny (*Zoarces*) and the kelp-fishes (*Climidae*), is a blennioid. The family *Blenniidae* contains numerous small species in tropical and subtropical seas, mostly shore-fishes that lurk under stones and weeds in shallow pools. The shanny (*Blennius pholis*) is the commonest British species.

BLERA (mod. BIEDA), ancient Etruscan town on the Via Clodia, about 32m. N.N.W. of Rome. It is on a long, narrow tongue of rock at the junction of two deep glens. Two ancient bridges both belong to the Via Clodia; many rock-hewn tombs imitate houses, with beams and rafters represented in relief (see Koch, von Mercklin, Weickert, in *Römische Mitteilungen* (1915), 161 seq.). There was another Blera in Apulia, on the Via Appia between Venusia and Tarentum.

BLESBOK, an African antelope (*Alcephalus albifrons*) allied to the hartebeest (q.v.). See ANTELOPE.

BLESSINGTON, MARGUERITE, COUNTESS OF (1789–1849), Irish novelist and miscellaneous writer, daughter of Edmund Power, a small landowner, was born near Clonmel, Co. Tipperary, Ireland, on Sept. 1, 1789. Her childhood was made unhappy by her father's character and poverty, and her early womanhood wretched by her marriage at the age of 15 to a Captain Maurice St. Leger Farmer, whose drunken habits brought him at last as a debtor to the king's bench prison, where, in Oct. 1817, he died. His wife had left him some time before, and in Feb. 1818 she married Charles John Gardiner, earl of Blessington. Of rare beauty, charm and wit, she was no less distinguished for her generosity and for the extravagant tastes which she shared

with her husband, which resulted in encumbering his estates with a load of debt. In the autumn of 1822 they went abroad, spent four months of the next year at Genoa in close intimacy with Byron, and remained on the Continent till Lord Blessington's death in May 1829. Some time before this they had been joined by Count D'Orsay, who in 1827 married Lady Harriet Gardiner, Lord Blessington's only daughter by a former wife. D'Orsay, who had soon separated from his wife, now accompanied Lady Blessington to England and lived with her till her death. Their home, first at Seamore Place, and afterwards Gore House, Kensington, became a centre of attraction for whatever was distinguished in literature, learning, art, science and fashion. Lady Blessington was for some years editor of *The Book of Beauty* and *The Keepsake*, popular annals of the day. In 1834 she published her *Conversations with Lord Byron*. Her *Idler in Italy* (1839–40), and *Idler in France* (1841) were popular for their personal gossip and anecdote, descriptions of nature and sentiment. Early in 1849, Count D'Orsay left Gore House to escape his creditors; the furniture and decorations were sold, and Lady Blessington joined the count in Paris, where she died on June 4, 1849.

See her *Literary Life and Correspondence* (3 vols., edit. by R. R. Madden, 1855). Her portrait was painted in 1808 by Sir Thomas Lawrence.

BLICKLING HOMILIES, an Anglo-Saxon ms. of the time of Aelfred and Aelfric, consisting of sermons and legends. The originals are at Blickling Hall, Aylsham, Norfolk, England; they were edited for the Early English Text Society by Richard Morris.

BLIDA, a town of Algeria, in the department of Algiers, 32 m. by railway S.W. from Algiers, on the line to Oran. Pop. (1926) 24,758. It lies surrounded with orchards and gardens, 630 ft. above the sea, at the base of the Atlas, on the south edge of the fertile plain of the Metija, and the right bank of the Wad-el-Kebir affluent of the Chiffa, which provides power for large corn mills and several factories, and also supplies the town, with its numerous fountains and irrigated gardens. Blida is surrounded by a wall with six gates, and is further defended by Fort Mimich, on a steep hill left of the river. The present town is French in character and has a flourishing trade, chiefly in oranges and flour. The orange groves contain over 50,000 trees. In the public gardens is a group of magnificent olive trees. It is one of the pleasantest spots in Algeria. In the vicinity are the villages of Joinville and Montpensier, which owe their origin to military camps established in 1838: and on the road to Medea are the tombs of the marabout Mohammed-el-Kebir, who died in 1580, and his two sons.

Blida, i.e., *boleida*, diminutive of the Arab word *belad*, city, occupies the site of a military station in the time of the Romans, but the present town appears to date from the 16th century. A mosque was built by order of Khair-ed-din Barbarossa, and under the Turks the town was of some importance. In 1825 it was nearly destroyed by an earthquake, but was speedily rebuilt. It was not till 1838 that it was finally held by the French, though they had held it eight years before.

Blida is the chief town of a commune of the same name, having (1926) a population of 36,687.

BLIGH, WILLIAM (1754–1817), English admiral, accompanied Captain Cook (q.v.) in his second expedition (1772–74), as sailing master of the "Resolution." He was nicknamed "bread-fruit Bligh" because of the discovery of the fruit on the voyage, and was sent in 1787 in H.M.S. "Bounty" to the Pacific, to fetch bread-fruit for introduction to the West Indies. On his return from Otaheite a mutiny broke out (1789) on the "Bounty," and Bligh, with 18 others, was set adrift. The mutineers settled on Pitcairn Island. Bligh eventually landed at Timor in the East Indies, having made a voyage of about 4,000 miles in an open boat. He returned to England, and ultimately introduced the bread-fruit tree into the West Indies. Bligh fought at Copenhagen (1801), and from 1805–08 was governor of New South Wales. There his soldiers mutinied against him, and he was a prisoner until 1810. He died in London in 1817. The mutiny on the "Bounty" inspired Lord Byron's "The Island." (See BOUNTY, MUTINY OF THE.)

BLIND, MATHILDE (1841-1896), English author, was born at Mannheim, on March 21, 1841. Her father was a banker named Cohen, but she took the name of Blind after her stepfather, the political writer, Karl Blind (1826-1907), one of the exiled leaders of the Baden revolt in 1848-49. Mathilde wrote three long poems, "The Prophecy of St. Oran" (1881); "The Heather on Fire" (1886), an indignant protest against the evictions in the Highlands, and "The Ascent of Man" (1888), which was to be the epic of the theory of evolution. She wrote biographies of George Eliot (1883) and Madame Roland (1886), and translated D. F. Strauss's *The Old Faith and the New* (1873-74) and the *Memoirs of Marie Bashkirtseff* (1890). She died on Nov. 26, 1896, bequeathing her property to Newnham College, Cambridge.

A complete edition of her poems was edited by Mr. Arthur Symonds in 1900, with a biographical introduction by Dr. Richard Garnett.

BLIND, TRAINING AND WELFARE OF THE. Section 69 of the English Education Act, 1921, defines the word "blind" as meaning "too blind to be able to read the ordinary school books used by children." In 1927 there were 2,554 blind children between the ages of 5 and 16 in England and Wales. Besides these it was estimated that there were nearly 7,000 partially-blind children. The total accommodation in schools in England and Wales for blind and partially-blind children is 4,514. The number of blind children under 5 years of age was 258, and the total number of registered blind persons was 46,822 of whom 31,667 were employable. Statistics show that the number of cases of blindness is on the decrease.

Attempts at Reform.—In 1910, an organization of blind workers, the National League of the Blind, began to direct public opinion to the need for a more systematic solution of the problem than could be secured by the piecemeal action and insufficient resources of voluntary institutions. The institutions had been in the main opposed to government assistance for the adult blind. The alternative plan, proposed by workshop authorities, was to secure government contracts for brushes, baskets, etc. Contracts were secured, but unfortunately could not be executed except at a loss. Because of the failure of this line of approach the institution authorities swung round in favour of state assistance.

BOWLING AT AN INSTITUTION FOR THE BLIND

Modern development in education has succeeded in alleviating many of the handicaps suffered by the blind. Throughout the world there are now established centres where those afflicted with loss of sight are taught to engage in activities for a healthy physical condition.

The number of blind men and women employed in British workshops was only 2,300. About 200 young persons were completing their technical training annually, and for these practically no provision was being made. Wages paid were inadequate and, owing to lack of funds, in most institutions little could be added thereto. As far back as the days of the Royal Commission on the Blind, 1885, the blind workers had been in favour of a state subsidy of wages in one form or another, but their petitions had gone unheeded. Now the matter came again to the front and,

along with the demand for municipal workshops, a measure before Parliament stipulated for an adequate wage. Institutions were thus driven to produce a measure of their own. In December 1910 an attempt was made to bring the two competing measures into line. An agreed bill secured its first reading in May 1914, but it got no further, probably because of the outbreak of war.

The forward step came by another route. W. Wardle, Labour M.P. for Stockport, initiated in March 1914 a debate on the conditions of the blind. In May the government set up a departmental committee "to consider

BLIND BOYS LEARNING CAMP COOKING

Scouting is another activity the blind boy is now able to enjoy. Under capable instruction, he soon learns to know the woods and outdoor life almost as thoroughly as his more fortunate brothers.

Grants and Pensions.—In August 1919 the Ministry of Health issued regulations explaining the services in respect of which grants would be paid. In 1921-2 the grants paid totalled £69,886, while in 1926-7 the total had increased to £112,510. In 1920 the Blind Persons Act was passed. This provided in Section 1 for the grant of Old Age Pensions to blind persons at the age of 50 instead of at the age of 70. Section 2 places a duty on local authorities to promote the welfare of blind persons, ordinarily resident in their area. They are given power to provide and maintain or contribute towards the provision and maintenance of workshops, hostels, homes or other places for the reception of blind persons, and, with the approval of the Minister of Health, to do such other things as may appear to them desirable for the purpose. Section 3 provides for the registration of charities for the blind. Local authorities have gradually increased their contributions towards this service since 1920. The amount was £14,671 in 1921-2 while for 1926-7 it was £173,828. In 1927 there were 17,232 registered blind persons in England and Wales between the ages of 50 and 70, and no less than 84 per cent were in receipt of an old age pension. The Public Health Act of 1925 gave local authorities further powers for measures for the prevention of blindness.

The World War.—During the years 1914-18 more than 10,000 soldiers and sailors lost their sight on active service. To this total the British Commonwealth contributed nearly 2,000, and Germany 3,000. In Britain these blinded men were cared for at St. Dunstan's in London, and Newington House in Edinburgh. There they were given fresh hope and were taught useful occupations. In Germany, an effort was made to find occupation for them in particular sections of industry. Messrs Siemens led the way, and about 450 were employed at the close of 1925.

Education.—The first state action in England and Wales towards the education of the blind was taken in 1885, when a Royal Commission was appointed to consider the condition of the blind. The commission reported in 1889 and its report resulted in the passing of the Elementary Education (Blind and Deaf Children) Act, 1893. This Act provided for the compulsory attendance at school of all blind children between the ages of 5 and 16.

Blind children under 5 years of age are eligible for admission to one of the three nursery schools or "Sunshine Homes," estab-

lished by the National Institute for the Blind at Chorley Wood, Southport and Leamington. From 5 to 16 years of age they are admitted to day and residential schools for the blind. There are two secondary schools, one for blind boys at Worcester, and one for blind girls at Chorley Wood. Students are trained at the Royal Normal College for the Blind, Upper Norwood, London, for the careers of school-teachers, musicians and typists. There are about 300 teachers engaged in teaching blind children in special schools.

After the age of 16 the blind are provided with further education and training. The responsibility for this training is placed by the Education Act, 1921, on the local education authority for higher education, namely, a county or county borough council. Section 2 (6) of the Blind Persons Act, 1920, provides that the local education authority shall secure adequate and suitable provision for the technical education of blind persons, ordinarily resident within their area, who are capable of receiving and being benefited by such education. Only those blind persons are admissible on the completion of their training to workshops for the blind who are "too blind to perform work for which eyesight is essential" (Blind Persons Act, 1920). In 1927 there were 1,704 students over 16 years of age in training in vocational courses held throughout the country. Students between 16 and 21 years of age, as well as being taught a trade, receive instruction in general subjects, commercial knowledge, singing, physical education and hygiene. The period of training may occupy from 2 to 4 years according to the trade. Vocational training is available for older blind persons who have become blind after leaving school.

Scotland.—The welfare of the blind in Scotland is similar to that in England and Wales. On April 1, 1927, there were 6,939 known blind persons in Scotland, of whom 340 were of or under school age. In 1926-27 grants were paid by the Scottish Board in respect of services provided for the welfare of the blind amounting to £16,033/15/0.

France.—The education of blind children in France is compulsory. The Education Act of 1882 stipulated that a standing order of the *administration publique* should settle the special conditions under which blind children should be educated. There is a National Institution in Paris which accommodates 230 boys and girls. This is State supported with some help from local authorities. There are a number of schools maintained by the Departments of Loire, Nord and Seine, and by the city of Lyons, and 26 private schools not under the control of the State. The age of admission of blind children to the schools varies from 3 to 10 years.

Denmark.—The care of the blind in Denmark was begun in 1811 when a private institution was founded. In 1853 this institution was taken over by the Government. There are schools for primary and technical education and these are State aided.

Spain.—Education of blind children in Spain is not compulsory. Only one blind school, the National College for the Deaf and Blind, in Madrid, is maintained by the State. There are two other schools in Madrid and these are maintained by the City authorities. Some blind schools are maintained in various places by provincial authorities, others by cities, and others by private societies. In the National College in Madrid the period of instruction is from 6 to 16 years of age.

Hungary.—Education of the blind is compulsory. Children are admitted to school at the age of 5. From 14 to 25 uneducated blind persons are admitted into schools for the young blind, but over the age of 25 they are sent to schools for the blind where they receive trade instruction.

Italy.—The education of blind children has been compulsory by law for years, but the law was not carried out by anyone until under the present Fascist Government, it was re-enacted on Dec. 31, 1923. Instruction is given as far as possible in institutions for the blind, but blind children can, if desired, enter schools for seeing children, unless they are mentally defective. Institutions whose activities are mainly educational have gradually passed from the care of the Ministry of the Interior

to that of the Ministry of Public Education. Blind schools are maintained partly by the Provinces and Communes and partly by money from charitable sources. The age of admission is generally 6 and the period of instruction usually lasts for 10 years. There are institutions for the blind at Torino, Milan, Trieste, Rome, Naples, etc.

Switzerland.—The education of the blind is not compulsory, and is not maintained by the public authorities, but only by private charity, with the exception of the Cantonal school at Zurich. Blind children are usually admitted from the age of 6 years.

Finland.—Education of blind children is compulsory in schools directed and maintained by the State. Children are admitted to school at 8 years of age, the highest age of admission being 11 years. Pupils usually remain at school for 10 years. Training establishments for the blind are provided and maintained by the society *Das Blindas Vanner* (Friends of the Blind), which receives a yearly grant from the State.

Czecho-Slovakia.—From 1869 when Czecho-Slovakia still formed part of the Austrian monarchy, education of blind children has been compulsory. Schools are maintained by the State and municipal authorities as well as by private endowment. The age of admission to schools is from 3 to 6 years. After the school period, trades are taught.

The United States.—Official provision is made for the education of the blind in the United States. After 21 years of agitation a bill to promote such education was passed in 1879 when the Federal Government appropriated \$10,000 annually for printing embossed books to be distributed to State schools; which appropriation was increased in 1927 to \$75,000. Each State Government holds itself financially responsible to place its blind either in

WEAVING DEPARTMENT IN THE HANDICRAFT CLASS OF THE NEW YORK ASSOCIATION FOR THE BLIND

Weaving is probably the most widely practised of all handicrafts engaged in by the blind. Others are sketching, wood carving and toy making. The practical application of these trades enables many men and women, otherwise dependent on charity, to earn their own living.

its State school, of which there are 39 in the country, or to place blind children in outside institutions at its expense. Great progress has been made.

The first school for the blind in the United States was founded in Boston, Mass., chiefly through the efforts of Dr. John D. Fisher, a young physician. It was incorporated in 1830, and in honour of T. H. Perkins (1764-1854) who gave his mansion to the institution, was named the Perkins Institution and Massachusetts Asylum (now School) for the Blind. Aid was granted by the State from the beginning. In 1831 Dr. Samuel G. Howe (q.v.) was appointed director, and held that position for nearly 44 years, being succeeded by his son-in-law Michael Anagnos (d. 1906), who

established a kindergarten for the blind at Jamaica Plain, in connection with the Perkins Institution. One of Dr. Howe's most notable achievements was the education of Laura Bridgman (q.v.) who was deaf, dumb and blind, and this has since led to the education of Helen Keller and other blind deaf-mutes. The New York institution was incorporated in 1831, and the Pennsylvania institution was founded at Philadelphia by the Society of Friends in 1833. The Ohio institution was founded at Columbus in 1837, the Virginia at Staunton in 1839, the Kentucky at Louisville in 1842, and the Tennessee at Nashville in 1844. The Pennsylvania Institution at Overbrook, Pa., and the Perkins Institution, Watertown, Mass., were pioneers in making provision for children of kindergarten age.

Readers for the blind desirous of university education are provided in nine States, beginning with New York State in 1907, and Missouri in 1913, where \$300 per annum is expended for each student. The training of teachers for work with the blind is encouraged and in 1921 Harvard University Graduate School of Education opened a course for them. Since then eight other universities and colleges have opened similar courses. Day school classes where blind children are taught to participate in regular work with other children, are conducted in 11 States. They were first established in Chicago in 1900, followed by Cincinnati, 1905, and Milwaukee, 1907. New York and Cleveland instituted them in 1909, since when they have spread over the country.

BLINDAGE, a temporary wooden screen faced with earth for protection against the effect of projectiles (from Fr. *blinder*, to blind).

BLIND HOOKEY, a game of chance, played with a full pack of cards. The deal, which is an advantage, is decided as at whist, the cards being shuffled and cut as at whist. The dealer gives a parcel of cards to each player including himself. Each player puts the amount of his stake on his cards, at which he must not look. The dealer has to take all bets. He then turns up his parcel, exposing the bottom card. Each player in turn does the same, winning or losing according as his cards are higher or lower than the dealer's. Ties pay the dealer. The cards rank as at whist. The suits are of no importance, the cards taking precedence according to their face-value.

BLINDING, a form of punishment anciently common in many lands. It was resorted to by the Roman emperors in their persecution of the Christians. The method of destroying the sight varied. Sometimes a mixture of lime and vinegar, or barely scalding vinegar alone, was poured into the eyes. Sometimes a rope was twisted round the victim's head till the eyes started out of their sockets. In the middle ages the punishment seems to have been changed from total blindness to a permanent injury to the eyes, amounting, however, almost to blindness, produced by holding a red-hot iron dish or basin before the face. Under the forest laws of the Norman kings of England blinding was a common penalty.

BLINDNESS. The World War gave an impetus to the movement for the emancipation of the blind that had begun in the 18th century. Every country involved in the holocaust was driven to face the problem presented by a number of vigorous citizens, normal in every way but deprived of sight. These men of every rank of life were unconscious pioneers and leaders of the blind. As the number of those stricken through the wars of the Crusades brought about the establishment of the first public institution for the assistance of the blind 600 years before (see FRANCE), so these 20th century warriors have made their presence felt in legislative and other spheres.

Blind men and women have made positions for themselves in the past in isolated cases, but to-day there is hardly an avenue of life in which a man or woman without sight is not succeeding. The way has been opened in literature, the arts, the Church, law, politics, commerce, trade, agriculture and sport. Even the unemployable blind are not left destitute.

Since the beginning of history there have been individual blind persons gifted with exceptional initiative or enterprise, or who,

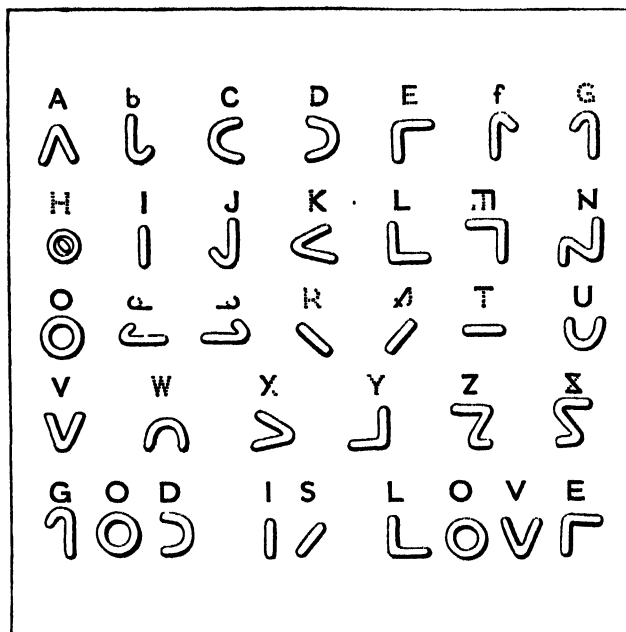

FIG 1—READING FOR THE BLIND ACCORDING TO DR. MOON'S ALPHABET WHICH IS BASED ON ROMAN LETTERS

having had the advantage of a good education, have burst the bonds of affliction and led useful and interesting lives. The blind community as a whole, however, is and has always been poor, and it was not until private and public efforts were made to secure education and training for them that any opportunity for even the slightest degree of progress from a condition of absolute dependence was afforded. Inability to read was the greatest handicap, and the development of methods whereby this became possible was the first great step forward in the education of the general blind community.

Systems of Reading.—The earliest authentic records of tangible letters for the blind describe a plan of engraving the letters upon blocks of wood, the invention of Francesco Lucas, a Spaniard. In 1640 a writing-master in Paris cast a movable leaden type for the use of the blind. Pins inserted in cushions were next tried, and large wooden letters. Cast metal letters followed, and in Germany R. Weissembourg made use of letters cut in cardboard, and afterwards pricked maps in the same material. By this method he taught Mlle. Paradis, the talented blind musician and the friend of Valentin Haüy. To Haüy belongs the honour of being the first to emboss paper as a means of reading for the blind, his books were embossed in large and small italics, from movable type set by his pupils. Haüy's first pupil, François Lesueur, was sorting the papers on his teacher's desk and came across a card strongly indented by the types in the press. The blind lad showed his master he could decipher several letters on the card. Immediately Haüy traced with the handle of his pen some signs on paper. The boy read them, and the result was printing in relief, the greatest of Haüy's discoveries.

The first book for the blind produced in the United Kingdom was by John Gall, of Edinburgh, in 1827; it was printed in a triangular modification of the common alphabet. Five years later the Scottish Society of Arts offered a prize of £20 for the best alphabet for the blind, and a Dr. Fry of London carried off the prize from 16 competitors. Gall's publication and the move made by the Society of Arts had attracted attention. Overseas visitors

came to Scotland to investigate progress, among them Dr. Howe of Boston, who went home to set up a printing press, while John Alston of Glasgow launched an appeal for a printing fund and printed a Bible for the blind in Fry's type.

At the beginning of the 19th century 23 different methods of embossed printing were in existence. The best known are Lucas's, Frere's, Moon's and Braille's. The Moon type invented by Dr. Moon of Brighton in 1847, which partly retains the roman outlines, is easily learnt by those who have become blind late in life (fig. 1).

The Braille system is now in world-wide use, even having been adapted to Chinese by Dr Murray, a Scottish missionary, and a Braille magazine is published in Esperanto. Louis Braille (1809-1852) was born near Paris, and became blind when three years of age. He was a pupil and later an instructor at the Institution des Jeunes Aveugles, Paris, and adapted the system that bears his name from that invented by Captain Charles Barbier, a young French cavalry officer. Louis Braille published his system in 1829 and developed it further five years later. It was not given official recognition in Paris until two years after Braille's death. The Braille alphabet consists of varying combinations of six dots in an oblong, the vertical side containing three dots and the horizontal two. There are 63 possible combinations of these six dots, and after the letters of the alphabet have been supplied, the

remaining signs are used for punctuation, contractions, etc. (fig. 2) For writing, a ruler is used, consisting of a metal bed either grooved or marked by groups of little pits, each group consisting of six, over this bed is fitted a brass guide, punched with oblong holes whose vertical diameter is three-tenths of an inch, while the horizontal diameter is two-tenths. The pits are arranged in two parallel lines, and the guide is hinged on the bed in such a way that when the two are locked together the openings in the guide correspond exactly to the pits in the bed. The brass guide has a double row of openings, which enables the writer to write two lines; when these are written, he shifts his guide downwards until two little pins, which project from the under surface at its ends, drop into corresponding holes of a wooden board; then two more lines are written, and this operation is repeated until the bottom of the page is reached. The paper is introduced between the frame and the metal bed. The instrument for writing is a blunt awl,

1 st LINE	A	B	C	D	E	F	G	H	I	J
2 nd LINE	K	L	M	N	O	P	Q	R	S	T
3 rd LINE	U	V	X	Y	Z	and	for	of	the	with
4 th LINE	th	gh	sh	th	wh	ad	er	ou	ow	W

FIG. 2.—THE BRAILLE ALPHABET. ONE OF THE MOST WIDELY USED ALPHABETS FOR THE BLIND

which carries a little cap of paper before it into the grooves or pits of the bed, thereby producing a series of little pits in the paper on the side next the writer. When taken out and turned over, little prominences are felt, corresponding to the pits on the other side. The reading is performed from left to right, consequently the writing is from right to left; but this reversal presents no practical difficulty as soon as the pupil has caught the idea that in reading and writing alike he has to go forwards (fig. 3).

The first ten letters, from "a" to "j" are formed in the upper and middle grooves, the next ten, from "k" to "t," are formed by adding one lower back dot to each letter of the first series; the

third row is formed from the first by adding two lower dots to each letter; the fourth row, similarly, by adding one lower front dot.

The first ten letters, when preceded by the prefix for numbers stand for the nine numbers and the cipher. The same signs, written in the lower and middle grooves, instead of the upper and middle, serve for punctuation. The seven last letters of each series

FIG. 3.—APPARATUS EMPLOYED IN WRITING BRAILLE

stand for the seven musical notes—the first series representing quavers, the second minims, the third semibreves, the fourth crotchets. Rests, accidentals and every other sign used in music can be readily and clearly expressed without having recourse to the staff of five lines which forms the basis of ordinary musical notation, and which, though it has been reproduced for the blind, can only be considered as serving to give them an idea of the method employed by the seeing, and cannot, of course, be written. By means of this dotted system, a blind man is able to keep memoranda or accounts, write his own music, emboss his own books from dictation and carry on correspondence.

The first complete copy of the Bible (English) in Braille was in 39 large foolscap volumes. It was produced between 1877-90, and every dot was punched out by the hand of one man. Invention of the stereotype-machine by Frank Hall (U.S.A.) in 1893 led to a tremendous increase in the production of Braille books. The National Institute for the Blind can print 6,000 pages an hour with its electrically driven press.

Music and Broadcasting.—Music as a profession and recreation plays a very important part in the life of the blind. Numbers of blind persons make a living or augment their income as organists, singers, instrumentalists and teachers. In recent years music, through broadcasting, has contributed enormously to the happiness of the blind of all classes. Listening to broadcasting is such an ideal pastime and means of self-education for blind people that considerable efforts have been made through voluntary agencies to supply a wireless set to all who cannot afford to buy one.

Apparatus.—Much ingenuity has been displayed by blind persons and others in the adaptation and development of apparatus which mitigates the handicap of blindness. There are frames for guiding hand writing, hand frames and styles for writing Braille letters and notes, machines for carrying out the same function more rapidly and machines for writing a system of Braille shorthand at a great speed which enables work comparable to that of a stenographer to be done. Embossed carriage scales in place of the ordinary engraved scales are attached to standard typewriters enabling the blind to use these machines for private or business purposes with great efficiency. Many types of watches have been

devised with open face, stout hands and embossed figures or dots at quarter hour or five minute intervals. These are commonly in use amongst the blind of all classes.

Many games such as chess, draughts, dominoes, have been adapted for the use of the blind, and most card games can be played with cards upon which Braille characters are embossed to indicate suits and values. Some blind people are extremely expert

FIG. 4.—ARITHMETIC BOARD FOR THE BLIND, USED FOR THE MOST COMPLICATED ARITHMETICAL CALCULATIONS
Each pin can be placed so as to represent one of the 16 different characters illustrated. Special pins are also available representing algebraical symbols

at chess and bridge, and hold their own in competition with sighted players.

Many boards have been constructed to enable the blind to work arithmetical problems. The one which is most used was invented by the Rev. W. Taylor (fig. 4). The board has star-shaped openings in which a square pin fits in eight different positions. The pin has on one end a plain ridge and on the other a notched ridge; 16 characters can be formed with the two ends. The board is also used for algebra, other type furnishing the algebraic symbols.

Numerous forms of exercise and recreation can be enjoyed by the blind, usually with some sighted assistance and sometimes with special apparatus or methods. These include horse-riding, rowing and sculling, swimming, skating, dancing and walking. Successful efforts have been made to organize field sports, including modified forms of running, goal kicking, jumping, putting-the-weight, tug-of-war, etc.

Independence.—Blind people must rely very largely upon sighted assistance in the foregoing and many other matters such as the reading of correspondence, current newspapers, etc. Great efforts have, however, been made by all classes having the requisite opportunity and education to acquire a degree of independence so far as this is attainable. Much success has attended these efforts, and those amongst the blind community who are not prevented by physical or mental affections have developed a high degree of skill in attending to their own personal wants, amusing themselves, getting about alone in and out of doors, etc. The blind do not develop a special sense to replace the lost sense of sight, but the remaining primary senses and possibly many secondary and little-used senses acquire added keenness and usefulness with practice. The sense of hearing becomes keener mentally rather than physically, and numerous audible indications of what is going on around him are correctly interpreted by a trained and educated blind man. Sounds of all kinds, echo, and possibly air pressure, contribute to the endowment of a blind person with the power of discerning obstacles which make it possible for him to walk alone, especially in familiar surroundings, but even sometimes in entirely strange places. Some blind people in the ordinary course of their daily avocation travel many miles alone on foot or by means of the common transport services.

The Mind of the Blind Child.—Those who are charged with the education of the blind, especially children, should give particular attention to instruction in the attainment of personal independence.

As more sensations are received through the eye than through any other organ, the mind of a blind child is vacant, and the training should begin early or the mind will degenerate. Indirectly the loss of sight results in inaction. If no one encourages a blind child to move, he will sit quietly in a corner, and when he leaves his seat will move timidly about. This want of activity produces bad physical effects, and further delays mental growth. The blind are often injured, some of them ruined for life, through the ignorance and mistaken kindness of their friends during early childhood. They should be taught to walk, to go up and down stairs, to wash, dress and feed themselves. They should be carefully taught correct postures and attitudes, and to avoid making grimaces. They should be told the requirements of social conventions which a seeing child learns through watching his elders. They have no consciousness that their habits are disagreeable, and the earlier unsightly mannerisms are corrected the better. Blind children have a stronger claim upon the public for education than other children, because they start at a disadvantage in life, they come mostly of poor parents, and without special instruction and training they are almost certain to become a public charge during life.

THE BLIND IN GREAT BRITAIN

Two departments of State are responsible to parliament for the welfare of the blind; the Ministry of Health, which administers grants payable out of moneys voted by parliament and is the central authority for all matters relating to the blind under the Blind Persons Act; and the Board of Education. Both these departments keep in touch with local authorities, local committees and institutions for the blind by means of inspectors.

Under the Blind Persons Act, 1920, a blind person is "one so blind as to be unable to perform any work for which eyesight is essential." The definition according to the Education Act, 1921, is wider, and signifies a child "too blind to be able to read the ordinary school-books." It is therefore possible for a child to be educated as "blind" and yet remain ineligible for benefits under the Blind Persons Act, 1920.

The number of blind persons stated to exist in any country depends upon the definition of blindness, its interpretation and the extent to which registers are kept. It will be understood, therefore, that statistics of this kind relating to various countries may not be strictly comparable.

The Blind Persons Act, 1920, provides for the keeping of a register of the blind within each area. The operation of the act has led to the discovery of a number of blind persons hitherto unknown. The return of the blind for 1927 gave the total number of blind persons in England and Wales as 46,822. In 1927 there were 44,010 blind over 16 years of age. Of these 9,160 were employed; 635 trained but unemployed, 1,704 under training; 844 not under training but trainable, and 31,667 unemployable. Over 67.6% of the total number of blind in England and Wales are classed as unemployable.

Voluntary Institutions.—The first institution for the blind in England was founded in Liverpool in 1791 as the result of the initiative of two blind men, Edward Rushton, a bookseller, and James Christie, a musician. Rushton (b. 1750) was travelling to Dominica when malignant ophthalmia broke out in the cargo of slaves on his ship. He was then about 19 and his life had been saved, some years before, by a negro who had sacrificed himself. Rushton went into the hold to help the sufferers, and contracted their disease, becoming totally blind. Sixteen years later he brought about the establishment of the School for the Indigent Blind in Liverpool.

Other institutions were founded in quick succession, many as the result of the efforts of those who had become blind. Scotland took a step in 1793, the interest of several people having been aroused by the translation of *Education of the Blind* by Valentin Haüy, as made by Thomas Blacklock, a blind Scottish poet and scholar, and the Edinburgh asylum for the relief of the indigent and industrious blind was established by the Rev. David Johnston, D.D. It now has 405 beneficiaries on the roll, in addition to a number of outdoor pensioners. Dublin followed Scotland's example 17 years later (Richmond asylum, Dublin, 1810).

In 1853 Miss Elizabeth Gilbert (b. 1826), daughter of the bishop of Chichester, who had lost her sight when three years of age, began to make enquiries as to the position of her fellows. There were then about 30,000 blind people in the United Kingdom; 27,000 of these were regarded as "adults" and 1,000 of them drew pensions averaging £10 per annum from various charities. The remainder were either supported by relatives, or gained a precarious living as best they might. Of the 3,900 under 21 years of age about half were receiving training in schools and institutions, but no provision being made for after-care or supervision, these, on discharge, frequently found themselves unable to work at the trades they had been taught. Miss Gilbert saw the need, and determined to establish an out-workers scheme. So the Association for Promoting the General Welfare of the Blind was born (1856), its modest beginning a cellar rented at eighteenpence a week, and six employees—"men who for want of work have been compelled to solicit alms, or who may be likely to be tempted to do so." In 1927 there were 163 blind men and women working in the association and 41 who were too old to work who were receiving pensions. Goods were sold to the value of £32,176.

By 1923, 1,206 blind workers were employed permanently by 25 workshops in England and Wales. These drew £65,255 in wages, and a slightly higher sum in supplement (£65,454). Goods sold realized £268,926; trade deficit per blind person was £22; augmentation, £51 per blind person; loss to agencies £73 per blind person.

About 1860 Dr. T. R. Armitage, then on the threshold of a promising medical career, was threatened with blindness. Renouncing his profession, he devoted himself to work in connection with those who had lost their sight. Having reorganized the Indigent Blind Visiting Association he founded the British and Foreign Blind Association for promoting the education and employment of the blind (1868) ultimately to develop into the National Institute, and brought the Braille system into use in England. Four years later Dr Armitage, as the result of a meeting with Mr. (later Sir Francis) Campbell, was to be instrumental in establishing the Royal Normal College and Academy of Music for the Blind, of which Dr. Campbell became director.

The Royal Normal College accepts pupils of both sexes from the ages of five to 21. A good general education and physical training are given, and particular attention is paid to the teaching of music, pianoforte tuning, etc., as a means of earning a livelihood. Stenography and typewriting are also taught, and good posts have been found for many ex-pupils. Before the establishment of the college it was a rare thing for a blind person to follow a musical profession or avocation with financial success. Since its foundation many scores of musicians and piano-tuners have found it possible to earn a living, and degrees and diplomas of high merit, including several Mus.Bac., F.R.C.O., L.R.A.M., etc., have been secured by ex-pupils of the college. The college is recognized as a teachers' training college by the Board of Education.

The National Library for the Blind was to come into being in 1882 through the instrumentality of two women, Miss Arnold and Mrs. Dow, the former being blind. With slates and styles they set themselves to work to produce books in Braille and, aided by a grant of £25, opened a "library" from which books were hired out to a small circle of readers at a charge of one penny per week. Two years after its inception an annual report shows the income to be £58. To-day the National Library ranks with the National Institute for the Blind as one of the great national factors serving the blind community as a whole. It has 137,337 volumes on its shelves, and a daily circulation of 800 books. Its income for the current year (1927) is £13,624, and a northern branch was opened in Manchester in 1918. The service is free to all blind readers and the General Post Office delivers an average volume, some 5 lb. in weight, for a penny. In certain cases the library pays this charge. Books are sent not only to readers in Great Britain, but also overseas. When the heavy volumes become worn or pass out of general circulation they are used for the benefit of those suffering from contagious diseases. Some go to leper settlements. The library supplies books on philosophy,

psychology, the natural sciences, history, biography and travel, in addition to lighter reading. New novels are occasionally transcribed within a month of publication; one of average length runs into five Braille volumes. An expert will transcribe a volume in about ten days. Braille can be read at speeds ranging from 50 to 150 words a minute.

Although the foundation of the National Institute for the Blind was laid when the British and Foreign Blind Association came into being under the direction of Dr. T. R. Armitage, it was not until 46 years later (1914) that the title of the organization was changed, the work under the inspiration of Sir Arthur Pearson, Bt, having grown too wide for the original name to be truly descriptive. The institute publishes books, music and periodicals tending to raise the standard of education among the blind. In 1927 the total publications (in embossed types) were: Books, bound volumes, 24,213; magazines, periodicals, newspapers, instruction cards, etc., 372,903. The institute also undertakes the establishment of a students' library, research work and the placement of the blind amongst the sighted in factories; offers facilities for training in massage; runs homes for blind babies, a college to provide blind girls with a public school education, supplies blind home-workers with raw materials and markets their goods, and also maintains homes for the aged blind and a hostel for blind workers.

Generally speaking, the work of the institute is national in character, and it has become since Sir Arthur Pearson was its president in 1914 and introduced new methods of appealing for funds, an important factor in the finances of blind institutions throughout the country. From 1914 to the present time a gradual process of co-ordination of the activities of blind institutions, with the object of avoiding overlapping both in public collections and administration, has taken place, with the National Institute occupying a central position of great influence and power. An effort to unify the collecting activities of the blind institutions throughout the country has progressed satisfactorily until by 1927 the majority of important agencies have been brought to operate together and to issue but one appeal to the public.

St. Dunstan's.—St. Dunstan's (*q.v.*) founded by Sir Arthur Pearson in 1915, as a hostel and organization for the training, settlement and welfare of soldiers, sailors and airmen blinded in the World War is the only important national agency which conducts its appeals and works independently.

Worcester College for the Blind is an endowed public school for the education of blind boys, run, as far as possible, on normal public school lines. It owes its foundation to the Rev. H. Blair, formerly a master at King's school, Worcester, who saw the need for such a college when a totally blind boy who hoped to enter Trinity college, Dublin, was sent to him as a pupil. The boy ultimately took his M.A. degree, and carried off six open prizes. About 50% of the scholars are totally blind, and the remainder have too little sight to permit of their education being carried on in the usual way. Boys are accepted from the age of eight. Various scholarships and exhibitions are available for students whose parents are unable to afford the usual fees, and there are several valuable leading scholarships tenable at the universities. The college has educated and equipped for life over 240 blind students. About 100 have graduated at the universities, and many have obtained high honours. Over 30 have taken holy orders, and many are successful as solicitors, barristers, musicians, schoolmasters, lecturers or business men. A noteworthy figure in connection with Worcester College for the Blind is that of Sir A. W. G. Ranger, D.C.L. Himself a pupil of the college he was for over a quarter of a century honorary secretary of the board of governors. Before his retirement from public life in 1922 he was chairman of the National Institute for the Blind, and vice-chairman of St. Dunstan's. Sir Washington Ranger was one of the first to make an outstanding success as a solicitor, though handicapped by blindness from early youth. He was knighted in 1918 for his public service.

A college and association of teachers of the blind has been formed to promote and encourage the training of teachers of the blind, and to raise the status of such teachers.

A number of voluntary organizations have been established for the benefit of the blind in addition to those already mentioned. One of the largest is Gardner's Trust, created as the result of a bequest of £300,000 left in 1879. It has founded scholarships for men and women at the universities, administers a scholarship fund for blind boys for Worcester college students, and in addition to helping these towards a professional career, including music, applies a definite portion of its income towards providing instruction in handicrafts and trades. It also pensions certain unemployable blind.

The Cordwainers' Company is another doing excellent work. It was founded by the effort of John Came in 1796, who left £37,000 for the benefit of certain deserving classes, including the blind. The number of pensioners in the last category has steadily increased. Two blind sisters who had been pensioners for several years augmented the charity to a small degree by surrendering their pensions when they inherited property and donating £100 to the company "in gratitude for kindness shown."

Hetherington's Charities for Aged Blind, administered by Christ's Hospital, was founded in 1774 by a clergyman "in the hope that his example would be followed by others." The governors now pay out over £8,000 a year in pensions to blind persons from 50 to 70 years of age.

Others of the great guilds, including the Clothworkers' Company, the Drapers' and the Goldsmiths', dispense funds to much the same effect for the benefit of various classes of those without sight.

A number of institutions carry on the technical training of the blind, manage workshops, home-workers' schemes and home-teaching services, some of which confine their attentions to the unemployable. In addition county associations have been formed in most parts of England; these are usually the agents for the county council in their work in the welfare of the blind in rural areas and in towns where no agency is already working. These have been united into a Union of Counties Associations.

The blind community includes two trades unions—the National Union of the Professional and Industrial Blind, and the National League of the Blind. The former is a general association for promoting the welfare of its members, and includes a number of blind persons engaged in professional pursuits. The latter engages principally in propaganda with the object of increasing the extent to which the blind are cared for by the state and the municipality, as opposed to charitable agencies.

Government Service.—The earliest legislation in England concerning the welfare of the blind was the Act for the Relief of the Poor of Queen Elizabeth's day (1601). This laid the responsibility for the support of blind people together with destitute persons, upon their relatives, and failing these on the overseers.

Spasmodic regulations concerning the establishment of special schools and the education of blind adults followed at wide intervals of time, and nearly three hundred years later a royal commission was appointed (1886) "to investigate and report upon the condition of the blind . . . the various systems of education, elementary, technical and professional, at home and abroad, and the existing institutions for that purpose; the employments open to and suitable for the blind, and the means by which education may be extended so as to increase the number of blind persons qualified for such employment." At that date there were 32,296 blind persons in the United Kingdom according to the last census, but the accuracy of those figures was questioned. The blindness of 30% of the inmates of asylums was due to purulent ophthalmia and might have been prevented. There were 61 institutions for the blind, and a few board school classes in the larger towns, but owing to the unsatisfactory state of the law some blind children were receiving no education at all, since compulsory attendance was not enforced. Of those who had been trained in various institutions only 58% were following the trades they had been taught, and 15% of these were earning under 5s. per week. The main occupation followed was basket-making, while music and piano-tuning, brush, mat and mattress making, chair-caning, rope and twine spinning and weaving were also taught. Earnings amounted to but a few shillings a week, though those engaged in musical

occupations earned twice as much as the craftsmen, and the highest earnings of all were recorded by Scripture readers, visitors, teachers and collectors. No provision other than the workhouse was made for aged blind.

The commission reported in 1889 and its report resulted in the passing of the Elementary Education (Blind and Deaf Children) Act, 1893, which provided for the compulsory attendance at school of all blind children between the ages of five and 16, and for the provision of special schools. A clause in the Education Act of 1902 empowered the education authorities to make further provision for the blind over the age of 16.

In March 1914, as a result of a resolution of the House of Commons, a departmental committee was set up to enquire into the general welfare of the blind. The report of this committee, which was delayed owing to the war, appeared in 1917, and at the end of that year an advisory committee on the welfare of the blind was appointed by the president of the Local Government Board. This body has issued a series of valuable reports, which register what has been done and is being done for the blind.

In August 1919 the Ministry of Health issued regulations and rules governing grants out of public monies to be distributed in aid of certain services carried on for the welfare of the blind, and so enabled the work to be developed. These public monies are voted annually by parliament as part of the vote of the Ministry of Health, and provide for grants to agencies for the welfare of the blind. Under the Board of Education (Special Services) Regulations, 1925, grants are also made in aid of the education, training and maintenance of blind children and students, at the rate of 50% in the case of students nominated by education authorities, and at a lower rate in the case of students nominated by boards of guardians or private persons, etc. Local authorities are also empowered to make maintenance grants to blind students attending institutions of higher education.

Under the Blind Persons Act, 1920, blind persons are entitled to receive the old age pension at 50 instead of 70 years of age. In March 1927, 14,562 persons in England and Wales between 50 and 70 were in receipt of this pension.

The same act imposed the duty of making arrangements for the welfare of the blind, to the satisfaction of the minister of health, on the council of every county and county borough. Each was required to submit a scheme outlining their plans for the exercise of their new powers. Before the end of 1927 all the 147 councils had prepared schemes. In general they made provision for: (1) children under school age; (2) education and training of (a) children and (b) young persons and adults; (3) employment either in workshops or as home-workers; (4) hostels for blind workers; (5) homes; (6) unemployable blind; (7) home-teaching; (8) registration.

Under the Maternity and Child Welfare Act it is possible to have blind children between the ages of two and five who may be found to be living under unsatisfactory conditions sent to one of the special schools certified by the Board of Education.

The responsibility for the education of children between the ages of five and 16 who are too blind to be able to read ordinary school books rests on the local education authority under the supervision of the Board of Education (Education Act, 1921).

It has been found that further education beyond the school-leaving age (16 for blind children) is essential for those who are to be prepared for remunerative employment. The responsibility for the provision of this training rests on the local education authority for higher education, namely a county or county borough council. Special training courses at a number of training institutions have been recognized by the Board of Education and grants are paid to these on account of the trainees they receive.

Training is provided not only for children, but for those who have become blind in later life, provided that the authorities are satisfied that the adult is trainable and, when trained, will be a blind person within the meaning of the regulations of the Ministry of Health entitling him or her to employment under the workshops or home-workers schemes. In practice it has been proved that those who become blind after 50 can rarely be trained for remunerative employment.

When a blind person has been trained for a manual occupation and lives within reach of a workshop for the blind he will normally be employed there. Failing such a centre arrangements can be made for him to follow his trade as a home-worker.

There are 57 workshops in England and Wales in receipt of a grant from the Ministry of Health. Some are small, employing only 10 to 20 workers; the largest has one hundred and eighty employees on its books.

Men's trades are usually basket, mat and brush making, bedding, upholstery, cabinet making, cane-furniture making, chair seating and boot-repairing. Women's trades are hand and machine knitting, light baskets, bedding, chair seating, wiredrawn brush making, rug-making and, in one or two instances, hand loom-weaving.

Ministry of Health regulations provide that "the recognized standards of the trade in which the workshop employees are engaged, so far as they relate to rates of pay, bonus, hours of labour, and holidays, must be observed." But few persons handicapped by blindness can earn a living wage on a commercial basis, therefore certain schemes of augmentation of wages have been introduced.

The most recent act for the benefit of the blind was the Wireless Telegraphy (Blind Persons' Facilities) Act, 1926. This gave the privilege of a free wireless licence to blind persons within the meaning of the act. Within a year of the passage of this act (December, 1927) 10,125 free licences had been taken out.

Other privileges exclusively enjoyed by the blind include the right to keep a dog, as a guide, without a licence, and concessions under which a blind person and a sighted guide may travel on certain railways, tramways, omnibuses, etc., at half rates.

Prevention of Blindness.—The Royal Commission 1886-89 found that a high percentage of blindness was preventable and the same conclusion was reached by the departmental committee on the causes and prevention of blindness which issued its final report in 1922.

As ophthalmia neonatorum was accountable for 20-30% of children in blind schools the committee examined with special care figures supplied by the Ministry of Health from 78 county boroughs, since 1915 when ophthalmia neonatorum was made notifiable throughout England and Wales

Per 1,000 births	1915	1916	1917	1918	1920
	14.39	15.93	16.72	16.95	17.84

A final opinion as to the increase or decrease of the incidence of the disease was difficult to reach but a more thorough and extensive training of midwives in connection with this disease, and the importance of prompt diagnosis, was recommended.

Recommendations were also made as to the educational provision for children with impaired vision, and the education of medical students in ophthalmology, and in connection with the development of works and safety committees with regard to the prevention of accidents in industrial life.

Since the publication of the final report (1922) a clause in the Public Health Act of 1925 has empowered local authorities, with the consent of the minister of health, "to make such arrangements as they may think desirable for assisting in the prevention of blindness, and in particular for the treatment of persons resident in their areas suffering from disease of or injury to the eyes."

Scotland.—Following on the recommendation of the departmental committees on the welfare of the blind which reported in 1917 and recommended the establishment in the Local Government Board, London, of a special department whose function should be the general care and supervision of the blind in England and Wales, and the appointment of an advisory committee, the cabinet authorized the establishment of a special department in the Local Government Board for Scotland, and the appointment of a separate advisory committee for the northern kingdom.

Accordingly a Scottish advisory committee was appointed. This acted in close co-operation with the English advisory committee and made its first report to the president of the Scottish Board of Health for the period 1918-20. Substantial effect was given to the committee's recommendations in the Blind Persons Act of 1920.

It was advised that legislative action should be taken in regard to (1) the provision of maintenance for children below school age; (2) the provision of technical education and vocational education for adolescents and adults; (3) maintenance for the unemployable blind; (4) the provision of residential homes; (5) workshop accommodation on adequate lines; (6) provision for the regulation of collections on behalf of the blind.

The State, local authorities and voluntary agencies are now responsible for the welfare of the blind in Scotland and in the years 1919-26 the sum of £83,902 has been paid by the board to voluntary agencies.

Figures supplied by the Scottish Board of Health to 1927 give the total number of blind in Scotland as 6,939, 62.7% of whom are unemployable. Over 2,000 are in receipt of the old age pension.

Northern Ireland.—Though in Northern Ireland, as in England and Wales, the care of the blind is the concern of the councils of counties and county boroughs, under the Blind Persons Act, 1920, only the Belfast county borough has (1927) put into operation a scheme for the welfare of the blind. In other parts blind persons are dependent upon friends, the poor law or district councils or eight philanthropic institutions, of which one is a training institution and workshop, one undertakes educative work for the blind, deaf and dumb, two are homes for the blind and the remaining four are hospitals which have special departments for caring for those who are blind. In September 1927 there were 1,758 persons in Northern Ireland in receipt of pensions under the Blind Persons Act, 1920. Northern Irish ex-service men blinded in the World War are under the care of St. Dunstan's (qv).

THE BLIND OF THE BRITISH EMPIRE

Canada.—Canada has a widely scattered blind population estimated at from 5,000 to 7,000. Until the World War attracted attention to the needs of the war-blinded, little was done for civilians. Four schools had been established for juveniles and two industrial institutions which employed under 50 workers. No accurate statistical record had been attempted.

The Canadian National Institute for the Blind which, since 1916 had become a powerful organization owing to the practical interest taken in the work for the blind by several blinded Canadian soldiers on their return from a period of training at St. Dunstan's, obtained its federal charter in 1918, its object being to "ameliorate the condition of the blind, and to prevent blindness." Federal grant covers administrative expenses while contributions and provincial government grants finance the practical work which extends from sea-board to sea-board and covers Newfoundland. Home-workers are encouraged, but institute factories have been opened. Raw material is supplied at cost and goods not sold locally may be sent to the central salesroom. In the first year of operation 9,000 dollars' worth of goods were sold through the institute; by the ninth year the value had increased to \$466,000. Placement work is undertaken and an arrangement has been effected with the Workmen's Compensation boards in certain provinces by which the institute pays the premiums on blind persons placed in general industry.

Through the National Council for Child Welfare and similar agencies the National institute locates blind infants and watches over their development. Treatment at birth, to lessen the risk of ophthalmia neonatorum is compulsory in six provinces (1927). From seven to 20 years of age juveniles come under the educational authorities of Canada. Sight-saving classes for those with impaired vision have been started in several centres and some provincial governments make special grants to local schools which provide these. Technical training as well as educational instruction is provided in the Canadian schools for the blind and a few scholarships are awarded to particularly promising students.

Training in institute industries is offered to those who lose their sight between the ages of 21 and 50.

Two out of the nine provinces have adopted a pensions scheme somewhat similar to that in force in England, under which the blind benefit as others, receiving the pension at 70. The National Institute provides relief in necessitous cases below this age.

Australia.—The Commonwealth made special provision for the permanently blind under the Old Age and Invalid Pensions Act 1920, by which a pension not exceeding £39 per annum may be paid to a blind applicant, provided that his income, together with the pension, does not exceed £221 per annum "or such other amount as is declared a basic wage." Each individual State provides for the education and welfare of the blind on institutional lines. The Victorian and New South Wales schools and institutes for the blind offer particular opportunities for gifted pupils to pass on to the University Conservatorium of Music, while industrial departments provide employment for blind workers in such activities as broom- and mat-making. In several of the States, as also Tasmania, Braille writers' associations have been organized for the transcription of books as an adjunct to libraries. In Hobart an active Blind Mutual Progress Society is in being.

South Africa.—There is no relief granted by the Government of the Union of South Africa to persons afflicted with blindness except ex-service men who lost their sight as the result of war service.

There is an institution at Worcester, Cape Province, founded by a blind man, which conducts excellent work in the education of the blind. This institution receives liberal grants from the local education authority. A South African library for the blind was established in 1920 at Grahamstown, and is gradually extending its work of supplying both English and Afrikaans Braille books to blind people in the Union, while recently (1927) the Athlone blind school has been opened for non-European blind children in Capetown, and there are several other small organizations carrying out social work for the blind in various centres.

New Zealand.—In New Zealand institutes for the blind are financed by the government and through voluntary sources. They educate, train and employ blind persons. As a result of a considerable fund collected in 1922 in memory of Sir Arthur Pearson, the Jubilee Institute for the Blind, Auckland, which was founded in 1890, was enabled greatly to extend its work and make provision for the training and welfare of the blind of all ages and both sexes, throughout the dominion. Here, as in Canada, the return of blinded ex-soldiers after the World War caused a great revival of interest in the blind.

In 1924 a Blind Pensions Act came into operation which entitles those born blind, or who have become blind whilst permanently resident in New Zealand, whose relatives are unable to provide maintenance, to a pension payable at the rate of £45 10s. per annum, provided the applicant be "of good character." The pension is not payable to inmates of institutions, nor to those absent from the country. A notable feature of the act is that a blind person who is employed in any occupation may draw an additional weekly allowance equal to 25% of his total receipts, provided that these do not exceed £3 12s 6d per week.

India.—The total number of blind persons in India (census 1921) is 479,637 (including the Indian States). In British India alone there are 73,000 blind and deaf mute children between the ages of five and 15. Thirteen schools for the blind have been established at which the registered attendance is 1,183. These teach basket-making, mat-weaving and music. At the most advanced schools Braille is taught.

The number of blind who earn a livelihood in India is small. One of the most lucrative professions is that of Koran instructor in mosques.

The greater part of the work for the blind is carried on through missionary societies, but the Ministry of Development and district boards make grants to certain schools where an industrial as well as elementary education is in operation, and offer opportunities to those who train as teachers.

A company of blind Boy Scouts was formed in India in 1923, and an establishment of Girl Guides is in contemplation. The Bombay Blind Relief Association is taking preventative and remedial measures through field-workers in the villages.

Burma.—Out of a population of 13,000,000, about 25,000 are blind. Until the Mission to the Blind of Burma was formed no attempt was made to train these people. The mission gives educational and technical instruction to boys and girls, fitting them for

industrial life, and selects the more intelligent to be trained as teachers or for the professions. All pupils are taught to read and write in Braille.

THE BLIND OF NATIONS GREAT AND SMALL

The first effort towards organized help for the blind in Europe was made by Christians. St. Basil opened a hospice for the blind in Cappadocia during the 4th century; a Syrian hermit Lymnaeus followed his example in the 5th. Two hundred years later a retreat was established in Jerusalem for those without sight and not long afterwards the movement struck roots in France, originated by St. Bertrand, Bishop of Le Mans.

In the 11th century William the Conqueror founded several hospices in Normandy. The 12th century saw the beginning made in Bavaria and in 1260 an asylum was founded in Paris by Louis IX. (St. Louis), known as the Hotel des Quinze-Vingts, which has endured to this day. It was not until the close of the 18th century that any real attempt was made to educate or train those without sight.

Valentin Haüy, the man to whom the title "Father and Apostle of the Blind" was afterwards given, had his attention attracted to the problem by the contrast afforded by the public performance of Theresa von Paradis and the spectacle presented by some untrained and illiterate blind persons who, tricked out in fantastic attire, were trying to attract custom by making mock music. Shortly afterwards he came across François Lesueur, a blind boy, begging in the streets, and resolved to make a practical beginning. Compensating the child for his lost earnings, Haüy began to train him, and almost by accident discovered a method of embossing letters that François could decipher. With fine courage Haüy opened the Institution National des Jeunes Aveugles, and a philanthropic society sent him 12 blind children as his first pupils. News of Haüy's success in teaching these children to read spread. The Academy of Science examined and approved his raised print, and he was received by the king. When the revolution broke out Haüy's school was taken over by the State and later incorporated with the Quinze-Vingts. In 1806 the emperor Paul of Russia invited Valentin Haüy to Russia there to establish a school on similar lines, which he did so successfully that others were opened in Finland and Poland. Sweden was quick to follow suit. Great Britain had opened her Liverpool school in 1791, and Vienna an establishment in 1804. Haüy also established a school in Berlin (1806) and within a short time institutions were opened in almost every German principality and throughout the Continent.

In the early years of the 19th century America began to move, and the New England Blind Asylum, later to be known as the Perkins Institution and Massachusetts School for the Blind, was founded as the direct outcome of a visit paid by an American doctor to the school founded by Valentin Haüy in Paris. The blind historian, William H. Prescott, was one of the organizers. A doctor, Samuel Howe, was sent abroad to study methods and returned bringing with him two blind teachers, one from France, and one from England.

Austria.—There were 5,359 blind people in Austria in 1924 and a number of schools have been opened for children without sight. There is no law making attendance at these compulsory, they are residential and accept pupils from eight to 18 years of age. Austria has established nine training institutions, one of which is financed by the State. There are also ten homes for the blind where the residents help to pay the cost of maintenance by working at trades, usually piano-tuning, chair-caning and brush-making. Additional funds are provided by voluntary contributions and grants from societies and municipalities. Workshops have been opened where employers are put on piece work and receive a small government subsidy. Five societies have federated and now have a central warehouse and purchasing system. A Health Insurance Act is in force under which come the blind, together with other workers. Insured persons are entitled to free medical and hospital service. Dismissal while certified as unfit is not permitted.

The 400 war-blinded come in a separate category and are dealt with by the societies organized for the benefit of disabled ex-service men. They have a preference on the application lists for work in tobacco shops, which are a state monopoly.

Belgium.—There are eight schools for the blind in Belgium, three for boys, two for girls, and three mixed. These are maintained by private enterprise and are not State-managed, though two are largely maintained by the Governments of the provinces in which they are situated. In the case of five of these schools they are managed and staffed by religious bodies. In 1927 the number of blind children at these schools was 403, various preventive measures by way of the education of the public and regulations in regard to conditions of child-birth, having in recent years greatly reduced the rate of infant blindness. The majority of blind people are trained as musicians or in occupations connected with this profession.

Owing to the country being over-run by the armies of the Central Powers during the greater part of the war Belgium was unable to make adequate arrangements for the care of her blinded soldiers until after 1918. A small, though noteworthy part of British effort to help Belgium in her difficulties, was the training and care of a number of Belgian blinded soldiers at St. Dunstan's, London (q.v.), during 1915-18.

After the Armistice, Belgian blinded soldiers were trained and re-educated at an institute at Boitsfort, Brussels, but upon the completion of the training problem this was closed, and the Queen's fund for blinded soldiers founded, to assist former inmates of the Boitsfort institute with monetary grants, help in kind, advice, etc.

China.—Blindness is very prevalent in China owing to neglect in infancy, disease and cholera, but no Government statistics are available. There are over 20 centres for educating the blind, and these are supported by missionary societies or interested foreigners. At these the inmates are trained in basket-making, netting, etc. The Hill Murray school for boys, Peking, was the first to be established in 1874, followed by the David Hill school for boys, Hankow, in 1888, and a school for girls in Canton in 1891.

As blind people in China have established a reputation for the possession of occult powers many of the untrained gain a livelihood by exercising these, fortune-telling and begging. Small printing presses have been set up at Peking and Shanghai which issue books and a magazine. What is known as the "union system" of Braille is used, worked on a phonetic basis. The difficulty of producing Braille books in China is obvious since there are over 10,000 characters in the Chinese language.

Czechoslovakia.—The care of the blind in Czechoslovakia is in the hands of the State (as regards the provinces of Slovakia and Ruthenia), of the provincial authorities (in the provinces of Bohemia and Moravia), and of charitable institutions which are subsidized partly by the State and partly by the four individual provinces into which the country is divided for matters of administration. In Bohemia there are three institutions for children, and three for adults; in Moravia one provincial institute for the education of the blind at Brno, and three institutions for adults maintained by societies. In Slovakia one State institution for blind children, and an establishment for the congenital blind from the ages of 15 and 20 attached to the Red Cross. In Carpathian Ruthenia there is an establishment for blind children. There are a number of societies for the benefit of the adult blind, the most important being in Prague, where there are workshops and sale-rooms for the goods made, and hostels for the blind workers. There are no pensions for the aged civilian blind.

The Ministry of Social Welfare is responsible for activities for the blind. It arranges for education from the age of seven to 14 or 16, then drafts the pupils to industrial schools for training, after which the Ministry makes an endeavour to find employment for them.

The war blinded are, as in Germany, given preferential consideration in regard to employment in State-owned tobacco shops, are granted loans and provided with dog guides. The totally blind receive a State pension of 5,000 pangoes (equivalent to £30) per annum. Of the total estimated number of blind people in Czechoslovakia (about 5,000) 600 are blinded ex-service men.

France.—France has a blind population of approximately 29,000, including the war-blinded (3,000 in 1918) and to assist these she has 35 schools, 23 workshops and 19 homes.

The oldest society in France for the benefit of the blind is the *Quinze-Vingts* founded 600 years ago by "St. Louis" after his return from the Crusades. There is always a long waiting list of those hoping for admission. The fortunate ones are provided with rooms for themselves and families and a small pension; complete independence is maintained. Those on the original foundation used to earn money by offering up prayers. Annexed to the *Quinze-Vingts* is *La Société d'Assistance aux Aveugles reconnue d'utilité Publique*, which gives financial aid and finds employment.

The *Valentin Haüy* association stands high among the societies which give fine service to the blind. It has 15,000 names upon its register, undertakes the care of children, provides vocational re-education, supplies tools and raw materials, sells goods made by the blind, runs workshops, visits the sick and aged and offers help in lesser ways. Its branch, the *Centre d'Approvisionnement Intellectuel* is very active. The *Bibliothèque Braille* has 2,500 readers on its lists, to whom 56,000 volumes have been circulated.

The French Government supports one school for the blind, the famous *Institution National des Jeunes Aveugles*, which was founded by *Valentin Haüy* in 1784. It accommodates both boys and girls and is under the control of the *Ministère du Travail et de l'Hygiène*. The institute provides a general education with musical training for those qualified to receive it, places its pupils and undertakes after-care work. A Braille printing establishment publishes both French and foreign literature.

Outside this official organization there are many private organizations to which some funds are allotted by the departments and municipalities. Among the smaller establishments doing interesting work is that of the *Blind Sisters of St. Paul* (*Les Soeurs Aveugles de St. Paul*), which was founded in 1850 by *Mère Berunion*. The community originally numbered 13 nuns of whom seven were blind.

A French blinded soldier draws 6,300 francs per annum in pension, which in special cases may be augmented to 10,000. There is a 10% increase for additional disability. The Government makes a children's allowance of 830 francs per annum. In 1924 France passed a compulsory Employment Act for the benefit of her handicapped citizens, but only those blind who lost their sight in the World War can claim the benefit of the act, and employers were given two years in which to make any necessary changes in their staffs. The number of places to be reserved in each particular industry is settled by the Ministry of Labour in consultation with the provincial authority for the war-disabled. Those reduced 80% in capacity (this includes the blind) are counted double in respect of the obligation of employment. The wage-rate is fixed by a State commission. Notice of discharge must not be less than two weeks for a workman and two months for a clerk. There are a number of voluntary institutions in France formed primarily for the benefit of the war-blinded. Among these should be mentioned the *Union des Aveugles de Guerre* which has raised a subscription emergency fund and runs a seaside home for the benefit of those needing rest. The *Phare de France* runs a guest house accommodating 50 men at a low rate, and *Les Amis des Soldats Aveugles* distributes gifts and funds. Through the French Red Cross the American Braille press distributes Braille papers to war-blinded men throughout France.

Germany.—The latest statistics from Germany are those of 1924, which give a total of 35,624 blind persons, of whom 2,724 are war-blinded. The first training establishments were organized by Dr. Zeune for the benefit of the 500 soldiers who were blinded in the Napoleonic wars. Almost all Germany's institutions are state-aided, and after-care work was begun in 1843. There is a separate employment exchange for the handicapped, which includes the blind. Registration of affected businesses at the employment bureau of the official general after-care department and the education of blind children are compulsory. A commission of State, the Ministry of Labour, Education and Welfare, is responsible for the well-being of the blind, and this official body works in conjunction with a voluntary society known as the *Blind Relief Chamber*. By decree of the Prussian Ministry of War, elementary re-education of blinded soldiers was undertaken by the hospitals, after which each patient had the opportunity of undergoing tech-

nical training offered by the State, the municipality or a voluntary body.

The most important move in connection with the blind in Germany was the passage of the Employment of the Handicapped Act enacted in 1919, amended in 1923. This makes compulsory the engagement of one disabled man if 20 normal workers are employed, with one additional for every further unit of 50. Disabled under the act means those 50% handicapped through the war or accident, and consequently pensioned. Employers are obliged to permit their businesses to be inspected in order that work may be found for disabled men and those who do not engage the requisite number are required to pay a redemption tax of six marks for every working day for every war-disabled man not so employed. A disabled man can be dismissed only after a month's notice and with the consent of the general after-care department, and the dismissed employee has the right of appeal to the commission of war-disabled which is formed at every general after-care department. A recalcitrant employer may be fined anything from one to 1,000 marks, while the privilege of the Handicapped Act may be temporarily withdrawn from a difficult employee. In all cases the war-blinded are given preference.

A committee for examination and adaptation of new professions and working possibilities for the blind, has been formed by blind experts and representatives of trade and industry, which has resulted in the discovery of 200 fresh avenues of employment. The possibility of factory work as a means of livelihood for those so handicapped came about by chance. A blinded soldier who had been a blacksmith vowed that he could never be happy at any work which did not enable him to touch iron. The founder of the Silex school for the blind obtained permission to search for possible work for this man in a munition factory, and succeeded so well that five began work there a few days later. At Siemens Town, near Berlin, 98 blind men have found employment. The earnings of a blind man average 70% that of a sighted person.

As a result of the united efforts of the Association of War Blinded Soldiers and the German Sheep Dog Society, a school for the training of dog-guides was opened soon after the war. These have proved successful in many cases and the German Government gives a small subsidy to every blind man provided with a dog to meet cost of upkeep. Applicants for dogs attend at the training school and dog and man complete the course together.

The German State pays an annual sum of approximately 22,671,000 marks for the support of her blinded soldiers.

The Leipzig library is the largest centre for the distribution of literature in Germany. It contains 26,000 books.

Italy.—In 1923 a decree making the education of the blind compulsory was approved by the council of ministers, acting on the advice of a commission. Those institutions whose activities are mainly educational have been transferred to the supervision of the Ministry of Public Instruction, and receive financial grants from the Government. A commission has been appointed to supervise the national Braille printing house. The first book calling attention to the blind was published in 1846. There are important institutions for the blind in Florence, Naples, Rome and Milan. At the last mentioned blind children are given free board and lodging and are trained in the Montessori system, being passed on to other institutions as they grow older, until a wage-earning capacity is attained.

Work for Italian war-blinded has been undertaken in various centres, including Milan, and in 1927 a workshop for the war-blinded was opened in Rome, and a home to house the workers who remain there is nearing completion.

Japan.—Interest in the blind was first aroused in Japan in the 9th century when Prince Hitoyasu, a son of the 54th emperor, went blind and became a priest. He developed a personal interest in those without sight and distributed his income among them. After his death successive rulers continued the prince's benefactions. And, in memory of Hitoyasu, his blind attendants were appointed to look after the welfare of the blind throughout Japan; these, showing capacity, brought about the appointment of other blind men to Government service. A number were appointed to memorize the history of the empire through remote ages, in chron-

ological order, and transmit it from generation to generation, so forming a living library.

At this period there were two distinct classes of blind people in Japan, monks and laymen. The most famous of the former belonged to a Buddhist sect, and travelled the country playing musical instruments and offering up prayers. Of the laymen a few adopted literature, while the lesser educated practised acupuncture, massaging and shampooing; professions which were reserved to them to a great degree, the guilds to which they belonged being powerful.

In 1870 many of the privileges of the blind, the Government posts, the levy and right of monopolization of certain professions, were swept away, those with sight being permitted to enter into competition with them. A few years later (1878) the first private school for the blind and dumb was opened by private enterprise. There are now 82 in all, one government, 28 public and 53 private schools in existence; two thirds of these are very small. The system is free, co-educational, vocational and residential. Voluntary contributions and Government grants defray expenses. There is no compulsory education for blind children, as the accommodation is inadequate. The Government subsidizes every student training as a teacher. So far no social work or after-care work has been organized for the blind in Japan. Both a daily and a weekly newspaper are published in Braille, each having a circulation of about 1,000. The number of blind in Japan is about 100,000.

Poland.—According to the census of 1921 the number of blind persons in Poland was 16,144, or 6.4 per 10,000 inhabitants. Laws passed by the republic in 1921 and 1923 lay down regulations for the care of the blind, particularly the war blinded, who are rendered financial and medical assistance, artificial eyes, the capitalization of rents, help in obtaining work, provision of tools, dog guides, etc. The Law of Social Welfare (1923) makes regulations for the care of blind civilians, the financial burden of which falls mainly upon communal unions, the State bearing expenditure where voluntary funds prove inadequate for maintenance, housing, clothing, training in handicrafts. There are five educational establishments for the blind in Poland and four workshops, maintained by voluntary contributions and subsidized by the State. Blind persons who are unemployable and without relatives are maintained in homes organized by municipalities and social societies. The education and instruction of blind children is under the care of the minister of religion and public instruction, the expenditure in connection with poor children being borne by the State Treasury. In 1926 there were four institutions, residential, accommodating 250 blind children. Special training facilities for the teachers of the blind are provided at the State Institute of Pedagogy for Special Schools, Warsaw, founded 1921. The first institution for the blind in Poland was established in 1817; since the establishment of the independent republic of Poland in 1918 the State has undertaken much responsibility for the blind and has fostered home industries, desiring that the blind should work at home or amongst normal workmen rather than be segregated in workshops devoted entirely to the blind. One of the workshops for the war-blinded—the Society for the Protection of the Blind, Warsaw—was founded by a young nun who had been blinded by accident a few years before the World War, and who had obtained special trained help from Paris for the re-education of herself and some other blind girls, with whom she subsequently founded a new order among which one-third of the sisters are blind.

Russia.—The original movement towards bettering the position of the Russian blind began in 1806, but the Revolution after the World War swept existing institutions into the melting pot. To-day no statistics are available.

There are schools for the blind in the principal cities; that in Moscow accommodated 180 pupils and a hostel or almshouse for women with 200 inmates. Leningrad (St Petersburg) and Moscow have established labour homes or colonies, where the inhabitants work at basket and brush making and the pasting of paper bags. They are given free quarters and small wages. The whole control is in the hands of a committee of the blind. A college of music is in existence where blind soldiers are trained as cinema and concert performers, where they are paid at "standard rates."

The largest library in Russia contains about 3,000 volumes. The only press for Braille books is in Moscow where work is done on three small hand presses of a primitive kind. Braille typewriters have not been introduced, and there is a scarcity of handframes. A Pan-Russian union of the blind has been established to work in co-operation with the Government for the betterment of conditions.

Spain.—The most efficient of the organizations for the benefit of the blind in Spain is the Centro Instrutivo y Protector de Ciegos, a private institution founded in Madrid in 1894. The directors are blind; general care is taken of the 1,000 blind persons in Madrid; elementary education and instruction in music are given to about 350 boys and girls; a circulating library of embossed books was started in 1907; a small workshop for men and women engaged in brush and broom making and saddlery is maintained.

Although more than 200 institutions claim to care for the blind in Spain the majority are general homes and hospitals who make some small special provision for those blind people who happen to enter them.

Officially the care of the blind is the province of the Ministry of Public Instruction, which has established several institutions, the principal being the national college for the deaf and dumb and blind in Madrid founded in 1805, subsidized by the Government, which provides education for over 100 blind pupils from five to 20 years of age. The Ministry of the Interior (Official Charities section) also undertakes the supervision of private institutions for the blind, notably a college for the blind of Santa Catalina de los Donados in Madrid, which dates from the 15th century and provides a general education for a small number of pupils between eight and 14 years of age.

The very few soldiers blinded in the Moroccan wars are re-educated with other disabled soldiers, and no special provision is made for them.

It is interesting to note that official recognition of the necessity for educating the blind in Spain was not obtained until the latter end of the 19th century when the presentation to the queen of an intelligent and well educated blind girl aroused interest in the possible attainments of the blind. Before that date it had been regarded as an unnecessary luxury to train blind people to read.

Switzerland.—Switzerland has a blind population of 2,260 (census 1920) and the first society to concern itself with the welfare of this section of the population came into existence in 1802. A hundred and one years later (1903) a central organization was formed to co-ordinate the many societies then in being. One institution for the benefit of children under school age has been opened, and a kindergarten to which these children may pass is to be opened shortly. Practically all other bodies are voluntary and local, and any additional help that may be offered by the central association at St. Gall, is given through these.

United States.—The census of 1920 estimates the blind population of the United States at 75,000, approximately 50% being over 50 years of age. There is no Federal Pension law, but a few States give pensions and where these are in force the percentage of blind in receipt thereof is as high as 78%.

The Perkins Institute, originally the New England Asylum for the Blind, was established in 1830 and Laura Bridgman was among the first pupils. The printing of embossed books was begun and in 1879 Congress granted an annual subsidy of \$10,000 (increased to \$50,000 in 1919) to the American Printing House for the Blind in Kentucky. The American Braille press is a war-development. Its publications are in several languages and it prints music as well as literature. Through its branch in Paris the press serves European war-blinded with free publications. It has readers in every civilized country in the world.

Every blind American child depends on the State for its education, but each individual State has made different arrangements both official and voluntary. America spends \$2,740,000 annually in educating her blind. (See BLIND, TRAINING AND WELFARE OF THE, U.S. Section.)

Of the 24,000,000 children of school age 25% have some defect of vision. An Eyesight Conservation council has been formed to arouse public interest in eye-hygiene. This body has discovered

that there are 200,000 eye accidents a year in American industry, and that in a single State a million dollars has been paid for damaged eyes in one year. A movement for special classes for the semi-sighted was organized on the British model, and the first class was opened in Boston in 1913; many States have followed the lead given. In some States the Board of Education carries through home teaching, the marketing of goods and distribution of books.

Factories absorb a large percentage of American blind; others engage in professional work, salesmanship, piano-tuning, caning, basket work, etc. The making of dolls' wigs is offering satisfactory employment to blind girls in one district. Men engaged in weaving are earning equal wages to those with sight. A correspondence school for blind students in one State has enrolled 1,500 students; the most popular course is life insurance.

The American Foundation for the Blind (publishes the *Outlook*, the chief journal) was established in 1921; it is national in scope, co-operates with the National Committee for the Prevention of Blindness and the Boards of Health and Education. The American Association of Workers for the Blind holds biennial conventions and contemplates international gatherings held in Europe.

Responsibility for the care and preliminary training of the four to five hundred Americans who lost sight while in military service, rested in the first place on the Surgeon-General of the U.S. Army, and then on the Federal Board for Vocational Training.

The Red Cross (the organization of which was made possible by a grant from the Permanent Blind Relief Fund collected for the benefit of Allied soldiers and sailors) took up work for these men on their final discharge. The Federal Government made provision for the war-blinded through insurance, private company rates being prohibitive. Insurance was made compulsory, also for seamen in private employment entering the war zone, and the Treasury, through the Bureau of War Risk Insurance, took out policies for these on reasonable terms. Owners of American vessels were compelled to insure their crews.

MEN BLINDED IN THE WORLD WAR

Many thousands of young men were blinded in the World War. High explosive shells and hand grenades caused by far the largest number of casualties, but a few were the result of rifle and machine-gun bullets, explosions, etc. Various forms of chemical warfare caused tens of thousands of cases of temporary blindness, but extremely few were permanently disabled even in a small measure by this weapon. There were in addition a considerable number of men who became blind through hardship, exposure or disease contracted on service. In most of these cases the British Government recognized that their condition was aggravated by service and granted pensions.

The blinded soldiers, sailors and airmen of the British Imperial forces numbered in 1928 2,131. They receive pensions from the United Kingdom or Dominion Governments varying from £2 per week for a private in the United Kingdom army, with an addition of 10s. a week for his wife and 10s. a week attendant allowance, and allowances for children born before disablement, to the maximum of £5 under the alternative pension scheme (based on pre-war earnings of the individual) for a private soldier, with appropriate increases according to rank. Over 95% of these officers and men were trained at and receive the life-long care of St. Dunstan's Organization for Blinded Soldiers, Sailors and Airmen, London (q.v.).

It is of interest to add that at the eleventh session (1927) of the League of Nations' health committee, at the instance of the British member, it was decided to utilize the machinery of the League for a general enquiry into the welfare of the blind.

FAMOUS BLIND PEOPLE

It may be interesting, in conclusion, to mention here some prominent blind people; biographies of others, such as Milton or Fielding, will be found under their names.

John Stanley (1713-1786), Mus.Bac.Oxon., was born in London in 1713. At seven he began to study music, and made such rapid progress that he was appointed organist of All-Hallows, Bread Street, at the age of eleven. He graduated as Mus.Bac. at Oxford when sixteen, and was organist of the Temple church at the age

of twenty-one. He composed a number of cantatas, and after the death of Handel he superintended the performance of Handel's oratorios at Covent Garden. He received the degree of doctor of music, and was master of the king's band.

Marie Thérèse von Paradis (b. 1759), the daughter of an imperial councillor in Vienna. She was a godchild of the empress Marie Thérèse, and as her parents possessed rank and wealth, no expense was spared in her education. Weissembourg, a blind man, was her tutor, and she learned to spell with letters cut out of pasteboard, and read words pricked upon cards with pins. She studied the piano with Richter (of Holland) and Kozeluch. She was a highly esteemed pianist, and Mozart wrote a concerto for her; she also attained considerable skill on the organ, in singing and in composition. She made a concert tour of Europe, visiting the principal courts and everywhere achieving great success.

Louis Braille (1809-1852). In 1819 he went to the school for the blind in Paris. He became proficient on the organ, and held a post in one of the Paris churches. While a professor at the Institution Nationale des Jeunes Aveugles, he perfected his system of point writing.

Dr. T. R. Armitage (b. 1824). After spending his youth on the Continent, he became a medical student, first at King's college, and afterwards at Paris and Vienna. His career promised to be a brilliant one, but at the age of 36 failing sight caused him to abandon his profession. For the rest of his life he devoted his time and fortune to the interests of the blind.

Elizabeth Gilbert (b. 1826), daughter of the bishop of Chichester. She lost her sight at the age of three. She was educated at home, and took her full share of household duties and cares and pleasures. When she was 27, she began to consider the condition of the poor blind of London. She saw someone must befriended those who had been taught trades, someone who could supply material, give employment or dispose of the articles manufactured. In 1854 her scheme was started, and work was given to six men in their own homes, but the number soon increased. In 1856 a committee was formed, a house converted into a factory, and the Association for Promoting the General Welfare of the Blind was founded.

Sir Francis Joseph Campbell (1832-1914) was born in Tennessee, U.S.A. An acacia thorn pierced his eye-ball during a childish game when he was about three years of age. Shortly afterwards the family fortunes suffered a reverse, and the household was removed to a mountain farm, on which all the children worked except the blind boy. He was urgent that a task should be given to him, but it was refused and it was only when he had proved his capability by chopping up a stack of firewood that his father was convinced that a niche could be found in the world for one without sight. He was sent to a school for the blind and took full advantage of his opportunities. Later, when a school was established in his native State, the duty of finding scholars was deputed to young Campbell, who with sighted friends, rode from border to border, climbing mountains, swimming rivers and bringing blind children in, sometimes strapped to his waist and riding pillion behind him. At 22 he was musical director in an educational establishment, but his abolitionist tendencies ruined him and he was forced to leave the town and start again. In 1861 he spent a year in Germany, and started homeward determined to found a conservatorium of music for the blind. At Liverpool he met Dr. Armitage. The foundation of the Royal Normal College was the result of the association of these two men and the generosity of the duke of Westminster and the general public. He wrote an article on blindness in the 11th ed. of the *Encyclopædia Britannica*.

Henry Fawcett was accidentally blinded when in his 25th year by stray shot from his father's gun. Courageous and ambitious, his first words were, "This shall make no difference." Fawcett returned to Cambridge and a year or so later became professor of political economy. He was elected member of parliament for Brighton and subsequently for Hackney. In 1880, he became postmaster-general. So little was it realized that a blind man could be a normal human being that the committee of the Reform Club hesitated to accept Fawcett as a member until persuaded by an

eloquent speech from Thackeray, who asserted that Fawcett would soon make all forget his blindness. In later life, Germany and France, as well as England and Scotland, did him honour. Fawcett's monument in Westminster abbey was raised by public subscription. (See also FAWCETT, HENRY.)

Dr William Moon (1818-1894) lost his sight in early manhood when preparing to enter the ministry, and henceforward devoted himself to missionary work among the blind. Having studied the various systems of embossed writing he evolved a simpler method to be known as the Moon type, by which the blind of all ages might learn to read, but the system though readable was not writeable. Backed financially by Sir Charles Lowther, also blind, and by grants from other sources, Dr Moon was able to lay the foundations of a great work. The Moon Society came into being in 1847 and over half a million volumes and pamphlets and 170,000 book plates have been produced. The Moon Society is now under the control of the National Institute for the Blind.

Sir (Cyril) Arthur Pearson, Bt, G.B.E. (1866-1921). Becoming blind between 1910 and 1913 after a life of unusual activity in the foundation and conduct of newspapers and periodicals, Arthur Pearson inspired a renaissance in the blind world. He established the National Institute for the Blind (1913-14) as at present constituted, and St. Dunstan's (qv) (1915). His personality and knowledge of affairs and publicity were a new factor in the blind world. The influence of his work at St. Dunstan's, through the blinded soldiers, spread throughout the empire and to many foreign countries where a new spirit invigorated existing work for the blind and new activities were started. He was the outstanding figure in the whole blind world in his own time, and was consulted by British and foreign governments in regard to blind problems.

Henry Martyn Taylor, F.R.S. (1842-1927), became blind about 1894, and was elected to the Royal Society 1898. He developed the Braille alphabet and devised amplifications which rendered possible the reproduction of mathematical formulæ, figures and diagrams. He personally transcribed into Braille text-books on geometry, algebra, conic sections, trigonometry, astronomy, geology, the foundations of mathematics, metaphysics, physiology, sound, music, mechanics, etc. He was instrumental in the establishment of the Embossed Scientific Books Fund which has been accepted as a trust, administered by the Royal Society. At the time of his death Taylor was senior on the roll of Fellows of Trinity College, Cambridge. He was the author of many valuable treatises and wrote the *Encyclopædia Britannica* article on Newton.

(I FR.)

Blind Musicians.—The number of blind musicians who have attained excellence and in some cases distinction in their art has been remarkable. The two greatest of all, Bach and Handel, are, it is true, hardly typical instances, since each of these masters lost his sight only at the end of his career. Both continued to compose notwithstanding, Handel continuing also to perform in public. Another notable case of the same period was that of Fray Pablo de Nasarre, the blind organist of Saragossa (1683-1724). More modern instances have been those of Alfred Hollins (b. 1865) and William Wolstenholme (b. 1865), distinguished English organists, who have been blind from birth.

BLINDNESS, CAUSES OF. The most reliable statistics which we possess deal with blindness in the first quarter of life. Here we find congenital anomalies causing 25% of blindness. These are unpreventable until the eugenic millennium is reached, but to an extent, useful vision may be obtained and preserved.

Ophthalmia neonatorum (gonorrheal ophthalmia of the newborn) causes approximately another 25%. This disease is almost entirely preventable in modern practice. The disease is curable without damage in almost every instance provided the baby is treated early enough. Blindness due to this is decreasing.

Syphilis, mostly congenital, probably causes 10% of blindness, mostly through interstitial keratitis and uveitis. It is entirely preventable; it is possible by modern treatment to reduce materially the amount of blindness caused.

Atrophy of the optic nerve, not over 5%, is largely, though not entirely, unpreventable. Myopia in its "pernicious" form, 3% of blindness, is controllable if taken early. Phlyctenular keratitis, 2%, largely dependent on tuberculosis and poor hygiene, is preventable and remediable.

To injuries may be ascribed from 5% to 8%. In a considerable group of diseases of the eye, cornea, uveal tract, retina and optic nerve leading to blindness, the cause factor is doubtful.

It will be seen that in this early age group a very large proportion of blindness is preventable. In later years of life, statistics of blindness are, in the main, very unreliable, and only facts will be given which seem reasonably certain.

Injuries, especially in men, cause 7% to 10% of blindness, largely preventable through protective devices. In connection with this group, sympathetic disease as a cause of blindness was almost negligible in the World War. If the war blind in Germany, France and England are counted among the injuries, at least 5% must be added.

Syphilis (acquired), largely through disease of the uveal coat and optic nerve, is responsible for 10% to 15% of blindness, which is largely preventable and remediable if treated early.

Myopia, the cause of blindness in 14%, is controllable if taken in childhood. Glaucoma is of slight importance in infancy, youth, and up to middle age, but after the age of 45 becomes the most important cause of blindness, amounting to from 25% to 35% in the latter half of life. The acute congestive type is amenable to operation in the early stages and thus remediable. The simple, non-congestive type and secondary glaucoma, if taken early, are remediable to a considerable degree. Untreated, glaucoma always leads to blindness.

Atrophy of the optic nerve, a common cause of blindness, is estimated as high as 18%. It is frequently due to syphilis and in that case preventable. Also preventable and remediable to a certain extent is blindness due to accessible tumors, etc.

Diseases of the uveal tract (iritis, cyclitis, choroiditis) are responsible for a considerable group of the blind. In part, these are caused by syphilis, tuberculosis, focal infections in various parts of the body, general disease, and unknown causes, and they are to a certain extent remediable. General systemic conditions, such as nephritis, diabetes and arterio-sclerosis may cause blindness in their terminal stages.

Trachoma probably causes 50% of blindness in certain parts of China; in Missouri, U.S.A., the figure is 25%. Generally it is an unimportant cause and the results are preventable. Smallpox is said to cause 20% of blindness in Mexico. (G. S. DE.)

BLIND POOL, in the United States an arrangement by which several individuals, firms or corporations entrust their interests or their funds to the direction and management of one person, who is authorized to carry out a secret deal without instructions or interference from the others. Often the pool agreement provides that the members are not entitled even to any information from the manager until the expiration of the agreed upon period. Blind pools are usually organized for speculative purposes and the main advantages claimed for them are absolute secrecy and the efficiency with which the manager can operate because of his freedom from control of any kind. (See POOLS.)

BLIND SPOT, the place of entry of the optic nerve into the retina, an area insensitive to light with a diameter in man of about

one-twelfth of an inch, lying about 15° from the middle of the yellow spot on the nasal side. In binocular vision the spot is not noticed, because the part of the visual field covered by the blind spot of one eye is covered by a sensitive area in the other. In monocular vision objects which fall entirely within its area are not seen.

BLINDWORM, the name applied in Great Britain to the legless lizard *Angius fragilis* (see SLOW WORM) and in America to several allied species, of which the best known is the glass-snake (*Ophiosaurus ventralis*), which ranges from Illinois to Florida and Mexico. All possess the power of breaking off the tail if seized thereby, and are perfectly harmless. The term is also applied to small tropical and subtropical burrowing snakes of the family Typhlopidae, numerous species of which inhabit America; and to the Coecilia, which are Amphibia (q.v.).

BLINK MICROSCOPE, an auxiliary astronomical instrument. Two photographic plates of the same star-field taken at different epochs are placed in the machine and viewed one with one eye and the other with the other eye, and adjusted as in a stereoscope so that a single visual impression is given. An arrangement is provided by which the plates are alternately in rapid succession hidden from sight. Attention is at once called to any star image which has changed in the interval between the two epochs by the corresponding flicker. In this way variable stars and stars with large proper motion are detected.

Proper motions can also be detected without the flicker arrangement, since the displacement of the star-image gives a stereoscopic effect, the star appearing to stand out in relief in front of or behind the plane of the other stars. When used in this manner the instrument is called a stereocomparator.

BLISS, CORNELIUS NEWTON (1833-1911), American merchant and politician, was born at Fall River (Massachusetts), on Jan. 26, 1833. He was educated in his native city and in New Orleans, where he early entered his stepfather's counting-house. Returning to Massachusetts in 1849, he became a clerk, and subsequently a junior partner, in a prominent Boston commercial house. Later he removed to New York city to establish a branch of the firm. In 1881 he organized and became president of Bliss, Fabyan & Company, one of the largest wholesale dry-goods houses in the U.S.A. A consistent advocate of the protective tariff, he was one of the organizers, and for many years president, of the American Protective Tariff League. In politics an active Republican, he was chairman of the Republican State committee in 1887 and 1888, and contributed much to the success of the Harrison ticket in New York in the latter year. He was treasurer of the Republican national committee from 1892 to 1904, and was secretary of the interior in President McKinley's cabinet from 1897 to 1909. His lack of sympathy with Theodore Roosevelt's growing influence caused him to retire from politics; and he died in New York on Oct. 9, 1911.

BLISS, TASKER HOWARD (1853-), American soldier, was born at Lewisburg, Pa., on Dec. 31, 1853. He graduated at West Point military academy in 1875, and from 1885 to 1888 was professor of military science at the Naval War college. In 1897 he went to Madrid and was military attaché at the American legation. He served through the Porto Rican campaign during the Spanish-American War and from 1898 to 1902 was in charge of Cuban customs and collector for the port of Havana. In 1903 he became commandant of the Army War college. From 1903 to 1905 he was a member of the Joint Army and Navy board and also of the general staff. From 1905 to 1909 he held various commands in the Philippines. During the latter half of 1909 he was president of the Army War college, afterwards becoming assistant chief of the staff, to which post he returned in 1915 after four years' service in command of military departments. In 1917 he was made chief of staff and promoted to the rank of general, but he retired later in the year, having reached the age limit. He was a member of the Allied Conference (1917), of the Supreme War Council (1918) and of the International Peace Conference (1918-19).

His published writings include "European Conditions versus Disarmament" in *Foreign Affairs*, i., No. 3 (1923); "With the Earl of Birkenhead and P. H. Kerr," *Approaches to World Problems* (1924);

and "Disarmament and American Foreign Policy" in *International Conciliation*, No. 220 (1926).

BLISTER, a small vesicle filled with serous fluid raised on the skin by a burn, by rubbing on a hard surface, as on the hand in rowing, or by other injury; also used of a similar condition caused artificially, by the application of mustard, of various kinds of fly (see *CANTHARIDES*) and of other vesicatories. Similar small swellings, filled with fluid or air, on plants and on the surface of steel or paint, etc., are also called "blisters."

BLISTER RUST, or white pine blister rust, a destructive forest-tree disease among white (five-needle) pines so widespread in the United States at the present time that it threatens the preservation of forest reserves. It is caused by a parasitic fungus on the foliage of currant (particularly black currant) and gooseberry bushes, both wild and domestic. It attacks a white-pine tree through the needles or the young twigs; then, growing into the inner bark, it kills the tree by girdling.

The presence of blister rust is detected by the appearance of orange-coloured blisters, which do not, however, appear until the spring of the third or fourth year after infection. They are about the size of a navy bean, and contain the spores or seeds of the disease. Being small and light in weight, they are often carried great distances by the wind, but the only place of germination is on the leaves of currant and gooseberry bushes. There they grow into the leaf tissue, producing currant rust, or the summer stage of the blister rust fungus. Currant rust is detected by the appearance of orange-coloured pustules containing spores on the under side of the leaf. The summer stage gives rise at last to spores which infect the winter host, i.e., the white pine, thus completing the life-cycle. The black currant, however, is a favourite "host" of the blister rust disease.

The disease is apparently of Asiatic origin, and was introduced into North America on white-pine planting stock imported from Europe. It was first discovered on the North American continent in 1906. In the United States the following States are infected: New York, New Jersey, Pennsylvania, Michigan, Wisconsin, Minnesota and Washington; in Canada, the following provinces: British Columbia, Ontario, Quebec, Prince Edward Island, New Brunswick and Nova Scotia. In New England and New York, 10% of the white pines over large areas are infected, and in some smaller areas the infection ranges from 50 to 100%.

As is evident, blister rust has spread with such rapidity and to such an extent that its eradication is now practically impossible. It can, however, be controlled. Since this forest-tree disease must first undergo an intermediate development on the leaves of currant or gooseberry bushes and does not pass directly from a diseased pine tree to a healthy one, or to any other plants, the growing currants and gooseberries must be considered in connection with its control and the preservation of white pine forests. The value of the former as food products is of relatively small importance. The value of standing white pine in the United States is approximately \$500,000,000; in Canada, \$600,000,000. The white pine is a great national asset, the preservation of which is essential to future forestry development. To this end, the U.S. Department of Agriculture at Washington, D.C., has declared the growing of currants and gooseberries a public menace and recommends their elimination. The following States have passed laws concerning currants and gooseberries in relation to blister rust control: Connecticut, Idaho, Maine, Massachusetts, Minnesota, New Hampshire, New York, Oregon, Pennsylvania, Rhode Island, Vermont, Washington and Wisconsin. There are also Federal and State quarantine regulations governing the movement of currant and gooseberry plants.

See U.S. Dept. Agr. *Bulletin* 957 (Washington, 1922); U.S. Dept. Agr. *Farmers' Bulletin* 1308 (Washington, 1924); U.S. Dept. Agr. *Misc. Circular*, 40 (Washington, 1925).

BLISTER STEEL, a special variety of steel made by the cementation process, in which, under great heat, iron is changed into steel by the penetration of carbon into its substance. Bars of wrought iron are brought into contact with charcoal in a closed furnace for a week or ten days and heated to about 1,000°C. In these conditions the carbon dissolves in the metal and pene-

trates it, changing the iron into steel. The name "blister steel" arises from the fact that as the carbon, diffusing in the iron, meets the particles of slag which are always present in wrought iron it forms carbonic oxide, which, unable to escape, puffs up the molten metal and causes blisters. Blister steel is not a homogeneous product. Its special employment is in making crucible cast steel. (See *IRON AND STEEL*)

BLIZZARD (origin probably onomatopoeic, cf "blast," "bluster"), an intensely cold wind of gale force filling the air with fine dry snow, part of which may have been lifted from the snow-covered ground. The phenomenon is practically confined to polar lands and large land areas of the temperate zone; originally the name was given to the northerly winds in the rear of the cyclones crossing the Eastern States of America during winter.

BLOCH, ERNEST (1880—), composer, was born at Geneva, Switzerland, July 24 1880. He studied harmony under Jaques-Dalcroze, Geneva, the violin with Ysaye, Brussels, and composition under Ivan Knorr, Frankfurt. His lyric drama *Macbeth* was performed at the Paris Opera Comique, 1911. He arrived in America in 1916, and was appointed director, Cleveland Institute of Music, 1920. His compositions include *Hebraic Rhapsody* for 'cello and orchestra, a violin concerto, two symphonies, *Ilver Printemps* and *Vivre Amer*, symphonic poems, suite for viola and pianoforte which won the Elizabeth Sprague Coolidge prize 1919, first performed at the Berkshire festivals, Pittsfield, Massachusetts, a violin sonata and a quintet. In 1920 he gave the music division, Library of Congress, the greater part of his finished manuscripts, sketches, correspondence and family papers.

BLOCH, MARK ELIEZER (c. 1723–1799), German naturalist, was born at Ansbach, of poor Jewish parents, and died at Carlsbad Aug. 6, 1799. After taking his degree as doctor at Frankfurt-on-Oder he established himself as a physician at Berlin. He is best known by his important work on fishes (see *ICHTHYOLOGY*). Bloch was 56 when he began to write on ichthyological subjects. He wrote *Allgemeine Naturgeschichte der Fische* (1782–95, 12 pts., 432 coloured plates), and left an unfinished *Systema ichthyologiae* (ed. Schreiber, 1801). His collection of fishes was bequeathed to the Berlin Museum.

BLOCK, MAURICE (1816–1901), French statistician, was born in Berlin of Jewish parents Feb. 18 1816, and died in Paris Jan. 9 1901. He settled in Paris and became a naturalized Frenchman. Entering the ministry of agriculture in Paris in 1844, he was one of the heads of the statistical department from 1852 to 1862.

His principal works are *Dictionnaire de l'administration française* (1856); *Statistique de la France* (1860); *Dictionnaire général de la politique* (1862); *L'Europe politique et sociale* (1869); *Traité théorique et pratique de statistique* (1878); *Les Progrès de l'économie politique depuis Adam Smith* (1890); he also edited from 1856 *L'Annuaire de l'économie politique et de la statistique*, and wrote in German *Die Bevölkerung des französischen Kaiserreichs* (1861), *Die Bevölkerung Spaniens und Portugals* (1861); and *Die Machtstellung der europäischen Staaten* (1862).

BLOCK, a piece of wood. The word is used in various senses, e.g., the block upon which people were beheaded, the block or mould upon which a hat is shaped, a pulley-block, a printing-block, etc. From the sense of "obstruction" comes a "block" in traffic, a block in any proceedings. For the block system of signalling on railways, see *RAILWAY SIGNALS, AUTOMATIC*.

BLOCKADE has been defined as "an act of war carried out by the warships of a belligerent, detailed to prevent access to or departure from a defined part of the enemy's coast." It differs from a "pacific blockade" (qv) inasmuch as the latter is not strictly an operation of war and cannot rightly be enforced against neutrals. The former may be either "military" or "commercial." A "military blockade" is one undertaken to attain some specific military objective, e.g., the capture of a naval port. A "commercial blockade" has no immediate military objective but is designed to cause the enemy to surrender or come to terms by cutting off all commercial intercourse by sea. A belligerent may, if he can, blockade the whole of the enemy's seaboard, but the mere proclamation of a blockade of the whole or any part of the enemy's coast, without anything more, is of no legal effect. Such

proclamations were formerly common and were known as "paper blockades." A belligerent may not blockade neutral territory unless it is in the actual control or occupation of the enemy, nor may he blockade enemy territory in such a way as to prevent access to neutral territory.

The common law of blockade rests mainly upon the principles laid down by the Anglo-American Prize Courts, the more important of which are summarized in the judgments of Dr. Lushington and of the Privy Council in *The Fransiska*, Spinks 111; 10 Moo. P.C. 37. In order, therefore, to render a blockade valid under the common law and to impose penalties upon neutral vessels for breach of it, the following facts must be proved.

(1) A blockade must be duly established, *i.e.*, it must be instituted under the authority of the belligerent Government. Usually the officer in command of the naval force institutes the blockade under express instructions, but if he does so without them—an unlikely occurrence in modern times—his action must be ratified by his Government. In either case, although in the British view an official notification is not necessary, neutral Powers are notified in practice through diplomatic channels and the blockade is officially proclaimed. The officer in command must also notify the local authorities and the foreign consuls. (2) It must be effective. Paper blockades were declared illegal by the Declarations of the Armed Neutralities of 1780 and 1800, and it was to suppress their subsequent continuance that Art. 4 of the Declaration of Paris 1856 (*qv*) provided that "blockades in order to be binding must be effective," *i.e.*, maintained by a force sufficient really to prevent access to the coasts of the enemy. The Continental view demanded a stricter standard of sufficiency than the Anglo-American. The latter, however, ultimately prevailed. (3) It must be continuously maintained and impartially enforced against all vessels alike. If interrupted—except when temporarily interrupted by adverse weather—it must be duly re-established. Certain classes of vessels are exempt from the latter part of this rule, *viz*, neutral warships and neutral vessels carrying distressed seamen of their own nationality sent home by the resident minister of the neutral State, and neutral vessels compelled by stress of weather, need of provisions or repairs to put into the blockaded port. Under the Anglo-American practice vessels which have received a special licence from the Government of the blockading State or the commander of the blockading force are also exempt. (4) There must be some violation either by egress or ingress by the vessel. At the London Naval Conference of 1909 it was generally agreed that there must be some notice, either actual or presumptive. In respect of egress the fact of blockade is sufficient. In respect of ingress, if the blockade has been officially notified notice will be presumed, if there has been sufficient time for the vessel to receive it, since it is the duty of the neutral Government to communicate such notice to its subjects. If the blockade is *de facto*, express notice must be given to the vessel by the blockading force and endorsed on the ship's papers. (5) There must be actual or constructive knowledge of the blockade by those responsible for the conduct of the vessel.

A blockade terminates (1) if it is expressly raised by the blockading Government or by the officer in command of the blockading force, (2) if it ceases to be effectively maintained; (3) if the blockaded place is actually occupied by the blockading State.

The penalty for breach of blockade was the loss of the ship in any event, and of the cargo if at the time of shipment the blockade was known or might have been known by the shipper: *The Panaghia Rhomba*, 12 Moo. P.C. 168; Scott, 951 (1858).

At the London Naval Conference, 1908, an attempt was made to codify the law of maritime warfare. The provisions in the Declaration of London, 1909, relating to blockade are substantially merely declaratory of the common law. Two important amendments, however, were made. By Art. 17 neutral vessels may only be captured for breach of blockade "within the area of the warships assigned to render the blockade effective." Under the customary law they are liable to capture during any part of the outward or return voyage. By Art. 10 the doctrine of continuous voyage was declared inapplicable to blockade. Although the

Declaration had not been ratified by any State, it was, subject to some additions and modifications, adopted by all the belligerents at the commencement of the World War. On Feb. 4, 1915, Germany declared its submarine blockade against Great Britain, and on March 1, the British Government announced that it was the intention of the Allied Governments as a *retaliatory* measure "to seize all ships carrying goods of presumed enemy destination, ownership or origin." Although in effect blockades, neither of these measures was legally a blockade, since they did not conform to the provisions of the law of blockade. By the withdrawal of the Declaration and subsequent Orders by the Maritime Rights Order in Council, July 17, 1916, and by reliance upon the law of contraband, the situation was regularized for the Allied Governments.

For the controversy between Great Britain and the United States upon the so-called blockade of Germany, *see* Parl. Pap. (Cd. 7816), and (Cd. 8233), 1915. (H. H. L. B.)

IN NAVAL SCIENCE

In the last hundred years the methods of enforcing blockade have changed as much as ships themselves, but command of the sea is still the essential condition.

In the wars of the 17th and 18th centuries, blockade was enforced by maintaining squadrons in the vicinity of the enemy ports, the most notable example being the British blockade of the French and Spanish ports from the outbreak of war in 1803 to its close in 1814. This blockade foiled Napoleon's plans for the invasion of England, because it prevented Villeneuve from making a junction with the divisions in Brest and Rochefort, after he had slipped out of Toulon and drawn Nelson to the West Indies and back after him. On Villeneuve's return in August 1805 Napoleon at once recognized that his invasion plans had miscarried and on Sept. 1, the Grand Army, which he had concentrated on the heights above Boulogne, was marched off into Germany. It was not until Oct. 21 that the greater part of the combined French and Spanish fleet was destroyed at Trafalgar (*qv*), the remnant being locked up in harbour till the end of the war by the blockade.

Napoleon's fleet being disposed of, British sea-power entered on a desperate struggle with his land power expressed in terms of commercial blockade. This conflict eventually (1812) landed Britain in a war with the United States, and drew Napoleon into the expedition to Russia which caused his downfall. The points of similarity and contrast between that long economic struggle and the one in the World War afford an interesting study.

In the Russo-Japanese War (1904-05) the Japanese fleet did maintain a close blockade of Port Arthur, but suffered severely from submarine mines. There were then no submarines or aircraft.

A nation fighting for its existence and depending for success on its maritime superiority cannot afford to see one of the main objects for which its naval strength was developed largely discounted by neutrals who, ostensibly taking no part in the struggle, supply its enemy with the sinews of war.

The ultimate aim of a sea Power is to protect its own sea communications while denying over-sea supplies to the enemy. The right of a belligerent to stop contraband of war from going to its enemy has always been admitted, but it is not unnatural that the weaker maritime Powers and neutrals should prefer that goods carried in neutral ships should be secure from capture, that is the principle that "the flag covers the goods" or "free ships, free goods." During the hundred years that followed Napoleon's downfall Great Britain was almost invariably a neutral and her own commercial interests found profit in this latter view. Her statesmen, who might have had longer vision, sacrificed this vital belligerent right by signing the Declaration of Paris in 1856. "I believe" said the late Lord Salisbury speaking in the House of Lords on March 6, 1871, "that since the Declaration of Paris, the fleet, valuable as it is for preventing an invasion of these shores, is almost valueless for any other purpose."

A further check on the use of Britain's sea-power for preventing supplies from going to the enemy was the Declaration of London. Of the two descriptions of articles enumerated in this instrument, the absolute contraband list was small, being confined to articles

of exclusive military value such as guns, explosives, etc. These were liable to capture when destined to the enemy in neutral ships either direct or through neutral territory and in this case the doctrine of continuous voyage was recognized.

The conditional contraband list was composed of articles necessary to the civil population as well as to the military forces, such as food, fuel and clothing. This was liable to capture only if shown to be destined for the armed forces or to a government department of the enemy State, and provided it went direct to an enemy port. It could not be touched if discharged in a neutral port for transmission by rail or inland waterway. The evidence required by the declaration to prove the innocence of a cargo could so simply be evaded as to render this class of goods practically immune from capture, and in this case even the doctrine of continuous voyage was disallowed.

New Conditions.—In the old wars land communications were bad and the enemy, when blockaded, could obtain comparatively little in the way of oversea supplies through the territory of neutral neighbours; but the advent of railways and motor transport and development of inland waterways have changed all that. In the case of Germany, especially, much of her seaborne trade normally passes through Dutch and Scandinavian ports while, owing to the mining of the approaches to the Baltic, England was able to interfere but little with her trade in that sea.

International law as it existed in 1914 only recognized blockade based on the conditions of a hundred years ago, so the closing of the outer seas to the shipping of the Central Powers and to absolute contraband as defined in the Declaration of London was of itself insufficient to affect them really seriously. Though the British Admiralty had given consideration to this matter of blockade the mechanism of modern seaborne commerce is too intricate to be controlled by naval means alone, and little provision had been made for building up an adequate organization. The Declaration of London had never been ratified by any Power, but it was adopted by Great Britain in agreement with France and Russia by Order in Council of Aug. 20, 1914. The absolute contraband list had indeed been enlarged and the doctrine of continuous voyage extended to conditional contraband. The method of consignment had also been rendered more strict, but even so Lord Salisbury's fears of 1871 proved to be only too well justified!

BLOCKADE IN THE WORLD WAR

Light torpedo craft, submarines, mines, and aircraft have made it impossible to maintain a close blockade as in old days, and in the World War Great Britain and her allies were compelled to find means of making their blockade effective with the squadrons at a safe distance. British and French cruiser squadrons patrolled the Channel, North Sea and Straits of Otranto but no blockade of Germany was declared. The rapid development of submarine activity led shortly to the substitution of a boarding squadron of small ships in the Straits of Dover for the cruisers in the Channel, and to the withdrawal of the northern force to the area between Iceland and the Scottish coast. The old cruisers originally forming this patrol were relieved by armed merchant cruisers as soon as they could be got ready and called the 10th Cruiser squadron. This squadron experienced great difficulty in carrying out visit and search according to the old-established ideas. It is practically impossible to do this at sea under modern conditions, and so neutral ships, under suspicion of carrying contraband, had to be sent into harbour. The delay thus caused acted as an additional deterrent to neutral owners from carrying goods of a suspicious nature.

Great Britain's most effective weapon was "Bunker Control." The world's shipping was at that time almost entirely dependent on British coal, and by withholding it from owners who were reluctant to comply with the requirements of the blockade she was able to bring great pressure to bear. The "Evidential System" for determining the real destination of goods from documentary evidence proved valueless, and in spite of all efforts it was obvious that supplies were pouring into Germany through Scandinavia, Holland and (at first) Italy. Germany herself, however, gave the Allies the opportunity of escaping from their difficulties.

The complete stoppage of her shipping was telling on her and the rapid development of submarine warfare induced her to issue the celebrated order of Feb. 1915 in which she declared the waters around Great Britain and Ireland a military area, and announced that every hostile merchant ship found therein would be sunk without regard to the safety of passengers or crew. Even neutral ships in that area would be in danger. That this callous renunciation of the laws of humanity and international maritime law was to be no empty threat was soon proved, and the sinking of the "Lusitania" produced a feeling of horror throughout the civilised world. Great Britain and France replied with what has come to be known as the "Reprisals Order," which empowered their naval forces to stop all ships of enemy origin, ownership, or destination, so that the allied navies were freed from the trammels of the Declarations of Paris and London.

The Reprisals Order brought Britain into sharp conflict with America, just as, previously, the declaration of 1806 had done. During the prolonged diplomatic correspondence which followed she used the term blockade, which was technically incorrect in view of the fact that the Reprisals Order affected neutral territory. Though the doctrine of continuous voyage was recognized, neutral territory was technically exempt from blockade and neutrals were thus given an opening for discussing measures which were perfectly sound and logical in themselves in view of modern conditions. Every means was adopted to ensure that the blockade should interfere as little as possible with legitimate trade, and in order to avoid unnecessary delay cargoes sent in for adjudication were first examined by a contraband committee before being sent to the prize court.

The American contention that their trade with neutrals was suffering as compared with pre-war conditions was shown by their own figures to be incorrect. Whereas before the War it had been steadily diminishing in volume for some years, a circular issued by the Department of Commerce at Washington on Jan. 23, 1915 gave the following figures (in millions of dollars) for America's foreign trade:

August	110
September	156
October	194
November	205
December	246

Further figures show that the trade with Scandinavia and Holland had increased by 300%. It was obvious that those countries' own requirements could not have risen to that extent, and that they must have been re-exporting to Germany.

That the Allies' blockade measures were interfering with neutral trade less than Germany's activities is shown by the fact that up to Jan. 3, 1915, out of 45 neutral ships which had been temporarily detained by the Allies only 8 had been placed in the prize court, while 25 had been reported as destroyed by mines scattered by Germany on the high seas.

America was however on firmer ground when she called attention to the magnitude of Britain's own exports to these same countries, figures produced proving conclusively that Britain herself was doing exactly what she was trying to prevent America from doing. The cry of "Business as usual" had largely governed her policy, no matter who the business was with, and, but for this, Germany must have succumbed long before she did.

The economic blockade involved an enormous amount of work, for dealing with which practically the only machinery existing before the War was the prize court. Various committees and departments were formed in London to deal with different sections of it, and these were amalgamated into the Ministry of Blockade under Lord Robert Cecil early in 1916. The contraband department of the Foreign Office was the nucleus round which the organization grew, the personnel being chiefly drawn from the Foreign Office, Admiralty and Board of Trade. The Foreign Office was particularly interested in relations with neutrals and smoothing over difficulties with them, the Admiralty strove to make the blockade as effective as possible, while the Board of Trade watched over commercial interests. It took England over two years of bitter experience to realize that modern war on a

large scale involves the whole nation, with all its interests and resources. Not until she realized that "Business as usual" is incompatible with a "Nation in arms" did she reap the full benefit from her sea power.

The British Government had first of all tried to persuade neutral Governments contiguous to Germany to prohibit the export to her of all goods which were declared contraband in London. This proved unworkable and a little experience showed that the Government would have to deal direct with neutral traders and shipping companies. The leading commercial magnates in the Netherlands, Denmark and Switzerland were induced to form themselves into trusts and were made the sole consignees of those goods which the British Government wished to prohibit from going into Germany, on condition that they would not re-export the goods consigned to them. The cardinal feature of the blockade, however, was what was called "rationing." This had been proposed in 1914 but was not adopted until 1915, as it was only slowly realized that it could be put into practice. The conception of rationing was that the imports for home consumption of the neutral countries contiguous to Germany were a true measure of the home requirements of those countries and that, therefore, if the Allies allowed such neutrals to import commodities on the scale of their pre-war imports, with a small margin for contingencies, their merchants would be unable to increase imports for the special purpose of selling to Germany. In 1915 rationing agreements were concluded with Switzerland, Holland and Denmark, and the Ministry of Blockade, when it was subsequently formed in 1916, adopted and actively pursued the policy.

Towards the end of 1914 the three Scandinavian Governments had held a conference at Malmö at which they agreed to suppress all trade statistics, so there was strong presumptive evidence of a big re-export trade; their rations were accordingly based on pre-war figures. With the United States a very successful arrangement known as "Letters of Assurance" was arrived at, by which American traders submitted to the British Embassy at Washington a complete list of the goods they wished to ship and their quantities, and applied for permission to pass them through the patrols. Thanks to an elaborate organization formed solely for the purpose of making the necessary investigations as rapidly as possible, the permit or refusal was generally telegraphed within 48 hours.

The "Blacklisting System" grew out of the postal and telegraph censorship, which disclosed the firms in America and Scandinavia mostly concerned in the organization of German trade. Bunker control enabled the Allies to deal satisfactorily with blacklisted firms. When the United States came into the war in April 1917 they passed measures for stopping all German trade and for making it impossible for adjacent neutrals to re-export to the Central Powers. Bunker control had already made it possible for England to withdraw the 10th Cruiser Squadron, so America was not called upon to assist in the naval side of the blockade; but in all else, blacklisting, export embargoes, postal and telegraph censorship, they acted far more drastically and severely than the other Allies.

Effects of the Blockade.—Germany was reduced to terrible distress in the winter of 1916, and it was only the conquest of Roumania and occupation of the Ukraine which saved a breakdown. The complete loss of all artificial fertilisers at a very early period was a severe blow, as without these the soil cannot produce its normal harvest, much less replace the lack of sea-borne supplies. The loss of oils and fats was soon badly felt. Not only did the population suffer on account of it, but the lack of lubricants lowered the transporting capacity of the railways.

The meat imported from adjacent neutrals in 1915-16 never sufficed to fill the deficit caused by the British agreement with the American Meat Packers' Association, while the cattle killed at home in any year could not be replaced in the next owing to lack of fodder for raising the young stock.

This lack of the necessities of life was most keenly felt in the industrial districts of the west and centre of Germany. In the autumn of 1919 it was officially reported to the British Gov-

ernment that "the nation of Germany is broken both in body and spirit." Austria felt the blockade even more than Germany. When the Armistice was signed the population of Vienna was in little better plight than that of Paris during the starvation period of the siege of 1871.

The economic blockade proved that modern States are interdependent to a degree unsuspected before the War. An industrial country cannot be isolated from the outer world and produce both machinery and food supplies; an agricultural country may possibly feed itself but cannot also provide arms and material for its armies. Even after the coalition of the Central Powers covered half Europe the lack of sea-borne supplies created wants and deficits which in their turn created others, until in the end the entire population of Germany, Austria, Bulgaria, and Turkey broke down under the strain created by these progressive discomforts and sufferings. For further discussion of the Economic Blockade see **RATIONING OF NEUTRALS (BLOCKADE)**; **RESTRICTION OF ENEMY SUPPLIES COMMITTEE**; **BLOCKADE, MINISTRY OF**; **WAR TRADE ADVISORY COMMITTEE**.

BLOCKADE: ECONOMIC: see **RATIONING OF NEUTRALS (BLOCKADE)**; **RESTRICTION OF ENEMY SUPPLIES COMMITTEE**; **BLOCKADE, MINISTRY OF**.

BLOCKADE, MINISTRY OF. This department, one of the many administrative improvisations of the World War, was created on February 23, 1916, when Lord Robert Cecil received his appointment as minister of blockade. The term is technically incorrect, for no general blockade, in the strict legal sense, had been declared, but it expresses the purpose of the ministry, which was to co-ordinate and tighten up the whole machinery by which economic pressure was brought to bear on the Central Powers. The war had already assumed the character of a struggle for exhaustion, and it was imperative to take further steps for cutting off the supplies that continued to reach Germany through neutral ports; but every additional turn of the screw involved fresh interference with neutral interests, and the whole "blockade" policy had to conform continuously to the diplomatic situation. These considerations dictated the form given to the ministry. Lord Robert Cecil was already an under-secretary of State for foreign affairs, and he retained that position. He worked, as minister of blockade, in the Foreign Office, and the contraband department of the Foreign Office formed his staff. As minister of blockade he received a seat in the cabinet, and became the responsible head of all those departments and committees—the war trade advisory committee, the war trade department, the blockade, contraband, licensing, and enemy exports committees, etc.—which, whether within or without the Foreign Office, were directly concerned with the restriction of enemy supplies. Commander the Rt. Hon. F. Leverton Harris, R.N.V.R., M.P., became his parliamentary secretary, and he had the assistance of Vice-Admiral Sir D. de Chair, K.C.B., M.V.O., as naval adviser.

From the first, the new minister adopted as the keynote of his policy, the rationing principle, by which the imports of neutral countries contiguous to Germany were restricted to their normal, peace requirements. This principle had already been accepted by the Government, and many important rationing agreements with neutral importers had been concluded; but its application received a wide extension during 1916, through a long series of formal embargoes laid on shipments of commodities which were being imported by the northern neutrals in excess of their home requirements. (See **RATIONING OF NEUTRALS [BLOCKADE]**; **RESTRICTION OF ENEMY SUPPLIES COMMITTEE**; and **WAR TRADE ADVISORY COMMITTEE**.)

Two other weapons taken over and developed by the ministry were the "Navicert" system and the Black Lists. By the former, American exporters agreed to submit, in advance, particulars of all shipments to Scandinavia, receiving Letters of Assurance in respect of approved shipments, which entitled the ship to pass without detention. The Black Lists were used to deny British goods, and the assistance of British banks, accepting houses, and underwriters, to neutral firms engaged in enemy trade. The creation of a financial section of the ministry of blockade, in May 1916, was of great assistance both in the working of the Black Lists, and in restricting the enemy's financial operations abroad.

Throughout 1917 and 1918 the ministry of blockade remained the connecting link between the cabinet, the Foreign Office, and the numerous bodies, advisory or executive, engaged in weaving that intricate network of agreements and embargos, prohibitions and licences, on which the exertion of economic pressure came more and more to depend. Its task of adjusting the activities of these bodies to the exigencies of foreign policy was, of course, greatly facilitated by the entry of the United States into the war, and in the final stages of the conflict, it received the co-operation of the Allied Blockade committee, established in March 1918, with a rationing and statistical sub-committee, appointed in May of the same year. Even after the Armistice it continued to perform essential functions, for it was not until the signing of the Peace treaty with Germany, in June 1919, that the blockade was finally lifted.

While the policy of the ministry followed, in the main, lines already laid down and partially adopted, there can be no question as to its service in increasing the stringency of the stranglehold on the Central Powers. The instruments of the blockade were so numerous and various, yet so intimately related to each other and to foreign policy that a central directing authority, in close and continuous touch with the Foreign Office itself, was absolutely essential to the full development of its powers.

(C. E. F.)

BLOCK AND TACKLE, one of the most useful and extensively applied of mechanical devices. The principle is represented at A in the diagram, showing the suspension of a load W by two "parts" or "falls" of rope, so that a weight of 1 lb applied at P will pull a load of 2 lb. at W; this assumes friction to be absent, and the rope perfectly flexible. By increasing the number of pulleys and consequently falls of rope, in the manner shown at B, the mechanical advantage is increased, according to:—

$$W = nP$$

n being the number of parts of rope that spring from the movable block. If, for instance, there are three pulleys at the top, and two on the moving block, it will be evident that the weight is supported by five parts of rope, therefore a force of 120 lb. will hoist a load of 600 lb. Blocks are used for rigging, tightening guys, lifting loads, and hauling. The objection that the load is not held, as it is in the differential pulley-blocks, and worm-gear types, may be obviated by fitting a friction brake. The block B is of this self-sustaining form, the act of moving the hand-rope outwards or to one side applying the brake.

BLOCKHOUSE, in fortification, a small roofed work serving as a fortified post for a small garrison. The word, common since 1500, is of uncertain origin, and was applied to what is now called a *fort d'arrêt*, a detached fort blocking the access to a landing, channel, pass, bridge or defile. The modern blockhouse is a building, sometimes of two storeys, which is loopholed on all

sides. Blockhouses are built of wood, brick, stone, corrugated iron or any material available. During the South African War (1899–1902) they were often sent from England to the front in ready-made sections. Their use played an important part, in conjunction with "sweeping" operations by mobile columns, in the final subjugation of the Boers.

BLOCK PARTY, in the United States, a party held on the side-walks surrounding or the street between two city blocks. During the World War the custom of giving parties in the streets for the benefit of wartime activities arose in the cities of the United States. With the permission of the city authorities the street was closed to vehicular traffic. Coloured hunting and national flags were used as decorations on the fronts of the surrounding buildings; festoons of electric lights illuminated the street at night. A small admission fee was charged to those who wished to take part in the street party. The main feature of the nightly merriment was a band which played for dancing. The custom has persisted, and block parties are given by local political and social organizations, and by Church bodies. Summer resorts give them for the benefit of local organizations.

BLOEMAERT, ABRAHAM (1564–1651), Dutch painter and engraver, born at Gorinchem, the son of an architect, was first a pupil of Gerrit Splinter (pupil of Frans Floris) and of Joos de Beer, at Utrecht. He then spent three years in Paris, studying, and on his return to his native country received further training from Hieronymus Francken. He settled finally at Utrecht, where he became dean of the Gild of St. Luke. He painted and etched historical and allegorical pictures, landscapes, still-life, animal pictures, and flower pieces. Among his pupils are his four sons, Hendrick, Frederick, Cornelius and Adriaan (all of whom achieved considerable reputation as painters or engravers), the two Honthorsts, and Jacob G. Cuyper.

BLOEMEN, JAN FRANS VAN (1662–1740), Flemish painter, born at Antwerp, studied and lived in Italy. At Rome he was styled Orizonte, on account of his painting of distance in his landscapes, which are reminiscent of Gaspard Poussin. His brothers Pieter (1657–1719), styled Standaardt (from his military pictures), and Norbert (1670–1746) were also painters.

BLOEMFONTEIN (blōm'fōn-tīn), capital of the Orange Free State, U. of S. Africa, 29° 7' S., 26° 13' E. 4,518 feet above sea-level. Distance by rail from Port Elizabeth 450m., from Durban 514, from Cape Town 750. Population in 1926, including the suburbs, 22,587 Europeans, 23,500 Bantu and coloured. The climate in winter is bracing and healthy, and sharp frosts occur. The summers are hot, the mean maximum temperatures for December and January being over 86°F. The average rainfall is from 20 to 25 inches.

Bloemfontein has one of the best "native villages" in South Africa. This is situated to the south of the main town, and contains about 20,000 natives. Its rectangular houses are of *pisé de terre*, and were built in most cases by their occupants, who are chiefly Basuto and Bechuana.

Bloemfontein is a clean, spacious town, lighted by electricity, and with a good water-supply from Mazelspoort (14m) and from the Modder river at Sanna's Port (21m). The town dates back to about 1852, and became a municipality in 1880. It is the trading centre for a large part of the Orange Free State, and also does a good deal of trade with Basutoland. The surrounding country is good for cattle and sheep, and the Bloemfontein stock fairs are among the largest in South Africa. Large irrigation schemes are being developed in the neighbourhood. Furthermore the town has become an important educational centre; the Grey University college, constituent college of the University of South Africa, lies on the western outskirts of the town; 14m to the north is the Glen Agricultural college. Owing to its central position in South Africa, Bloemfontein, in addition to being the provincial capital of the Orange Free State, has become a favourite centre for religious, political and educational conferences. It is the judicial capital of the Union, and there the court of appeal for the Union of South Africa was established in 1910. Bloemfontein is the seat of a bishopric of the English Church. An English and a Dutch daily newspaper are published.

PRINCIPLES OF BLOCK AND TACKLE
A. Gain of power by having two "falls" of rope
B. Block and tackle with brake

BLOET, ROBERT (d. 1123), English bishop, was chancellor to William I. and Rufus. From the latter he received the see of Lincoln (1093) in succession to Remigius. He administered his see with skill and prudence, built largely, and kept a magnificent household, which served as a training-school even for the sons of nobles. Bloet was active in assisting Henry I. during the rebellion of 1102, and became his justiciar. Latterly, however, he fell out of favour, and was impoverished by the fines which the king extorted from him. He was the patron of the chronicler Henry of Huntingdon, whom he advanced to an archdeaconry.

See Henry of Huntingdon (*Historia Anglorum*) and W. Malmesbury (*De Gestis Pontificum*), also E. A. Freeman, *William Rufus* (1882); Sir James Ramsay, *The Foundations of England*, vol. II. (1898).

BLOIS, LOUIS DE (1506–1566), Flemish mystical writer, generally known under the name of Blosius, was born at the Château of Donstienne, near Liège, of a noble family. He was educated at the court of the Netherlands with the future emperor Charles V. of Germany, who remained to the last his staunch friend. At the age of 14 he received the Benedictine habit in the monastery of Liessies in Hainaut, of which he became abbot in 1530. Charles V. pressed upon him the archbishopric of Cambrai but in vain.

Blosius's works, which were written in Latin, have been translated into almost every European language. The best editions of his collected works are the first edition by J. Projus (Louvain, 1568), and the Cologne reprints (1572, 1587). His best-known works are: the *Institutio Spiritualis* (Eng. trans., *A Book of Spiritual Instruction*) (1900); *Consolatio Pusillanimum* (Eng. trans., *Comfort for the Faint-Hearted*) (1903); *Sacellum Animae Fidelis* (Eng. trans., *The Sanctuary of the Faithful Soul*) (1905); all these three works were translated and edited by Father Bertrand Wilberforce, O.P., and have been reprinted several times; and especially *Speculum Monachorum* (French trans. by Félicité de Lamennais, 1809; Eng. trans., Paris, 1676; re-edited by Lord Coleridge, 1871–72, and inserted in "Paternoster" series, 1901).

See Georges de Blois *Louis de Blois, un Bénédictin au XVI^e siècle* (1875), Eng. trans. by Lady Lovat (1878, etc.).

BLOIS, central France, capital of the department of Loir-et-Cher, 35m. S.W. of Orléans, on the railway between that city and Tours. Pop. (1926) 19,456. It is situated in a wooded district on the right bank of the Loire, stretching up the slopes of the hills on either side. Blois is first mentioned by Gregory of Tours in the 6th century, and increased in importance as the seat of a powerful countship (see below). In 1196 Count Louis granted privileges to the townsmen. The oldest part of the château was built in the 13th century. In 1429 Joan of Arc made Blois her base of operations for the relief of Orléans. In the 16th century Blois was often the resort of the French court. Its inhabitants included many Calvinists, and struggles between them and Roman Catholics occurred (16th century). In 1814 Blois was for a short time the seat of the regency of Marie Louise, wife of Napoleon I. An 18th-century bridge unites Blois with the suburb of Vienne on the left bank of the river. The streets of the higher and older part of the town are narrow and steep. The famous château of the family of Orléans (see ARCHITECTURE: RENAISSANCE ARCHITECTURE IN FRANCE), a fine example of Renaissance architecture, stands on the more westerly of the two hills. It has three main wings and a fourth smaller one, and is built round a courtyard. The north-west wing was erected by Francis I., and contains the room where Henry, duke of Guise, was assassinated by order of Henry III. The striking feature of the interior façade is the celebrated spiral staircase tower, the bays of which, with beautifully sculptured balustrades, project into the courtyard. The north-east wing, in which is the entrance to the castle, was built by Louis XII. and is called after him; it contains picture-galleries and a museum. Opposite is the Gaston wing, erected by Gaston, duke of Orléans, brother of Louis XIII., which contains a majestic domed staircase. In the north corner of the courtyard is the Salle des États, which, together with the Donjon in the west corner, survives from the 13th century. The cathedral of St. Louis (17th century), but in Gothic style, is surpassed in interest by St. Nicholas, once the church of the abbey of St. Laumer (12th and 13th centuries). The Renaissance Hôtel d'Alluye is one of the best of many mansions. The town is a market for the agricultural and pastoral regions of Beauce and Sologne, and

has a considerable trade in grain, the wines of the Loire valley, brandy and timber. It manufactures boots and shoes, biscuits, chocolate, furniture, machinery and vinegar. Blois is the seat of a bishop (17th century), a prefect and a court of assizes. It has a tribunal of first instance, a tribunal of commerce and a board of trade arbitrators.

BLOIS, COUNTSHIP OF. From 865 to about 940 the countship of Blois was held in fee by the margrave of Neustria, Robert the Strong, and by his successors, the abbot Hugh, Odo (or Eudes), Robert II. and Hugh the Great. It then passed to a new family, at first vassals of the dukes of France, but after 987 the direct vassals of the crown. These new counts were originally very powerful. With the countship of Blois they united, from 940 to 1044, that of Touraine, and from about 950 to 1218, and afterwards from 1269 to 1286, the countship of Chartres remained in their possession.

Their line began with Theobald I., the Cheat, who became count about 940. He was succeeded by his son, Odo I., about 975. Theobald II., eldest son of Odo I., became count in 996, and was succeeded by Odo II., younger son of Odo I., about 1005. Odo II. was one of the most warlike barons of his time. With the already considerable domains which he held from his ancestors, he united the heritage of his kinsman, Stephen I., count of Troyes. In 1033 he disputed the crown of Burgundy with the emperor, Conrad the Salic, and perished in 1037 while fighting in Lorraine. He was succeeded in 1037 by his eldest son, Theobald III., who was defeated by the Angevins in 1044, and was forced to give up the town of Tours and its dependencies to the count of Anjou. In 1089 Stephen Henry, eldest son of Theobald III., became count. He took part in the first crusade, fell into the hands of the Saracens, and died in captivity; he married Adela, daughter of William I., king of England. In 1102 Stephen Henry was succeeded by his son, Theobald IV. the Great, who united the countship of Troyes with his domains in 1128. In 1152 Theobald V. the Good, second son of Theobald IV., became count; he died in 1191 in Syria, at the siege of Acre. His son Louis succeeded in 1191, took part in the fourth crusade, and after the taking of Constantinople was rewarded with the duchy of Nicaea. He was succeeded by his son, Theobald VI. the Young, who died childless. In 1218 the countship passed to Margaret, eldest daughter of Theobald V., and to Walter (Gautier) of Avesnes, her third husband.

The Chatillon branch of the counts of Blois began in 1230 with Mary of Avesnes, daughter of Margaret of Blois and her husband, Hugh of Chatillon, count of St. Pol. In 1241 her brother, John of Chatillon, became count of Blois, and was succeeded in 1279 by his daughter, Joan of Chatillon, who married Peter, count of Alençon, fifth son of Louis IV., king of France. In 1286 Joan sold the countship of Chartres to the king of France. Hugh of Chatillon, her first-cousin, became count of Blois in 1293, and was succeeded by his son, Guy I., in 1307. In 1342 Louis II., eldest son of Guy I., died at the battle of Crécy, and his brother, Charles of Blois, disputed the duchy of Brittany with John of Montfort. Louis III., eldest son of Louis II., became count in 1346, and was succeeded by John II., second son of Louis II., in 1372. Guy II., brother of Louis III. and John II., succeeded in 1381, but died childless. Overwhelmed with debt, he had sold the countship of Blois to Louis I., duke of Orleans, brother of King Charles VI., who took possession of it in 1397.

In 1408 the countship of Blois was united with the crown by the accession of King Louis XII., grandson and second successor of Louis I., duke of Orleans.

See Bernier, *Histoire de Blois* (1682); La Saussaye, *Histoire de la ville de Blois* (1846). (A. Lo.)

BLOK, ALEXANDER (1880–1921), Russian poet, was born in St. Petersburg (Leningrad). His father was professor of mathematics at Warsaw. In 1903 he married the daughter of the Russian scientist Mendeleyev. His first book of poems, *Songs to the Belle Dame* (1904), shows the influence of the mystic poet and philosopher V. Soloviev. Later his romantic style was changed to one of bitter irony and his works show deep disillusionment conflicting with a national idealistic inspiration. "The

Scythians" is representative of this latter phase. All these alternating motives, expressing the eternal contrast between the real and the ideal, form the vast scope of Blok's greatest poetry. The Bolshevik revolution inspired him to write his famous poem "The Twelve"—English translations by C. E. Bechhofer (1920), and B. Deutch and A. Yarmolinsky, New York (1920). The poem is an apologia for the revolution. He is the finest lyric poet of modern Russia, and ranks with the great masters of the past. His outstanding qualities are the depth of feeling manifested in his poetry, the rich melody of his verse, his extremely varied rhythm, and the blending of an exquisite lyrical style with the raciness of speech of the masses.

Blok's principal poems, besides those already mentioned, are "The Unexpected Joy" (1907), the lyric drama *The Fair Booth*, "The Earth under Snow," "Hours of the Night," "The Hoary Morning" and the romantic drama *The Rose and the Cross*.

BLOK, PETRUS JOHANNES (1855–), Dutch historian, was born Jan. 10, 1855 at Helder, Holland. After holding a professorship in Groningen university, he became, in 1894, professor of Dutch history in the University of Leyden, a position which he retained until 1925. His most important work is *Geschiedenis van het Nederlandsche Volk (History of the Dutch People)* (1892). Among his other historical books are *Eene Hollandsche Stad in de Middeleeuwen (A Dutch Town in the Middle Ages)* (1882); *Willem de Eerste Prins Van Oranje (Prince William the First)* (1910–1920).

BLOMEFIELD, FRANCIS (1705–1752), English topographer of the county of Norfolk, was born at Fersfield in that county. On leaving Cambridge he was ordained, becoming in 1720 rector of Hargham, Norfolk, and immediately afterwards rector of Fersfield, his father's family living. In 1733 he mooted the idea of a history of Norfolk, for which he had begun collecting material at the age of 15, and shortly afterwards, while collecting further information for his book, discovered some of the famous *Paston Letters*. By 1736 he was ready to put some of the results of his researches into type. Two volumes of his compilation, the *History of Norfolk*, were published during his lifetime, and part of a third was left in ms. at his death. This, with two further volumes by the Rev. C. Parkin, was published at Lynn (1769–75), and the whole was republished in 11 vols. in 1805–10.

BLOMFIELD, SIR ARTHUR WILLIAM (1829–1899), English architect, son of Bishop C. J. Blomfield, was born on March 6, 1829, and educated at Rugby and Trinity, Cambridge. He was articled to P. C. Hardwick. He became president of the Architectural Association in 1861, and a fellow (1867) and vice-president (1886) of the Royal Institute of British Architects. In 1887 he became architect to the Bank of England, and designed the law courts branch in Fleet street, and he was associated with A. E. Street in the building of the law courts. In 1889 he was knighted. He died on Oct. 30, 1899. His two sons, Charles J. Blomfield and Arthur Conran Blomfield, also became architects. Sir Arthur Blomfield's work at St. Saviour's, Southwark, is a notable example of his use of revived Gothic. He was highly esteemed as a restorer.

See R. T. Blomfield, *Notes on the Life of Sir A. W. Blomfield* (1901).

BLOMFIELD, CHARLES JAMES (1786–1857), English divine, was born on May 29, 1786, at Bury St Edmunds, and educated there at the grammar school and at Trinity college, Cambridge, of which he became a fellow in 1809. In 1828 he became bishop of London, where he reigned for 28 years. He took a leading part in that movement of Church reform which led to the ecclesiastical commission, and did much for the extension of the colonial episcopate; and his genial and kindly nature made him a mediator in the controversies arising out of the tractarian movement. Newman, indeed, described him as "an active and open hearted man . . . engaged for years in diluting the high orthodoxy of the Church," but the bishop's policy was really comprehensive and conciliatory, and, being a warm admirer of Newman himself, he wished to appoint him to a Whitehall preachership. He died on Aug. 5, 1857. He is sometimes cited as the typical "Greek-play Bishop," on account of the many excellent editions of Greek

classics which he produced in his earlier years.

See *Memoirs of Charles James Blomfield, D.D., Bishop of London, with Selections from his Correspondence*, ed. by his son, Alfred Blomfield, (1863); G. E. Biber, *Bishop Blomfield and His Times* (1857).

BLOMFIELD, EDWARD VALENTINE (1788–1816), English classical scholar, was born at Bury St. Edmunds. He became a fellow and lecturer of Emmanuel college, Cambridge, and is chiefly known by his translation of Matthiae's *Greek Grammar* (1819), which was prepared for the press by his brother.

See "Memoir of Edward Valentine Blomfield," by Bishop Monk, in *Museum Criticum*, No. vii.

BLOMFIELD, SIR REGINALD (1856–), English architect and author, was born on Dec. 20, 1856 at Aldington in Kent, where his father was rector, and was educated at Haileybury and at Exeter college, Oxford. He worked for three years under his uncle, Sir Arthur Blomfield, and studied in the Royal Academy school of architecture, where he was largely influenced by Norman Shaw. The Gothic and Mediaeval tradition of his uncle's office had but little effect on his work as an architect, which rather follows the classical spirit and the inspiration derived from the later Renaissance architecture of England. This is shown in his country houses, among which are Moundmere, Basingstoke; Wyphurst, Cranleigh; and Uretham hall, Norfolk. He also carried out alterations at Brocklesby park, Lincs.; Ape-thorpe, Northants.; Chequers court, Bucks, and elsewhere. Amongst his London work are the United University club, Pall Mall; the Goldsmiths' college, New Cross; and Paul's cross, St Paul's Churchyard. At Oxford he built the new buildings for Lady Margaret Hall, and at Bath the Holbourne Museum. With Sir Aston Webb and Ernest Newton he was appointed to advise as to the architectural treatment of the Quadrant, Regent Street, London, and he designed a portion of the façade *Formal Garden in England* (1892), written in collaboration with F. Inigo Thomas, advocated the claim of the architect to consider as his right not only the design of the building but its environment. His *History of Renaissance Architecture in England* (1897) and his works on French architecture (1911 and 1921), became standard textbooks.

Blomfield was elected A.R.A. in 1905 and R.A. in 1914. He was professor of architecture at the Royal Academy from 1906 to 1910, and president of the R.I.B.A. in 1914. During the World War he held a commission as officer in charge of trench work. He was a principal architect of the Imperial War Graves Commission, and one of the chief designers of various forms of local war memorial. In 1919 he was knighted. The English memorial church at Ypres and his new bridge at Stratford on Avon are among his recent works.

BLONDEL, DAVID (1591–1655), French Protestant minister, was professor of history at Amsterdam. His works show a considerable critical faculty. They include a treatise on the so-called False Decretals; and two treatises, *Éclaircissement de la question si une femme a été assise au siège papal de Rome* (1647), and *De Joanna Papissa* (1659), in which, with much learning, the myth of "Pope Joan" is destroyed. The exposure caused some indignation in Protestant circles, since it disposed of a scandal useful in polemics; nevertheless all the works of Blondel were in 1925 still on the *Index* of books forbidden by the Roman Catholic Church.

BLONDEL, JACQUES FRANÇOIS (1705–1774), French architect, began life as an architectural engraver. He was among the earliest founders of schools of architecture in France; but he is now best remembered by his voluminous work *L'Architecture française*, a precious collection of views of famous buildings, many of which have disappeared or been remodelled.

BLONDIN (1824–1897), French tight-rope walker and acrobat, was born at St Omer, France, on Feb. 28, 1824, and died in London on Feb. 19, 1897. His real name was Jean François Gravelet. When five years old he was sent to the École de Gymnase, at Lyons, and, after six months' training as an acrobat, made his first public appearance as "the Little Wonder." He especially owed his celebrity and fortune to his idea of crossing Niagara Falls on a tight-rope, 1,100ft. long, 160ft. above the water. This he accomplished, first in 1859, a number of times, always with different theatric variations: blindfold, in a sack, trundling a

wheelbarrow, on stilts, carrying a man on his back, sitting down midway while he made and ate an omelette. In 1861 he appeared in London, at the Crystal Palace, turning somersaults on stilts on a rope stretched across the central transept, 170ft. from the ground. His final performance was given at Belfast in 1896.

BLOOD. The general principle on which the chemical life of the body is conducted is that each living cell carries out in its own substance all those chemical processes necessary to its existence. Therefore all the materials which it requires must be carried to it and all those which it discards must be removed. Throughout the whole body therefore a system of transport is necessary, with which every living cell is in intimate contact. That system, very primitive in the case of the more humble creatures, has become highly specialized in the vertebrate creation.

The principal materials which a living cell, be it a muscle fibre, a nerve cell or a gland cell, requires are (1) sugar, (2) the basis of albuminous material, (3) fat, (4) vitamins, (5) oxygen, (6) salts, (7) hormones, (8) water. The blood picks these up where they may be had, in the lung or in the alimentary canal or elsewhere, it being the province of the organs of digestion to reduce the solid constituents of the food to such a form that the blood can absorb them. The principal substances of which the cell must be rid are carbonic acid and simple soluble compounds of nitrogen—compounds of ammonia etc., or, in the case of the liver, urea.

In all the higher animals blood consists of a fluid, the plasma, in which are suspended corpuscles of various kinds adapted for special purposes.

THE PLASMA

This fluid is nearly but not quite colourless and is clear, unless a meal containing fat has recently been eaten, when the plasma is somewhat milky, because of the minute globules of fat which it transports. In anaemia also the plasma may be milky. The two materials dissolved in greatest quantity are albuminous substances (proteins) and common salt.

The general nature of plasma resembles that of raw egg white, diluted with a 0.9% solution of salt. In detail, however, plasma differs in every respect; its composition is roughly as follows:—

Water	90%
Proteins (Fibrinogen, paraglobulin, serum albumen)	9%
Salts	0.9%
Sugar, urea, uric acid, kreatin	traces

Water is primarily present in order to dissolve the other substances and to give the blood a degree of fluidity sufficient to secure its easy propulsion through the minute capillaries.

Protein.—The chemical basis of all life is protein in solution. All the cells with which the blood is in intimate relation are made of it. The protein cannot get in or out of these cells, and among its properties is that of attracting water to itself. If therefore there were proteins in the cells and not in the blood, water would always be passing from the blood into the cells, till the latter became dropsical. The protein in the blood balances that in the cells and so the water equilibrium is maintained. The case is different with salts; they can pass to and fro with the water and therefore they do not set up any permanent stream of water in any direction.

A second purpose of one protein at least, fibrinogen, is to confer on blood the power of clotting. The clot is the first aid to the healing of a wound; it at once plugs the wound and forms a scaffold on which new tissue is built. Thus if the chin be cut in shaving, the solidification of the blood is not due to drying or exposure but to a chemical process in the plasma which causes the fibrinogen (hitherto in solution) to separate out as a solid sponge of fibrin connecting the edges of the wound and through which the corpuscles of the blood cannot pass. The blood of some persons does not clot readily. Such are called "haemophils." For these, wounds, even such as those occasioned by the pulling of teeth, are very serious on account of the difficulty of stopping the bleeding. Haemophilia is a hereditary complaint (*see HEREDITY*). It does not appear in women and is never transmitted from one generation to the next through men. Thus, if in the following family tree M stands for man and W for woman, those persons only marked with a star could be haemophilic:—

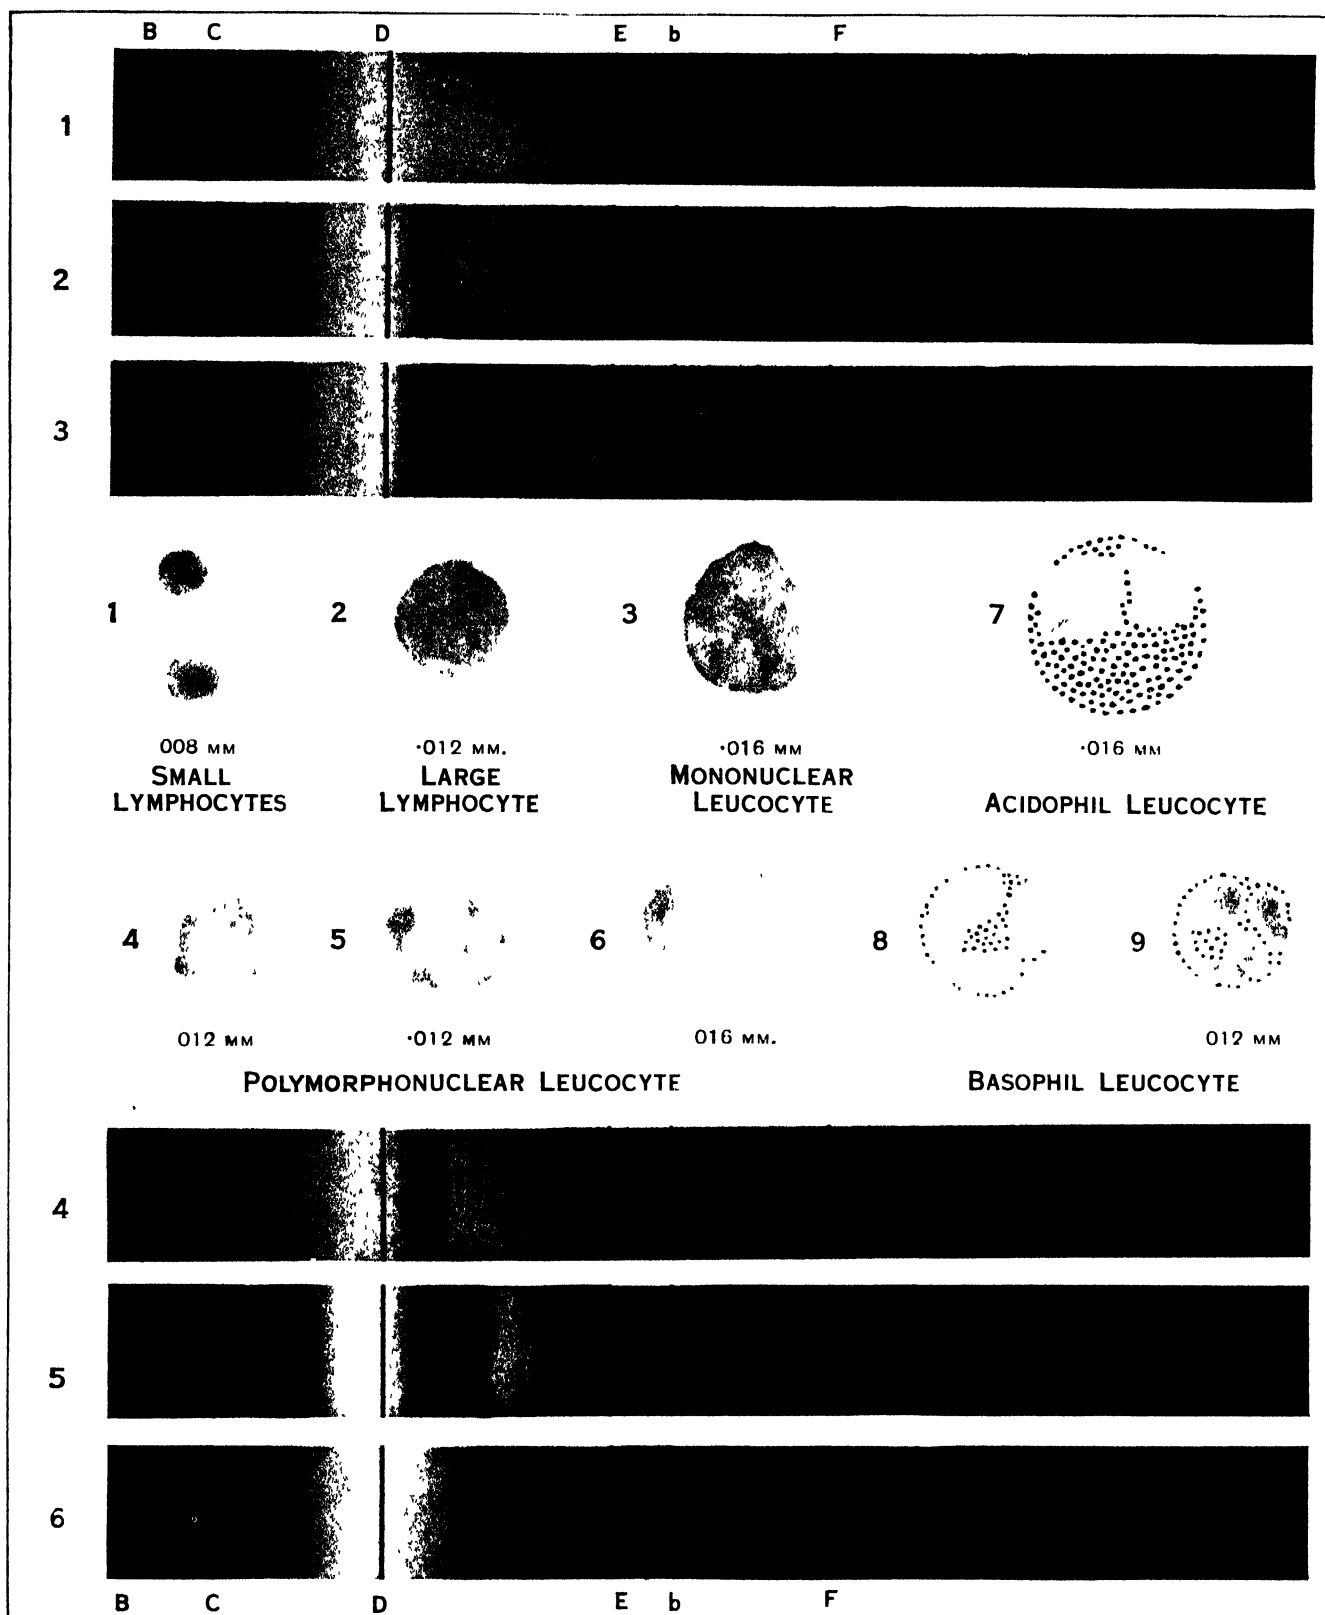

If therefore M₁ and W₁ had bred only boys, the haemophilic taint would have disappeared. What precisely occurs during the formation of the clot has been the matter of endless research. Microphotographs show a sort of net of material forms which is rendered obvious by bright illumination, as is the mote in the sunbeam. This net is of fibrin. Fibrin is the result of some transformation of the fibrinogen into solid form. The transformation is wrought by minute quantities of a substance, fibrin ferment or thrombin, which is scarcely present at all in circulating blood but which is formed when the blood is injured or is in contact with injured tissue.

From the chemist's point of view the protein molecule consists of a great number of organic acids held together in a particular way by a link of which ammonia is the basis. When digestion takes place the protein is broken in the alimentary canal into the individual amino-acids. These form molecules small enough to pierce the walls of the capillary vessels surrounding the intestine and so they are picked up by the blood and conveyed to the tissues. If the protein molecule of a cell in one of the tissues has lost a particular amino-acid, the appropriate one can be acquired from the assortment which the blood carries. Similarly, when the protein molecule of a cell loses an amino-acid, the lost matter does not appear in the blood as such, but as a salt of ammonia. It is carried as such to the liver, where it is turned into urea and thrust back into the blood. Hence the presence of ammonium salts and urea in the plasma.

Salts.—Sodium chloride in blood serves primarily to dissolve the protein. Two out of the three proteins in blood are insoluble in pure water. Protein can only form the basis of living material if it is in solution. Many salts might serve equally well to dissolve the protein but they are not innocuous in other respects. Potassium chloride would stop the heart, ammonium chloride would cause convulsions and so on.

The body is capable of regulating the percentage of sodium chloride in the blood with great accuracy. If it is not eaten in sufficient quantity the kidney ceases to excrete it, and the urine, which normally contains a considerable quantity, is almost free from it. The result of a deficiency of sodium chloride may be felt by persons who carry on sustained and heavy work in very hot surroundings (deep mines or ships' furnaces). Such may perspire 18 pounds of sweat (which is practically sodium chloride solution) in a few hours. By drinking water they make up the deficiency of fluid but not of salt, and the percentage of sodium chloride in the blood sinks, which causes agonizing cramp in their abdominal muscles. These cramps do not occur if the loss is made up by the drinking of salt and water or even of beer.

Although the elements calcium, potassium and magnesium are present in much smaller quantities than sodium, it is not to be supposed that they are correspondingly valueless. Especially it appears that the proper working of the heart depends upon the balance of calcium and potassium. Calcium also has a special relation to the clotting of blood, which does not take place in its absence. Among the salts in plasma, sodium bicarbonate holds a special place (1) because of its peculiar relation to the transport of carbonic acid from the tissues in which that gas is produced to the lungs and (2) because of its intimate connection with the fact that the blood is, and is maintained within very narrow limits, just on the alkaline side of absolute neutrality. The concentration of hydrogen ions in normal plasma equals 0.4×10^{-7} grams of hydrogen per litre (pH=7.4). As any considerable increase in this causes laboured respiration, the increase is checked automatically, for the laboured respiration augments the volume of carbonic acid expelled from the plasma into the air, so tending to reduce the

ABSORPTION SPECTRA (SHOWN IN THREE BANDS AT TOP AND THREE AT BOTTOM)

1. Spectrum of white light, used as standard of comparison with spectra of forms of haemoglobin 2 Oxyhaemoglobin (haemoglobin, which is pigment of red blood corpuscles, compounded with oxygen, as in arterial blood) 3 Reduced haemoglobin, without oxygen, as in venous blood. 4 Carboxyhaemoglobin

(haemoglobin combined with carbon monoxide) 5 Methaemoglobin (haemoglobin in which oxygen cannot be reduced) 6 Haemochromogen (crystalline pigment derived from haemoglobin)

CORPUSCLES (SHOWN IN CENTRE)

1. Small lymphocytes (white corpuscle surrounded by very slight cell body; chiefly in adults). 2 Large lymphocyte (is surrounded by larger cell body; chiefly in children) 3 Mononuclear leucocyte (white corpuscle whose one nucleus is surrounded by relatively large cell body). 4, 5, 6. Polymor-

phonuclear leucocyte (white corpuscle, multiformed nucleus with granules neutral stained) 7 Acidophil leucocyte (white corpuscle with granules acid stained). 8, 9 Basophil leucocyte (white corpuscle with granules basic stained)

concentration of hydrogen ions in the plasma. (See RESPIRATION.) On the other hand, should the blood become unduly alkaline, the kidney will redress the reaction by secreting an increased quantity of alkali in the urine. This balance of acid and alkali, the maintenance of which preserves the reaction of the blood at pH of 7.4, is called the "acid-base equilibrium" of the blood. To give a single instance of the way in which it is maintained: when a considerable meal is eaten acid is secreted in the stomach for the purpose of effecting its digestion. This acid is withdrawn from the blood which in itself would make the blood more alkaline, the kidney then secretes sodium; hence the so-called alkaline tide in the urine.

Among fluids blood is remarkable in that addition of acid and alkali produce only a trifling alteration in the hydrogen ion concentration as compared with what they would in water if added to it. This fact is expressed by the phrase "blood is very highly buffered." The buffering of blood is achieved principally by the interaction of the sodium bicarbonate in the plasma and the haemoglobin in the corpuscles. If carbonic acid is added to the plasma, sodium is withdrawn from the sodium chloride liberating chlorine ions; these tend to pass into the corpuscles which are very permeable to them and there unite with some of the sodium which had hitherto been in combination with the haemoglobin.

Hormones.—Among the discoveries of the last 40 years has been that of the importance of a chemical substance of great potency secreted into the blood by such organs as the suprarenal gland, the islets of the pancreas, the pituitary body, etc. These carried in the blood stream stimulate parts of the body remote from those by which they are secreted, and are called hormones. (See HORMONES and ENDOCRINOLOGY)

THE RED BLOOD CORPUSCLE

The primary object of the red blood corpuscle is that of an oxygen transporter. Its efficiency as such depends upon the quantity of haemoglobin it contains. The average number of red corpuscles in man is 5,000,000,000 per cubic centimetre of blood. The average weight of haemoglobin in the same is 0.13 gram and the average amount of oxygen which these will transport is .185 cu. cm. This is more than 50 times the quantity which could be dissolved in a cubic centimetre of blood in its passage through the lung, in the absence of haemoglobin. The intensive oxidation in the tissues of warm-blooded animals has only been made possible by the existence and utilization of haemoglobin.

The number of red blood corpuscles per cubic millimetre of blood varies in different animals thus:—

Animal	Man	Goat	Sheep	Bird	Fish	Frog	Proto- teus
Millions of red blood corpuscles per cu. mm. blood	4-5	9-10	13-14	1-4	0.25-2	0.5	0.04

Even in the same person the number differs considerably at different times; factors which induce rapid sweating cause an increase; the number increases also at high altitudes. (See ANOXÆMIA.)

The size and shape also vary. In the mammals the cells are round, except in the camel, which has oval corpuscles. In the lower vertebrates they are oval and nucleated. Thus:—

Diameter of red blood corpuscles in thousandths of a mm. (μ)

Animal	Pigeon	Frog	Newt	Proteus	Amphiuma
Long axis	14.7	22.3	29.3	58	77
Short axis	6.5	15.7	19.5	35	

The diameters of some mammalian forms are as follows:—

Diameter in thousandths of a mm. (μ)

Animal	Man	Dog	Rabbit	Cat	Goat	Musk-deer
Diameter red blood corpuscles	7.5	7.3	6.9	6.5	4.1	2

The above figures are only approximate, for as stated below a single corpuscle alters somewhat in size from time to time, and in the same individual the size of the red blood corpuscles may vary somewhat according to the conditions of stress under which they are produced.

Specific Gravity.—The specific gravity of blood depends principally upon the quantity of haemoglobin present; normally it is between 1.055 and 1.060, distilled water being 1.000. Since the methods for the measurement of haemoglobin have been improved, less account has been taken of specific gravity. The red blood corpuscle in man consists of a minute disc-shaped body having a diameter of 7μ ($1\mu = \frac{1}{1,000}$ mm.) and a thickness of about 1μ . It is very elastic and in the small vessels may take up almost any shape, as has recently been shown by Krogh. It is not, however, amoeboid.

In composition the red corpuscle consists of 60% water and 40% solids, of which 90% is the red pigment haemoglobin. In the larger vessels the red corpuscles tend to form "rouleaux"—an arrangement which is likely to occur in the case of any series of discs with fatty surfaces, floating in an aqueous fluid. Although in mammals they are normally nonnucleated, under abnormal conditions such as anaemia nucleated corpuscles appear in the circulating blood.

The intimate structure of red blood corpuscles has been a matter of much controversy, some authors regarding them simply as bags of fluid and others as consisting of a sponge work or stroma, which is more close at the outside than elsewhere. In the absence of ascertained knowledge of the correctness of either view it may be said that discussions on the chemistry and physics of the red corpuscles are usually carried out on the basis of the former, the corpuscle being regarded as material surrounded by a membrane possessing certain definite chemical and physical characteristics. The membrane is permeable, for instance, to water, and to acid radicles, but less so to sodium, potassium, etc. These facts form the basis of complicated readjustments of equilibria between the constituents of the corpuscles and those of the plasma, when the latter are altered. Among the materials which may pass through the corpuscle membrane is water, therefore the corpuscle may swell and shrink. Normally it swells if the medium in which it is placed is made more acid.

Haemolysis.—The passing of water into the corpuscle may take place on such a scale as ultimately to burst the membrane, the solution of haemoglobin previously enclosed escapes into the surrounding fluid, and the structures which contained the haemoglobin are left as "shadows." This process is known as "laking" or haemolysis which may be induced by the addition of distilled water to blood. The corpuscles may be ruptured in other ways, by freezing and thawing, by the addition of saponin, or bile salts. More remarkable is the fact that if the blood corpuscles of one species are injected into the vessels of another they are destroyed, their haemoglobin being liberated. This phenomenon is not due to osmotic or similar changes, but to some specific substance in the plasma which attacks the foreign corpuscles. That substance is called a haemolysin. It is one of several substances on which the immunity of the body from disease depends (See IMMUNOLOGY.)

Fragility of Red Blood Corpuscles.—All corpuscles are not disrupted with equal ease by haemolytic agents. Thus whilst all or nearly all corpuscles are disrupted by distilled water, salt solutions of less saline concentration than plasma will disrupt some and not others: the "fragility" of the corpuscles differs. Thus in the case of a cat:—

Strength of salt solution	.64	.60	.56	.52	.48	.44	.40	.36
Percentage of corpuscles haemolysed		.0	8	12	45	80	88	93
							99	

The resistance of the red cells of some animals is greater than that of others. If different animals are graded as regards the resistance of their red cells to saponin the following order would be observed: lamb, goat, ox, cat, grey mouse, pig, grey rat, dog, white rat, rabbit and guinea-pig. The resistance of their red cells to hypotonic salt solutions is, on the contrary, in precisely the opposite order.

Significance of Red Corpuscles.—This is both physical and chemical.

Physical: (1) In the fine vessels the diameter of which is not larger or not much larger than a red corpuscle, the packing of the haemoglobin in the corpuscle ensures that the propulsion of the whole of the haemoglobin along the vessel, were it simply dissolved, would result in a flow in the vessel of the streamline character. Movement would be confined principally to the central core of fluid. (2) The vessel walls are so delicate that haemoglobin diffuses through them. Were they made less diffusible so as to retain the haemoglobin, they would offer a greater resistance to other substances which require to traverse them quickly.

Chemical: (1) The exchange of oxygen between blood and haemoglobin should take place most efficiently in a medium slightly less alkaline than the blood plasma; this medium is supplied in the corpuscle. (2) The haemoglobin of many animals crystallizes easily; the corpuscle, by what means we do not know, holds it in solution—a condition necessary to its function.

The *origin* of red corpuscles in the embryo is in the forming blood vessels. These are laid down as ropes of tissue which ultimately become differentiated, the outer cells forming the vessel wall, the inner acquiring haemoglobin and becoming the nucleated ancestors of the red blood corpuscles. About half way through embryonic life in the mammal these nucleated ancestors disappear from the general circulation and are found only in the spleen, the liver and the bone marrow, and at a later stage the bone marrow is the sole normal breeding ground for red blood corpuscles. The activity of the bone marrow during life is regulated to some degree by circumstances; any exaggerated destruction of corpuscles such as bleeding, or the injection into the veins of such drugs as pyrogallol acid, will awake the bone marrow to greater production. So also will conditions which reduce the efficient functional activity of the corpuscles, such as exposure to low oxygen pressures. On the other hand, the normal activity of the bone marrow may become impaired, resulting in certain grave kinds of anaemia.

The *longevity* of a red corpuscle has been placed at 30–70 days. The calculation does not rest on any very reliable basis. Probably it is safe to say that the lifetime of the red corpuscle is to be measured in months, being longer than weeks and shorter than years. The ultimate fate of the pigment of red corpuscles is for the most part to have its iron detached in the liver and for the rest of the haematin moiety to be secreted as bile pigment. The debris of broken-down corpuscles is found in the spleen.

WHITE CORPUSCLES

The blood contains about 11,000 white corpuscles per cubic millimetre; thus there is only one white corpuscle to 400–500 red. The number varies within considerable limits.

The white corpuscles in blood are of at least five kinds; the classical classification depends upon (1) whether the protoplasm of the cells contains granules—those in which it does not being called hyaline and (2) among the granular ones whether the granules stain with acid dyes such as eosin (acidophil, eosinophil) or basic dyes such as methylene blue (basophil) (*see PLATE*). These five cells are given many different names.—

1. Small hyaline, *lymphocyte*
2. Large hyaline, mononuclear, *monocyte*.
3. Fine granular eosinophil, neutrophil, polynuclear, *polymorphonuclear*.

4. Coarsely granular eosinophil, *eosinophil*.
5. Basophil, *mast cell*.

1. **The lymphocyte** is about 6.5 μ in diameter. It has a large spherical nucleus which is surrounded by a small rim of clear protoplasm. It forms normally about 20–25% of the white corpuscles. It is not amoeboid, nor is it phagocytic (*i.e.*, it does not ingest other cells). These cells are formed in the lymphatic glands.

2. **The large hyaline cell** may really include two quite different cells of similar appearance, one of which is a larger edition of the lymphocyte, the other being the monocyte proper. The nucleus is spherical or kidney shaped. The protoplasm is larger in amount than in the lymphocyte. About 4% of the white

cells in the blood are large hyaline cells. The monocyte is highly amoeboid and phagocytic, its tendrils being long and delicate.

The relation of the monocyte to certain other cells in the body is a matter of much discussion. It has been seen in cultures to ingest large quantities of other cells taking on the appearance of a cell known as the clasmocyte. Also there is similar evidence of the epitheloid cells common in tuberculous lesions being merely monocytes which have wandered from the blood in special guise. Some authors go much farther, alleging that the monocyte can turn into other cells; *e.g.*, connective tissue cells, and that these can return to become monocytes once more. Such a view involves the general conception of a cell being at one moment the cell of one type of tissue, at another that of another and is to be treated with great reserve.

3. **The Polymorphonuclear Cell.**—This contains a nucleus consisting usually of several lobes joined by threads. The protoplasm contains numerous fine granules which stain with eosin. The cell is about 10 μ in diameter. It is highly amoeboid and phagocytic and forms about 70% of the total number of leucocytes.

The polymorphonuclear cells wander into infected tissues in great numbers, their presence forming an important factor in the processes of shutting off foci of infection and of repair of tissue (*see PATHOLOGY*). These cells are formed in the red marrow of the bones.

4. **The coarsely granular eosinophil cells** are about 12–15 μ in diameter, the nucleus is horseshoe shaped, the protoplasm contains large granules which stain conspicuously with eosin. They form about 2% of the white cells. According to Hardy and Kanthak they are not phagocytic but secrete their granules in the neighbourhood of cells to which the granules are poisonous. The cell is amoeboid.

5. **The Basophil Cell.**—This possesses a spherical nucleus and the protoplasm contains a small number of granules staining deeply with basic dyes. It forms about 0.5% of the white cells.

PLATELETS

As well as the red and white corpuscles there are in the blood certain formed elements of a much more obscure character. Much smaller than the corpuscles they form minute rods or plates. In the frog they appear to be nucleated. Their function is not completely understood.

QUANTITY OF BLOOD IN THE BODY

The body of an adult man contains about 5 litres of blood, usually rather less. The quantity in man may be measured in one of two ways. Each depends upon putting a known quantity of some substance into the body, and, after it has been distributed uniformly over the whole circulating fluid, measuring the degree of dilution which has taken place. The two substances used are (1) carbon monoxide and (2) vital red.

(1) Carbon monoxide to the extent of about 250 c.c.m. (the exact quantity being known) is inhaled from a special apparatus; the gas unites with the haemoglobin of the blood, producing a compound the concentration of which can be measured spectroscopically.

(2) Vital red is a pigment for which it is claimed that its injection into the blood stream has no deleterious effects, that the quantity injected does not leave the blood for some time, but in its entirety remains dissolved in the plasma. A known quantity of vital red is injected into a vein, a sample blood is subsequently withdrawn and centrifuged, the plasma is tinted red with the dye and the depth of the tint is a measure of the degree to which the dye has been diluted.

Probably different species and indeed different individuals in the species differ considerably in the quantity of blood contained in their vessels, some being more fully blooded than others. As a very rough estimate the blood volume is somewhere around $\frac{1}{12}$ – $\frac{1}{10}$ of the body weight in man. It is believed to increase at great heights, under tropical conditions and during anaemia.

Considerable loss of blood may take place without serious ill-effects, but if the volume decreases beyond a certain point the

blood pressure commences to drop and a condition of shock supervenes. Besides the blood which actually circulates in the arteries, veins and capillaries, the body possesses reserves which can be mobilized. One such is known to be located in the spleen. On the onset of haemorrhage the spleen shrinks, squeezing blood as from a sponge into the circulation, thus some animals may lose a fifteenth of their blood without the volume of that fluid in circulation suffering any appreciable decrease, the spleen contributing as much as is lost by the haemorrhage.

The blood may lose in volume from causes other than haemorrhage, *i.e.*, through exposure or injury, especially to the visceral organs, and a condition may arise in which the capillary walls appear to become unduly permeable and dilated; the plasma then escapes into the tissue spaces, the number of corpuscles per cubic millimetre increases, they being left in the vessels when the fluid escapes and ultimately the volume of blood becomes so small that the arterial pressure cannot be maintained. The condition is known as "surgical shock" and can be closely simulated by the introduction into the circulation of the drug histamine.

BLOOD PIGMENTS

The red pigment of the corpuscles, which is responsible for their capacity to carry oxygen, is called haemoglobin. It consists of a compound of a protein "globin" with a crystalline substance haematin.

The Importance of Haematin.—Haematin has the formula $C_{54}H_{70}N_{16}O_4FeOH$. Its principal chemical characteristics are (1) that it contains iron; (2) that it contains four pyrrol groupings—a fact which gives it a superficial relationship to chlorophyll; (3) it is easily reduced and reoxidized by chemical reagents. This oxidation does not seem actually to involve the valency of the iron, which is in the ferrous condition throughout. In haemoglobin the ratio of the iron by weight to the detachable oxygen (*labile*) is by weight as 56.32. In small quantities haematin is widely distributed both in the animal and vegetable kingdoms, as has recently been shown by Keilin. It forms compounds, other than haemoglobin, with proteins, a conjunction of three such is frequently found both in animals and plants giving the spectroscopic appearance of a substance with four absorption bands. To their spectrum the name cytochrome was given. In reality it consists of six bands, three of which overlap and is really three spectra, each of two bands superposed. The three spectra correspond of course to the three haematin-protein compounds mentioned above. The function of cytochrome appears to be that of a catalyst.

The Importance of the Globin.—Unlike cytochrome, haemoglobin can easily be crystallized, the corpuscles of different animals yielding crystals of different forms. They present specific differences in solubility, in the power of uniting with gases and in the position of the bands in their absorption spectra. Such differences are believed to be due to the specific characters of the globin. Haemoglobin unites with oxygen to form a compound of so loose a nature that (1) it can be completely broken down by a vacuum and (2) proportion of the whole haemoglobin oxidized is a function of the partial pressure of oxygen to which it is exposed. On this property depends the value of the pigment as a carrier of oxygen (*see* RESPIRATION).

Carboxyhaemoglobin.—Haemoglobin unites with carbon monoxide in a manner quite similar to that of its union with oxygen, but the affinity of the pigment for carbon monoxide is much greater than for oxygen; at the body temperature in man it is about 250 times as great. (For carbon monoxide poisoning, *see* ANOXAEMIA.)

The spectrum also of carboxyhaemoglobin is very similar to that of oxyhaemoglobin, having two absorption bands in the green as well as a considerable absorption of the ends of the spectrum, especially the blue end. It also has an absorption band in the ultra violet. Haemoglobin also unites with nitrous oxide; their compound does not occur in blood.

Methaemoglobin.—In all the above compounds the iron is in the ferrous state; a compound sometimes found in the blood in certain cases of poisoning (*see* ANOXAEMIA) is methaemoglobin, which differs from ordinary haemoglobin by containing its

iron in the ferric condition. Its absorption spectrum contains a conspicuous band in the red. It is formed by the action of potassium ferricyanide, nitrites, nitro-bodies, etc., on haemoglobin in the blood.

Haemochromogen.—There are some other important derivatives of haemoglobin which do not occur in blood—of these perhaps the most important is haemochromogen, a body in which haematin, in the reduced condition, is united not with native globin but with another protein formed by the action of strong alkali on globin and known as denatured globin, principally because it is insoluble at the point of neutrality. The practical importance of haemochromogen lies in two facts: (1) that it is very easily made from old blood by the action of alkali in combination with a reducing agent; (2) of all the blood pigments it is the one whose spectrum can be recognized in the greatest dilution. Therefore in medico-legal cases stains suspected of being due to blood can be tested by attempting the conversion of the pigment into haemochromogen and the observation of the material obtained with the spectroscope. BLOOD, PATHOLOGY OF (*see also* ANAEMIA) The changes in the blood in disease are probably as numerous and varied as the diseases which attack the body. The immense majority of these changes are, however, so subtle that they escape detection by our present methods. But in certain directions, notably in regard to the relations with micro-organisms, changes in the blood-plasma can be made out, though they are not associated in all cases with changes in the formed elements which float in it, nor with any obvious microscopical or chemical alterations.

The phenomena of immunity (*q.v.*) from the attacks of bacteria or their toxins, of agglutinative action, of opsonic action, of the precipitin tests, and of haemolysis, are all largely dependent on the inherent or acquired characters of the blood serum.

The methods at present employed in examining the blood clinically are: the enumeration of the red and white corpuscles per cubic millimetre; the estimation of the percentage of haemoglobin and of the specific gravity of the blood; the microscopic examination of freshly-drawn blood and of blood films made upon cover-glasses, fixed and stained. In special cases the alkalinity and the rapidity of coagulation may be ascertained, or the blood may be examined bacteriologically. We have no universally accepted means of estimating, during life, the total amount of blood in the body, though the method of Haldane and Lorrain Smith, in which the total oxygen capacity of the blood is estimated, and its total volume worked out from that datum, has seemed to promise important results (*Journ. of Physiol.* vol. xxv p. 331, 1900).

Volume and Composition.—Estimates of the total volume of blood in man vary between about $\frac{1}{10}$ and $\frac{1}{3}$ of the body weight but no doubt it varies from time to time. After death the amount of blood sometimes seems to be increased, and sometimes, as in "pernicious anaemia," it is certainly diminished. But the high counts of red corpuscles which are occasionally reported as evidence of plethora or increase of the total blood are really only indications of concentration of the fluid except in certain rare cases. It is necessary, therefore, in examining blood diseases, to confine ourselves to the study of the blood-unit, which is always taken as the cubic millimetre, without reference to the number of units in the body.

Though the relative proportions of the leucocytes are probably continually undergoing change even in health, especially as the result of taking food, the number of red corpuscles remains much

more constant. Through the agency of some unknown mechanism, the supply of fresh red corpuscles from the bone-marrow keeps pace with the destruction of effete corpuscles, and in health each corpuscle contains a definite and constant amount of haemoglobin. The disturbance of this arrangement in anaemia may be due to loss or to increased destruction of corpuscles, to the supply of a smaller number of new ones, to a diminution of the amount of haemoglobin, in the individual new corpuscles, or to a combination of these causes.

It is most easy to illustrate this by describing what happens after a haemorrhage. If this is small, the loss is replaced by the fully-formed corpuscles held in reserve in the marrow, and there is no disturbance. If it is larger, the amount of fluid lost is first made up by fluid drawn from the tissues, so that the number of corpuscles is apparently diminished by dilution of the blood; the erythroblasts, or formative red corpuscles, of the bone-marrow are stimulated to proliferation, and new corpuscles are quickly thrown into the circulation. These are apt, however, to be small and to contain a subnormal amount of haemoglobin, and it is only after some time that they are destroyed and their place taken by normal corpuscles. If the loss has been very great, nucleated red corpuscles may even, in some cases, be carried into the blood-stream.

Destruction and Regeneration.—The blood possesses a great power of recovery, if time be given it, because the organ (bone-marrow) which forms so many of its elements never, in health, works at high pressure. Only a part of the marrow, the so-called red marrow, is normally occupied by erythroblastic tissue, the rest of the medullary cavity of the bones being taken up by fat. If any long-continued demand for red corpuscles is made, the fat is absorbed, and its place gradually taken by red marrow. This compensatory change is found in all chronic anaemias, no matter what their cause may be, except in some rare cases in which the marrow does not react.

It is often very difficult, especially in "secondary" anaemias, to say which of the above processes is mainly at work. In acute anaemias, such as those associated with septicaemia, there is no doubt that blood destruction plays the principal part. But if the cause of anaemia is a chronic one, a gastric cancer, for instance, though there may be an increased amount of destruction of corpuscles due to sepsis, and though there is often loss by haemorrhage, the cancer interferes with nutrition, the blood is impoverished and does not nourish the erythroblasts in the marrow sufficiently, and the new corpuscles which are turned out are few and poor in haemoglobin. In chronic anaemias, regeneration always goes on side by side with destruction, and it is important to remember that the state of the blood in these conditions gives the measure, not of the amount of destruction which is taking place so much as of the amount of regeneration of which the organism is capable. The evidence of destruction has often to be sought for in other organs, or in secretions or excretions.

Leucocytosis.—The number and nature of the leucocytes in the blood bears no constant or necessary relation to the number or condition of the red corpuscles, and their variations depend on entirely different conditions. The number in the cubic millimetre is usually about 7,000, but may vary in health from 5,000 to 10,000. A diminution in their number is known as *leucopenia*, and is found in starvation, in some infective diseases, as for example in typhoid fever, in malaria and Malta fever, and in pernicious anaemia. An increase is very much more frequent, and is known as *leucocytosis*, though in this term is usually connoted a relative increase in the proportion of the polymorphonuclear neutrophile leucocytes. Leucocytosis occurs under a great variety of conditions, normally to a slight extent during digestion, during pregnancy, and after violent exercise, and abnormally after haemorrhage, in the course of inflammations and many infective diseases, in malignant disease, in such toxic states as uraemia, and after the ingestion of nuclein and other substances. It does not occur in some infective diseases, the most important of which are typhoid fever, malaria, influenza, measles and uncomplicated tuberculosis. In all cases where it is sufficiently severe and long continued, the reserve space in the bone-marrow is filled up by the

active proliferation of the leucocytes normally found there, and is used as a nursery for the leucocytes required in the blood. In many cases leucocytosis is known to be associated with the defence of the organism from injurious influences, and its amount depends on the relation between the severity of the attack and the power of resistance. There may be an increase in the proportions present in the blood of lymphocytes (*lymphocytosis*), and of eosinophile cells (*eosinophilia*). This latter change is associated specially with some forms of asthma, with certain skin diseases, and with the presence of animal parasites in the body, such as ankylostoma and filaria.

Leucaemia.—The disease in which the number of leucocytes in the blood is greatest is *leucocythaemia* or leucaemia. There are two main forms of this disease, in both of which there are anaemia, enlargement of the spleen and lymphatic glands, or of either of them, leucocytic hypertrophy of the bone-marrow, and deposits of leucocytes in the liver, kidney and other organs. The difference lies in the kind of leucocytes present in excess in the blood, blood-forming organs and deposits in the tissues. In the one form these are lymphocytes, which are found in health mainly in the marrow, the blood itself, the lymph glands and in the lymphatic tissue round the alimentary canal; in the other they are the kinds of leucocytes normally found in the bone-marrow—myelocytes, neutrophile, basophile, and eosinophile, and polymorphonuclear cells, also neutrophile, basophile and eosinophile. The clinical course of the two forms may differ. The first, known as lymphatic leucaemia or *lymphoemia*, may be acute, and prove fatal in a few weeks or even days with rapidly advancing anaemia, or may be chronic and last for one or two years or longer. The second, known as spleno-myelogenous leucaemia or *myelaemia*, is almost always chronic, and may last for several years. Recovery does not take place, though remissions may occur. The use of the X-rays has been found to influence the course of this disease very favourably, at least, for a time. The most recent view of the pathology of the disease is that it is due to an overgrowth of the bone-marrow leucocytes analogous in some respects to tumour growth and caused by the removal of some controlling mechanism rather than by stimulation. In course of time a lymphoemia may pass into a myelaemia. The anaemia accompanying the disease is due partly to the leucocyte overgrowth, which takes up the space in the marrow belonging of right to red corpuscle formation and interferes with it.

BLOODLESS SURGERY. The method originated by Lorenz is employed in orthopaedics and, strictly speaking, is not bloodless, for the bruising that may result is evidence of ruptured blood-vessels; a better term would be woundless or subcutaneous surgery.

Stretching Procedure.—The contrast between surgery and bloodless surgery in correction of an orthopaedic deformity is as follows:—Orthosurgery, by cutting or excising, adapts the bones to the shortened soft parts; bloodless surgery lengthens the shortened soft parts by stretching until they correspond to the length of the bones. This lengthening is effected by repeated (many hundred) small stretching procedures (the modelling correction of the Germans) and not by a single forcible procedure (the forcible correction of the French), which introduces undesirable damage, such as fracture or injury to nerves. Modelling and forcible correction differ further in that the former gradually annihilates the natural elasticity of the shortened soft parts so that they fail to retract when the modelling tension ceases, and can be fixed, passively, in any desired position by a suitable appliance. This gradual process is unaccompanied by the pain that characterizes forcible correction.

Modelling Correction.—Modelling correction is not without danger, even if cautiously performed. The soft parts, when subjected to tension and extension, are of different tolerance. Muscles and ligaments are little liable to damage. In case of absolute resistance to stretching, the tendons are severed with a thin, sharp knife (tenotome). The blood-vessels, being elastic, are less sensitive to stretching, but the circulation can be greatly impaired if excessive stretching of the vessels causes their inner walls to come in contact.

Nerve Stretching.—Of all soft parts the nerves are the most sensitive to stretching. "Pins and needles" is a familiar example of the fact. Should pressure on the nerve last a comparatively short time (say some hours) paralysis may ensue, the nerve remaining anatomically uninjured. Such a paralysis persists for many months.

Reactive Swelling.—Another danger of modelling correction is reactive swelling of the soft parts after the procedure. The plaster cast, maintaining the limb in the corrected position, must therefore be very accurately upholstered and even split appropriately, to provide room for the swelling, which is always to be expected, or gangrene may develop.

Nature of Deformity.—The aim of modelling procedure is correction of deformity, and the essence of deformity is impairment of function, with or without obvious alteration in shape of the bones of which a joint is composed. Most of the deformities are represented by fixed joints. The angle, in which a joint is fixed, is of no importance. Ankylosis is beyond the reach of bloodless surgery. If an ankylosed knee is not straight, it cannot be made so by the modelling correction, but solely by the chisel. Contracted joints, however, with even the slightest trace of mobility, represent the most important objects of bloodless treatment. But even here the field of bloodless surgery is limited by the nature of the underlying disease.

Contractures.—To make evident the necessity of such further limitation, contractures must be classified according to their origin. The most important causes of contractures are tuberculous disease of the joints, rickets and similar softening of the bones and infantile paralysis. Congenital deformities, though less frequent, are, in many cases, the cause of contractures. In addition there are contractures caused by accident (fractures of bones, luxations of joints), by rheumatic joint diseases, by luetic, cerebral affections, etc.

Tuberculous Contractures.—On the whole the army of cripples can be divided into two groups, viz., diseased cripples and healthy cripples. Among the first are those whose contractures are due to tuberculosis. The treatment of tuberculous bone and joint diseases exclusively belongs to bloodless surgery. Resections of tuberculous joints in children in the course of time often result in deformities more severe than those occurring naturally. Open-air life, plentiful food and sunshine, combined with bloodless mechanical treatment, bring about results which contrast favourably with those due to the knife. This is particularly noticeable in spinal tuberculosis.

The Plaster Bed.—The apparently difficult problem of immobilizing the spinal column has been solved by Lorenz's plaster bed, which is a well-upholstered plaster model of the trunk. Though pain has been severe, especially during the night, the patient in his plaster bed is exempt to such a degree that he bears perambulator exercise with equanimity. Thus he is neither confined to his bed nor to his room, he can enjoy open air, sunshine, undisturbed sleep, his appetite increases, and he gets well without any operation. The developing gibbosity can be lessened, and sometimes even prevented, by adjustable cushions placed underneath the prominent parts. A similar plaster bed has been employed with benefit for spinal injuries.

Other Joint Diseases.—In the same way immobilization is essential in the treatment of all other tuberculous diseases of the joints (hip-disease, white swelling of the knee, etc.). Immobilization by plaster casts is superior to extension, though this latter method is also useful as a means of fixation. By far the greater number of cases of tuberculous joint diseases, develop contractures, whatsoever method of treatment they may have gone through. Should the contracture not be evident at the time when the treatment has come to an end, it will develop later.

The usual contraction of the knee-joint is flexion, of the hip-joint flexion and abduction. Although Lorenz advocates bloodless surgery in the treatment of the acute stage of tuberculous joint diseases, he warns strongly against treatment of the resulting contractures by modelling correction. The healed tuberculous joint is comparable to a bone scar and should not be torn asunder, lest the tuberculous process be stirred up anew. Such contrac-

tures call for the chisel, and correction is done not in, but near, the joint (pararticular osteotomy).

Rickets.—To the diseased cripples also belong patients suffering from rickets. During the acute stages of the disease, correction of deformities belongs to bloodless procedures. Patients with lateral deviation of the spine too, belong to this class, because their deformity is due to a pathological softening of the bones of the spine. Besides measures to improve the general health of such patients, gymnastics, massage, corsets, etc., are of great importance in treatment, in which the plaster bed plays a great part.

Healthy Cripples.—Finally reference must be made to the class of healthy cripples. Leaving on one side deformities due to accident where recourse may be had to bloodless surgery, mention must be restricted to deformities consequent on infantile paralysis, the most terrible scourge of childhood. It can well be asserted that all contractures caused by paralysis can be straightened out by the bloodless method. When the normal shape of the limbs is restored, a very simple brace is sufficient to make walking possible. It must be admitted that conditions can be improved by successful transplantation of tendons. But this operation is not absolutely necessary. Many cases do without it—for instance, cases of paralytic flexure-contraction of the knee-joint. Instead of transplanting the active flexors of the knee-joint to the paralysed extensor (quadriceps), Lorenz substitutes the lost power of this latter muscle by the weight of the body. This is done by a slight over-stretching of the contracted knee, by which the line of weight is thrown in front of the axis of the knee-joint.

Arthrodesis, or artificial stiffening of joints by an operation on the cartilage, and on the bone, gives poor results, except in the shoulder joint. Lorenz also strongly objects to extirpating bones in paralytic deformities of the foot. At first the result may seem to be good enough, but very often in the course of years consecutive deformities develop, which are worse than the original ones. To the healthy cripples belong further such congenital deformities as congenital wry-neck, congenital club-foot and (most frequent of all) congenital dislocation of the hip joint.

Advantages of Modelling Correction.—In all these cases modelling correction, assisted by preliminary tenotomy, if necessary, can overcome the severest deformity. It restores the normal position of the deformed bones to each other and maintains this position by mechanical means. The bandaged foot, being compelled to support the weight of the body, is subject to the formative power of physiological function. By acting in their normal function the deformed bones, in the course of time, assume the normal shape. In this way the function, viz., to bear the weight of the body, is forced to serve the purpose of the orthopaedic treatment. Similar benefit may often be derived from the treatment in cases of flat-foot.

Luxation of the Hip-joint.—Congenital luxation of the hip-joint can be entirely cured by the method of bloodless surgery. Reposition of the displaced head of the femur into the acetabulum is brought about by manoeuvres which are entirely consistent with those of modelling correction. By repeated stretching of the soft parts the head of the femur is forced into the acetabulum. Far more difficult is the second part of the treatment, *i.e.*, retention of the head of the bone in the socket, the latter being too small and too shallow to retain it within its defective borders. To accomplish this, the thigh has to be fixed in certain extreme positions by which the head is prevented from slipping out of the socket. Owing to forced pressure of the head into the socket, the latter develops according to the size and shape of the head of the femur, while without it the socket would get smaller and smaller. Contractures and shortening of certain soft parts caused by the extreme position of the thigh help to retain the head in its normal place. It takes about a year before the socket is developed so far as to guarantee retention of the head. The third part of the treatment consists in gradual reduction of the extreme abducted position of the thigh into the normal one. The difficulty of simultaneous treatment of bilateral hip luxation can be imagined. Children with unilateral luxation are allowed to move about during the greater part of the treatment's duration and bear fairly well the impediment caused by the fixing bandage.

Described thus shortly the plan of treatment seems to be simple but its actual achievement is by no means so. Experience has proved, that within certain limits of age (up to five or six years) the cure of the children can be a perfect one, while in older cases at least great improvement can be obtained. This is so much the more remarkable, as surgeons of all times regarded the deformity in question as absolutely incurable.

BLOOD-LETTING, the abstraction of a portion of the blood, from three or four ounces up to twenty or even thirty in extreme cases. This may be effected by venesection, or the application of leeches, or more rarely by cupping (*q.v.*). In the past, blood-letting was used to such excess, as a cure for almost every known disease, that public opinion became opposed to it. Later, this prejudice has disappeared to a great extent. In certain pathological conditions it brings relief and saves life when no other means would act with sufficient promptness to take its place.

Venesection, in which the blood is usually withdrawn from the median-basilic vein of the arm, should be carried out with strict asepsis and then is without danger. If only a small amount of blood is to be abstracted, leeches may be used and the nurse can apply them. From one to twelve leeches are applied at the time, the average leech withdrawing some two drachms of blood. As much again can be abstracted by the immediate application of hot fomentations to the wounds. Leeches should always be applied over some bony prominence, that pressure may be effectively used to stop the haemorrhage afterwards. They should never be placed over superficial veins, or where there is much loose subcutaneous tissue. If, as is often the case, there is any difficulty in making them bite, the skin should be pricked at the desired spot with the point of a sterilized needle, and the leech will then attach itself without further trouble. Also they must be left to fall off of their own accord, the nurse never dragging them forcibly off. If cold and pressure fail to stop the subsequent haemorrhage, a little powdered alum or other styptic may be inserted in the wound. The following are the main indications for blood-letting. (1) For stagnation of blood on the right side of the heart with constant dyspnoea, cyanosis, etc. In acute lung disease, the sudden obstruction to the passage of blood through the lungs throws such an increased strain on the right ventricle that it may dilate to the verge of paralysis; but by temporarily lessening the total volume of blood, the heart's work is lightened for a time, and the danger at the moment tided over. This is a condition frequently met with in the early stages of acute pneumonia, and acute bronchitis, when the obstruction is in the lungs, the heart being normal. But the same condition also accompanies failure of compensation with back pressure in certain forms of heart disease (*q.v.*) (2) To lower arterial tension. In the early stages of cerebral haemorrhage (before coma has supervened), when the heart is working vigorously and the tension of the pulse is high, removal of a pint of blood may lead to arrest of haemorrhage by lowering the blood pressure temporarily and so giving the blood in the ruptured vessel an opportunity to coagulate. (3) In various convulsive attacks, as in acute uraemia and eclampsia.

Though there is no doubt that blood-letting often benefits the patient remarkably, its mode of action is not fully clear. Changes in the composition and volume of the blood induced by haemorrhage (*q.v.*) are of short duration unless indeed the amount of blood removed is so great as to be dangerous.

BLOOD-MONEY, the money-penalty paid in old days by a murderer to the kinsfolk of his victim. The system was common among the Scandinavian and Teutonic races previous to the introduction of Christianity, and a scale of payments, graduated according to the heinousness of the crime, was fixed by laws,

which settled who could exact the blood-money, and who were entitled to share it; blood-money could be exacted for all crimes of violence. Some acts, such as killing anyone in a church or while asleep, or within the precincts of the royal palace were excepted; the criminal was outlawed, and his enemies could kill him wherever they found him. Colloquially the term is used of the reward for betraying a criminal.

BLOOD PRESSURE, the hydrostatic pressure under which the blood exists in the arteries and veins of human beings and animals. This pressure was first measured by the Rev. Dr. Stephen Hales, in 1733. Hales connected the femoral artery of a horse to a glass tube 9 ft. in length. When the blood was permitted to flow into this tube, it rose 8 ft. 3 in., showing that the pressure of the blood due to the pumping of the heart-beat was equal to the weight of a column of blood of this height. When a similar tube was attached to a vein, the blood rose only 12 inches. In 1828 was invented the mercury manometer, which consisted of a U tube, with mercury resting at the same level in both arms of the tube. When the pressure of blood from an artery was applied to the top of the mercury column in one arm, it forced the mercury column in the other arm of the tube to rise. The difference in height of the two mercury columns then represented the number of millimetres which the blood pressure had lifted the mercury column. Since then, blood pressure has been given in terms of millimetres of mercury.

The sphygmomanometer was devised by von Basch, in 1887, for measuring the blood pressure in the arteries of man. The modern form of this instrument consists of a rubber bag, into which air can be pumped by means of a hand-bulb, with a pressure gauge communicating with the air inside the bag (The pressure gauge may consist of a spring device, calibrated to correspond with mercury pressure, or of a column of mercury which can be read on a millimetre scale as its level changes) The bag is wrapped around the subject's arm (usually the left), above the elbow, in a position appropriate to shut off the flow of blood in the brachial artery, when the bag is inflated. Air is then pumped into the bag until the pulse in the radial artery, at the wrist, disappears. The reading of the pressure gauge at this moment gives the systolic blood pressure; *i.e.*, the pressure necessary to suppress the maximum pressure of blood in the artery.

Three phases of arterial blood pressure are customarily distinguished during a single beat of the heart: systolic during the heart's systole, when the arterial blood pressure is at its maximum; diastolic, when the heart is in diastole, with arterial pressure at its minimum; and the mid-point, or mean between these two extremes, called the "pulse-pressure." If the pulse beat be recorded graphically, as the air pressure compressing the artery is diminished, the pressure at which the maximum pulse wave is obtained marks the diastolic pressure. By the auscultation method of obtaining blood pressure, a stethoscope is placed over the brachial artery just below the cuff, the air pressure in the cuff is raised above that necessary to obliterate the artery and is then allowed to fall slowly. The first sound heard through the stethoscope gives the systolic blood pressure; since this marks the moment when the maximum arterial pressure is just able to break through the closed artery. The pressure at which the sound is last heard is the diastolic pressure.

It is a common belief that systolic blood pressure in adults equals 100 plus the individual's age; but research has not verified this idea. Erlanger reports that the average adult (20 to 25), when wholly free from emotional excitement, has a systolic pressure (brachial artery) of 116 mm., and a diastolic of 65 millimetres. Psychologists have found that normal adults have systolic blood pressure varying between 90 and 150 mm., with little or no uniformity, or correspondence with the physical age of the individual (up to 35 years). Blood pressure changes very greatly under emotional excitement, and the excitement caused by undergoing a physical examination, or having the blood pressure taken for such a purpose as obtaining a life insurance policy, has been found to raise the systolic blood pressure 50 to 60 millimetres.

Blood pressure is of value to physicians in diagnosing various diseases, especially such disorders as arteriosclerosis, or dis-

tinguishing between hyper-thyroid and hyper-adrenal conditions. Systolic blood pressure has been found useful by psychologists as a means of detecting emotional excitement (see DECEPTION TESTS).

Knowledge of the pressure of blood in the veins is not as frequently required as is arterial pressure. The simplest method of determining venous pressure in man is that of Gaertner. The subject's arm is slowly raised until the veins on the back of the hand just disappear. The height above the heart at which this happens gives the venous pressure in the right auricle, the entire vein constitutes, in essence, a manometer tube leading from heart to hand, with the height of the hand above the heart thus measuring the height to which the venous blood-column is supported by the pressure exerted upon it.

Marston, *Sex Characteristics of Systolic Blood Pressure Behavior*, *Journal of Experimental Psychology*, volume 6, No. 6, December, 1923 (see *Arteries, Diseases of*). (W. M. M.)

BLOODROOT (*Sanguinaria canadensis*), a North American plant of the poppy family, Papaveraceae, called also red puccoon, common in rich woods in eastern North America. It is a low, smooth, bluish-green perennial which blossoms usually before its own leaves or those of its native woodland unfold. The showy white or pinkish flowers, about 2 in. broad, are usually borne singly on stalks about 8 in. long. The flower stalks and the large, rounded, many-lobed leaves rise from a horizontal rootstock, often an inch thick and several inches long. The rootstock, together with other parts, is surcharged with an acrid, orange-red juice, whence the name. The plant contains an alkaloid, sanguinarin (see ALKALOIDS), used in medicine. Throughout its range the bloodroot is one of the most attractive early bloomers and is often transplanted for ornament. In Great Britain the name bloodroot is sometimes applied to the tormentil (*Potentilla Tormentilla*) and the crimson crane's bill (*Geranium sanguineum*).

BY COURTESY OF THE WILD FLOWER SOCIETY
BLOODROOT, A FRAGILE FLOWER OF EARLY SPRING, COMMON ON THE BORDERS OF WOODS AND COPSES

BLOODSTONE or **HELIOTROPE** is a dark-green variety of crypto-crystalline silica, having bright-red nodules distributed throughout its mass. Polished sections therefore show red spots on a dark-green background and, from the resemblance of these to drops of blood, it derives its name. The word heliotrope is derived from the Greek (*Helios*, the sun; *trope*, a turning) and related to one of its supposed properties described by Marbodius in the following lines.—

The Heliotrope or "gem that turns the sun,"
From its strange power the name has justly won:
For set in water opposite his rays,
As red as blood 'twill turn bright Phoebus' blaze.

It was greatly prized in the middle ages and used in sculptures representing flagellation and martyrdom; it is of small importance now. On heating, the red spots turn black and the green background changes to grey.

BLOOD TRANSFUSION, the term used in medical literature for the process of transferring the blood from the circulation of one living animal to that of another. The first authentic record of it was not made until the middle of the 17th century. A Florentine physician, Francesco Folli, claimed to have transfused blood from one animal to another on Aug. 13, 1654. Subsequently many experiments bearing on the subject were made by Dr. (later Sir Christopher) Wren, Richard Lower, Edmund King, and Thomas Cox, their experiences being recorded in the *Philosophical Transactions* published by the Royal Society about 1666. Some of these experiments were witnessed by Samuel Pepys, who referred to them in his *Diary*. In spite of this activity in England the credit

for first performing a blood transfusion upon a human being must be given to Jean Denys of Montpellier. An account of his experiment done upon a boy aged 15, was published in the *Philosophical Transactions* for July 22, 1667.

On this occasion, and indeed throughout the 17th century, the blood for transfusion was taken from a lamb or calf, and, although good therapeutic results were claimed at first, the operation soon fell into disrepute and was almost entirely abandoned. Little or nothing was heard of it during the 18th century and it was not until 1818 that attention was again focused upon its possibilities. The coagulation of the blood outside the body was always the prime difficulty. One way of overcoming this was to remove the fibrin which forms the basis of the clot, and from 1835 onwards this defibrinated blood was used by various operators.

Transfusion did not, however, come into general use as a therapeutic measure during the 19th century, and after the year 1875 was largely neglected. This was probably due to the increased number of disasters which had attended the operation as soon as it began to come into fashion. An improvement in technique was initiated in America through advances in the surgery of the blood vessels, and this culminated in the work of Crile, who about 1907 described in detail an efficient method of performing *direct* transfusion by means of an anastomosis between an artery of the donor and a vein of the recipient.

Meanwhile discoveries were being made which tended to eliminate the chief factor responsible for the fatal results of some of the earlier transfusions. It had long been known that the bloods of different species of animals were incompatible, that is to say, the blood of a calf introduced into the circulation of a man was inevitably and rapidly destroyed, this process being attended by more or less serious symptoms, or even by death, according to the amount of blood introduced. In 1907 it was shown by Jansky in Scandinavia that an analogous incompatibility exists in all races of man between the bloods of different individuals, so that a given recipient may safely receive the blood of certain selected donors only. Hitherto no such selection had been practised. Jansky's work was repeated by Moss in America in 1910, and human beings have since that time been classified into four definite groups, the blood of only one of these being suitable for more or less indiscriminate injection into all recipients.

A further advance was made in 1914 when Agôte of Buenos Aires first used sodium citrate as an anti-coagulant for the donor's blood. This substance, when mixed with the blood as it issues from the donor's vein, combines with, and renders inert, the calcium which is present in the blood in small quantity and is an essential factor in the coagulation reaction. The blood then remains fluid, for an indefinite time, and the small amount of citrate which it contains is usually harmless to the recipient. Direct transfusion by Crile's method was technically difficult to perform, and it was soon abandoned in favour of citrated blood. This method was introduced opportunely for use in the treatment of the wounded during the World War, though it was largely employed only after the entry of the American surgeons into the hospitals in France. Some surgeons, however, then believed, and still believe, that citrate is responsible for the reactions, usually mild in degree, which follow a certain percentage of all transfusions, however carefully the bloods of donor and of recipient may have been tested. In spite of much controversy the supposed harmful effect of citrate has not yet been proved, and this method, which has many advantages, is more often used than any other. If whole, or untreated, blood be preferred, coagulation may be retarded by receiving the blood into a glass vessel coated on the inside with paraffin; it must then be transferred to the recipient as rapidly as possible.

In 1923 a return was made by Storer to the older method of using defibrinated blood to which no foreign substance has been added, and it is possible that this may prove to be the method of choice in the future. Storer's ground for eliminating the anti-coagulant was the belief that its presence impaired the anti-bacterial properties of the donor's leucocytes, but his contention still has to be substantiated in practice.

Blood transfusion has been found to have its greatest clinical

value in the treatment of acute anaemia (*see* ANAEMIA) due to loss of blood after injury, or in cases such as bleeding from a gastric ulcer or *post-partum* haemorrhage. Transfusion is also of value in combating the shock following severe surgical operations or injury, which may or may not have been accompanied by much loss of blood, and in the treatment of several diseased conditions in which, for one reason or another, the patient's blood is deficient in its power of coagulation. Thus, in the hereditary disease known as haemophilia, the patient may be rendered temporarily normal by transfusion of blood, and persistent bleeding will cease. Transfusion has been used in the treatment of a very large number of patients suffering from pernicious anaemia, some having received as many as thirty injections of blood over a period of several years; but, although a temporary remission of the disease may be obtained and the patient's life be prolonged, the disease cannot thereby be cured. The limitations of transfusion as a therapeutic measure, are, therefore, fairly well defined. It is still used more widely in America than in other countries, but it is coming to be employed more frequently everywhere.

Transfusion may also be considered from the point of view of the donor. Here the chief point of interest is the amount of blood which he can afford to lose without danger. It has been found that a healthy young man can part with any amount up to a litre of blood without experiencing anything more than a transient faintness. Usually he is not called upon to give more than 500 to 750 cu. cm. for one transfusion.

BLOODY ASSIZES, the name given in history to the commission conducted by Chief Justice Jeffreys after the Monmouth Rebellion in the west of England in 1685. Over 300 persons were condemned to death; hundreds more were transported. Although modern research has acquitted Jeffreys, in certain cases, of any technical irregularity, the trials generally were conducted with a ferocity which has, with reason, made his name notorious. (*See* JEFFREYS, G. J.; LISLE, ALICE; MONMOUTH, DUKE OF.)

BLOOM, the blossom of flowering plants (from Ang.-Sax. *blōma*, a flower), or the powdery film on the skin of fresh-picked fruit; hence applied to the surface of newly minted coins or to a 'cloudy appearance on the varnish of painting due to moisture.

In metallurgy, a term used of the rough billets of iron and steel, which have undergone a preliminary hammering or rolling, and are ready for further working. *See* IRON AND STEEL.

BLOOMER, AMELIA JENKS (1818–1894), American dress-reformer and women's rights advocate, was born at Homer (N.Y.), on May 27, 1818. In 1849 she took up the idea—previously originated by Mrs. Elizabeth Smith Miller—of a reform in woman's dress, and the wearing of a short skirt, with loose trousers, gathered round the ankles. The name of "bloomers" gradually became popularly attached to any divided-skirt or knickerbocker dress for women. Until her death on Dec. 30, 1894, Mrs. Bloomer took a prominent part in the temperance and woman suffrage movements.

BLOOMFIELD, MAURICE (1855–1928), American Indological and philological scholar, was born on Feb. 23, 1855, in Bielitz, Austria. He went to the United States in 1867, studied at the University of Chicago, Furman university, Greenville, S.C., Yale university and at Johns Hopkins, to which university he returned as professor of Sanskrit and comparative philology in 1881 after a stay of two years in Berlin and Leipzig. He is best known as a student of the Vedas. He translated, for Friedrich Max-Müller's *Sacred Books of the East*, the "Hymns of the Atharva-Veda" (1897); contributed to the Bühler-Kielhorn *Grundriss der indo-arischen Philologie und Altertumskunde* the section "The Atharva-Veda and the Gopatha Brāhmana" (1899); was first to

edit the Kauṣika-Sūtra (1890); published in conjunction with Prof. Richard von Garbe of the Tübingen university a chromo-photographic reproduction of the Paippalāda version of the Atharva-Veda (Baltimore, 1901). In 1907 he published, in the Harvard oriental series, *A Vedic Concordance*; in 1905 *Cerberus, The Dog of Hades*, a study in comparative mythology; in 1908 *The Religion of the Vedas*; in 1916 *Rig-Vida Repetitions*; in 1919 *The Life and Stories of the Jaina Savior Pārśvanātha*. The bulk of his work as an investigator is laid down in numerous articles on Indic and linguistic and ethnological subjects printed in the learned journals of America and Europe. He died in San Francisco, Calif., June 12, 1928.

See the complete bibliography at the end of the foreword to *Studies in Honor of Maurice Bloomfield*, by a group of his pupils (New Haven, 1920).

BLOOMFIELD, ROBERT (1766–1823), English poet, was born of humble parents, at the village of Honington, Suffolk. He was apprenticed at the age of 11 to a farmer, but he was too small and frail for field labour, and four years later he came to London to work for a shoemaker. The poem that made his reputation, *The Farmer's Boy*, was written in a garret in Bell alley. The manuscript, declined by several publishers, fell into the hands of Capell Loft, who arranged for its publication with woodcuts by Bewick in 1800. The success of the poem was remarkable, over 25,000 copies being sold in the next two years. His reputation was increased by the appearance of his *Rural Tales* (1802), *News from the Farm* (1804), *Wild Flowers* (1806), and *The Banks of the Wye* (1811). Influential friends attempted to provide for Bloomfield, but the poet died in poverty at Shefford, Bedfordshire. His *Remains in Poetry and Verse* appeared in 1824.

BLOOMFIELD, a town of Essex county (N.J.), U.S.A., about 12m. west of New York, adjoining Newark. It is served by the Erie and the Lackawanna railways, and has easy access for motor trucks to the Port Newark terminal and by way of the Holland tunnel to the New York water-front. The area is 5.42 sq. miles. The population was 9,668 in 1900; 22,019 in 1920, of whom 4,587 were foreign-born white; and was estimated at 25,955 in 1925.

Bloomfield is an important industrial centre, as well as a residential suburb of Newark and New York. Its 57 manufacturing establishments in 1925 produced a diversity of articles, ranging from safety-pins to motor trucks, and valued at \$49,639,921. The area now called Bloomfield was a part of Newark, and its early settlers (1670–1700) were for the most part sons of the men from Connecticut who founded Newark. It was known at first as Wardsession, but in 1796 received its present name, in honour of Gen. Joseph Bloomfield (1753–1823). In 1812 it was incorporated as a township, and in 1900 as a town. Belleville was separated from it in 1839; Montclair in 1868; and Glen Ridge in 1895.

BLOOMINGTON, a city in the north-central part of Illinois, U.S.A., 125m south-west of Chicago; the county seat of McLean county. It is an important highway and railway centre of the Illinois corn-belt; at the intersection of Federal highways 51 and 66 and nine State highways; is served by the Chicago and Alton, the Illinois Central, the Big Four, the Nickel Plate, and the Illinois Traction (electric) railways; and has a municipal airport, with hangar and equipment. The population was 28,725 in 1920 (87% native white); and was estimated in 1927 at 34,000.

The city has 60m. of wide paved streets, shaded with elms, oaks, and maples which were systematically planted in its early days. It is the headquarters of the Chicago and Alton Railroad, which has here its general offices and shops employing 3,000 men. Important industries are connected with books and stationery; stoves and furnaces; portable barn elevators and smoke-houses, concrete ventilated corn-cribs and granaries, and lighting plants for farms; washing machines, oil burners, ventilating systems, window screens, awnings, automobile and aeroplane radiators, etc. The varied output of the manufacturing establishments in 1927 was valued at about \$16,000,000. Coal has been mined in the vicinity since 1867. Illinois Wesleyan University, founded here in 1850 by a group of the county families, has an enrolment of

about 1,200 and an endowment of over \$1,000,000. In 1857 the first State institution for the training of teachers in the Mississippi valley (now called the State Normal University) was established on the outskirts of Bloomington, in what is now the separately incorporated town of Normal. Its enrolment is about 1,600, besides over 3,000 in the summer school. The State home for the orphans of soldiers and sailors is here. There are three country clubs, a municipal golf course, a choral society of 300 voices, and a theatrical organization of 300 members. Bloomington stands on the site of Blooming Grove, which was crossed by several trails in pioneer days. The first settlement was made in 1822; the town became the county seat in 1831, and was incorporated as a city in 1850; the public school system was established in 1857. In 1856 it was the meeting place of the first convention of the Republican Party in Illinois, called by editors of the state who were opposed to the Kansas-Nebraska bill, and attended (among others) by Owen Lovejoy, Richard Yates, John M. Palmer, and Abraham Lincoln.

BLOOMINGTON, a city of Indiana, U.S.A., 53m. southwest of Indianapolis; the county seat of Monroe county. It is served by the Monon route and the Illinois Central railway. The population in 1920 (95% native white) was 11,595, and was estimated locally in 1927 at 18,000. There are limestone quarries in the vicinity, and the city has considerable manufactures of furniture, baskets, and hampers, gloves, wax products and other commodities, amounting in value in 1925 to \$10,962,456.

Bloomington was settled about 1818. It is the seat of Indiana university, which had an enrolment of 5,742 students in 1926-27, and a budget appropriation from the legislature of \$1,610,000 for the year 1927-28. Its history goes back to the State seminary, established in 1820 on land granted by Congress for the purpose in 1816. The name was changed to Indiana college in 1828, and to Indiana university in 1838, to correspond with the development in scope. Since 1867 women have been admitted to all departments. The school of medicine, with its training school for nurses and its three teaching hospitals, and the school of dentistry, are in Indianapolis. The extension division maintains centres in Indianapolis, Ft. Wayne, and Gary. The biological station of the university is on Winona lake, in the northern part of the state.

BLOOMSBURG, a town in east central Pennsylvania, U.S.A., on Fishing creek, near the Susquehanna river, 35m. SW. of Wilkes-Barre; the county seat of Columbia county. It is on Federal highway 11, and is served by the Bloomsburg and Sullivan, the Reading, the Lackawanna, and (through East Bloomsburg, just across the river) the Pennsylvania railways. The population in 1920 (96% native white) was 7,819. The town is built on a bluff commanding extensive views, and is the seat of a State normal school, established in 1869. There are manufactures of importance, including carpets, silk, woollen goods, fountain pens, cars and car wheels, and oil-burning locomotives. Bloomsburg was laid out in 1802, became the county seat in 1846, and was incorporated in 1870.

BLORE HEATH, BATTLE OF. This was the second important battle of the Wars of the Roses (*qv*), and ended like that of St. Albans four years before in a Yorkist victory. The site is near Market Drayton, and the date was Sept. 23, 1459.

BLOUNT, CHARLES (1654-1693), English deist, was born at Upper Holloway. His father, Sir Henry Blount (1602-82), was the author of a *Voyage to the Levant*, describing his own travels. He gave his son a careful education, and is said to have helped him in his *Anima Mundi* (1679), which gave great offence by the sceptical views on immortality expressed in it. It was suppressed by order of the bishop of London, but a re-issue was permitted. Blount was an admirer of Hobbes, and published his "Last Sayings" (1679), a pamphlet consisting of extracts from *The Leviathan*. His best-known book, *The Two First Books of Philostratus concerning the Life of Apollonius Tyaneus* . . . (1680), is said to have been prohibited in 1693, chiefly on account of the notes, which are stated by Bayle (note, *s.v. Apollonius*) to have been taken mainly from a ms. of Lord Herbert of Cherbury. Blount contributed materially to the removal of the restrictions on the freedom of the press, with two

pamphlets (1693) by "Philopatris," mainly derived from Milton's *Areopagitica*.

Shortly before his death a collection of his pamphlets and private papers was printed with a preface by Charles Gildon, under the title of the *Oracles of Reason*. His *Miscellaneous Works* (1695) is a fuller edition by the same editor.

BLOUNT or BLUNT, EDWARD (born 1565?), the printer, in conjunction with Isaac Jaggard, of *Mr. William Shakespeares Comedies, Histories and Tragedies. Published according to the true Originall Copies* (1623), usually known as the first folio of Shakespeare. It was produced under the direction of John Heming (died 1630) and Henry Condell (died 1627), both of whom had been Shakespeare's colleagues at the Globe theatre, but as Blount combined the functions of printer and editor on other occasions, it is fair to conjecture that he to some extent edited the first folio.

The Stationers' Register states that he was the son of Ralph Blount or Blunt, merchant tailor of London, and apprenticed himself in 1578 for ten years to William Ponsonby. He became a freeman of the Stationers' Company in 1588. Among the most important of his publications are Giovanni Florio's Italian-English dictionary and his translation of Montaigne, Marlowe's *Hero and Leander*, and the *Six Court Comedies* of John Lyly. He wrote a preface to *Hero and Leander*, in which he defended the dead poet's reputation. He himself translated *Ars Aulica, or the Courtier's Arte* (1607) from the Italian of Lorenzo Ducci, and *Christian Policie* (1632) from the Spanish of Juan de Santa Maria. From 1609 he was for a time in partnership with William Barret, and published in 1612 Shelton's translation of *Don Quixote*.

BLOUNT, THOMAS (1618-1679), English antiquarian, was the son of Myles Blount, of Orleton in Herefordshire. He was born at Bordesley, Worcestershire. He was called to the bar at the Inner Temple, but, being a zealous Roman Catholic, his religion interfered considerably with the practice of his profession. He retired to his estate at Orleton, where he died on Dec. 26, 1679.

His principal works are: *Glossographia; or, a dictionary interpreting the hard words of whatsoever language, now used in our refined English tongue* (1656, reprinted in 1707), which went through several editions and remains most amusing and instructive reading; *Nomolexicon: a law dictionary interpreting such difficult and obscure words and terms as are found either in our common or statute, ancient or modern lawes* (1670; third edition, with additions by W. Nelson, 1717); and *Fragmenta Antiquitatis: Ancient Tenures of land, and jocular customs of some manners* (1670; enlarged by J. Beckwith and republished, with additions by H. M. Beckwith, in 1815; again revised and enlarged by W. C. Hazlitt, 1874). Blount's *Boscobel* (1651), giving an account of Charles II's preservation after Worcester, with the addition of the king's own account dictated to Pepys, has been edited with a bibliography by C. G. Thomas (1894).

BLOUNT, SIR THOMAS POPE (1640-1697), English author, eldest son of Sir Henry Blount and brother of Charles Blount (*qv*), was born at Upper Holloway. He represented the borough of St. Albans in the two last parliaments of Charles II, and was knight of the shire from the revolution till his death. He was created a baronet in 1679. His *Censura celebrorum authorum* (1690) was originally compiled for Blount's own use, and is a dictionary, in chronological order, of what various eminent writers have said about one another. It was published at Geneva in 1694 with all the quotations from modern languages translated into Latin, and again in 1710. His other works are *A Natural History, containing many not common observations extracted out of the best modern writers* (1693), *De re poetica, or remarks upon Poetry, with Characters and Censures of the most considerable Poets* . . . (1694), and *Essays on Several Occasions* (1692). It is on this last work that his claims to be regarded as an original writer rest. Blount displays throughout a hatred of pedantry and convention, which makes his book still interesting.

See A. Kippis, *Biographia Britannica*, vol. ii (1780). For an account of Blount's family see Robert Clutterbuck, *History and Antiquities of the County of Hertford*, vol. i. pp. 207-212 (1815).

BLOUNT, WILLIAM (1749-1800), American politician, was born in Bertie county (N.C.), on March 26, 1749. He was a member of the early continental congresses, of the Constitutional Convention at Philadelphia in 1787, and of the State con-

vention which ratified the Federal Constitution for North Carolina in 1789. From 1790 until 1796 he was governor superintendent of Indian affairs of the "Territory South of the Ohio River." He presided over the Constitutional Convention of Tennessee in 1796 and became one of its first representatives in the United States Senate. Blount was impeached by the House of Representatives on July 7, 1797, for his connection with a conspiracy to seize the Spanish-owned Floridas and Louisiana for England, then at war with Spain, and on the following day was formally expelled from the Senate for "having been guilty of high misdemeanour, entirely inconsistent with his public trust and duty as a senator." On Jan. 14, 1799, however, the Senate, sitting as a court of impeachment, decided that it had no jurisdiction, Blount not then being a member of the Senate, and, in the Senate's opinion, not having been, even as a member, a civil officer of the United States. The case is significant as being the first impeachment brought before the United States Senate. Blount was enthusiastically supported by his constituents, and upon his return to Tennessee was made a member and the presiding officer of the State Senate. He died at Knoxville on March 21, 1800.

For a defence of Blount, see Gen. Marcus J. Wright's *Account of the Life and Services of William Blount* (Washington, D.C., 1884).

BLOW, JOHN (1648-1708), English musical composer, was born in 1648, probably at North Collingham in Nottinghamshire. He became one of the children of the Chapel Royal when the choir was reconstituted in 1660. He composed several anthems at an unusually early age, including *Lord, Thou hast been our refuge*; *Lord rebuke me not*; and the so-called "club anthem," *I will always give thanks*, the last in collaboration with Pelham Humphrey and William Turner. To this time also belongs the composition of a two-part setting of Herrick's *Goe, perjur'd man*, written at the request of Charles II. to imitate Carissimi's *Dile, o celi*. When his voice broke he spent his time in the study of music, and in 1669 became organist of Westminster Abbey. In 1673 he was made a gentleman of the Chapel Royal, and in September of this year he was married to Elizabeth Braddock, who died in childbirth ten years later. Blow, who by the year 1678 was a doctor of music, was named in 1685 one of the private musicians of James II. Between 1680 and 1687 he wrote the only stage composition by him of which any record survives, the *Masque for the Entertainment of the King: Vernus and Adonis*. In 1687 he became master of the choir of St. Paul's church; in 1695 he was elected organist of St. Margaret's, Westminster, and is said to have resumed his post as organist of Westminster Abbey, from which in 1680 he had retired to make way for his pupil, Henry Purcell. In 1699 he was appointed to the newly created post of composer to the Chapel Royal. Fourteen services and more than a hundred anthems by Blow are extant. In addition to his purely ecclesiastical music Blow wrote *Great sir, the joy of all our hearts*, an ode for New Year's day 1681-82; similar compositions for 1683, 1686, 1687, 1688, 1689, 1693 (?), 1694 and 1700; odes, etc., for the celebration of St. Cecilia's day for 1684, 1691, 1695, and 1700; for the coronation of James II. two anthems, *Behold, O God, our Defender*, and *God spake sometimes in visions*; some harpsichord pieces for the second part of Playford's *Musick's Handmaid* (1689); *Epicedium for Queen Mary* (1695); *Ode on the Death of Purcell* (1696). In 1700 he published his *Amphion Anglicus*, a collection of pieces of music for one, two, three and four voices. His pupil, Henry Purcell, said of him that his "character is sufficiently known by his works, of which this very instance (the Gloria from his *Jubilate in C major*) is enough to recommend him as one of the greatest masters in the world." Blow died on Oct. 1, 1708, at his house in Broad Sanctuary, and was buried in the north aisle of Westminster Abbey.

BLOWGUN or, as it is usually called, **BLOWPIPE**. This, with its poisoned dart, is a lethal weapon employed in South America, and in the Malay peninsula and archipelago. In each case it is used by savages of high ethnological status and mental development, usually forest peoples, its efficacy depending largely upon the user not being seen.

The blowpipe is a wooden tube some seven feet long (bore about one-third of an inch across) the external diameter dimin-

ishing from about one inch at the mouth end to three-quarters at the nozzle. The tube is made of a light, rigid wood, found commonly throughout Borneo and Malaya. A piece being selected, free from knots, it is roughly shaped. This is bored with an iron rod, eight feet long, with a cutting edge at one end. The pole and the boring tool are placed upright, the pole being fixed in a vice of branches of trees, the rod passing through guides above the ground.

Two men do the drilling. One brings the chisel down repeatedly on to the centre of the pole, turning it slightly each time. The other moistens the wood with water, which he ladles into the hole. It takes from eight to ten hours to bore through the pole, and although the chisel does fine work, the natives polish the inside with a rattan. When satisfied with this, they whittle away the outside to the required size and smoothness.

When a native of Borneo uses the blowpipe, he lashes a short spear to the end, so that he may ward off the attacks of infuriated victims. The weight of this spear would distort the tube, and make it difficult to take true aim. Accordingly, he slightly curves the thin end, so that the weight of the spear and lashings compensates and bends the tube perfectly straight. The mouth end of the pole is fixed somewhere in the dwelling, and is supported by a loop, weights being attached to the other end. The curvature is judged sufficient when, on looking through the tube, only two-thirds of the bore can be seen through. The blowpipe is then warmed, to make it "set." When this is done, a little, round piece of wood is lashed on to the upper side of the narrow end to act as a sight.

The darts used are made of splinters of palm-wood eight to ten inches long, sharpened at one end, the whole length being whittled down until the diameter is about that of a steel knitting-needle. The butt is a cone made of soft pith about half an inch long, being, at its base, exactly the size of the bore of the pipe. At the pointed end the shaft is partially cut through at intervals of about a quarter of an inch, in order that it may break easily and ensure the lethal portion remaining in the wound made. Where the game is large the shaft of the dart is split at the point and a sharp triangular metal point, cut from an oil tin, inserted and secured by a wooden peg.

As to the poison used, Dr. C. G. Seligmann, in a note published by the *Journal of the Anthropological Institute* (1902) says that it is obtained either from *Strychnos* or *Antiaris*. The Bornean tribes use the inspissated juice of the *Ipo* or upas tree (*Antiaris toxicaria*); it is yellow-white in colour, becoming buff on exposure to air, and of a very bitter taste. It is a glucoside which acts on the heart-muscles and central nervous system. The juice is obtained by making incisions in the bark, and collecting the sap. It is dried slowly over a fire, until almost black, and viscous, like sealing wax, and when wanted for use is softened in warm water and kneaded. The darts are smeared with the poison while it is moist, and then dried by the fire. A little pith-cone is afterwards fixed on the dart. The poison usually retains its power for two months from the time it is taken from the tree. Neither the weapons nor the darts vary much in respect to local conditions.

See C. Hose and W. McDougall, *The Pagan Tribes of Borneo* (1912); *Handbook to the Ethnographical Collection of the British Museum* (2nd ed. 1925). (C. H.)

BLOWING ENGINES. Appliances for the production of a stream of air under pressure may be divided into three groups, namely compressors, blowing engines and blowers, the latter being again sub-divided into positive blowers and fans. The distinctions between these groups are drawn in several ways by different makers, but the simplest and perhaps the most generally used is based upon the pressures at which they are intended to work; air compressors deliver a stream of air at a pressure almost invariably above 40 lb. per sq. in.; blowing engines work between 5 lb. and 30 lb. per sq. in., occasionally going up to 40 lb.; and blowers below 5 lb. per sq. in., though often considerably lower. It may be noted that appliances of the last group are used for exhausting as well as for forcing air, whereas those of the first two groups are used only for forcing. The boundaries between these two groups are by no means sharply drawn, and there is a certain amount of slackness in the terminology employed; thus some makers will call an appliance a turbo-compressor, which others would describe as a

turbo-blower. To some extent the objects for which the stream of air is required is also taken into account; thus an appliance producing a stream of air at a pressure of about 40lb. would probably be described as an air compressor if the air were employed to work a compressed air engine or a drill, but would be called a blowing engine if the air were utilized for a metallurgical operation. The term blowing engine is practically restricted to appli-

FIG. 1.—DIAGRAM OF SECTION OF BLOWING CYLINDER, SHOWING PISTON AND AIR ADMISSION AND DISCHARGE VALVE

ances used in the metallurgy of iron, large blowing engines at a relatively low pressure being used for supplying blast to blast-furnaces, whilst those giving a smaller air supply, but at a higher pressure, are employed for blowing Bessemer converters, which are, however, gradually becoming obsolete.

As regards their mode of operation, blowing engines may be divided into two main classes, reciprocating and rotary

Reciprocating Blowing Engines.—The blowing end of a reciprocating blowing engine consists of a cylinder (or cylinders) fitted with admission and discharge valves, the piston being caused to move to and fro by being direct-coupled to a steam engine or gas engine. As a rule the pressures generated are so low that it is not worth while to make use of any special arrangement for getting rid of the heat evolved by the compression of the air

The simplest type of construction of a blowing cylinder is shown diagrammatically in longitudinal section in fig. 1. A and A' are the air admission valves and D and D' the air discharge valves which open into a chamber or receiver connected with the air delivery pipe. When the piston is moving in the direction indicated by the arrow, A' and D are open and A and D' are closed, these relations being reversed when the piston is travelling in the opposite direction. Sometimes the air admission valves are open to the atmosphere, as indicated in fig. 1, but in many modern instances the air is drawn from a casing to which an air pipe is connected opening outside the engine house, so that cool air can be used. Sometimes the incoming air is artificially refrigerated, and also dried, by passing it through a "silica gel" tower. Moreover, a filter can be disposed at the mouth of the suction pipe, so that only dust-free air is aspirated. In the simple form of cylinder here illustrated, the valves are opened and closed by the pressure of the air itself, and hence do not open or close instantaneously the moment the direction of the piston is reversed, because it necessarily takes some little pressure, positive or negative, to overcome the inertia of the valve. This drawback is got over in modern blowing engines by the employment of mechanically actuated valves. There is also considerable difference in the construction of the valves themselves; the old form of simple flap valve is now hardly ever seen, annular or disk valves of thin sheet steel, poppet valves, slide valves and cylindrical rotating valves being all used by different makers.

Blowing cylinders may be arranged either horizontally, if space is not important; or vertically, in which case they are more difficult to repair. Large blowing engines, such as are used for blast-furnaces, are mostly of the vertical type in Great Britain and of the horizontal type in the United States. It is a matter of indifference whether in the vertical engine the blowing cylinder is above or below the steam cylinder, but the former is the more usual place. Blowing engines, whether vertical or horizontal, must be arranged with a heavy fly-wheel, for it must be remembered that the air pressure in the blowing cylinder reaches its maximum at the same time that the steam pressure in the steam end is falling

rapidly. Modern blowing engines consist as a rule of a pair of blowing cylinders direct-coupled to a corresponding pair of steam cylinders, the latter being often low and high pressure respectively, and thus forming a cross-compound engine. A good example of this type is shown in fig. 2. (See also *Journal of the Iron and Steel Institute*, 1889, No. 1, fig. 2, plate 2.) The boiler pressure is 100lb. per sq.in., the two steam cylinders being 36in. and 64in. in diameter respectively. The blowing cylinders work up to a maximum pressure of 10lb. per sq.in.; they are 88in. in diameter and 60in. stroke, and running at 23 revs. per min. they are capable of blowing 19,000 cu ft. of free air per minute.

A number of reciprocating blowing engines are now quite often gas-driven instead of steam-driven, the waste gas of the blast-

furnace being as a general rule employed for this purpose. Since such gas is of low calorific value (say about 100 BTU per cu ft.), these engines must be of large capacity. The first person to utilize blast-furnace gas in explosion engines was B. H. Thwaite about 1894; and the first gas-driven blowing engine (of 600 h.p.) was built at Seraing, Belgium, in 1899. One of the most serious difficulties connected with this use of the blast-furnace gas is the necessity of thoroughly cleaning the waste gas from the dust with which it is always charged; after leaving the ordinary furnace dust-catchers, the gas contains about 5 grams of dust per cu.

FIG. 3.—TANDEM TWO-CYLINDER GAS BLOWING ENGINE. THE TWO CYLINDERS OF THIS ENGINE DELIVER A BLAST AT A PRESSURE OF 10 LB. PER SQ. INCH

metre, and for use in gas engines this must be reduced to below 0.01 gram per cu metre (*see IRON AND STEEL*). Various methods of cleaning have been employed successfully. A gas blowing engine suitable for this purpose is shown in vertical section and plan (fig. 3). This is a double acting tandem, two-cylinder gas engine, developing 1,250 b.h.p., the gas cylinders being 39½ in. in diameter by 47½ in. stroke, direct-coupled to a blowing cylinder of 93 in.

BY COURTESY OF THE INGERSOLL RAND COMPANY, LTD

FIG. 4.—VERTICAL SECTION THROUGH THE BLOWING END OF A TURBO-BLOWER. THE FIVE IMPELLERS ARE ATTACHED TO THE CENTRAL SHAFT. THIS IS A TYPE MUCH USED FOR BLAST-FURNACE WORK

diameter. This engine made 90 strokes per minute, giving a blast of free air equal to 29,400 cu.ft. per minute, which it delivered at a pressure of 10 lb. per sq. in., the actual volume of air delivered at this pressure being 17,600 cu.ft. per minute. The consumption of blast-furnace gas per b.h.p. per hour in these engines was approximately 100 cu.ft. at full load, therefore about 10,000 B.T.U. per b.h.p. per hour.

Where coke-oven plants are combined with blast-furnaces, it is possible to mix a proportion of rich coke-oven gas (with about 450 B.T.U. per cu.ft.) with the blast-furnace gas, such a mixture giving excellent results.

Turbo-blowers.—A form of blowing engine that has obtained much popularity in recent years since its introduction in 1902 is the turbo-blowing-engine, or, as it is often called, the turbo-blower—which may be described as a reversed steam turbine. In the turbo-blower the discs are mechanically rotated and become impellers which force the air through the guides and thus gradu-

ally raise it to the required pressure; the greater the number of stages the greater is the pressure obtained. Turbo-blowing engines are at their best when delivering large quantities of air at relatively low pressures, and are, therefore, particularly well adapted for blast furnace work. In practice, since their speed of revolution has to be tolerably high, they are generally direct-coupled to steam turbines, though occasionally they are driven in the same way by electric motors. The general arrangements of a turbo-blowing engine may be seen from fig. 4, which is a vertical section through the blowing end of one of a pair of such engines; as will be seen, it is a five-stage blowing engine, the five impellers being shown attached to the central shaft, and it is intended to compress 50,000 cu.ft. of free air per minute up to a pressure of 15 lb. per sq. inch. The usual American practice is to build such turbo-blowing engines with capacities ranging from 30,000 to 80,000 cu.ft. of free air per min. and for pressures ranging between 12 and 25 or exceptionally up to 30 lb. per sq. inch. For the higher pressures the turbine casing is jacketed to receive a flow of cold water and thus absorb the heat generated by the compression of the air. These blowing engines run at between 2,750 and 4,000 revs per min., and the horse-power developed by the steam turbine is from 3,000 to 9,000 b.h.p.

Fig. 6 shows a vertical section through steam turbine and turbo-blower complete, built for British blast-furnaces. As will be seen

BY COURTESY OF MESSRS ALLDAYS AND SONS, LIMITED

FIG. 5.—VERTICAL SECTION THROUGH ROOTS BLOWER

The curved arrows indicate direction of rotation of impellers; the straight arrows indicate the course of air flow

from the section, the turbo-blower is a single flow three-stage blower and is intended to compress 20,000 cu.ft. of free air per minute against a maximum pressure of 10 lb. per sq. inch. Generally speaking, British blast-furnace practice demands both smaller quantities of air and lower pressures than are usual in the United States. As compared with gas-driven blowing engines, turbo-blowing-engines are somewhat less efficient, but they generally cost less in up-keep and are, generally speaking, more reliable, this latter quality being of the utmost importance for appliances that are required to work continuously for long periods, as is the case with blast-furnace blowing engines.

Positive Blowers.—Finally, mention may be made of the positive blower, such as is generally used for foundry cupolas and for water-jacket furnaces for smelting copper and lead. The most widely employed blower for these purposes is shown in cross section (fig. 5). It will be seen that the blower consists of a couple of impellers, dumb-bell shaped in cross section, which are rotated

FIG 6—VERTICAL SECTION THROUGH A 3-STAGE SINGLE-FLOW TURBO-BLOWER HERE THE STEAM-TURBINE IS COUPLED TO THE BLOWER DIRECT

within a casing in such a way as to force a continuous stream of air through it. These blowers are in the majority of cases belt-driven, but may also be driven by gearing or at times direct-coupled to a dynamo. They are positive, inasmuch as the quantity of air delivered by their agency depends entirely upon the speed of rotation, and is not affected by the pressure against which they are called upon to work. What are known as low-pressure blowers are usually built for pressures up to 1½ lb. or 2 lb. per sq. in., whilst high-pressure blowers will work up to pressures of 5 lb. per sq. inch. For ordinary cupola practice about 1 lb. per sq. in. is required

(H. Lo.)

BLOWITZ, HENRI GEORGES STEPHAN ADOLPHE DE (1825–1903), Anglo-French journalist, was born, according to the account given in his memoirs, at his father's château in Bohemia on Dec. 28 1825. Young Blowitz became acquainted in Paris with M. de Falloux, minister of public instruction, who appointed him teacher of foreign languages at the Tours Lycée, whence, after some years, he was transferred to the Marseilles Lycée. In 1859 he resigned his post, but remained at Marseilles, devoting himself to literature and politics. In 1869 information which he supplied to a legitimist newspaper at Marseilles with regard to the candidature of M. de Lesseps as deputy for that city led to a demand for his expulsion from France. He was, however, allowed to remain, but had to retire to the country. In 1870 his predictions of the approaching fall of the empire caused the demand for his expulsion to be renewed. While his case was under discussion the battle of Sedan was fought, and Blowitz applied for naturalization as a French subject. Once naturalized, he went to Marseilles. Thiers employed him in collecting information at Versailles and then offered him the French consulship at Riga. But Laurence Oliphant, then Paris correspondent of *The Times*, for which Blowitz had already done some occasional work, asked him to act as his regular assistant for a time. In 1873 Blowitz became chief Paris correspondent to *The Times*, and became famous in journalism and diplomacy.

In 1875 the duc de Decazes, then French foreign minister, showed Blowitz a confidential despatch from the French ambassador in Berlin (in which the latter warned his government that Germany was contemplating an attack on France), and requested the correspondent to expose the German designs in *The Times*. Blowitz's most sensational journalistic feat was achieved in 1878, when his enterprise enabled *The Times* to publish the whole text

of the treaty of Berlin at the actual moment that the treaty was being signed in Germany. In 1877 and again in 1888 Blowitz rendered considerable service to the French Government by his exposure of internal designs upon the Republic. He died on Jan. 18 1903.

My Memoirs, by H. S. de Blowitz, was published in 1903.

BLOWPIPE, in the arts and chemistry, a tube for directing a jet of air into a fire or into the flame of a lamp or gas jet, for the purpose of producing a high temperature by accelerating the combustion. The blowpipe has been in common use from the earliest times for soldering metals and working glass, but its introduction into chemical analysis is to be ascribed to A. F. Cronstedt, who employed it for testing minerals. The first work on this application of the blowpipe was by G. v. Engeström, and was published in 1770 as an appendix to a treatise on mineralogy. Its application was improved by T. O. Bergman, J. G. Gahn, and especially by J. J. Berzelius, C. F. Plattner, and R. W. Bunsen.

The simplest and oldest form of blowpipe is a conical brass tube, about 7 in. in length, curved at the small end into a right angle, and terminating in a small round orifice, which is applied to the flame, while the larger end is applied to the mouth. Where the blast has to be kept up for only a few seconds this instrument is quite serviceable, but in longer chemical operations inconvenience arises from the condensation of moisture exhaled by the lungs in the tube. Hence most blowpipes are now made with a cavity for retaining the moisture. The mode of blowing is peculiar and requires some practice; an uninterrupted blast is kept up by the muscular action of the cheeks, while the ordinary respiration goes on through the nostrils.

If the flame of a candle or lamp be closely examined, it will be seen to consist of four parts—(a) a deep blue ring at the base; (b) a dark cone in the centre; (c) a luminous portion round this, and (d) an exterior pale blue envelope (*see FLAME*). In blowpipe work only two of these four parts are made use of, viz., the pale envelope, for oxidation, and the luminous portion, for reduction. To obtain a good *oxidizing flame*, the blowpipe is held with its nozzle inserted in the edge of the flame close over the level of the wick, and blown into gently and evenly. A conical jet is thus produced, consisting of an inner cone, with an outer one commencing near its apex—the former, corresponding to (a) in the free flame, blue and well defined; the latter corresponding to (d),

pale blue and vague. The heat is greatest just beyond the point of the inner cone, combustion being there most complete. Oxidation is better effected (if a very high temperature be not required) the farther the substance is from the apex of the inner cone, for the air has thus freer access. To obtain a good *reducing flame* (in which the combustible matter, very hot, but not yet burned, is disposed to take oxygen from any compound containing it), the nozzle, with smaller orifice, should just touch the flame at a point higher above the wick, and a somewhat weaker current of air should be blown. The flame then appears as a long, narrow, luminous cone, the end being enveloped by a dimly visible portion of flame corresponding to that which surrounds the free flame, while there is also a dark nucleus about the wick. The substance to be reduced is brought into the luminous portion, where the reducing power is strongest.

Various materials are used as supports for substances in the blowpipe flame; the principal are charcoal, plaster of Paris, platinum, and glass or porcelain. *Charcoal* is valuable for its infusibility and low conductivity for heat (allowing substances to be strongly heated upon it) and for its powerful reducing properties; so that it is chiefly employed in testing the fusibility of minerals and in reduction. Blocks of compressed charcoal are now made especially for use with the blowpipe. Gas-carbon is sometimes used, since it is more permanent in the flame than wood charcoal. *Platinum* is employed in oxidizing processes and in the fusion of substances with fluxes; also in observing the colouring effect of substances on the blowpipe flame (which effect is apt to be somewhat masked by charcoal). Most commonly it is used in the form of wire, with a small bend or loop at the end.

The mouth blowpipe is unsuitable for the production of a large flame and cannot be used for any lengthy operations; hence recourse must be made to types in which the air-blast is occasioned by mechanical means. The laboratory form in common use consists of a bellows worked by either hand or foot, and a special type of gas burner formed of two concentric tubes, one conveying the blast, the other the gas; the supply of air and gas being regulated by stopcocks. Blowpipes in which oxygen is used as the blast are commonly used in conducting fusions which require a temperature above that yielded by the air-blowpipe.

For the applications of the blowpipe in chemical analysis see *CHEMISTRY: Analytical*.

BLÜCHER, GEBHARD LEBERECHT VON (1742–1819), Prussian general field-marshal, prince of Wahlstadt in Silesia, was born at Rostock on Dec. 16, 1742. In his 14th year he entered the service of Sweden, and in the Pomeranian campaign of 1760 he was taken prisoner by the Prussians. He was persuaded by his captors to enter the Prussian service. He took part in the later battles of the Seven Years' War as a hussar officer. In peace his ardent spirit led him into excesses of all kinds, and being passed over for promotion, he sent in his resignation, to which Frederick the Great replied, "Captain Blücher can take himself to the devil" (1773). He now settled down to farming, and in 15 years he had acquired an honourable independence. After the death of Frederick the Great he was reinstated as major in his old regiment, the Red Hussars. He took part in the expedition to Holland in 1787, and in the following year became lieutenant-colonel. In 1789 he received the order *pour le mérite*, and in 1794 he became colonel of the Red Hussars. In 1793 and 1794 he distinguished himself in cavalry actions against the French, and for his success at Kirrweiler he was made a major-general. In 1801 he was promoted lieutenant-general.

He was one of the leaders of the war party in Prussia in 1805–06, and served as a cavalry general in the disastrous campaign of the latter year. At Auerstädt Blücher repeatedly charged at the head of the Prussian cavalry, but without success. In the retreat of the broken armies he commanded the rear-guard of Prince Hohenlohe's corps, and upon the capitulation of the main body of Prenzlau he carried off a remnant of the Prussian army to the northward, and in the neighbourhood of Lübeck he fought a series of combats, which, however, ended in his being forced to surrender at Ratkau (Nov. 7, 1806). His adversaries testified in his capitulation that it was caused by "want of provisions and

ammunition." He was soon exchanged for General Victor, and was actively employed in Pomerania, at Berlin, and at Königsberg until the conclusion of the war. After the war, Blücher was looked upon as the natural leader of the patriot party, with which he was in close touch during the period of Napoleonic domination. His hopes of an alliance with Austria in the war of 1809 were disappointed. In that year he was made general of cavalry. In 1812 he expressed himself so openly on the alliance of Russia with France that he was recalled from his military governorship of Pomerania and virtually banished from the court.

When at last the Napoleonic domination was ended by the outbreak of the War of Liberation in 1813, Blücher was at once placed in high command, and he was present at Lützen and Bautzen. During the armistice he worked at the organization of the Prussian forces, and when the war was resumed Blücher became commander-in-chief of the Army of Silesia, with Gneisenau and Müffling as his principal staff officers, and 40,000 Prussians and 50,000 Russians under his control. (The autumn campaign of 1813 will be found described in the article *NAPOLEONIC CAMPAIGNS*.) He met and defeated Marshal Macdonald at the Katzbach, and by his victory over Marmont at Möckern led the way to the decisive overthrow of Napoleon at Leipzig, which place was stormed by Blücher's own army on the evening of the last day of the battle. On the day of Möckern (Oct. 16, 1813) Blücher was made a general field-marshal, and after the victory he pursued the routed French with his accustomed energy. In the winter of 1813–14 Blücher, with his chief staff officers, was mainly instrumental in inducing the allied sovereigns to carry the war into France itself. The combat of Brienne and the battle of La Rothière were the chief incidents of the first stage of the celebrated campaign of 1814, and they were quickly followed by the victories of Napoleon over Blücher at Champaubert, Vauxchamps and Montmirail. But the courage of the Prussian leader was undiminished, and his great victory of Laon (March 9–10) practically decided the fate of the campaign. After this Blücher infused some of his own energy into the operations of Prince Schwarzenberg's Army of Bohemia, and this army and the Army of Silesia marched in one body direct upon Paris. The victory of Montmartre, the entry of the allies into the French capital, and the overthrow of the First Empire were the direct consequences. Blücher was disposed to make a severe retaliation upon Paris for the calamities that Prussia had suffered from the armies of France, had not the allied commanders intervened to prevent it. Blowing up the bridge of Jena was said to be one of his contemplated acts. On June 3, 1814, he was made prince of Wahlstadt (in Silesia on the Katzbach battlefield).

After the peace he retired to Silesia, but the return of Napoleon soon called him to further service. He was put in command of the Army of the Lower Rhine with General Gneisenau as his chief of staff (*see WATERLOO CAMPAIGN*). In the campaign of 1815 the Prussians sustained a very severe defeat at the outset at Ligny (June 16), in the course of which the old field-marshal was ridden over by cavalry charges, his life being saved only by the devotion of his aide-de-camp, Count Nostitz. He was unable to resume command for some hours, and Gneisenau drew off the defeated army. The relations of the Prussian and the English headquarters were at this time very complicated, and it is uncertain whether Blücher himself was responsible for the daring resolution to march to Wellington's assistance. This was in fact done, and after an incredibly severe march Blücher's army intervened with decisive and crushing effect in the battle of Waterloo. The great victory was converted into a success absolutely decisive of the war by the relentless pursuit of the Prussians, and the allies re-entered Paris on July 7. Prince Blücher remained in the French capital for some months, but his age and infirmities compelled him to retire to his Silesian residence at Kriebitz, where he died on Sept. 12, 1819, aged 77. He retained to the end of his life that wildness of character and proneness to excesses which had caused his dismissal from the army in his youth. The qualities which made him a great general were his patriotism and the hatred of French domination which inspired every success of the War of Liberation. He was twice married,

and had, by his first marriage, two sons and a daughter. Statues were erected to his memory at Berlin, Breslau and Rostock.

Of the various lives of Prince Blücher that by Varnhagen von Ense (1827) is the most important. His *Campagne Journal der Jahre 1793 und 1794* appeared in 1796, and his *Gevanken über Formierung einer preussischen Nationalarmee* in 1805.

See J. Scherr, *Blücher, seine Zeit und sein Leben* (Leipzig, 1862-63); K. W. von Schöning, *Geschichte des Königlich-preussischen 5. Husaren-Regiments mit besonderer Rücksicht auf Blücher* (1843); F. Schulze, *Briefe und Reden* (2nd ed. 1917); J. Herold, *Gebhard Leberecht Blücher* (vol. i., 1921).

BLUE, the name of a colour. From the fact of various parties having adopted the colour blue as their badge, various classes of people have come to be known as "blue" or "blues"; thus "true blue" meant originally a staunch Presbyterian, the Covenanters having adopted blue as their colour as opposed to red, the royal colour. From the blue ribbon worn by the knights of the Garter comes the use of the phrase as the highest mark of distinction that can be worn, especially applied on the turf to the winning of the most famous English flat-race, known as the Derby. The "Blue Peter" is a rectangular blue flag, with a white square in the centre, hoisted at the top of the foremast as a signal that a vessel is about to leave port. At Oxford and Cambridge a man who represents his university in certain athletic sports is called a "blue" from the "colours" he is then entitled to wear, dark blue for Oxford and light blue for Cambridge.

BLUEBEARD, the monster of Charles Perrault's tale of *Barbe Bleue*, who murdered his wives and hid their bodies in a locked room. Perrault's tale was first printed in his *Histoires et contes du temps passé* (1697). The essentials of the story—Bluebeard's prohibition to his wife to open a certain door during his absence, her disobedience, her discovery of a gruesome secret, and her timely rescue from death—are to be found in other folklore stories, none of which, however, has attained the fame of *Bluebeard*. Though Perrault does not state the number of his crimes, Bluebeard is generally credited with the murder of seven wives. His history belongs to the common stock of folklore, and has even been ingeniously fitted with a mythical interpretation. In France the Bluebeard legend has its local habitation in Brittany, but whether the existing traditions connecting him with Gilles de Rais (*q.v.*) or Comorre the Cursed, a Breton chief of the 6th century, were anterior to Perrault's time, we have no means of determining. The identification of Bluebeard with Gilles de Rais, the *bête d'extermination* of Michelet's forcible language, persists locally in the neighbourhood of the various castles of the baron, especially at Machecoul and Tiffauges, the chief scenes of his infamous crimes. Gilles de Rais, however, had only one wife, who survived him, and his victims were in the majority of cases young boys. The less widespread identification of Bluebeard with Comorre is supported by a series of frescoes dating only a few years later than the publication of Perrault's story, in a chapel at St. Nicolas de Bieuzy dedicated to St. Tryphine, in which the tale of Bluebeard is depicted as the story of the saint, who in history was the wife of Comorre. Comorre or Conomor had his original headquarters at Carhaix, in Finistère. Alain Bouchard (*Grandes croniques*, Nantes, 1531) asserts that Comorre had already put several wives to death before he married Tryphine. In the *Légendes bretonnes* of the count d'Amezeuil the church legend becomes a charming fairy tale.

See also E. A. Vizetelly, *Bluebeard* (1902); E. Sidney Hartland, "The Forbidden Chamber," in *Folklore*, vol. iii. (1885); and the editions of the *Contes* of Charles Perrault (*q.v.*). Cf. A. France, *Les Sept Femmes de Barbe Bleue* (1909).

BLUEBELL, the name applied in England to the wild hyacinth (*Scilla festalis*) and in Scotland and the United States and Canada to the harebell (*Campanula rotundifolia*), in both cases on account of the shape of the flowers. In the eastern United States the Greek valerian (*Polemonium reptans*) is also called bluebell; on the Pacific coast *Phacelia minor*, a plant of the waterleaf family (Hydrophyllaceae), is known as the California bluebell. (See **CAMPANULA**; **HYACINTH**; **VIRGINIA COWSLIP**.)

BLUEBELLS: see **VIRGINIA COWSLIP**

BLUEBERRY (*Vaccinium*), the name given in North America to certain widely branching shrubs of the heath or

huckleberry family, *Ericaceae* or *Vacciniaceae*, prized for their sweet, edible fruits. The British species of the genus are called bilberries (*q.v.*). The most important North American forms are the high or swamp blueberry of the North (*V. corymbosum*), 4 ft. to 12 ft. high, native to bogs and swamps from Maine and Quebec to Minnesota and southward, the fruit blue with a thick bloom; the high or swamp blueberry of the South (*V. virgatum*), 2 ft. to 12 ft. high, found in swamps and pine barrens from Virginia to Florida, the fruit black with little bloom; the high black blueberry (*V. atrococcum*), in range and other respects similar to *V. corymbosum* except that the fruit is black and shiny; the low, sweet or early blueberry (*V. pennsylvanicum*), 1 ft. to 2 ft. high, supplying the bulk of the blueberries of the market, abundant on pine barrens, dry heaths and mountain lands from Newfoundland to Saskatchewan and south to Virginia and Illinois, fruit blue-black or red, with or without a bloom; the Canadian blueberry (*V. canadense*), similar in size and range to *V. pennsylvanicum*, but with more acid, smaller and later fruits; and the late low blueberry (*V. vacillans*), 1 ft. to 3 ft. high, of sandy or rocky places from Maine to Wisconsin and south to Georgia and Kansas, the fruit blue with a heavy bloom.

Blueberries grow only in acid soils and must have on their roots a certain fungus which seems to be necessary to their processes of nutrition. Some species succeed on upland and others on marsh or bog land, but there must be no standing water on their roots in summer. In southern Alabama and northern Florida hundreds of acres of selected native plants are grown on upland soils. The high blueberry (*V. corymbosum*) from selected native plants and seedlings in plant breeding is grown commercially in New Jersey. Several of these seedlings have been named; the largest fruited bear berries about $\frac{3}{4}$ in. in diameter.

(C. P. C.)

BLUEBIRD (*Sialia sialis*), an American bird, blue in plumage, with a red breast. A harbinger of spring, this is one of the most familiar and best-loved birds in the United States. The nest is built in holes in trees and similar situations, but the bluebird is all too often driven out of these situations by the imported house-sparrow (*Passer domesticus*).

Other species are the mountain bluebird (*S. arctica*), of the Rocky mountains and more western states, an exquisite azure; the western bluebird (*S. mexicana occidentalis*); and the chestnut-backed bluebird (*S. m. bairdi*).

BLUE BONNET (*Lupinus texensis*), a North American plant of the pea or pulse family (Leguminosae), native to the plains of Texas. It grows about a foot high, has silky-haired leaves composed of five leaflets, and bears handsome clusters of purplish-blue flowers, marked in the centre with white or yellow. As early as March the plant in bloom covers immense slopes in southern and western Texas with a blue carpet. The blue bonnet is one of the most popular wild flowers of the Southwest, and has been adopted as the State flower of Texas. In Scotland the name is given to the bluebottle (*Centaurea Cyanus*) and also to the blue scabious or devil's-bit (*Scabiosa Succisa*). See **LUPINE**.

BLUE-BOOK, the general name given to the reports and other documents printed by order of the British Parliament, so called from their being usually covered with blue paper, though some are bound in drab and others have white covers. The printing of its proceedings was first adopted by the House of Commons in 1681; in 1836 began the official practice of selling parliamentary papers to the public. All notices of questions, resolutions, votes and proceedings in both houses of parliament are issued each day during the session; other publications include the various papers issued by the different government departments, the reports of committees and commissions of inquiry, public bills, as well as returns, correspondence, etc., specially ordered to be printed by either house.

Most foreign countries have a distinctive colour for the binding of their official publications. That of the United States varies, but foreign diplomatic correspondence is bound in red. German official publications are bound in white; French, in yellow; Austrian, in red; Portuguese, in white; Italian, in green; Spanish, in red; Mexican, in green; Japanese, in grey; Chinese, in yellow.

BLUE-BOTTLE (*Musca vomitoria*), a large fly (see DIPTERA), common in Europe generally and in great disfavour on account of its habit of laying its eggs in meat. The body is blue (whence the name) and the flight noisy. *M. caesar*, the green-bottle, is only less common and is also found in America. The blow-fly (*Sarcophaga carnaria*) is larger, with an abdomen of blackish-brown, assuming a blue tint in certain aspects. The larvae are not confined to dead animals, but occur on living earthworms and even on sheep. *S. mortuorum*, with a steel-blue abdomen, is an allied species. For the plant, blue bottle, see CORN-FLLOWER.

BLUEFIELD, a rapidly growing city of Mercer county, West Virginia, U.S.A., in the Appalachian mountains on the southern boundary of the State, amid beautiful scenery, at an elevation of 2,600ft. It is served by the Norfolk and Western railway, and by regular motor-bus service as far as Huntington, Asheville and Knoxville. The population increased from 4,644 in 1900 to 15,282 in 1920, of whom 2,718 were negroes; and 19,343 in 1925, according to a special enumeration by the U.S. census bureau. Including the adjoining city of Bluefield, Va., the population of the urban unit in 1925 was 23,329.

Bluefield is the outlet for the Pocahontas coal field, which in 1924 produced 17,143,000 tons, and its growth is due primarily to the development of this field. The nearest mine, however, is 12m. from the city. In 1883, when the first shipments of this famous "smokeless" coal were made, the site of the city was covered with the bluegrass fields which gave it its name. Practically all the buildings are new, substantial and modern in type, designed in anticipation of further growth. In a decade over \$2,000,000 was spent on public school buildings alone. There is a State normal school for negroes (Bluefield institute). The Concord State normal school for white students is at Athens, 18m. away, over a hard-surfaced road. Bluefield was incorporated in 1889 and adopted a city manager form of government in 1921.

BLUEFIELDS, the principal Caribbean port of Nicaragua, Central America. Pop. 7,226. It is located near the mouth of the Bluefields river, and is visited by steamers from New Orleans and coasting schooners, while a river steamer plies the Bluefields river and considerable trade is carried on with the interior, where bananas, lumber, cattle and gold are produced. The actual port is El Bluff, across the bay, where the customs are in charge of an American employee of the Nicaraguan government. Bluefields has been the scene of several revolutionary outbreaks, the custom in recent years having been for U.S. marines to land and establish a "neutral zone" around the centre of the town, where the banks and houses of the foreign residents are situated.

BLUE GRASS (*Poa pratensis*), a perennial rough-stalked meadow grass which owes its name to the tiny, bright blue flowers it bears. It is also called June grass, spear grass and meadow grass. The seeds are brown in colour. Common to meadows all over temperate parts of the United States, Europe and Asia, it has reached greatest perfection in the limestone regions of Kentucky and Tennessee. Because of the plentiful and high-quality blue grass crops in this State, Kentucky is known as the "Blue Grass State."

Blue grass, while usually sown from seed by the farmer for pasture land, is generally present in permanent grass-lands which are moderately well drained and in a fair condition of fertility, and is indispensable for any mixed pasture in the eastern United States. It also yields hay of fine quality, but not of great quantity. It is widely spreading in habit and under favourable conditions forms a dense sod. It grows in clump-like formations with a considerable growth of lower leaves; the stem is comparatively short and slender. For sowing purposes, the blue grass seeds are harvested and before being marketed are subjected to a rubbing process which frees them of their silky, webby hairs.

The Texas blue grass (*P. arachnifera*) is also a valuable pasture plant, standing drought better than *P. pratensis*. The Canada blue grass (*P. compressa*) is inferior. There are about 150 species of *Poa*, a cosmopolitan genus, of which 8 species occur in Great Britain and about 75 in North America.

BLUE ISLAND, a city of Cook county (Illinois), U.S.A., 16m. S. of the Chicago Loop, on a ridge six miles long by two to three wide, which rises abruptly out of the prairie to a height of 40-50ft. It is on the Dixie highway and the Calumet-Sag canal; and is served by the Rock Island, the Illinois Central, and five other railways. The population was 11,424 in 1920, and was estimated at 13,184 in 1925. The Chicago freight yards of the Rock Island lines are situated here, as well as the division roundhouse and repair shops, and shops of other railways. There are large brickyards, a canning plant, and factories making steel and wire products, tile, and dental supplies. Blue Island was settled in 1835 and became a city in 1902.

BLUE-JOINT or **BLUE-STEM**, a name given in North America to various tall coarse grasses with smooth stems overcast with a whitish bloom, especially to certain species of *Agropyron*, *Andropogon* and *Calamagostis*.

BLUEPRINT, a photographic print showing white lines on a blue background; sometimes called a cyanotype. It is used instead of original plans by architects and engineers to guide them during the construction of buildings, bridges or other engineering work. The photograph is obtained by preparing sensitized paper which is brushed with a solution of one part of ammonium ferric citrate in four parts of water and then treated with a solution made up of one part of potassium ferricyanide in four parts of water. There are many variations of this process, which was discovered by Sir John Herschel. It was based on the reduction of a ferric salt to a ferrous salt by the action of light in the presence of organic matter. The paper is left in a dark place to dry. The drawing, which is usually on vellum or on a very high grade of linen, is placed over the sensitized paper, and the combination is then exposed to the sun or to an intense arc light for 10 to 12 minutes. After the exposure the paper is washed with pure water. The lines of the drawing protect the cyanide from the action of the light, and when the paper is washed, white lines appear corresponding to the black lines of the drawing. The negative may be used over again. Paper of a similar type, but with a brown background, may be obtained by adding a solution of 50 grains of uranium sulphate in two ounces of water to a solution of 120 grains of potassium ferricyanide in two ounces of water. Various modern processes have been developed whereby dark lines may be obtained on a light background. As a matter of commercial practice, architects and engineers do not prepare their own blueprints, but take their plans to specialists. The latter use large machines of the cylinder type. (A. L. WE.)

BLUES, a term applied to a particular type of "jazz" or "rag-time" music which has enjoyed much popular favour in the 20th century. Blues, in their original vocal form, are distinguished chiefly by their peculiar structure—three lines of verse—although they take their name from their most common motif, that of depression. Originating among the illiterate Southern negroes, they were first brought before the notice of the general public in 1909. In that year a mayoral contest was taking place in Memphis in which three candidates were competing, assisted by as many coloured bands. Mr. W. C. Handy, the son and grandson of Methodist ministers, was in charge of one of these. His candidate was a Mr. E. H. Crump, and one of the airs which he devised for his orchestra was named after his employer. So popular did it become that Mr. Crump was elected mayor, Mr. Handy became locally famous, the term "Blues" appeared out of nowhere, and "Mr. Crump" rechristened "Memphis Blues," started the avalanche of this form of music that has since swept over the country. Because of their undistinguished origin and associations the "Blues" were frowned upon at first but they made their way notwithstanding and, with the appearance of Mr. Carpenter's "Krazy Kat" in 1922 and of Mr. Gershwin's "Rhapsody in Blue" in 1924, Mr. James Weldon Johnson's prediction, made in 1921, that they would ultimately have an effect on serious modern music, may be said to have been realized. While melancholy is the predominating characteristic of the "Blues," the personality of the singer is at least equally stressed. He sings of his troubles and resentments, of his strong desires and pleasures, but all in a vein of cheerful philosophy and of uncomplaining acceptance of the blows of fate,

which gives to these ditties a character and fascination all their own.

BLUE SKY LAWS. This term is popularly applied in the United States to statutes enacted in almost all the States to protect credulous purchasers of stocks and bonds from fraud. Formerly, in the absence of definite laws to prevent the practice, promoters of fraudulent schemes and projects made with impunity the most extravagant representations, the sky being the only limit to their claims. Kansas, in 1911, was the first State to enact a Blue Sky law. Among other requirements it compelled investment companies to file with the secretary of State a full description of their business and prohibited their selling securities until authorized by the bank commissioner. Within two years 18 other States had adopted similar legislation. Confronted by laws which seriously threatened their enormous revenue and menaced themselves with imprisonment, promoters of "wild-cat" and other spurious schemes sought in 1914 to have Blue Sky legislation declared unconstitutional. Courts in Michigan, Ohio and Iowa upheld these contentions, but in 1917 the United States Supreme Court decided that Blue Sky laws were constitutional on the ground that "the prevention of deception is within the competency of government." By 1928 all of the States except Nevada and Delaware had Blue Sky laws or their equivalents in force.

BLUESTOCKING, a derisive name for a literary woman. About 1750 Mrs Elizabeth Montagu (*q.v.*) made a determined effort to introduce into society a more intellectual tone by holding assemblies at which literary conversation and discussions were to take the place of cards and gossip. Most of those attending were conspicuous by the plainness of their dress, and a Mr. Benjamin Stillingfleet specially caused comment by always wearing blue or worsted stockings. It was in special reference to him that Mrs Montagu's friends were called the Bluestocking Society. The origin of the name is also attributed to Mrs. Montagu's deliberate adoption of blue stockings as the badge of the society she wished to form. She is said to have obtained the idea from Paris, where in the 17th century there was a social reunion on the lines of that formed in 1400 at Venice, the ladies and men of which wore blue stockings.

BLUETHROAT, a bird, *Luscinia svecica*, allied to the nightingale, but with a blue throat, a dark brown and chestnut tail and a beautiful song. In habits it is shy and skulking. It haunts thickets of birch and willow, especially when swampy, and nests on the ground. Five to seven grey-green eggs, speckled with red-brown, are laid in late June. The bird breeds in northern and central Europe and Asia, migrating to Africa and India in winter. In the white-spotted bluethroat (*L. cyanecula*), the patch on the blue throat is white instead of rufous. It breeds in central Europe.

BLUETS (*Houstonia caerulea*), a popular North American wild flower of the madder family (Rubiaceae), known also as innocence, eyebright and quaker-ladies. It is native to grassy places and wet rocks from Nova Scotia to Wisconsin and south to Georgia and Missouri. This early spring favourite, which grows perennially in matted tufts, with smooth stems 3 in. to 7 in. high, is aptly described by Asa Gray as "a delicate little herb producing in spring a profusion of light blue flowers fading to white, with a yellowish eye." In the southern United States there are about 20 other species of *Houstonia*, some of which are known as bluets, as the thyme-leaved bluets (*H. serpyllifolia*), the least bluets (*H. minima*), the small bluets (*H. patens*), and the purple bluets or Venus' pride (*H. purpurea*) which grows 18 in. high. In Great Britain the corn bluebottle (*Centaurea Cyanus*) is sometimes called bluet.

BLUE WATER HIGHWAY, a thoroughfare extending

from Sarnia to Orillia, in the province of Ontario, Canada. It is about 270m long and for the most part improved with paving. Skirting Lake Huron and Georgian bay for most of the way, it provides an unusual water-side route that passes through Goderich, Southampton, Owen Sound, Collingwood and Midland.

BLUE-WEED: see VIPER'S BUGLOSS

BLUFF, an adjective used of a ship, meaning broad and nearly vertical in the bows (possibly connected with an obsolete Dutch word, *blasf*, broad). Similarly, of a cliff or shore, presenting a bold and nearly perpendicular front; of a person, good-natured and frank, with a rough or abrupt manner. Another word "bluff," perhaps connected with Ger. *verbluffen*, to baffle, meant originally a horse's blinker, the verb meaning to blindfold. It survives in such games as poker, where "to bluff" means to bet heavily on a hand so as to make an opponent believe it to be stronger than it is; hence the phrase "a policy of bluff."

BLUFFTON, a city of Indiana, U.S.A., on the Wabash river and the Nickel Plate railway, 85m. N.E. of Indianapolis; the county seat of Wells county. It has sawmills and planing-mills; manufactures pianos, beds, ironing-boards, windmills, iron pumps, and wooden novelties; and has limestone quarries in its vicinity. The population in 1920 was 5,391.

BLUING, indigo, aniline dyes or prussian blue used in water to bring out the whiteness of clothes after washing. A useful liquid bluing may be made by dissolving 1½ parts of indigo-carmin in 15 parts of water to which ¼ of a part gum arabic has been added.

BLUM, LEON (1872—), French politician, was born on April 9, 1872, in Paris, a member of an Alsatian Jewish family. In 1890 he entered the "École Normale Supérieure," taking his degree in philosophy. He also studied law, and in 1895 entered the Conseil d'État. In 1919, however, he was elected to the Chamber. Whilst still engaged in law he became prominent as a brilliant literary and dramatic critic. His first book, *Nouvelles conversations de Goethe avec Eckermann*, was published anonymously in 1902. He took part in the Dreyfus campaign with Jaurès, whom he loved and admired. From 1905-14 he was dramatic critic on *Comoedia* and *Le Matin*. He joined the Socialist Party in 1899, but it was only during the World War and after that he became an active member. In 1919 he was returned for the Seine to the Chamber of Deputies and strenuously opposed Poincaré's policy concerning the occupation of the Ruhr.

When the Herriot ministry was in office (June 1924 to April 1925) he was the power behind the throne. The Government needed the support of the Socialists. Blum, the real leader of the Socialist group in the Chamber, was therefore able, without assuming any personal responsibility, to control policy to a large extent. After the fall of Herriot's ministry and under the successive cabinets which had to deal with the financial crisis, his influence decreased. When Poincaré constituted his Coalition Government (end of July 1926) Blum and his group went entirely into opposition. He opposed Poincaré's measures and consistently criticized and attacked his policy. An accomplished speaker, Blum in the party congresses has generally been able to carry his point that the Socialists should not assume power without a complete majority, but adopt, according to circumstances, a policy of opposition to all Conservative ministries, or support of such radical ministries as would accept their financial programme.

BLUM, ROBERT FREDERICK (1857-1903), American artist, was born in Cincinnati (O.), on July 9, 1857. He was employed for a time in a lithographic shop, and studied at the McMicken Art School of Design in Cincinnati, and at the Pennsylvania Academy of Fine Arts in Philadelphia, but he was practically self-taught, and early showed great and original talent. He settled in New York in 1879, and his first published sketches—of Japanese jugglers—appeared in *St. Nicholas*. His most important work is a large frieze in the Mendelssohn Music Hall, New York, "Music and the Dance" (1895). His pen-and-ink work for the *Century* magazine attracted wide attention, as did his illustrations for Sir Edwin Arnold's *Japonica*. He had been interested for years in Japan and its art. "A Daughter of Japan," drawn

by Blum and W. J. Baer, was the cover of *Scribner's Magazine* for May 1893, and was one of the earliest pieces of colour-printing for an American magazine. In *Scribner's* for 1893 appeared also his "Artist's Letters from Japan." He was an admirer of Fortuny, whose methods somewhat influenced his work. Blum's Venetian pictures, such as "A Bright Day at Venice" (1882), have lively charm and beauty. He died June 8, 1903 in New York city. He was a member of the National Academy of Design, being elected after his exhibition in 1892 of "The Ameya," and was president of the Painters in Pastel. Although an excellent draughtsman and etcher, it was as a colourist that he chiefly excelled.

BLUMENBACH, JOHANN FRIEDRICH (1752-1840), German physiologist and anthropologist, was born at Gotha on May 11, 1752. After studying medicine at Jena, he graduated doctor at Göttingen in 1775, and was appointed extraordinary professor of medicine in 1776 and ordinary professor in 1778. He died at Göttingen on Jan. 22, 1840. He was the author of *Institutiones Physiologicae* (1787), and of a *Handbuch der vergleichenden Anatomie* (1804), but he is best known for his work in connection with anthropology, of which science he has justly been called the founder. He was the first to show the value of comparative anatomy in the study of man's history, and his craniometrical researches justified his division of the human race into several great varieties or families, of which he enumerated five—the Caucasian or white, the Mongolian or yellow, the Malayan or brown, the Negro or black, and the American or red. His most important anthropological work was his description of 60 human crania published originally in *fasciculi* under the title *Collectionis suae craniorum diversarum gentium illustratae decades* (Göttingen, 1790-1828).

BLUMENTHAL, LEONHARD, COUNT VON (1810-1900), Prussian field-marshal, was born at Schwedt-on-Oder on July 30 1810, and died at Quellendorf on Dec. 22 1900. He entered the Guards as 2nd lieutenant in 1827 and took part in 1848 in the suppression of the Berlin riots. In 1849 he served on the staff of General von Bonin in the Schleswig-Holstein campaign, and so distinguished himself, particularly at Fredericia, that he was appointed chief of the staff of the Schleswig-Holstein army. He was appointed personal adjutant to Prince Frederick Charles in 1858. He was chief of the staff of the 3d Army Corps in 1864 when on the outbreak of the Danish War of 1864 he was made chief of the general staff of the army against Denmark, and distinguished himself particularly at Düppel and the passage to Alsen island. In the war of 1866 Blumenthal was chief of the general staff to the crown prince of Prussia, commanding the 2nd Army. From 1866 to 1870 he commanded the 14th division at Düsseldorf. In the Franco-German War of 1870-71 he was chief of staff of the 3rd Army under the crown prince. In 1873 he became a general of infantry, and ten years later he was made a count. In 1888 he was made a general field-marshal, after which he was in command of the 4th and 3rd Army inspections.

BIBLIOGRAPHY.—Blumenthal's diary of 1866 and 1870-71 has been edited by his son, Count Albrecht von Blumenthal (*Tagebuch des G. F. M. von Blumenthal*), 1902; an English translation (*Journals of Count von Blumenthal*) was published in 1903.

BLUMENTHAL, a town in the Prussian province of Hanover, on the Weser, 12m. N.W. of Bremen. Pop. (1925) 12,765. It is a shipbuilding district, with machine-making and woolcombing industries.

BLUNDERBUSS (a corruption of the Dutch *donder*, thunder, and the Dutch *bus*; cf. Ger. *Büchse*, a box or tube, hence a thunder-box or gun); perverted in form after *blunder* (perhaps with some allusion to its blind or random firing), an obsolete muzzle-loading firearm with a bell-shaped muzzle. Its calibre was large so that it could contain many balls or slugs, and it was intended to be

fired at a short range so that some of the charge was sure to take effect. It was used effectively in the defense of narrow passages. Sometimes made of brass and causing a very loud report. The word is also used by analogy to describe a blundering and random person or talker.

BLUNT, JOHN HENRY (1823-1884), English divine, published among other works an annotated Prayer Book (1867), a *History of the English Reformation* (1868) and a *Book of Church Law* (1872), as well as a *Dictionary of Doctrinal and Historical Theology* (1870), a *Dictionary of Sects and Heresies* (1874), an *Annotated Bible* (3 vols., 1878-79), and a *Cyclopaedia of Religion* (1884).

BLUNT, WILFRID SCAWEN (1840-1922), English poet and publicist, was born Aug. 17 1840 at Petworth House, Sussex, and died at Crabtree Park Sept. 10 1922. He was the son of Francis Scawen Blunt, who served in the Peninsular War and was wounded at Corunna. He was educated at Stonyhurst and Oscott, and entered the diplomatic service in 1858, serving successively at Athens, Madrid, Paris and Lisbon, and in South America. He retired from the service on his marriage with Lady Anne Noel, daughter of the earl of Lovelace and a granddaughter of the poet Byron. In 1872 he succeeded, by the death of his elder brother, to the estate of Crabtree Park, Sussex, where he established a famous stud for the breeding of Arab horses. With Lady Anne Blunt he travelled repeatedly in northern Africa, Asia Minor and Arabia, two of their expeditions being described in Lady Anne's *Bedouins of the Euphrates* (2 vols. 1879) and *A Pilgrimage to Nejd* (2 vols. 1881). Mr. Blunt became known as an ardent sympathizer with Mohammedan aspirations, and in his *Future of Islam* (1888) he directed attention to the forces which afterwards produced the movements of Pan-Islamism and Mahdism. He was a violent opponent of British policy in the Sudan, and in *The Wind and the Whirlwind* (in verse, 1883) prophesied its downfall. He supported the national party in Egypt, and took a prominent part in the defence of Arabi Pasha. *Ideas about India* (1885) was the result of two visits to that country, the second in 1883-84. In 1885 and 1886 he stood unsuccessfully for parliament as a Home Ruler; and in 1887 he was arrested in Ireland while presiding over a political meeting in connection with the agitation on Lord Clanricarde's estate, and was imprisoned for two months in Kilmainham. His best-known volume of verse, *Love Sonnets of Proteus* (1880), is a revelation of his real merits as an emotional poet. *The Poetry of Wilfrid Blunt* (1888), selected and edited by W. E. Henley and Mr. George Wyndham, includes these sonnets together with "Worth Forest, a Pastoral," "Griselda" (described as a "society novel in rhymed verse"), translations from the Arabic, and poems which had appeared in other volumes. He published a complete edition of his poetical works in 1914 and two volumes of *My Diaries* (1919 and 1920).

BLUNTSCHLI, JOHANN KASPAR (1808-1881), Swiss jurist and politician, was born at Zürich, the son of a soap manufacturer. Educated at the *Politische Institut* of his native town and at Berlin and Bonn, he threw himself into Swiss politics, pleading in his *Das Volk und der Souverän* (1830) for constitutionalism and protesting against radical policy. Elected in 1837 a member of the great council, of which he became president, his uncompromising conservatism made his position untenable. After the overthrow of the Sonderbund in 1847 he settled at Munich, where he became professor of constitutional law in 1848.

There he devoted himself to the work of his chair, and published *Allgemeines Staatsrecht* (1851-52); *Lehre vom modernen Staat* (1875-76); and with Karl Brater (1819-69), *Deutsches Staatswörterbuch* (11 vols., 1857-70; abridged by Edgar Loening into 3 vols., 1869-75). Meanwhile he had laboured at his code for the canton of Zürich, *Privatrechtliches Gesetzbuch für den Kanton Zürich* (4 vols., 1854-56). The section, devoted to contracts in this work, served as a model for codes in Switzerland and other countries. In 1861 Bluntschli went to Heidelberg as professor of constitutional law, where he again entered the political arena, endeavouring in his *Geschichte des allgemeinen Staatsrechts und der Politik* (1864) "to stimulate," as he said, "the political conscious-

USED BY ENGLISH AND DUTCH SOLDIERS IN THE
17TH CENTURY

ness of the German people, to cleanse it of prejudices and to further it intellectually." In his new home, Baden, he strove, during the Austro-Prussian War of 1866, to keep the country neutral. From this time Bluntschli became active in the field of international law and wrote *Das moderne Kriegerrecht* (1866); *Das moderne Völkerrecht* (1868) and *Das Beuterecht im Krieg* (1878).

Bluntschli was one of the founders, at Ghent in 1873, of the Institute of International Law, and was the representative of the German emperor at the conference on the international laws of war at Brussels. He died suddenly at Karlsruhe on Oct. 21, 1881. His library was acquired by Johns Hopkins university at Baltimore, U.S.A.

BIBLIOGRAPHY.—Among Bluntschli's works, other than those before mentioned, may be cited *Deutsches Privatrecht* (1853-54); *Deutsche Staatslehre für Gebildete* (1874); and *Deutsche Staatslehre und die heutige Staatenwelt* (1880). For notices of his life and works see his interesting autobiography, *Denkwürdiges aus meinem Leben* (1884); F. von Holtzendorff, *Bluntschli und seine Verdienste um die Staatswissenschaften* (1882); and a biography by Meyer von Kronau in *Allgemeine deutsche Biographie*.

BLYTH, municipal borough and seaport of Northumberland, England, at the mouth of the river Blyth, on a branch of the L.N.E. railway. Pop. (1921) 31,822. This is the port for a considerable coal-mining district, and its harbour, on the south side of the river, is provided with mechanical appliances for shipping coal. There are five dry docks, and upwards of 1½ m. of quays. Timber is largely imported. Some shipbuilding and the manufacture of rope, sails and ship-fittings are carried on, and the fisheries are valuable. A municipal borough since 1922, Blyth is governed by a mayor and corporation of 40 members. Area, 4,312 acres. It is included in the parliamentary borough of Morpeth.

BLYTHEVILLE, a town in north-eastern Arkansas, U.S.A., eight m. from the Mississippi river, at an elevation of 252 ft., and 70 m. north of Memphis; the county seat of Mississippi county. It is on the Mississippi River Scenic highway, and is served by the Frisco, the St. Louis Southwestern and the Blytheville, Leachville, and Arkansas Southern railways. The population increased from 302 in 1900 to 6,447 in 1920, and was estimated locally in 1927 at 12,000, of whom 2,000 were negroes. Blytheville is an important cotton market, handling 250,000 bales a year. Mississippi county alone ginned 156,941 bales in 1925, and ranks third among the counties of the United States in the production of cotton. Poultry, hay, and corn are other big crops.

B'NAI B'RITH (Sons of the Covenant), INDEPENDENT ORDER OF, founded at New York in 1843, is the oldest and largest of the Jewish fraternal organizations. Its membership in 1927 was 78,637, its 607 Lodges and 15 Grand Lodges being distributed over England, the United States, Austria Hungary, Rumania, Egypt and Palestine. It is not a secret society and the ritual is published. Its object is to promote a high morality among Jews, based on standards of charity and brotherly love rather than dogma and ceremonial custom; political and religious discussions were from the first excluded from its debates. In 1851 the first Grand Lodge was established at New York; in 1856 the supreme authority was vested in a central body consisting of one member from each district lodge. The present constitution (adopted 1868) vests this authority in a president elected for five years, an executive body and a court of appeals. The first Lodge in Germany was instituted at Berlin in 1883. Many charitable and other public institutions have been established in the United States and elsewhere by the B'nai B'rith, which has also not only co-operated largely with other Jewish philanthropic organizations in succouring distressed Israelites throughout the world, but has also frequently undertaken relief of distress without reference to the creed of the sufferers. Various American Presidents have paid public tribute to the valuable work of the Order. See *The Jewish Encyclopaedia* (1902) s.v.: B'nai B'rith; also Manual (1926).

The Order in 1928 was primarily engaged in cultural efforts, conducting intensive educational programmes, maintaining Hillel Foundations at the universities, and sustaining the Aleph Zadik Aleph, a junior auxiliary.

BOA, a name formerly applied to all large serpents which, devoid of poison fangs, kill their prey by constriction; but now

confined to that subfamily of the *Boidae* which are devoid of teeth in the praemaxilla and are without supraorbital bones. The others are known as pythons (*q.v.*). The true boas comprise some 40 species in America, the Mediterranean region, Polynesia and Madagascar. All *Boidae* possess vestiges of pelvis and hind limbs, appearing externally as claw-like spurs on each side of the vent but they are so small that they are practically without function in climbing. The usually short tail is prehensile.

One of the commonest species of the genus *Boa* is the *Boa constrictor*, which has a wide range from tropical Mexico to Brazil. The head is covered with small scales. The general colour is a delicate pale brown, with about 18 darker crossbars, which are often connected by a still darker dorso-lateral streak, enclosing large oval spots. One each side is a series of large dark brown spots with light centres. On the tail the markings become bolder, brick red with black and yellow. The under parts are yellowish with black dots. This species rarely reaches a length of more than 10 feet. It climbs well, prefers open forest in the neighbourhood of water, is often found in plantations, where it retires into a hole in the ground, and lives chiefly on birds and small mammals.

BOABDIL (a corruption of the name Abu Abdallāh, the last Moorish king of Granada, called *el chico*, the little, and also *el zogybi*, the unfortunate). A son of Muley Abu'l Hasan, king of Granada, he was proclaimed king in 1482 in place of his father, who was driven from the land. Boabdil invaded Castile, was taken prisoner at Lucena in 1483, and only obtained his freedom by consenting to hold Granada as a tributary kingdom under Ferdinand and Isabella, king and queen of Castile and Aragon. The next few years were consumed in struggles with his father and his uncle Abdullah ez Zagal. In 1401 Boabdil was summoned by Ferdinand and Isabella to surrender the city of Granada, and on his refusal it was besieged by the Castilians. In Jan. 1492, Granada was surrendered, and the king spent some time on the lands which he was allowed to hold in Andalusia. He crossed to Africa, and was said to have been killed in battle fighting for his kinsman, the ruler of Fez. Other authorities claim that he lived at Fez until 1538 in great poverty. The spot from which Boabdil looked for the last time on Granada is still shewn and is known as "the last sigh of the Moor" (*el ultimo suspiro del Moro*). He is said to have been reproached for weeping over the prospect of the Alhambra by his mother, 'Ayesha (whose quarrels had helped to bring about the disastrous family divisions in the Moorish royal family), in the words "Thou dost well to weep like a woman for that which thou hast not defended like a man."

See J. A. Conde, *Dominación de los Arabes en España* (1840), translated into English by Mrs. J. Foster (1854-55); Washington Irving, *The Alhambra* (New York, ed. 1880).

BOADICEA, strictly BOUDICCA, a British queen in the time of the emperor Nero. Her husband Prasutagus ruled the Iceni (in what is now Norfolk) as an autonomous prince under Roman suzerainty. On his death (A.D. 61) without male heir, his dominions were annexed, and the annexation was carried out brutally. He had by his will divided his private wealth between his two daughters and Nero, trusting thereby to win imperial favour for his family. Instead, his wife was scourged (doubtless for resisting the annexation), his daughters outraged, his chief tribesmen plundered. The proud, fierce queen and her people rose, and not alone. With them rose half Britain, enraged, for other causes, at Roman rule. Roman taxation and conscription lay heavy on the province; in addition, the Roman government had just revoked financial concessions made a few years earlier, and L. Annaeus Seneca, who combined the parts of a moralist and a money-lender, had abruptly recalled large loans made from his private wealth to British chiefs. A favourable chance for revolt was provided by the absence of the governor-general, Suetonius Paulinus, and most of his troops in north Wales and Anglesey. All south-east Britain joined the movement. Paulinus rushed back without waiting for his troops, but he could do nothing alone. The Britons burnt the Roman municipalities of Verulam and Colchester, the mart of London, and several military posts, massacred "over 70,000" Romans and Britons friendly to Rome and almost annihilated the Ninth Legion marching from Lincoln to the rescue.

At last Paulinus, who seems to have rejoined his army, met the Britons in the field. The site of the battle is unknown. One writer has put it at Chester; others at London, where King's Cross had once a narrow escape from being christened Boadicea's Cross, and actually for many years bore the name of Battle Bridge, in supposed reference to this battle. Probably, however, it was on Watling Street, between London and Chester. In a desperate soldiers' battle Rome regained the province. Boadicea took poison; thousands of Britons fell in the fight or were hunted down in the ensuing guerrilla. Finally, Rome adopted a kindlier policy, and Britain became quiet. But the scantiness of Romano-British remains in Norfolk may be due to the severity with which the Iceni were crushed.

See Tacitus, *Annals*, xiv.; *Agric.* xv.; Dio lxii. The name Boudicca seems to mean in Celtic much the same as Victoria. (F. J. H.)

BOAR, the name given to the uncastrated male of the domestic pig (q.v.) and to some wild species of the family *Suidae* (see SWINE). The European wild boar (*Sus scrofa*) is distributed over Europe, northern Africa and central and northern Asia. Long extinct in the British Isles, it is still found in marshy woodland districts, where there is plenty of cover, in Spain, Austria, Russia and Germany. From the earliest times, owing to its great strength, speed and ferocity when at bay, the boar has been one of the favourite beasts of the chase.

In Europe the wild boar is still hunted with dogs, but the spear, except when used in emergencies and for giving the *coup de grâce*, has been replaced by the gun. The wild boar of India (*S. cristatus*) is slightly taller than *S. scrofa*, standing about 30 to 40 in. at the shoulder. It is found throughout India, Ceylon and Burma. Here the horse and spear are used for hunting it (see PIG-STICKING).

The boar is one of the four heraldic beasts of venery, and was the cognizance of Richard III., king of England. As an article of food the boar's head was long considered a special delicacy.

BOARD, a plank or long narrow piece of timber. The phrase "to keep one's name on the boards," at Cambridge university, signifies to remain a member of a college. Board was early used of a table, hence such phrases as "bed and board," "board and lodging"; or of a gaming-table, as in the phrase "to sweep the board," meaning to pocket all the stakes. The same meaning leads to "board of trade," etc.

From the meaning of border or side, and especially ship's side, comes "seaboard" meaning sea-coast, and the phrases "aboard" (Fr. *abord*), "overboard," "by the board"; similarly "weather-board," the side of a ship which is to windward, "larboard and starboard" (see STARBOARD).

BOARDING-HOUSE, a private house in which the proprietor provides board and lodging for paying guests. The position of a guest in a boarding-house differs in English law, to some extent, on the one hand from that of a lodger in the ordinary sense of the term, and on the other from that of a guest in an inn. Unlike the lodger, he frequently has not the exclusive occupation of particular rooms. Unlike the guest in an inn, his landlord has no lien upon his property for rent or any other debt due in respect of his board (*Thompson v. Lacy*, 1820, 3 B. and Ald. 283). The landlord is, however, under an obligation to take reasonable care for the safety of property brought by a guest into his house, and is liable for damages in case of breach of this obligation (*Scarborough v. Cosgrove*, 1905, 2 K.B. 803; see BAILMENT). Again, unlike the innkeeper, a boarding-house keeper does not hold himself out as ready to receive all travellers for whom he has accommodation, for which they are ready to pay, and of course he is entitled to get rid of any guest on giving reasonable notice (see *Lamond v. Richard*, 1897, 1 Q.B. 541, 548). What is reasonable notice depends on the terms of the contract;

and, subject thereto, the course of payment of rent is a material circumstance (see LANDLORD AND TENANT). Apparently the same implied warranty of fitness for habitation at the commencement of the tenancy which exists in the case of furnished lodgings (see LODGER AND LODGINGS) exists also in the case of boarding-houses; and the guest in a boarding-house, like a lodger, is entitled to all the usual and necessary conveniences of a dwelling-house. Although a boarding-house keeper is carrying on a "business," water supplied to him by a waterworks company but used only in the house for cleaning, cooking, drinking and sanitary purposes, may be water supplied for "domestic purposes" and not for those of "any trade, manufacture or business" (*Pidgeon v. Great Yarmouth Waterworks Co.* (1902), 1 K.B. 310).

The law of the United States is similar to English law.

Under the French *Code Civile*, claims for subsistence furnished to a debtor and his family during the last year of his life by boarding-house keepers (*maîtres de pension*) are privileged over the generality of movables, the privilege being exercisable after legal expenses, funeral expenses, the expenses of the last illness, and the wages of servants for the year elapsed and what is due for the current year (art. 2,101 [5]). Keepers of taverns (*aubergistes*) and hotels (*hôteliers*) are responsible for the goods of their guests—the committal of which to their custody is regarded as a deposit of necessity (*dépôt nécessaire*). They are liable for the loss of such goods by theft, whether by servants or strangers, but not where the loss is due to *force majeure* (arts. 1,952–54). Their liability for money, securities, jewellery and objects of value of any kind not actually deposited is limited to 1,000 francs (law of April 18, 1911). These provisions, which have been held in France, however, not to extend to *maîtres de pension* (Carpentier, *Code Civil*, art. 1,952, No. 27), are reproduced in substance, and with an extension to boarding-house keepers, in the Civil Codes of Quebec (arts. 1,814, 1,815, 1,994, 2,006) and of St. Lucia (art. 1,889). In Quebec, boarding-house keepers have a lien on the goods of their guests for the value or price of any food or accommodation furnished to them, and have also a right to sell their baggage and other property, if the amount remains unpaid for three months, under conditions similar to those imposed on innkeepers in England (art. 1,816 A; and see INNS AND INNKEEPERS); also in the Civil Code of St. Lucia (arts. 1,714, 1,715).

BOARDING-OUT SYSTEM, in the English Poor Law, the boarding-out of orphan or deserted children with suitable foster-parents. The practice was first authorized in 1868, though for many years previously it had been carried out by some boards of guardians on their own initiative. Boarding-out is governed by an order of the Local Government Board (now the Ministry of Health) issued in 1911, which permits guardians to board-out children within their own union, except in the metropolis, or in localities outside the union. Boarded-out children are subject to regular inspection by boarding-out committees specially appointed by the guardians of the union, and the work of the committees is watched by women inspectors appointed by the Minister of Health. Subject to the exercise of sufficient care in the selection of foster parents and of the children to be boarded-out, satisfactory results are obtained by this system of relieving children who have to be maintained at the public cost; they are given a natural life, and when they grow up they are without effort merged in the general population (Mackay, *Hist. Eng. Poor Law*). See also POOR LAW.

BOARD MAN, in the United States a member of an exchange who appears on the exchange floor and buys and sells. He generally transacts business for his own firm but may, by arrangement, buy and sell for any other member firm.

BOARD OF GUARDIANS: see POOR LAW.

BOARD OF TRADE, in Great Britain a department of Government (see GOVERNMENT DEPARTMENTS), in the United States a term practically synonymous with chamber of commerce, the first of which was established in New York in 1768. In the United States it is a voluntary organization, consisting of the business and professional men of a community whose purpose it is to promote the civic, industrial and general welfare. Since 1900 there has been a notable increase in these organizations

THE EUROPEAN WILD BOAR, WHICH ATTAINS A LENGTH OF 4 FT. AND IS LESS THAN 30 IN. HIGH

in number and effectiveness throughout the United States. Among their various activities are the stimulation of public interest in better streets, playgrounds, schools, museums, and parks, besides such matters as industrial development, insurance, banking and transportation.

BOARD OF TRADE UNIT, the unit of energy adopted by the British Board of Trade. It is equal, in electrical units, to one kilowatt-hour. (See UNITS, PHYSICAL.)

BOARD ROOM, the room where directors or other officers of a corporation or company meet. Also, in the United States, the room in a broker's office equipped for the convenience of customers, and especially for the purpose of supplying them with current market quotations. Tickers bring in the quotations and often customers read directly from the tapes of many machines. It is customary to have a large board on a wall of the room so ruled as to provide a space for each security or commodity quoted, and upon this board are displayed the quotations, as fast as they arrive, in large figures that can be seen from various parts of the room. A similar board in the New York Stock Exchange is generally known as the "Big Board," and that in the Curb exchange as the "Little Board." The "Board Room" is often called the "Customers' Room."

BOAS, FRANZ (1858–), American anthropologist, was born in Minden, Westphalia. He studied at Heidelberg, Bonn, and Kiel (1877–81). During the year 1883–84 he made a scientific journey through the Baffin Land region. The following year he acted as assistant in the royal ethnological museum in Berlin. From 1886–88 he served as associate editor of *Science* and from 1882–92 as instructor in anthropology at Clark university. In 1899 he was appointed professor of anthropology at Columbia university, and from 1901–05 he was curator of ethnology in the American museum of natural history. From 1907–08 he was president of the American anthropological society, and in 1910 held the same office with the New York academy of sciences.

The Jesup North Pacific expedition, which he planned, and himself took part in while connected with the American museum, resulted in disclosure of interesting relations between the north Asiatic and north-west American cultures. The reports covering this expedition were prepared under his editorship.

He wrote *The Growth of Children* (1896, 1904), *Changes in Form of Body of Descendants of Emigrants* (1911), *The Mind of Primitive Man* (1911), *Kultur und Rasse* (1913), *Baffin Land* (1885); *The Central Eskimo*, Sixth Annual Report, U.S. Bureau of Ethnology (1888); *Tsimshian Texts* (1902); *An Anthropologist's View of War* (1912); *Primitive Art* (1927); and edited the *Handbook of American Indian Languages* (1911).

BOAT, a comparatively small open craft for conveyance on water, usually propelled by some form of oar or sail.

The origin of the word "boat" is probably to be looked for in the A.S. *bāt*—a stem, a stick, a piece of wood. If this be so, the term in its inception referred to the *material* of which the primitive vessel was constructed, and in this respect may well be contrasted with the word "ship," of which the primary idea was the *process* by which the material was fashioned and adapted for the use of man.

We may assume that primitive man, in his earliest efforts to achieve the feat of conveying himself and his belongings by water, succeeded in doing so—(1) by fastening together a quantity of material of sufficient buoyancy to float and carry him above the level of the water; (2) by scooping out a fallen tree so as to obtain buoyancy enough for the same purpose. In these two processes is to be found the genesis of both boat and ship, of which, though often used as convertible terms, the former is generally restricted to the smaller type of vessel such as is dealt with in this article. For the larger type the reader is referred to *SHIP*.

Great must have been the triumph of the man who first discovered that the rushes or the trunks he had managed to tie together would, propelled by a stick or a branch (cf. *ramus* and *remus*) used as pole or paddle, convey him safely across the river or lake, which had hitherto been his barrier. But use multiplies wants, discovers deficiencies, suggests improvements. Man soon found out that he wanted to go faster than the raft would move,

that the water washed over and up through it, and this need of speed, and of dry carrying power, which we find operative throughout the history of the boat down to the present day, drove him to devise other modes of flotation as well as to try to improve his first invention.

The invention of the hollowed trunk, of the "dug-out" (*μονόξυλον*), however it came about, whenever and wherever it came into comparison with the raft, must have superseded the latter for some purposes, though not by any means for all. It was superior to the raft in speed, and was, to a certain extent, water-tight. On the other hand it was inferior in carrying power and stability. But the two types once conceived had come to stay, and to them severally, or to attempts to combine the useful properties of both, may be traced all the varieties of vessel to which the name of boat may be applied.

The development of the raft is admirably illustrated in the description, given us by Homer in the *Odyssey*, of the construction by the hero Ulysses of a vessel of this kind. Floating timber is cut down and carefully shaped and planed with axe and adze, and the timbers are then exactly fitted face to face and compacted with trenails and dowels, just as the flat floor of a lump or lighter might be fashioned and fitted nowadays. A platform is raised upon the floor and a bulwark of osiers contrived to keep out the wash of the waves (cf. *infra*, Malay boats). It seems as if the poet, who was intimately acquainted with the sea ways of his time, intended to convey the idea of progress in construction, as illustrated by the technical skill of his hero, and the use of the various tools with which he supplies him.

The dug-out had its limitations. The largest tree that could be scooped out afforded but a narrow space for carrying goods, and presented problems as to stability which must have been very difficult to solve. The shaping of bow and stern, the bulging out of the sides, the flattening of the bottom, the invention of a keel piece, the attempt to raise the sides by building up with planks, all led on towards the idea of constructing a boat properly so called, or perhaps to the invention of the canoe, which in some ways may be regarded as the intermediate stage between dug-out and boat.

Meanwhile the raft had undergone improvements such as those which Homer indicates. It had arrived at a floor composed of timbers squared and shaped. It had risen to a platform, the prototype of a deck. It was but a step to build up the sides and turn up the ends, and at this point we reach the genesis of ark and punt, of sampan and junk, or, in other words, of all the many varieties of flat-bottomed craft.

When once we have reached the point at which the improvements in the construction of the raft and dug-out bring them, as it were, within sight of each other, we can enter upon the history of the development of boats properly so called, which, in accordance with the uses and the circumstances that dictated their build, may be said to be descended from the raft or the dug-out, or from the attempt to combine the respective advantages of the two original types. Uses and circumstances are infinite in variety and have produced an infinite variety of boats. But we may safely say that in all cases the need to be satisfied, the nature of the material available and the character of the difficulties to be overcome have governed the reason and tested the reasonableness of the architecture of the craft in use. It is not proposed in this article to enter at any length into the details of the construction of boats, but it is desirable, for the sake of clearness, to indicate certain broad distinctions in the method of building, which, though they run back into the far past, in some form or other survive and are in use at the present day.

The tying of trunks together to form a raft is still not unknown in the lumber trade of the Danube or of North America, nor was it in early days confined to the raft. It extended to many boats properly so called, even to many of those built by the Vikings of old. It may still be seen in the Madras surf boats, and in those constructed out of driftwood by the inhabitants of Easter Island in the south Pacific. Virgil, who was an archaeologist, represents Charon's boat on the Styx as of this construction and notes the defect, which still survives, in the craft of the kind when loaded—

"Gemuit sub pondere cymba
Sutilis, et multam accepit rimosa paludem!"
Aen. vi. 303.

Next to the raft, and to be counted in direct descent from it, comes the whole class of flat-bottomed boats including punts and lighters. As soon as the method of constructing a solid floor, with trenails and dowels, had been discovered, the method of converting it into a water-tight box was pursued, sides were attached plank fashion, with strong knees to stiffen them, and cross pieces to *yoke* or *key* (cf. *ξύγον, κληίς*) them together. These thwarts once fixed naturally suggested seats for those who plied the paddle or the oar. The ends of the vessel were shaped into bow or stern, either turned up, or with the side planking convergent in stern or stern post, or joined together fore and aft by bulkheads fitted in, while interstices were made water-tight by caulking, and by smearing with bitumen or some resinous material which would be impervious to water.

The evolution of the boat as distinct from the punt, or flat-bottomed type, and following the configuration of the dug-out in its length and rounded bottom, must have taxed the inventive art and skill of constructors much more severely than that of the raft. It is possible that the coracle or the canoe may have suggested the construction of a framework of sufficient stiffness to carry a water-tight wooden skin, such as would successfully resist the pressure of wind and water. And in this regard two methods were open to the builder, both of which have survived to the present day: (1) the construction first of the shell of the boat, into which the stiffening ribs and cross ties were subsequently fitted; (2) the construction first of a framework of requisite size and shape, on to which the outer skin of the boat was subsequently attached.

Further, besides the primitive mode of tying the parts together, two main types of build must be noticed, in accordance with which a boat is said to be either carvel-built or clinker-built. (1) A boat is carvel-built when the planks are laid edge to edge so that they present a smooth surface without. (2) A boat is clinker-built when each plank is laid on so as to overlap the one below it, thus presenting a series of ledges running longitudinally. The former method is said to be of Mediterranean, or perhaps of Eastern origin. The latter was probably invented by the old Scandinavian builders, and from them handed down through the fishing boats of the northern nations to our own time.

Ancient Boats.—The accounts of vessels used by the Egyptians and Phoenicians generally refer to larger craft which naturally fall under the head of *ΣΙΠΡ* (*q v.*). The Nile boats, however, described by Herodotus (ii. 60), built of acacia wood, were no doubt of various sizes, some of them quite small, but all following the same type of construction, built up brick fashion, the blocks being fastened internally to long poles secured by cross pieces, and the interstices caulked with papyrus. The ends rose high above the water, and to prevent hogging were often attached by a truss running longitudinally over crutches from stern to stern. The Assyrian and Babylonian vessels described by Herodotus (i. 194), built up of twigs and boughs, and covered with skins smeared with bitumen, were really more like huge coracles and hardly deserve the name of boats.

The use of boats by the Greeks and Romans is attested by the frequent reference to them in Greek and Latin literature, though, as regards such small craft, the details given are hardly enough to form the basis of an accurate classification. We hear of small boats attendant on a fleet (*κελήτιον*, Thuc. i. 53), and of similar craft employed in piracy (Thuc. iv. 9), and in one case of a sculling boat, or pair oar (*ἀκάτιον ἀμφηρικόν*, Thuc. iv. 67), which was carted up and down between the town of Megara and the sea, being used for the purpose of marauding at night. We are also familiar with the passage in the Acts (xxvii) where in the storm they had hard work "to come by the boat"; which same boat the sailors afterwards "let down into the sea, under colour as though they would have cast anchors out of the foreship," and would have escaped to land in her themselves, leaving the passengers to drown, if the centurion and soldiers acting upon St. Paul's advice had not cut off the ropes of the boat and let her fall off.

There can be little doubt that boat races were in vogue among the Greeks (see Prof. Gardner, *Journal of Hellenic Studies*, ii. 91 ff.), and probably formed part of the Panathenaic and Isthmian festivals. It is, however, difficult to prove that small boats took part in these races, though it is not unlikely that they may have done so. The testimony of the coins, such as it is, points to galleys, and the descriptive term (*νεῶν ἀμιλλα*) leads to the same conclusion. It is hardly possible now to define the differences which separated *ἄκατος*, *ἀκάτιον*, from *κέλης*, *κελήτιον*, or from *λέμβος*, or *κάραβος*. They seem all to have been rowing boats, probably carvel-built, some with keels (*acatii modo carinata*, Plin. ix. 19), and to have varied in size, some being simply sculling boats, and others running up to as many as thirty oars.

Similarly in Latin authors we have frequent mention of boats accompanying ships of war. Of this there is a well-known instance in the account of Caesar's invasion of Britain (*B G.* iv. 26), when the boats of the fleet, and the pinnaces, were filled with soldiers and sent to assist the legionaries who were being fiercely attacked as they waded on to the shore. There is also an instance in the civil war which is a prototype of a modern attack of torpedo boats upon men of war, *i.e.*, when Antonius manned the pinnaces of his ships to the number of sixty, and with them attacked and defeated an imprudent squadron of *Quadrirèmes* (*B.C.* iii. 24). The class of boats so frequently mentioned as *actuariae* seems to have contained craft of all sizes, and to have been used for all purposes, whether as pleasure boats or as despatch vessels, or for piracy. In fact the term was employed vaguely just as we speak of craft in general.

The *lembus*, which is often referred to in Livy and Polybius, seems to have been of Illyrian origin, with fine lines and sharp bows. The class contained boats of various sizes and with a variable number of oars (*biremis*, Livy xxiv. 40, *sexdecim*, Livy xxxiv. 35); and it is interesting to note the origin in this case, as the invention of the light Liburnian galleys, which won the battle of Actium, and altered the whole system of naval construction, came from the same seaboard. Besides these, the piratical *myoparones* (see Cic. *In Verrem*); and the poetical *phaselus*, deserve mention, but here again we are met with the difficulty of distinguishing boats from ships. There is also an interesting notice in Tacitus (*Hist.* iii. 47) of boats hastily constructed by the natives of the northern coast of Asia Minor, which he describes as of broad beam with narrow sides (probably meaning that the sides "tumbled home"), joined together without any fastenings of brass or iron. In a sea-way the sides were raised with planks added till they were cased in as with a roof, whence their name *camarae*, and so they rolled about in the waves, having prow and stern alike and convertible rowlocks, so that it was a matter of indifference and equally safe, or perhaps unsafe, whichever way they rowed. Similar vessels were constructed by Germanicus in his north German campaign (*Ann.* ii. 6) and by the Suiones (*Ger.* 44). These also had stem and stern alike, and remind us of the old Norse construction, being rowed either way, having the oars loose in the rowlock, and not, as was usual in the south, attached by a thong to the thowl pin. Lastly, as a class of boat directly descended from the raft, we may notice the flat-bottomed boats or punts or lighters which plied on the Tiber as ferry-boats, or carrying goods, which were called *codicariae* from *caudex*, the old word for a plank.

It is difficult to trace any order of development in the construction of boats during the Byzantine period, or the middle ages. Sea-going vessels according to their size carried one or more boats, some of them small boats with two or four oars, others boats of a larger size fitted with masts and sail as well as with oars. We find *lembus* and *phaselus* as generic names in the earlier period, but the indications as to size and character are vague and variable. The same may be said of the *batelli*, *coquets*, *chaloupes*, *chalans*, *gattes*, etc., of which, in almost endless number and variety, the nautical erudition of M. Jal has collected the names in his monumental works, *Archéologie navale* and the *Glossaire nautique*. It is clear, however, that in many instances the names, originally applied to boats properly so called, gradually attached themselves to larger vessels, as in the case of *chaloupe* and others,

a fact which leads to the conclusion that the type of build followed originally in smaller vessels was often developed on a larger scale, according as it was found useful and convenient, while the name remained the same. Many of these types still survive and may be found in the Eastern seas, or in the Mediterranean or in the northern waters, each of which has its own peculiarities of build and rig.

Existing Types of Boats.—It would be impossible within our limits to do justice to the number and variety of existing types in sea-going boats, and for more detailed information concerning them the reader would do well to consult *Mast and Sail in Europe and Asia*, by H. Warington Smyth, an excellent and exhaustive work, from which much of the information which follows regarding them has been derived. In the Eastern seas the Chinese *sampan* is ubiquitous. Originally a small raft of three timbers with fore end upturned, it grew into a boat in very early times, and has given its name to a very large class of vessels. With flat bottom, and considerable width in proportion to its length, the normal *sampan* runs out into two tails astern, the timbers rounding up, and the end being built in like a bulkhead, with room for the rudder to work between it and the transom which connects the two projecting upper timbers of the stern. Some of them are as much as 30ft. in length and 8 to 10ft. in beam. They are good carriers and speedy under sail.

The Chinese in all probability were the earliest of all peoples to solve the chief problems of boat building, and after their own fashion to work out the art of navigation, which for them has now been set and unchanged for thousands of years. They appear to have used the lee-board and centre-board in junks and sampans, and to have extended their trade to India and even beyond, centuries before anything like maritime enterprise is heard of in the north of Europe. As regards the practice of long boat racing on rivers or tidal waters the Chinese are easily antecedent in time to the rest of the world. On great festivals in certain places the Dragon boat race forms part of the ceremony. The Dragon boats are just over 73ft. long, with 4ft. beam, and depth 21in. The rowing or paddling space is about 63ft. and the number of thwarts 27, thus giving exactly the same number of rowers as that of the *Zygites* in the Greek trireme. The two extremities of the boat are much cambered and rise to about 2ft. above the water. At about 15ft. from each end the single plank gives place to three, so as to offer a concave surface to the water. The paddle blade is spade-like in form and about 6½in. broad.

Both in Siam and Burma there is a very large river population, and boat racing is on festival days a common amusement. The typical craft, however, is the Duck-boat, which in the shape of hull is in direct contrast to the dug-out form, and primarily intended for sailing. It is interesting to note that the Siamese method of slinging and using quarter rudders is the oldest used by men in sailing craft, being in fact the earliest development from the simple paddle rudder, which has in all ages been the first method of steering boats. The king of Siam's state barge, we are told, is steered by long paddles, precisely in the same way as is figured in the case of the Egyptian boats of the 3rd dynasty (6000 B.C.). On the other hand the slung quarter rudders are the same in fashion as those used by Roman and Greek merchantmen, by Norsemen and Anglo-Saxons, and by mediaeval seamen down to about the 14th century.

The Malays have generally the credit of being expert boat-builders, but the local conditions are not such as to favour the construction of a good type of boat. "Small displacement, hollow lines, V-shaped sections, shallow draught and lack of beam" result in want of stability and weatherliness. But it is among them that the ancient process of dug-out building still survives and flourishes, preserving all the primitive and ingenious methods of hollowing the tree trunk, of forcing its sides outwards, and in many cases building them up with added planks, so that from the dug-out a regular boat is formed, with increased though limited carrying power, increased though still hardly sufficient stability. To ensure this last very necessary quality many devices and contrivances are resorted to. In some cases (just as Ulysses is described as doing by Homer, *Od.* v. 256) the boatman fastens

bundles of reeds or of bamboos all along the sides of his boat. These being very buoyant not only act as a defence against the wash of the waves, but are sufficient to keep the boat afloat in any sea. But the most characteristic device is the outrigger, a piece of floating wood sharpened at both ends, which is fixed parallel to the longer axis of the boat, at a distance of two or three beams, by two or more poles laid at right angles to it. This, while not interfering materially with the speed of the boat, acts as a counterpoise to any pressure on it which would tend, owing to its lack of stability, to upset it, and makes it possible for the long narrow dug-out to face even the open sea. It is remarkable that this invention, which must have been seen by the Egyptians and Phoenicians in very early times, was not introduced by them into the Mediterranean. Possibly this was owing to the lack of large timber suitable for dug-outs, and the consequent evolution by them of boat from raft, with sufficient beam to rely upon for stability.

In the boats of India the influence of Egyptian and Arab types of build is apparent, and the dinghy of the *Hughli* is cited as being in form strangely like the ancient Egyptian model still preserved in the Ghizeh museum. Coming westward the dominant type of build is that of the Arab *dhow*, the boat class of which has all the characteristics of the larger vessel developed from it, plenty of beam, overhanging stem and transom stern. The planking of the shell over the wooden frame has a double thickness which conduces to dryness and durability in the craft. On the Nile it is interesting to find the *naggar* preserving, in its construction out of blocks of acacia wood pinned together, the old-world fashion of building described by Herodotus. The *gaiassa* and *dahabiah* are too large to be classed as boats, but they and their smaller sisters follow the Arab type in build and rig. It is noteworthy that nothing apparently of the ancient Egyptian or classical methods of build survives in the Mediterranean, while the records of the development of boat-building in the middle ages are meagre and confusing. The best illustrations of ancient methods of construction, and of ancient seamanship, are to be found, if anywhere, in the East, that conservative storehouse of types and fashions, to which they were either communicated, or from which they were borrowed, by Egyptians or Phoenicians, from whom they were afterwards copied by Greeks and Romans.

In the Mediterranean the chief characteristics of the types belonging to it are "carvel-build, high bow, round stern and deep rudder hung on stern post outside the vessel." In the eastern basin the long-bowed wide-sterned *caïque* of the Bosphorus is perhaps the type of boat best known, but both Greek and Italian waters abound with an unnumbered variety of boats of "beautiful lines and great carrying power." In the Adriatic, the Venetian gondola, and the light craft generally, are of the type developed from the raft, flat-bottomed, and capable of navigating shallow waters with minimum of draught and maximum of load. In the western basin the majority of the smaller vessels are of the sharp-sterned build. Upon the boats of the *felucca* class, long vessels with easy lines and low free-board, suitable for rowing as well as sailing, the influence of the long galley of the middle ages was apparent. In Genoese waters at the beginning of the 19th century there were single-decked rowing vessels, which preserved the name of galley, and were said to be the descendants of the Liburnians that defeated the many-banked vessels of Antonius at Actium. But the introduction of steam vessels has already relegated into obscurity these memorials of the past. Along the Riviera and the Spanish coast a type of boat is noticeable which is peculiar for the inward curve of both stem and stern from a keel which has considerable camber, enabling them to be beached in a heavy surf. On the Douro, in Portugal, it is said that the boats which may be seen laden with casks of wine, trailing behind them an enormously long steering paddle, are of Phoenician ancestry, and that the curious signs, which many of them have painted on the cross board over the cabin, are of Semitic origin though now undecipherable.

Coming to the northern waters, as with men, so with boats, we meet with a totally different type. Instead of the smooth exterior of the carvel-build, we have the more rugged form of clinker-

built craft with great beam, and raking sterns and stems, and a wide flare forward. In the most northern waters the strakes of the sea-going boats are wide and of considerable thickness, of oak or fir, often compacted with wooden trenails, strong and fit to do battle with the rough seas and rough usage which they have to endure. In most of these the origin of form and character is to be sought for in the old Viking vessels or long *keeles* of the 5th century A.D., with curved and elevated stem and stern posts, and without decks or, at the most, half decked. In the Baltic and the North Sea most of the fishing boats follow this type, with, however, considerable variety in details. It is noticeable that here also, as in other parts of the world, and at other times, the pressing demand for speed and carrying power has increased the size in almost all classes of boats till they pass into the category of ships. At the same time the carvel-build is becoming more common, while, in the struggle for life, steam and motor power are threatening to obliterate the old types of rowing and sailing boats altogether. Next to the Norse skiff and its descendants, perhaps the oldest type of boat in northern waters is to be found in Holland, where the conditions of navigation have hardly altered for centuries. It is to the Dutch that we chiefly owe the original of our pleasure craft, but, though we have developed these enormously, the Dutch boats have remained pretty much the same.

The development of boat-building in the British Isles during the 19th century has been unceasing and would need a treatise to itself to do it justice. The expansion of the fishing industry and the pressure of competition have stimulated constant improvement in the craft engaged, and here also are observable the same tendencies to substitute carvel, though it is more expensive, for clinker build, and to increase the length and size of the boats, and the gradual supersession of sail and oar by steam power. Under these influences we hear of the *fife* and the *skaffie* classes, old favourites in northern waters, being superseded by the more modern *Zulu*, which is supposed to unite the good qualities of both; and these in turn running to such a size as to take them outside the category of boats. But even in the case of smaller boats the *Zulu* model is widely followed, so that they have actually been imported to the Irish coast for the use of the crofter fishermen in the congested districts. For the Shetland *sexern* and the broad boats of the Orkneys, and the *nabbies* of the west coast of Scotland, the curious will do well to refer to H. Warrington Smyth's most excellent account. On the eastern coast of England the influence of the Dutch type of build is manifest in many of the flat-bottomed and mostly round-ended craft, such as the Yorkshire *Billyboy*, and partly in the *coble*, which latter is interesting as built for launching off beaches against heavy seas, and as showing Norse influence, though in the main of Dutch origin.

The life-boats of the eastern coast are in themselves an admirable class of boat, with fine lines, great length and shallow draught, wonderful in their daring work in foul weather and heavy seas, in which as a rule their services are required. Here, however, as in the fishing boats, the size is increasing, and steam is appropriating to itself the provinces of the sail and the oar. The wherry of the Norfolk Broads has a type of its own, and is often fitted out as a pleasure boat.

The Thames and its estuary rejoice in a great variety of boats, of which the old *Peter* boat (so called after the legend of the foundation of the abbey on Thorney Island) preserved a very ancient type of build, shorter and broader than the old Thames pleasure wherry. But these and the old *hatch* boat have now almost disappeared. Possibly survivors may still be seen on the upper part of the tidal river. Round the English coast from the mouth of the Thames southwards the conditions of landing and of hauling up boats above high-water mark affect the type, demanding strong clinker-build and stout timbers. Hence there is a strong family resemblance in most of the short boats in use from the North Foreland round to Brighton. Among these are the life-boats of Deal and the other Channel ports, which have done and are still doing heroic work in saving life from wrecks upon the Goodwins and the other dangerous shoals that beset the narrowing sleeve of the English Channel. Along the southern coast, and to the west, where harbours are more frequent, a finer and deeper

class of boats, chiefly of carvel-build, is to be found. The Cornish ports are the home of a great boat-building industry, and from them a large number of the finest fishing boats in the world are turned out annually. Most of them are built with stem and stern alike, with full and bold quarters and ample floor.

It is not possible here to enumerate, much less to describe in detail, the variety of types in sea-going boats which have been elaborated in England and in America. For this purpose reference should be made to the list of works given at the end of the article.

The following is a list of the boats at present used in the royal navy. They have all of them a deep fore foot, and with the exception of the whalers and Berthon boats, upright stems and transom sterns. The whalers have a raking stem and a sharp stern, and a certain amount of sheer in the bows.

	Length Feet	Beam Ft. In.	Depth Ft. In.
1a. Dinghy. Freeboard about 9in. Weight 3cwt. 2qr. Between thwarts 2ft. 9in. Elm	13½	4' 8"	2' 2"
1b. Skiff dinghy for torpedo boats. Freeboard about 9in. Carry about ten men in moderate weather. Between thwarts 2ft. 7½in. Weight 3cwt. 4lb. Yellow pine	16	4' 6"	1' 10"
2a. Whaler for destroyers. 5in. sheer. Yellow pine	25	5' 6"	2'
2b. Whaler. Between thwarts 2ft. 10in. Freeboard about 12in. Weight 8 cwt. Strakes No. 13. Lap ¼in. Elm	27	5' 6"	2' 2"
(All have bilge strakes with hand-holes)			
3. Gig. Between thwarts 2ft. 9½in. Weight 8cwt. 2qr. 15lb. 13 strakes. Elm	30	5' 6"	2' 2"
4. Cutter. Between thwarts 3ft. 1in. To carry 140 men. Double skin diagonal. Teak	30	8' 1"	2' 8½"
5. Pinnace. Between thwarts 3ft. Carvel-built. Elm	36	10' 2"	3' 5"
6. Launch. Between thwarts 3ft 1in. To carry 140 men. Double skin diagonal. Teak	42	11' 6"	4' 6"
7. Berthon collapsible boats weighing 7 cwt. for destroyers.			

With the exception of the larger classes, viz., cutters, pinnaces and launches, the V-shape of the bottom is still preserved, which does not tend to stability, and it is difficult to see why the smaller classes have not followed the improvement made in their larger sisters.

Pleasure Boats and Racing.—Though the number and variety of sea-going boats is of much greater importance, no account of boats in general would be complete without reference to the development of pleasure craft upon rivers and inland waters, especially in England, during the past century. There is a legend, dating from Saxon times, which tells of King Edgar the Peaceable being rowed on the Dee from his palace in Chester to the church of St. John, by eight kings, himself the ninth, steering this ancient 8-oar; but not much is heard of rowing in England until 1453, when John Norman, lord mayor of London, set the example of going by water to Westminster, which, we are told, made him popular with the watermen of his day, as in consequence the use of pleasure boats by the citizens became common. Thus it was that the old Thames pleasure wherry, with its high bows and low sharp stern and V-shaped section, and the old skiff came into vogue, both of which have now given way to boats, mostly of clinker-build, but with rounder bottoms and greater depth, safer and more comfortable to row in. For racing boats see ROWING.

Folkhard, *The Sailing Boat*; R. C. Leslie, *Old Sea Wings* (E. W.A.)

BOATSWAIN: see NAUTICAL TERMS.

BOB, a "call" employed in bell-ringing to signify an alteration of the "coursing order" or order in which the bells are being rung.

The origin of the term is unknown, but it may have been adopted as a short, sharp word, easily uttered by the "conductor" and easily recognized by the ringers. (Cf. the term "Hopp!" employed for a similar purpose by Jaques-Dalcroze in his *Eurhythmics*.) Or, as applied to a "method" or system of ringing, it may refer to the evolution of "dodging"; but this is only surmise, as none of the old writers on the subject attempts to explain it.

"Bob" is also used to signify abridgement or shortening, as in the case of a bob-tailed horse or, in more recent times, the "bobbed" hair of a woman.

BOBBILI, a town of British India, in the Vizagapatam district of Madras, 70m. north of Vizagapatam town, on a branch line of the Bengal-Nagpur railway. Pop. (1921) 18,179. It is the residence of a raja of old family.

The attack on the fort at Bobbili made by Gen. Bussy in 1756 is a memorable episode. There was a constant feud between the chief of Bobbili and the raja of Vizianagram; and when Bussy marched to restore order the raja persuaded him that the fault lay with the chief of Bobbili and joined the French with 11,000 men against his rival. The defenders held out with desperate valour. Before surrender they killed their women and children and only succumbed at last because every man of them was either killed or mortally wounded. An old man, however, crept out of a hut with a child, the son of the dead chief, who was later invested with his father's estate. The old feud broke out again, and the Bobbili chief was forced to take refuge in the nizam's country, but was later restored by the British. In 1801 a permanent settlement was made with his son, and the title of raja was recognized as hereditary in the family.

For the siege see *Imp. Gazetteer of India* (Oxford, 1908), s.v. "Bobbili Estate."

BOBBIO, episcopal see of Lombardy, Italy, province of Pavia, 32½m. S.W. of Piacenza by road. Pop. (1921) town 2,260, commune 5,012. St. Columban became first abbot of Bobbio in 612 and died in 615. The church dedicated to him is Lombard (11th-12th centuries), restored in the 13th century. The monastery had famous manuscripts now at Rome (Vatican), Milan and Turin. The cathedral archives contain documents of the 10th and 11th centuries.

BOBCAT, a term loosely used to describe several smaller varieties of lynx (*q.v.*) found in North America. The name refers to the short, stumpy tail characteristic of these animals. The bobcat shows great individual variation as to size, softness of fur, proportion of light and dark markings. The usual weight of the northern species, which occurs from the Atlantic to the Pacific coast, varies from 12 to 16 lbs. The southern variety or bay lynx is most frequently found in Texas, Virginia, the Carolinas and Florida.

BOBO, an agricultural and pastoral, animistic people, divided into several tribes and speaking two different languages, living in the Upper Volta and in the valley of the Upper Black Volta, in the French Sudan. There is no tribal organization. Inheritance passes first to the brother and then to the son of the deceased.

See Cheron, "Les Bobo Fing," *Annuaire du Comité d'Études Hist. et Scient. d'Afrique Occidentale* (Gorée, 1916); Cremer, *Les Bobo* (1924).

BOBOLINK [a name derived from its call], or rice-bird, a North American bird of the family *Icteridae*, known scientifically as *Dolichonyx oryzivorus*. It is a migrant, reaching New Brunswick in summer and wintering in South America, which it reaches by a migration route through Jamaica. It is remarkable for its bunting-like bill. In the southern part of its range this bird feeds upon rice and grain and is consequently unpopular with the farmer. Farther north, however, it is an insect-eater, and the young, as is nearly always the case with small birds, are fed almost exclusively upon insects. The bobolink has a rippling song, which it generally sings while fluttering across a meadow.

BOBRUISK, a town and district in the White Russian Socialist Soviet Republic on the right bank of the Berezina river and on the railway between Minsk and Gomel. Lat. 53° 10' N., Long. 29° 12' E. Pop. (1926) 39,280, mainly White Russians and Jews. It is a centre for corn and timber products and has iron-

works and flour mills and a radio-station. The town was fortified by Alexander I. and withstood Napoleon's bombardment in 1812, and was further fortified by Nicholas I., but dismantled 1897. It suffered from fire in 1902 and from its position in the war zone 1914-21.

BOB-WHITE, the best known North American game bird, *Colinus virginianus*, of the New World family *Odontophoridae* (*q.v.*), is about 10 in. long, mottled, reddish-brown above, with white on the breast; resident east of the Rocky Mountains, north to Minnesota and Ontario and south to the Gulf of Mexico. It has been successfully introduced into Idaho and Oregon. The Bob-white resembles the (resident) partridge and (migrant) quail of Europe, and is known by both these names, but is best named from the ringing call, "Bob-white!" which resounds through the fields in the evening twilight when the family group is assembling for the night. These families, or "coveys," keep together until the spring following the birth of the young birds; they trot confidently through the stubble picking up seeds and insects,—altogether too confidently, for in many States they were brought close to extinction, but are again increasing under protection. Since 15 or 20 eggs are laid, they would increase rapidly if permitted. Heavy snow and ice bear hardly on these non-migratory birds; they will come readily to feeding stations in winter. In Florida is a smaller, darker subspecies (*C. v. floridianus*), while the Texas subspecies (*C. v. texanus*) is greyer above. Other subspecies and species extend through eastern and southern Mexico to the borders of Guatemala, including Grayson's Bob-white (*C. graysoni*), and the masked Bob-white (*C. ridgwayi*) also found in south-western Arizona.

BOCAGE, MANUEL MARIA BARBOSA DE (1705-1805), Portuguese poet, was a native of Setúbal. He entered the army at 14, transferring to the navy at 16. At the royal marine academy in Lisbon, however, he spent his time in love affairs and in society, where his skill in improvisation made him a great favourite. After some years spent in India and China he returned to Portugal, which was then enduring a severe reaction under the formidable intendant of police, Manique, who was determined to suppress Voltaireanism and the importation or discussion of liberal ideas. Bocage was imprisoned in 1707 on account of some anti-religious verses, but soon recovered his liberty. He was a member of the literary society called New Arcadia, where he had but one serious rival, José Agostinho de Macedo. He died on the eve of the French invasion. Perhaps his best work is to be found in the sonnets addressed to D. Maria Leite, an old friend who visited and consoled him on his death-bed. Bocage employed every variety of lyric and made his mark in all.

The best editions of his collected works are those of I. F. da Silva, with a biographical and literary study by Rubello da Silva, in 6 vols. (1853), and of Theophilo Braga, in 8 vols. (1875-76). See also I. F. da Silva, *Dicionário Bibliográfico Português*, vol. vi, pp. 45-53, and vol. xvi, pp. 260-264; T. Braga, *Bocage, sua vida e época literária* (1902).

BOCAGE, a term applied to several regions of France, the characteristics of which are a granite formation with associated heath or reclaimed land sparsely timbered (from OFr *boscage*, late Lat *boscum*, a wood). The most important are (1) the Bocage of Normandy, including portions of the departments of Calvados, Manche and Orne; (2) the Bocage of Vendée, in the departments of Vendée, Deux-Sèvres, Maine-et-Loire and Loire-Inférieure.

BOCAS DEL TORO, a town, province, island and bay on the northern coast of the republic of Panama. The population of the town is about 10,000, the chief industry of the region being the growing of bananas which are raised or bought by a large American fruit company for consumption in the eastern United States and Europe. The town is located on the island of the same name at one of the entrances of Chiriqui lagoon, 90 nautical m. from Port Limon, Costa Rica, and 140 nautical m. from Colon, Panama.

BOCCACCIO, GIOVANNI (1313-1375), Italian author, humanist and poet, whose *Decameron* is one of the earliest works in Italian prose and one of the most famous books in all literature,

was born out of wedlock in Paris in 1313¹ of a French mother, whose name was probably Jeanne (so that he is named after her), and of an Italian father, the Florentine banker and merchant, Boccaccio di Chellino da Certaldo, commonly called Boccaccio. At a date difficult to determine, but probably as a baby, he was brought to Florence, where his father almost immediately after his return from Paris in 1314 had married Margherita di Gian Donato de' Martoli. Boccaccio's boyhood was thus, as so many of his works lead us to believe, spent in Tuscany, perhaps at Certaldo, perhaps near Florence at Corbignano, where Margherita had brought some property to her husband. Of his early years we have very little knowledge, and none at all save what may be gathered from his earlier works which are full of autobiographical allegory. Before he was seven years old, as he tells us, he was set to learn to read and write. He studied *Grammatica* under Giovanni di Domenico Mazzuoli da Strada, father of the more famous Zanobi. He began Latin and arithmetic. His father destined him for business, but he early had a lively hatred of such a calling, and desired above all to devote himself to literature and to learning. His father, however, was not to be persuaded, and as the boy was unhappy at home with his step-mother, who had now a son of her own, born in 1321, he sent Giovanni to Naples to his commercial correspondents there, to learn business, as is generally believed in Nov. 1328.

Naples was at the height of its splendour under Robert the Wise, and the young Boccaccio, then 15, knew how to appreciate the delights of life in an exquisite climate amid all the gaiety and pleasure of that beautiful city, on the outskirts of a brilliant court. In his *Filocolo* and his *Fiammetta* he gives us a very vivid impression of the charm of Naples at this time. For six years, however, so he tells us, he did little but waste irrecoverable time with the merchant to whom his father had confided him. He most bitterly reproaches his father for this in his *De Genealogiis*: "If my father had dealt wisely with me I might have been among the great poets." At length, however, he found opportunity for culture, and met the scholar he calls Calmeta, most probably the astronomer Andalò di Negro, and finally his father allowed him to abandon a business career, though he made it a condition that Giovanni should study canon law. He was attracted by letters and may well have frequented the society of Paolo da Perugia, the librarian of King Robert, who had already begun to collect certain Greek manuscripts on the advice of the Calabrian monk Barlaam, who died Bishop of Gerace. But study by no means occupied all his time: life in that gay city, on the fringe of the court, more and more attracted him, and it was now, on Holy Saturday, March 30, 1336, in the Church of S. Lorenzo of the Franciscans, that he first caught sight of the woman who was so profoundly to influence his life and shape his work. This was Maria d'Aquino, a young married woman, natural daughter of King Robert, the lady whom he has immortalized under the name of Fiammetta.

The love story thus begun, if we interpret his own accounts aright, ended in utter disaster, but it nevertheless fills his whole life and inspires every book he wrote before the *Ninfale Fiesolano* and the *Decameron*. Fiammetta after giving herself to him had betrayed him. His misery at the loss of her was deepened by the fact that the ruin of his father at this time made it necessary for him to leave Naples and his love and return to Florence. It was

AFTER AN EDITION PUBLISHED IN SALAMANCA, SPAIN, 1486
TITLE PAGE OF BOCCACCIO'S LOVE STORY. "L' AMOROSA FIAMMETTA"

in 1341 that he came back to Tuscany and immersed himself in work. But during his love affair with Fiammetta he had already begun three works, and possibly finished two of them: the *Filocolo*, the *Filostrato* and the *Teseide*. In all these works and in the *Ameto*, the *Amorosa Visione* and the *Fiammetta* which followed them, his state of mind is visible. They are extraordinarily personal. A single thought seems to fill his mind: he had loved a princess and been loved in return; she had forsaken him; but she remained the lodestar of his life. He writes really of nothing else but this. Full of her he sets himself to enchant her with stories, to glorify her, to tell over and over again—under how many disguises!—his own story. It was the story of Florio and Biancofiore which he tells us had charmed Fiammetta at first hearing, when he had told it to her in the convent parlour at Sant' Arcangelo a Baiano, and it is round this tale that the enormous romance of the *Filocolo* (1st ed. Venice, 1472) is written. As he tells us in the first page, this was the first book he made to please her. It is the longest of his works after the *Decameron*—which the episode of the *Questioni* in the fourth book prophesies. He seems to have abandoned it in Naples at the end of the third book and to have resumed it later on his return to Florence, when he felt the need of expressing what he was suffering. What this was is obvious in the *Filostrato* (1st ed. Luca Veneto, 1480?), a poem in *ottava rima*, its first use in Italian, on the story of Troilus and Cressida. This is one of the loveliest and most spontaneous of his works. It has a special interest for us, for Chaucer drew upon it very largely for his *Troilus*; no fewer than 2,700 lines, nearly half the Italian poem, being literally translated by Chaucer into English. This is about a third of Chaucer's poem. In the *Teseide* (1st ed. Ferrara, 1475), another epic poem, we have the same state of mind. It is full of the agonies of his jealousy. It is prefaced by a letter to Fiammetta in which he tells her he has written this poem to please her—"thinking of past joy in present misery." As for the content, it must be enough here to say that it provided Chaucer with his Knight's Tale in the *Canterbury Tales*. It was begun in the shadow of Virgil's tomb, is modelled on the *Aeneid*, written in 12 books and has precisely the same number of lines as Virgil's poem. It is about twice as long as the *Filostrato*. All these books seem to have been begun in Naples; the *Ameto* (1st ed. Rome, 1478) may well have been conceived in Florence; the whole action takes place in the country about Fiesole, where his father had a villa and podere. We see here, too, the influence of Dante and Petrarch; the *Ameto* is indeed a sort of Dantesque allegory of prose scattered with verses. There follows the *Amorosa Visione* (1st ed. Milan, 1521), a long poem which recalls the happier time of his love, and which is dedicated to Fiammetta in an acrostic. In its construction and precision it reveals the study of Dante. It consists of 50 *capitoli*, each composed of 29 *terzine* and a verse of *chiusa*; that is to say there are 88 verses in each *capitolo*.

The last work directly concerned with Boccaccio's passion for Maria d'Aquino is the *Fiammetta* (1st ed. Padua, 1472). The action is very simple, but it is remarkable in this: here we have the love story told by Fiammetta as though it were her autobiography. But it is she who weeps for Giovanni, who has deserted her. This is the first psychological novel of Europe. Thereafter he turns away from the misery of his love story and writes a delicious idyll, the *Ninfale Fiesolano* (1st ed. Venice, 1477), the most mature of his poems—the loves of Affrico and Mensola, two small streams that flowed by his father's house at Corbignano near Florence. All bitterness is lost in music. He describes with the greatest affection and enthusiasm this country he loved best between the village of Settignano and Fiesole, which later was to be the setting of the *Decameron*.

But all that bright world about Florence, so full of voices for Boccaccio, was presently to be silenced by the most appalling material calamity that has ever befallen Europe—the Black Death of 1348. Three out of five persons died in Florence. The grass grew in the streets. People said the end of the world had come. In a sense they were right. It was the end of the Middle Age.

¹See Petrarca *Senili* VIII. I. Lett. del 20 luglio 1366 (trad. Fracassetti) p. 445; Filippo Villani, *Le vite d'uomini illustri Fiorentini* (Firenze, 1826) p. 12, tells us that Boccaccio died in 1375 aged sixty-two.

We do not know where Boccaccio was at this time. Did he perhaps close Fiammetta's eyes and bear her to the grave? If he did he was soon recalled to Florence by his father's death. And there, after that vengeance, whether of God or outraged nature, in which all he loved had been lost to him, he set himself to put in order that great Human Comedy which has given him immortality.

In the very opening page of the *Decameron* (1st dated ed. Venice, 1471) we see that even after writing six works in prose and verse about her, even now she is dead, he cannot forget Fiammetta. The great Proem opens with her unspoken name and closes too in the same fashion. And of those seven ladies and three youths who are the protagonists of the *Decameron* it is only she named Fiammetta who lives. But strangely enough Boccaccio himself is absent; you will scarcely find him in all the hundred tales of that work which best represents his genius, his humour and wide tolerance and love of mankind.

The *Decameron* is an absolute work of art, as detached as a play by Shakespeare or a portrait by Velasquez. The scheme is formal and should be compared with that of *The Thousand and One Nights* and *The Canterbury Tales*. There are ten protagonists, three youths and seven ladies, and the horror which is designed to set off the stories is a universal pestilence which has already half depopulated the City of Florence, and from which they all fled away to the exquisite seclusion of a great villa garden on the slopes under Fiesole, where they spend their time in telling the stories that have made this work immortal. It is the stories that matter. In Chaucer's *Canterbury Tales* the tales often weary us but the tellers never do. In Boccaccio the tales never weary us but the tellers always do. The *Decameron* is a world in itself, and its effect upon us who read it is the effect of life which includes, for its own good, things moral and immoral. The book has the variety of the world and is full of an infinity of people who represent for us the 14th century in Italy in all its fullness. It deals with man as life does, never taking him very seriously or without a certain indifference, a certain irony and laughter. Yet it is full too of a love of courtesy, of luck, of all sorts of adventures both gallant and sad. Even Chaucer is not so complete in his humanism, his love of all sorts and conditions of men. What immorality there is, is rather owing to the sources of some of the tales than to any invention on the part of Boccaccio, who softened much of their original grossness and later came to deplore what remained. But it is in its extraordinary variety of contents and character that the *Decameron* is chiefly remarkable. We are involved in a multitude of adventures, are introduced to innumerable people of every class, and each class shows us its most characteristic qualities. The book is full of people—living people—that is the secret of its immortality. And yet it must be confessed that while the book is a mirror of the world and doubtless as true to the life of its time as any book ever written, it lacks a certain idealism, a certain moral sense which even from a purely aesthetic point of view would have given a balance, a sense of proportion, to it. It is, however, the greatest, as it is the first, prose work in the Tuscan tongue, and it holds its own even with the Divine Comedy because of its humanity.

With the *Decameron*, Boccaccio's work as a creative artist came to an end. It is true that we have the mysterious and savage satire of the *Corbaccio* (1st ed. Florence, 1487), begun immediately after the *Decameron* was finished, that is about 1353, but the passion which had inspired everything he had done, and made him a great creative artist, here turns round, sneers at itself and we get that wild invective, laughable in its malice, against Woman, which characterizes it. From this time—he was more than 40 years old—he devotes himself to scholarship, forgets love, and turns to friendship: the second great influence of his life appears—Petrarch.

But before he gives himself wholly to his friend he turns—is it for consolation?—to the study of Dante. As soon as the *Corbaccio* is finished we find him at work on the *Vita di Dante* (1st ed. Venice, 1477), the earliest life of the poet, whose *Divine Comedy* he copies with his own hand in order to send it to

Petrarch; and we may understand how great a pioneer Boccaccio was in the appreciation of Dante when we learn from this fact that Petrarch had no copy in his library.

Even in his youth Boccaccio had regarded Petrarch with an enthusiasm and an unswerving modesty that, lasting as it did till his death, was one of the beautiful traits of his character. In 1351, in the name of Florence, he went to Padua to recall Petrarch from exile, and was his guest for some days. He was a witness of Petrarch's enthusiasm for "sacred studies," and more and more in accordance with Petrarch's doctrine we see him giving up all work in the vernacular and setting all his energy in the study of antiquity and the acquirement of learning. From a creative writer of splendid genius he became a scholar, a scholar of vast reading, but mediocre achievement. Little by little he seems to have gathered his notes into the volumes we know as: *De Montibus, Sylvis, Fontibus*, etc., a sort of Dictionary of Geography; the *De Casibus Virorum Illustrium* in nine books, which deals with the vanity of human affairs from Adam to his own time; the *De Claris Mulieribus*, which begins with Eve and comes down to Giovanna, queen of Naples, and the *De Genealogiis Deorum*, a cyclopaedia of learning concerning mythology. In all these works it must be admitted we see Boccaccio as Petrarch's disciple. Yet they must not be too much depreciated. They rendered great service; their vast usefulness is witnessed by their enormous popularity and the large number of editions through which they have passed. They were the text books of the Renaissance. Nor was this all his service. In 1358 there was introduced to Petrarch a certain Leon Pilatus, who gave himself out for a Greek, and Petrarch, who possessed a Greek ms. of Homer which he could not read, seized the opportunity to obtain a translation. In this he was not successful; so presently, bored with the barbarous Pilatus, he turned him over to Boccaccio, who with the utmost devotion took this disagreeable barbarian into his house, caused a Chair of Greek to be given him in the University of Florence, and quietly and heroically put up with his ferocious and repellant manners and bad temper till he obtained the translation; and thus it is to Boccaccio that we owe the restoration of Homer to the western world.

During the time he was engaged on this arduous and heroic task he was in a state of great spiritual distress, and hardly comforted by the wise letters of Petrarch. He was never wholly cured of a sort of disillusion and melancholy which went with a curious regret for the greatest achievement of his life. In this state of mind his good fortune was the friendship of Petrarch, which, together with a love of children very characteristic of him, appears always like a ray of sunshine in what proved to be a lonely and even gloomy old age, hard and bitter and passed in poverty. So poor was he that it seems his friends in Florence, hearing of his misery, founded the first Cathedra Dantesca to relieve him. He delivered his first lecture in the Church of Santo Stefano on Oct. 23, 1373, at the age of 60. In the winter of that year he was attacked by illness and returned to Certaldo, really to die. In the hands of an ignorant doctor he suffered tortures, and then a new ill befell him. In the summer of 1374 Petrarch died. He wrote a wonderful letter to Petrarch's son-in-law, full of adoration for his friend and anxiety about his works. That letter was his swan song; though he lingered on for some months, he can scarcely be said to have been alive. He died on Dec. 21, 1375, and was buried in the Church of SS. Jacopo e Filippo at Certaldo.

BIBLIOGRAPHY.—A complete edition of Boccaccio's Italian writings in 17 vols. was published by Moutier (Florence, 1827 *et seq.*). The Letters of Boccaccio were collected and printed by Corazzini (Florence, Sansoni, 1877). The Life of Boccaccio has been written by Tiraboschi, Mazzuchelli, Baldelli, Landau, Crescini (1887), Edward Hutton (1910, in English), and Henri Hauvette (1914, in French). See works cited in last two. The first printed edition of the *Decameron* seems to be that without date, place or printer's name, which is believed to belong to the year 1469 or 1470, and to have been printed at Florence. The best edition is that of Florence 1527 (counterfeited in London, 1727). A curious expurgated edition authorized by the ecclesiastical authority appeared at Florence 1573. The first English translation is that of 1620, reprinted in the Tudor Translations (1909). The best modern English translation is that of J. M. Rigg (1903). There are also modern reprints of the 1587 English translation of the *Fiammetta* (*Amorous Fiammetta*, with introduction by Edward Hut-

ton, Navarre Society, 1926), and of the 1566 English translation of the *Thirteen Questions* from the *Filocolo*, also with an introduction by Edward Hutton (Peter Davies, 1927). Sir Israel Gollancz translated and published the *Olympia Eclogue* in 1913. A Bibliografia Boccacciosa by Guido Traversari (vol. ii. *Scritti intorno al Boccaccio*) is in course of publication (Città di Castello, 1907 et seq.). (E. HN.)

BOCCALINI, TRAJANO (1556–1613), Italian satirist, was born at Loretto in 1556, the son of an architect. His most important work is the *Ragguagli di Parnaso*, in which Apollo is represented as receiving the complaints of all who present themselves, and distributing justice according to the merits of each particular case. To escape, it is said, from the hostility of those whom his shafts had wounded, he retired to Venice, and there died on Nov. 16, 1613. It was asserted, indeed, by contemporary writers that he had been beaten to death with sand-bags by a band of Spanish bravadoes, but the story is probably founded on his known hatred of the Spaniards. The only government, indeed, which is exempt from his attacks is that of Venice, a city for which he seems to have had a special affection.

The *Pietra* has been translated into French, German, English and Latin; the English translator was Henry, earl of Monmouth, his version being entitled *The Politicke Touchstone* (1674). Another posthumous publication of Boccacini was his *Commentarii sopra Corneio Tacito* (1669). Many of his manuscripts are preserved still unprinted.

BOCCHERINI, LUIGI (1743–1805), Italian composer, son of an Italian bass-player, was born at Lucca, and studied at Rome, where he became a fine 'cellist, and soon began to compose. He returned to Lucca, where for some years he was prominent as a player, and there he produced two oratorios and an opera. He toured in Europe, and in 1768 was received in Paris by Gossec and his circle with great enthusiasm, his instrumental pieces being highly applauded; and from 1769 to 1785 he held the post of "composer and virtuoso" to the king of Spain's brother, the infante Luis, at Madrid. He afterwards became "chamber-composer" to King Frederick William II of Prussia, till 1797, when he returned to Spain. He died at Madrid on May 28, 1805.

As an admirer of Haydn, and a voluminous writer of instrumental music, chiefly for the violoncello, Boccherini represents the effect of the rapid progress of a new art on a mind too refined to be led into crudeness, too inventive and receptive to neglect any of the new artistic resources within its cognizance, and too superficial to grasp their real meaning. His mastery of the violoncello, and his advanced sense of beauty in instrumental tone-colour, must have made even his earlier works seem to contemporaries at least as novel and mature as any of those experiments at which Haydn, with eight years more of age and experience, was labouring in the development of the true new forms.

Most of Boccherini's technical resources proved useless to Haydn, and resemblances occur only in Haydn's earliest works (e.g., in the slow movements of the quartets in op. 3 and in some as late as op. 17). Whichever derived the characteristics of such movements from the other, the advantage is decidedly with Boccherini. But the progress of music did not lie in the production of novel beauties of instrumental tone in a style in which polyphonic organization was either deliberately abandoned or replaced by a pleasing illusion, while the form in its larger aspects was a mere inorganic amplification of the old suite-forms, which presupposed a genuine polyphonic organization as the vitalizing principle of their otherwise purely decorative nature. The true tendency of the new sonata forms was to make instrumental music dramatic in its variety and contrasts, instead of merely decorative. Haydn from the outset busied himself with the handling of new rhythmic proportions; and if it is hardly an exaggeration to say that the surprising beauty of colour in such a specimen of Boccherini's 125 string-quintets as that in E major (containing the popular minuet) is more striking than Haydn's best scoring, it is nevertheless true that even this beauty fails to justify the length and monotony of the work. Where Haydn uses any fraction of the resources of such a style, the ultimate effect is in proportion to a purpose of which Boccherini, with all his genuine admiration of his elder brother in art, could form no conception.

Boccherini's works are, however, still indispensable for violoncellists, both in their education and their concert repertoires; and

his position in musical history is assured as that of one of the most original writers of music for stringed instruments in the late Italian amplifications of the older quasi-polyphonic sonata or suite-form that survived in his hands into the early 19th century. Boccherini may safely be regarded as its last real master. He was wittily characterized by the contemporary violinist Puppo as "the wife of Haydn"; which is good enough praise for those who hold a restricted view of woman's sphere.

See *Notice sur la vie et les ouvrages de Luigi Boccherini, suivie du catalogue raisonné, de toutes ses oeuvres, tant publiées qu'inédites*, by L. Picquot (1851). (D. F. T.)

BOCCHUS (c. 110 B.C.), king of Mauretania, and father-in-law of Jugurtha. In 108 he joined Jugurtha on condition of receiving a third of Numidia. But when the kings had been twice defeated, Bocchus again sought Roman alliance. He was persuaded by Sulla (q.v.) to seek favour by entrapping Jugurtha and handing him over to Rome (105 B.C.). As a result, the Romans made a treaty with Bocchus, and added part of Numidia to his kingdom. He sent to the capitol a group of Victories guarding a device in gold showing Bocchus handing over Jugurtha to Sulla.

BIBLIOGRAPHY.—See JUGURTHA; also Sallust, *Jugurtha*, 80–120; Plutarch, *Marius*, 8–32, *Sulla*, 3; A. H. J. Greenidge, *History of Rome* (London, 1904).

His son, BOCCHUS, was king of Mauretania, jointly with a younger brother Bogud. As enemies of the senatorial party, their title was recognized by Caesar (49 B.C.). During the African War they invaded Numidia and thus prevented King Juba from joining Metellus Scipio against Caesar. At the end of the war, Caesar gave Bocchus part of the territory of Massinissa, Juba's ally, which was recovered after Caesar's murder by Massinissa's son. After Caesar's death Bocchus supported Octavian, while Bogud supported Antony. During Bogud's absence in Spain, his brother seized the whole of Numidia, and was confirmed sole ruler by Octavian. After his death in 33, Numidia was made a Roman province.

BOCCIE: see LE BOCCIE.

BOCHART, SAMUEL (1599–1667), a famous French scholar, who was born at Rouen on May 30, 1599. He was for many years pastor of a Protestant church at Caen. In 1646 he published his *Phaleg* and *Chanaan* (Caen, 1646 and 1651), the two parts of his *Geographia Sacra*. His *Hieroicon*, which treats of the animals of Scripture, was printed in London (1663). In 1652 Christina of Sweden invited him to Stockholm, where he studied the Arabian manuscripts in the queen's possession. Bochart had a profound knowledge of the principal oriental languages, including Hebrew, Syriac, Chaldaic, and Arabic, but was obsessed by the desire to derive all languages from Phoenician.

A complete edition of his works was published at Leyden, under the title of *Sam. Bochart Opera Omnia* (1675; 4th ed. 1712). An *Essay on the Life and Writings of Samuel Bochart*, by W. R. Whittingham, appeared in 1829.

BOCHER, MAXIME (1867–1918), American mathematician, son of Ferdinand Bocher, professor of French at Harvard, was born in Boston, Mass., on Aug. 28, 1867. He was educated in the Cambridge Latin school and at Harvard college at which he graduated in 1888. Later he studied at the University of Goettingen from which he received in 1891 the degree of doctor of philosophy for his dissertation *Über die Reihenentwickelungen der Potentialtheorie*. After serving as instructor in 1891–94 and as assistant professor in 1894–1904, he was made professor of mathematics at Harvard. In 1913–14 he was exchange professor at Paris. He exercised great influence on mathematics and mathematical instruction in America, especially through his seminar teaching in which he stimulated students to undertake mathematical research. His own later work was chiefly concerned with differential equations, series and higher algebra. He died in Cambridge, Mass., on Sept. 12, 1918. Besides elementary texts on trigonometry and analytic geometry, he wrote *Introduction to Higher Algebra* (1907; Ger. trans. by Hans Beck 1910) and *An Introduction to the Study of Integral Equations* (1909). He was

one of the editors of *Annals of Mathematics* in 1896–1907, and again in 1910, and (with L. E. Dickson) was editor of the *Transactions of the American Mathematical Society* in 1907–09 and again in 1911.

See G. D. Birkhoff, "The Scientific Work of Maxime Bocher," *Bull. Am. Math. Soc.*, vol. xxv., pp. 197–215, and "The Life and Services of Maxime Bocher," *ib.*, pp. 337–350.

BOCHOLT, town in Westphalia, Germany, near the Dutch frontier, 12m N. of Wesel. Pop. (1925) 30,240. It is a centre of the cotton industry.

BOCHUM, a town of Germany, in the Prussian province of Westphalia, 11m W. of Dortmund. Pop. (1925) 156,799. It is a centre of the coal, iron and steel industries, with tin and zinc works. There is a chamber of commerce.

BOCLAND, BOCKLAND or **BOOKLAND**, in Anglo-Saxon law, a grant of folkland (*q. v.*) by the king, with the consent of the witan, at first usually to the church, occasionally to laymen for religious purposes. It was a grant of lordship and revenues, and perhaps of jurisdiction also. The grantee by the terms of the charter or book might possess powers equivalent to those of a modern tenant in fee simple. He might dispose of the land by will or make grants out of it to dependents.

BOCSKAY, STEPHEN (ISTVÁN) (1557–1606), prince of Transylvania, the most eminent member of the ancient Bocskay family, son of György Bocskay and Krisztina Sulyok, was born at Kolozsvár (Cluj) Transylvania. He advised Prince Zsigmond Báthory to contract an alliance with the emperor instead of holding to the Turk, and was sent on frequent missions to Prague and Vienna. The later Báthory princes of Transylvania confiscated his estates, and he sought protection at the imperial court (1599), but he was alienated by the attempts of the emperor Rudolph II to deprive Hungary of her constitution and the Protestants of their religious liberties, and by the outrages inflicted on the Transylvanians by the imperial generals Basta and Belgiojoso from 1602 to 1604. To save the independence of Transylvania, Bocskay assisted the Turks; and as a reward for his part in driving Basta out of Transylvania, the Hungarian diet, assembled at Modgyes, elected him prince (1604). The Ottoman sultan sent a special embassy to congratulate him, and a splendid jewelled crown made in Persia. Bocskay refused the royal dignity, but made skilful use of the Turkish alliance. To save the Austrian provinces of Hungary, the archduke Matthias, setting aside his semi-lunatic imperial brother Rudolph, entered into negotiations with Bocskay, and ultimately the peace of Vienna was concluded (June 23, 1606), which guaranteed all the constitutional and religious rights and privileges of the Hungarians both in Transylvania and imperial Hungary. Bocskay was acknowledged as prince of Transylvania and the right of the Transylvanians to elect their own independent princes in future was officially recognized. The fortress of Tokaj and the counties of Bereg, Szatmár and Ugocsa were ceded to Bocskay, with reversion to Austria if he should die childless. Soon after, at Zsitvatorok, a peace, confirmatory of the Peace of Vienna, was concluded with the Turks. Bocskay is said to have been poisoned (Dec. 29, 1606) by his chancellor, Mihály Kátay, who was hacked to bits by Bocskay's adherents in the market-place of Kaschau.

See *Political Correspondence of Stephen Bocskay* (Hung.) ed. by Károly Szábo (Budapest, 1882); Jenő Thury, *Stephen Bocskay's Rebellion* (1899).

BOD, the name by which Tibet is known to the Tibetans. The term is also used adjectivally for the people of the country and in such expressions as *Bod-Skad*, the Tibetan language. The etymology of the term is doubtful and the suggestion that it is connected with *Bodh* (wisdom) or *Buddh* (wise, Buddha) is probably nothing more than folk-etymology. (See **TIBET**).

BODE, JOHANN ELERT (1747–1826), German astronomer, was born at Hamburg on Jan. 19 1747. He founded in 1774, the well-known *Astronomisches Jahrbuch*, 51 yearly volumes of which he compiled and issued. He became director of the Berlin observatory in 1786, withdrew from official life in 1825 and died at Berlin Nov. 23 1826. His other works include: *Sammlung astronomischer Tafeln* (1776); *Erläuterung der Sternkunde*

(1776, 3rd ed. 1808); *Uranographia* (1801), a collection of 20 star-maps accompanied by a catalogue of 17,240 stars and nebulae. He propounded, in 1776, a theory of the solar constitution similar to that developed in 1795 by Sir William Herschel. He gave currency to the empirical rule known as "Bode's Law," which was actually announced by Johann Daniel Titius of Wittenberg in 1772. It is expressed by the statement that the proportionate distances of the several planets from the sun may be represented by adding 4 to each term of the series. 0, 3, 6, 12, 24, etc. The irregularity will be noticed of the first term, which should be 1½ instead of 0 (see **SOLAR SYSTEM**).

See J. F. Encke, *Berlin Abhandlungen* (1827), p. xi; H. C. Schumacher, *Astr. Nach.* (1827), v. 255, 367; Poggendorff, *Biog. literarisches Handwörterbuch*; *Allgemeine deutsche Biographie*, iii. 1.

BODE, WILHELM VON (1845–1929), German art critic, was born at Kalvorde, Brunswick, on Dec. 10, 1845. After having studied law he entered the legal profession. In 1869 he turned to the study of Dutch painting. He became assistant in the Berlin museum in 1872, curator of the department of Christian sculpture in 1883, and director of the Kaiser Friedrich Museum in 1890. During his management this museum became one of the foremost collections of the world. In 1905 he was made general director of all the royal museums in Prussia, resigning in 1920. His knowledge extended over a wide field and is especially valued in Dutch and Flemish painting and in Italian sculpture.

His more important works are: *Geschichte der deutschen Plastik* (1885); *Italienische Bildhauer der Renaissance* (1887); *Rembrandt*, 8 vols., assisted by Hofstede de Groot (1897–1900, Eng. trans. 1906); *Italienische Hausmöbel der Renaissance* (1902, Eng. trans. 1921); *Florentiner Bildhauer der Renaissance* (1902, Eng. trans. 1908); *Italian Bronze Statuettes of the Renaissance* (3 vols., assisted by Murray Marks, 1907); *Die Meister der holländischen und flämischen Malerschulen* (1919); *Adam Elsheimer* (1920); *Bertoldo und Lorenzo de Medici* (1925), and *Botticelli* (1926).

He described his administrative work in *Fünzig Jahre Museumsarbeit* (1922). On the occasion of his 80th birthday a volume was published entitled *Hauptwerke aus den staatlichen Museum zu Berlin, Wilhelm von Bode zu Ehren herausgegeben von den Abteilungsleitern* (1926). He died March 2, 1929.

BODEL, JEHAN (died c. 1210), French trouvère, was born at Arras in the second half of the 12th century. Very little is known of his life, but in 1205 he was about to start for the crusade when he was attacked by leprosy. In a touching poem called *Le Congé* (printed by Méon in *Recueil de fabliaux et contes*, vol. 1), he bade farewell to his friends and patrons, and begged for a nomination to a leper hospital. He wrote *Le Jeu de Saint Nicolas*, one of the earliest miracle plays preserved in French (printed in Monmerqué and Michel's *Théâtre français du moyen âge*, 1839, and for the *Soc. des bibliophiles français*, 1831); the *Chanson des Saisnes* (ed. F. Michel, 1839), four pastourelles (printed in K. Bartsch's *Altfranz. Romanzen und Pastourelle*, Leipzig, 1870); and probably the eight *fabliaux* attributed to an unknown Jean Bedel. The legend of St. Nicholas had already formed the subject of the Latin *Ludus Sancti Nicolai* of Hilarius. The *Chanson des Saisnes*, Bodel's authorship of which has been called in question, is a *chanson de geste* belonging to the period of decadence, and is really a *roman d'aventures* based on earlier legends belonging to the Charlemagne cycle. It embraces three distinct legends—those of the wars against the Saxons, of Charlemagne's rebellious barons and of Baudouin and Sebillie.

See also the article on Jehan Bodel by Paulin Paris in *Hist. litt. de la France*, xv., pp. 605–638; Gaston Paris, *Histoire poétique de Charlemagne* (1865); Léon Gautier, *Les Épopées françaises* (revised edit., vol. iii, pp. 650–684), where there is a full analysis of the *Chanson des Saisnes* and a bibliography; H. Meyer, in *Ausgaben und Abhandlungen aus . . . der romanischen Philologie* (Marburg, 1883), pp. 1–76, where its relation to the rest of the Charlemagne cycle is discussed.

BODENBACH: see **PODMOKLY**.

BODENSTEDT, FRIEDRICH MARTIN VON (1810–1892), German author, born at Peine, Hanover, April 22, 1810, and died at Wiesbaden on April 19, 1892. He became tutor in the

family of Prince Galitzin at Moscow, and then was head of a school in Tiflis. There he studied Persian literature, and in 1851 published a book of poems, *Die Lieder des Mirza Schaffy* (Eng. trans 1880), oriental in form and colouring, which had instant success. The book ran through 160 editions, and was translated into many languages. After his return to Germany Bodenstedt became (1854) professor of Slav languages at Munich, made many translations from Russian authors, and wrote a tragedy on the story of the false Demetrius, and an epic on a Circassian theme. In 1858 he became professor of early English literature, and from that time devoted his attention primarily to the Shakespearean drama. He collaborated with Paul Heyse and others in a new translation of Shakespeare's works (9 vols. 1868-73), and himself translated the sonnets. From 1866 onwards he was director of the Meiningen theatre, and he edited the *Tägliche Rundschau* from 1880 to 1888. Among Bodenstedt's other works are: *Tausend und ein Tage im Orient* (1849-50); *Shakespeare's Zeitgenossen und ihre Werke* (1858-60); an autobiography (1888); successful translations from Hafiz and Omar Khayyām, and lyrics and dramas which added little to his reputation.

An edition of his collected works was published at Berlin (1866-69) and his *Erzählungen und Romane* at Jena (1871-72). For further biographical details see Bodenstedt's *Erinnerungen aus meinem Leben* (1888-90); and G. Schenck, *Friedrich von Bodenstedt. Ein Dichtersleben in seinen Briefen* (1893).

BODH GAYA, a village in British India, in the Gaya district of Behar and Orissa, situated 6m. south of the town of Gaya. It is one of the holiest places in the Buddhist world, for it was here that, under a *pipal* tree (*Ficus religiosa*), Prince Gautama or Sakya Muni obtained enlightenment, i.e., became free from the circle of re-births and became the Buddha. In the 3rd century B.C. the emperor Asoka erected a temple here; part of the stone railing enclosing this temple and the *vajrasan* or diamond throne marking the spot where Buddha sat are still extant. Asoka's temple, having become ruinous, was replaced by another temple, identified with that now standing, which was restored in the 11th century A.D. and again by the British Government in 1882. The main tower rises to a height of 170 feet. In the courtyard round it are ranged a great number of stone *stupas* which devout Buddhist pilgrims left as memorials of their visit to the shrine. A *pipal* tree of no great age outside the temple is believed to be a lineal descendant of the sacred Bodhi tree under which Buddha sat, for the life of the tree was perpetuated, when it began to die, by dropping a seed in a fork or hollow.

See R. Mitra, *Buddha Gaya* (1878); Sir A. Cunningham, *Mahabodhi* (1892).

BODHIVAMSA or **MAHĀBODHIVAMSA**, a prose poem in elaborate Sanskritized Pali, composed by Upatissa in the first half of the 11th century A.D. Based on a Sinhalese original, after outlining the early history of Buddha and Buddhism it describes the bringing of a branch of the celebrated Bo or Bodhi tree (i.e., Wisdom Tree, under which the Buddha had attained wisdom) to Ceylon in the 3rd century B.C. The Bodhivamsa is mainly a compilation from the Nidānakathā Mahāvamsa, and other sources, but it has occasionally preserved details of the older tradition not otherwise known to us.

Edition in Pali for the Pali Text Society by S. Arthur Strong (1891); see W. Geiger, *Pali Literatur und Sprache*, p. 25 (Strasbourg, 1916).

BODICHON, BARBARA LEIGH SMITH (1827-1891), English educationalist, was born at Watlington, Norfolk, on April 8, 1827, the daughter of Benjamin Smith (1783-1860), long M.P. for Norwich. She early showed a force of character and catholicity of sympathy that later won her a prominent place among philanthropists and social workers. In 1857 she married an eminent French physician, Dr. Eugène Bodichon, and, although wintering many years in Algiers, continued to lead the movements she had initiated on behalf of English women. In 1869 she published her *Brief Summary of the Laws of England concerning Women*, which had a useful effect in helping forward the passage of the Married Women's Property act. In 1866, co-operating with Miss Emily Davies, she matured a scheme for the extension of university education to women, and the first small experiment at Hitchin developed into Girton college, to which Mme. Bodichon

gave liberally of her time and money. With all her public interests, she found time for society and her favourite art of painting. She studied under William H. Hunt, and her water-colours, exhibited at the Salon, the Academy and elsewhere, showed great originality and talent, and were admired by Corot and Daubigny. Mme. Bodichon died at Robertsbridge, Sussex, on June 11, 1891.

See Lady Stephen, *Emily Davies and Girton College* (1927).

BODIN, JEAN (1530-1596), French political philosopher, was born at Angers in 1530. Having studied law at Toulouse and lectured there on jurisprudence, he settled in Paris as an advocate. In 1588, in refutation of the views of the seigneur de Malestroit, comptroller of the mint, who maintained that there had been no rise of prices in France during the three preceding centuries, he published his *Responsio ad Paradoxa Malestretti* (*Réponse aux paradoxes de M. Malestroit*), which explained the revolution in prices which took place in the 16th century. Bodin showed a more rational appreciation than many of his contemporaries of the causes of this revolution. This tract, the *Discours sur les causes de l'extrême cherté qui est aujourd'hui en France* (1574), and the disquisition on public revenues in the sixth book of the *De la République* (1577) entitle Bodin to a distinguished position among the earlier economists.

His learning, genial disposition and conversational powers won him the favour of Henry III, and of his brother, the duc d'Alençon; and he was appointed king's attorney at Laon in 1576. In this year he represented the *tiers état* of Vermandois in the states-general of Blois, and contended with skill and boldness in extremely difficult circumstances for freedom of conscience, justice and peace. The nobility and clergy favoured the league, and urged the king to force his subjects to profess the Catholic religion. When Bodin found he could not prevent this resolution being carried, he contrived to get inserted in the petition drawn up by the states, the clause "without war," which practically rendered nugatory all its other clauses. While he thus resisted the clergy and nobility he opposed the king's demand to be allowed to alienate the public lands and royal demesnes. In 1581 he acted as secretary to the duc d'Alençon when that prince came over to England to seek the hand of Queen Elizabeth. Here he had the pleasure of finding that the *République* was studied at London and Cambridge, although in a barbarous Latin translation. This determined him to translate his work into Latin himself (1586). The latter part of Bodin's life was spent at Laon, which he is said to have persuaded to declare for the league in 1580, and for Henry IV five years afterwards. He died of the plague in 1596.

With all his breadth and liberality of mind Bodin was a credulous believer in witchcraft, the virtues of numbers and the power of the stars, and in 1580 he published the *Démonomanie des sorciers*.

Bodin's *Six livres de la République* (1576), translated into Latin by himself (1586), though it is said to be the beginning of the science of political economy, was only an incidental part of a larger scheme for a book on the universe. Bodin did not write the *Republic* from the point of view of an impartial philosopher. It was his intention to be very practical—not only to describe the ideal state, but also to establish detailed reforms in France. Two altogether distinct ideas stand out: his conception of sovereignty and his theory of climate. Sovereignty, he says, arises from human needs, and not from God—a hit at the Divine Right of Kings. He conceives of the state as an association of families which recognize unlimited law-making power in some person or group. The family is thus the corner-stone of the state, and the father, as its head, has absolute power, even of life and death, over his children. It must have property attached to it which, Bodin inconsistently says, the king may not take without the father's consent; hence if direct taxation is necessary the king must ask for a grant.

Bodin held that the main types of humanity, their laws and institutions, correspond to three climatic zones: the north, cold and dry, which produces a stupid but physically vigorous type tending towards democratic forms of government; the south which, being very hot, is peopled by intelligent but lazy, and consequently, politically passive races, usually governed by a

theocracy or some form of despotism; and lastly, the central zone where the climate is temperate, and where, as in the case of France, the favourite form of government is a true monarchy.

Bodin was probably the only writer of the 16th century who had grasped the fact that Europe was changing rapidly. He saw that no monarchy, however stable, could last for ever, but realized that the recognition of a strong monarchy in the France of his day, was the only hope of escape from political chaos.

Among his other works are *Oratio de instituenda in republica juventute* (1559); *Methodus ad facilem historiarum cognitionem* (1566); *Universale Naturae Theatrum* (1596, French trans. by Fougerolles, 1597), and the *Colloquium Heptaplomeres de abditis rerum sublimium arcanis*, written in 1588, published first by Guhr-auer (1841), and in a complete form by L. Noack (1857). The last is a philosophy of naturalism in the form of a conversation between seven learned men—a Jew, a Mohammedan, a Lutheran, a Zwinglian, a Roman Catholic, an Epicurean and a Theist.

Planchenaull, *Études sur Jean Bodin* (Angers, 1858); E. de Barthélemy, *Étude sur J. Bodin* (1876); for the political philosophy of Bodin, see P. Janet, *Hist. de la science polit.* (3rd ed. 1887); Hancke, *B. Studien über d. Begriff d. Souveränität* (Breslau, 1894); A. Bardoux, *Les Légistes et leur influence sur la soc. française*; Fournol, *Bodin prédécesseur, de Montesquieu* (1896); for his political economy, J. K. Ingram, *Hist. of Pol. Econ.* (London, 1888); for his ethical teaching, A. Desjardins, *Les Moralistes français du seizième siècle*, ch. v.; and for his historical views, R. Flint's *Philosophy of History in Europe* (ed. 1893), pp. 190 foll.

BODINGTON, SIR NATHAN (1848–1911), vice-chancellor of Leeds University, was born at Aston on May 29, 1848. A graduate of Wadham College, Oxford, he became a fellow of Oriel, and in 1882 professor of Greek and principal of Yorkshire College, Leeds. He secured the endowment and incorporation of the college as a university in 1903. He died at Leeds on May 12, 1911.

BODLE or **BODDLE**, a Scottish copper coin worth about one-sixth of an English penny, first issued under Charles II. It survives in the phrase "not to care a bodle," and is said to be derived from Bothwell, the name of a mint master.

BODLEY, SIR THOMAS (1545–1613), English diplomatist and scholar, founder of the Bodleian library, Oxford, was born at Exeter March 2 1545, and died in London Jan. 28 1613. Bodley was educated at Geneva, where his father had gone to live on account of his Protestant principles. On the accession of Queen Elizabeth he returned with his father to England and soon after entered Magdalen college, Oxford. In 1563 he was admitted a fellow of Merton college. In 1569 he was proctor, and for some time deputy orator. In 1584 he entered parliament as member for Portsmouth, and represented St. Germans in 1586. In 1585 Bodley was sent to form a league between Frederick II. of Denmark and certain German princes to assist Henry of Navarre. He was next dispatched on a secret mission to France, and in 1588 he was sent as minister to The Hague. The essential difficulties of his mission were complicated by the intrigues of the queen's ministers at home, and Bodley repeatedly begged that he might be recalled. He was finally permitted to return to England in 1596, but, finding his preferment obstructed by the jarring interests of Burleigh and Essex, he retired from public life. He was knighted on April 18 1604. He is remembered specially as the founder of the Bodleian library at Oxford. He determined, he said, "to take his farewell of State employments and to set up his staff at the library door in Oxford." In 1598 his offer to restore the old library was accepted by the university. In 1611 he began its permanent endowment, and the greater part of his fortune was left to it. He was buried in the choir of Merton college chapel, where a monument of black and white marble was erected to him.

Sir Thomas wrote his own life to the year 1600, which, with the first draft of the statutes drawn up for the library, and his letters to the librarian, Thomas James, was published by Thomas Hearne under the title of *Reliquiae Bodleianae, or Authentic Remains of Sir Thomas Bodley* (1703).

BODLEY, GEORGE FREDERICK (1827–1907), English architect, was born at Hull on March 14, 1827, the son of a physician. He was articled to Sir Gilbert Scott, under whose in-

fluence he became imbued with the spirit of the Gothic revival, and gradually became known as the chief exponent of 14th century English Gothic, and the leading ecclesiastical architect in England. One of his first churches was St. Michael and All Angels, Brighton, and among his principal erections may be mentioned: All Saints, Cambridge; Eton Mission church, Hackney Wick; Clumber church; Eccleston church; Hoar Cross church; St Augustine's, Pendlebury; Holy Trinity, Kensington; Chapel Allerton, Leeds; St. Faith's, Brentford; Queen's college chapel, Cambridge; Marlborough college chapel; and Burton church. His domestic work included the London School Board offices, the new buildings at Magdalen, Oxford, and Hewell Grange (for Lord Windsor). From 1869 he was for 20 years in partnership with Mr. T. Garner. He also designed (with his pupil James Vaughan) the cathedral at Washington (D.C.), U.S.A., and cathedrals at San Francisco and in Tasmania; and when Mr. Gilbert Scott won the competition for the new Liverpool cathedral Bodley collaborated as supervisor of its erection. Bodley was elected A.R.A., in 1881 and R.A., in 1902. In addition to being a most learned master of architecture, he was a beautiful draughtsman, and a connoisseur in art; he published a volume of poems in 1899; and he was a designer of wallpapers and chintzes for Watts and Co., of Baker street, London; in early life he had been in close alliance with the Pre-Raphaelites, and, like William Morris, he did a great deal to improve public taste in domestic decoration and furniture. He died on Oct. 21, 1907, at Water Eaton, Oxford.

BODMER, JOHANN JAKOB (1698–1783), Swiss-German author, was born at Greifensee, near Zurich, on July 19 1698. In 1725 he was appointed professor of Helvetian history in Zürich, a chair which he held for half a century, and in 1735 became a member of the "Grosser Rat." He published (1721–23), in conjunction with J. J. Breitinger (1701–74) and several others, *Die Diskurse der Mahlern*, a weekly journal after the model of the *Spectator*. Through his prose translation of Milton's *Paradise Lost* (1732) and his successful endeavours to make a knowledge of English literature accessible to Germany, he aroused the hostile criticism of Gottsched (*qv*) and his school, a struggle which ended in the complete discomfiture of the latter. His most important writings are the treatises *Von dem Einfluss und Gebrauche der Embildungskraft* (1727); *Von dem Wunderbaren in der Poesie* (1740); and *Kritische Betrachtungen über die poetischen Gemälde der Dichter* (1741), in which he pleaded for the freedom of the imagination from the restriction imposed upon it by French pseudo-classicism and for descriptive poetry in general. Bodmer's epics *Die Sündfluth* (1751) and *Noah* (1751) are weak imitations of Klopstock's *Messias*, and his plays are entirely deficient in dramatic qualities. He did inestimable service to German literature by opening up the field of early German poetry by his editions of the Minnesingers and part of the *Nibelungenlied*. He died on his farm near Zurich on Jan. 2 1783.

Braitmaier, *Geschichte der poetischen Theorie und Kritik von den Diskursen der Mäler bis auf Lessing* (Leipzig, 1888); *Denkschrift zu Bodmers 200. Geburtstag* (1900).

BODMIN, municipal borough and county town of Cornwall, England, 30m. W.N.W. of Plymouth, with stations on the G.W. and Southern railways. Pop. (1921) 5,526. It lies in a short valley opening westward upon that of the Camel, at the south end of the high open Bodmin moor. The site is near what seems to have been a transpeninsular route between the estuaries of the Fowey and the Camel in the early metal ages. There are traces of Roman occupation during the first century A.D. The name appears in an early charter as Bodmine, Bodman and Bodmyn. At the time of Domesday the manor, consisting of 68 houses and one market, was held by St. Petrock and owed its importance to its ecclesiastical associations. To successive priors, as mesne lords, it owed its first municipal privileges. Edward I. confirmed to the burgesses the pesage (a duty paid for the weighing) of tin, and Edward II. a market for tin and wool. The town was constituted a free borough in 1563, with two fairs and a Saturday market. The Corporation became extinct in 1789, but

a new charter of incorporation was granted in 1798 and remodelled by the act of 1835.

The large church of St Petrock is mainly Perpendicular, but has earlier portions. Parts of the buildings of a Franciscan friary, founded c. 1240, are incorporated in the market-house. Most of the county institutions are here, and the assizes were fixed here in 1837, having previously been held alternatively at Launceston. Cattle, sheep and horse fairs are held, and there is a considerable agricultural trade. The borough is under the mayor, four aldermen and 12 councillors. Area, 2,707 ac. For purposes of representation it is included in the Bodmin parliamentary county division.

BODO or **BĀRĀ**, a race of tribes in Assam divided roughly into two groups, the western consisting of the Chutiya, Plains Kachari, Rabha, Garo, Mech, Koch, Dhimal and Haijong tribes, the eastern of the Dimasa or Hill Kachari, Hojai, Lalung, Tippera and Moran tribes. The Bodo race were formerly dominant in Assam, where a Chutiya kingdom was destroyed by Shan invaders (see SHAN) who set up the Ahom kingdom in its place in the 13th century. The Chutiyas practised human sacrifice, but the general features of Bodo customs may be inferred from the accounts of Kacharis, Garos (*qq.v.*) and Tipperas. Most of the Bodo tribes have now become superficially Hinduized, and it has been suggested that the Tantrik beliefs, for which the Hinduism of Assam is conspicuous, are based on Bodo belief and custom which has permeated and coloured the superimposed religion. The languages belong to the Tibeto-Burmese family.

BODØ, a seaport on the north-western coast of Norway, in Nordland amt (county), 67° 17' N, on the north side of the entry into Salt fjord. Pop. (1920), 4,841. The rock-bound harbour admits large vessels, and there is a brisk trade in fish and eider-down. The neighbouring country has many scenic attractions. Sixty miles inland rises the great *massif* of Sulitelma on the Swedish frontier, with its copper mines, broad snow-fields and glaciers. The fjords of the district include the imposing Beieren-fjord, the Saltenfjord and the Skjerstadvfjord, at the narrow mouths of which a remarkable cataract (Saltstrøm) is formed at the turn of the tide.

BODONI, GIAMBATTISTA (1740–1813), Italian printer, was born in 1740 at Saluzzo in Piedmont, the son of a printer. He became a compositor for the press of the Propaganda. The infante Don Ferdinand, afterwards duke of Parma, placed him in charge of his fine printing-house in Parma, which he soon rendered the first of the kind in Europe. The intrinsic value of his editions is seldom equal to their outward splendour. His Homer, however, is a truly magnificent work; and, indeed, his Greek letters are faultless imitations of the best Greek manuscript. His editions of the Greek, Latin, Italian and French classics are all highly prized for their typographical elegance, and some of them are not less remarkable for their accuracy. Bodoni died at Padua in 1813. In 1818 a magnificent work appeared in two volumes quarto, entitled *Manuale Tipografico*, containing specimens of the vast collection of types which had belonged to him.

See De Lama, *Vita del Cavaliere Giambattista Bodoni* (1816), and Bertieri, *L'arte di Giambattista Bodoni* (1913).

BODY AND MIND. In seeking to deal with the perennial problem of "Body and Mind" our first task is to state in general terms how activities of the body are related to activities of the mind, accepting the distinction between body and mind at its face value—as it is understood in general speech. A body is something that can move in space and can be seen and touched, whereas the mind is revealed in consciousness, which is direct experience of mental activity and, as such, incapable of further definition. It is a matter of observed fact that mind or mental activity does occur in relation to bodily activity. We do not meet with minds independently of bodily organisms—at any rate, not in normal circumstances—and whereas at the time of Aristotle it was thought that the chief seat of the mind was the heart, it is now recognized by everyone that the brain—the most complex and dominant part of the nervous system—is that part of the body which is in immediate relationship to the mind, or to mental activity.

Two general questions arise. One is as to the various parts of the brain with which different kinds of mental activity are directly correlated. This is the question of cerebral localization. The other question is as to the exact nature of the relationship between mental activity and whatever kind of brain activity is correlated with it.

The Doctrine of Cerebral Localization, as first worked out by Fritz, Hitzig, Munk, Ferrier, etc., and developed in modern times by Sherrington, Head and others, is a theory of the localization, not of different kinds of mental activity, but of different kinds of physiological activity correlated therewith. The part of the brain chiefly concerned is the cerebral cortex, which is a layer of "grey" matter, one-eighth to one-twelfth of an inch in thickness, covering the two cerebral hemispheres. This cerebral cortex is a great "projection area," which acts as the ultimate receiving station for sensory impulses, and the primary transmitting station for motor impulses of a volitional, or at least of a conscious, type. Its extent is greatly increased by the "convolutions" into which it is thrown. The nerve fibres running from the cerebral cortex to the lower parts of the nervous system are mainly motor in nature, and carry impulses which pass through sub-cortical "centres" and eventually reach the various muscles on the opposite side of the body. The fibres that run into the cerebral cortex are mainly sensory in nature, and come eventually from the optic thalamus and other sub-cortical "centres" which receive impulses from the various sense organs—eye, ear, skin, etc.—likewise on the opposite side of the body. Within the cortex itself there run short "tangential" fibres which link up one part of the cortex with closely neighbouring parts. These are special association fibres which probably have to do with "immediate memory"—the memory for recent events. They are found to be degenerated in the brains of patients dying of chronic alcoholism, where an outstanding symptom is loss of memory for recent events.

Besides these tangential fibres, there are longer association fibres running from any one part of the cortex to more distant parts, including a mass of fibres, known as the "corpus callosum," linking the two cerebral hemispheres together.

By means of these association fibres and projection fibres, which link up cortical centres with one another, and, through sub-cortical centres, with the sense-organs and muscles of the body, an elaborate and complex system of "integrative action" (Sherrington) is possible, whereby the organism is enabled to react as a unity to its environment, and to obtain a unitary experience of that environment.

It has been discovered by physiological research that voluntary movement, or at least consciously-initiated movement, occurs in relation to physical change in a very special and restricted part of the cerebral cortex, viz., in the precentral convolution, the convolution in front of the fissure of Rolando. The localization is very precise, in that centres for movement of different muscles of the body are spatially distinct from one another. The muscles of the lower limb are represented in the upper part of the precentral convolution. The muscles of the trunk are represented in the middle part, and the muscles of the shoulder, upper arm, lower arm and hand are represented lower down. Lower down still the muscles of the face, tongue, lips and larynx are represented, so that the lowest part of the precentral convolution is concerned with the movement of the muscles of speech. In the post-central convolution, just behind the fissure of Rolando, there is localization of brain change correlated with cutaneous sensibility. The cutaneous sensations arise from the skin covering the sets of muscles represented by the corresponding areas in the precentral convolution. Other forms of sensory experience are correlated with change in other parts of the cerebral cortex. Visual sensation is related to change in the occipital lobe—at the back of the brain. Auditory sensation is related to change in the first and second convolutions of the temporal lobe—the lobe at the side of the cerebral hemisphere below the fissure of Sylvius. Sensations of taste and smell are probably related to change in the cerebral cortex covering the mesial surface of the hemisphere.

These motor and sensory areas are not to be regarded as having clear-cut boundaries, or as adjoining one another like a mosaic

pattern. There is probably depth-localization in the cerebral cortex in addition to correlation according to relationship of surface extent. Many details of the localization theory are still in dispute, especially as regards the more complex problems, such as that of aphasia (Henry Head). Moreover, some forms of affective experience, such as pleasure, pain, and emotional consciousness, are probably directly correlated with brain-change in the optic thalamus and other sub-cortical centres. What is not in dispute is that the different kinds of sensory experience are in direct relation to change in locally distinct parts of the cerebral cortex, and that consciously initiated motor experience is in very detailed relation to other areas of the cerebral cortex. Not only is there localization of brain changes concerned with sensory and motor consciousness, there is also a certain degree of localization of brain changes concerned with higher forms of mental activity. But such localization is not so precise, and its exact nature is still in dispute. In the view of Henry Head there is no exact "point-to-point" correspondence between brain change and mental process.

Psycho-Physical Relation.—The further, and more ultimate question now arises: What exactly is the relationship between any particular form of mental activity and its corresponding physiological correlate, or brain-event? Let us take as a definite example the visual perception of a patch of red colour. The physiological correlate of this experience is some kind of protoplasmic change in a definite part of the occipital cortex—a change ultimately describable in terms of molecular, atomic and intra-atomic movements or vibrations. Obviously, the two sides in this relation are entirely different from one another.

Materialism.—Of the various possible ways in which they may be conceived to be related, one is that the physical change in the occipital cortex produces the mental experience—the perception of red; and that there is a causal relationship between the two occurrences, a temporal sequence, in which the brain-event comes first and the mind-event comes second. Or again, let us take the experience of voluntarily moving the arm. Corresponding to that a physical change occurs in a definite part of the precentral convolution. Here, too, according to the same theory, the brain-event comes first. The change in the precentral convolution occurs because of antecedent change elsewhere in the brain. It produces both the experience of voluntary movement of the arm and also motor impulses which pass down the pyramidal tract to reach the muscles of the arm, causing their contraction. The theory thus illustrated is the theory of Materialism in its crude form. According to this theory there is always a sequence between brain change and consciousness, whether motor or sensory. The brain change always comes first and is the cause of the conscious change. Consciousness is always an effect, never a cause. Like the melody that floats from the harp-string or the shadow that accompanies the pedestrian's footsteps, it remains ineffective.

Interaction.—A second general theory of the psycho-physical relation is that mind and brain are two distinct substances or entities in causal interaction with one another. The mind is relatively passive in sensory perception and relatively active in the conscious initiation of muscular movement. One powerful argument against both these theories is that based upon the nature of the causal relation. In cases where a causal sequence is admitted and is regarded as intelligible, there is generally some thread of identity which can be postulated as running through the sequence, such that cause and effect can be conceived as earlier and later stages of a continuous process. But brain change is one thing, mental process is another; and so great is the disparity between them that it is impossible for the mind to pass smoothly and continuously, in thought, from the one to the other. For the theory of materialism there is also the difficulty that the form of causation assumed is a one-sided one, viz., one passing from the physical to the mental but not vice-versa, and therefore unique in the annals of scientific theory. A further difficulty with materialism is that it makes matter the only real agent, regarding the mind as passive on every occasion. In this it is contrary to direct experience, and leads to absurd results. Indeed,

we can draw up an argument according to which it refutes itself. Thus if the brain is the only real agent and the mind is always result and never cause, i.e., is always essentially passive, then mental activity is illusory. If mental activity is illusory, then intellectual activity is illusory. If intellectual activity is illusory, the products of intellectual activity are illusory. Now one such product is this theory of materialism, therefore this theory is illusory. No doubt, this "refutation" is too short and easy a way with materialism, but it does emphasize a serious difficulty in the theory.

Parallelism.—We now come to the theory of Parallelism, which represents an attempt to evade the aforementioned difficulties of materialism and interaction, especially that arising from the impossibility of conceiving any causal relation between realities so disparate in nature as the physical and the mental. According to the parallelist hypothesis, there is a point-to-point correspondence between mental processes and certain physical processes (their "physical correlates") in the organism, but without interaction. There is no temporal sequence between brain-event and mind-event, and no causal relation. The theory is a direct descendant of Spinoza's monistic doctrine that thought and extension are two distinct but corresponding aspects or "attributes" of one universal substance—God or Nature. Brain change is one manifestation of reality, and the consciousness corresponding to that brain change is another manifestation of the same reality. This theory may take different forms. The mental process and the corresponding physical process may be regarded as two aspects of something that is different from either, something that is "in itself" neither merely mental nor merely physical, or the physical process may be regarded as the more real of the two, manifesting consciousness as an additional characteristic, when of a certain degree of complexity; or, thirdly, the psychical process may be regarded as the true and ultimate reality, of which the physical process is the "appearance," or the aspect under which this reality appears to another "centre of consciousness" or subject of experience.

Two fundamental criticisms have been brought against the parallelist hypothesis. In the first place, it is argued that, whereas physical processes are multiple, mental processes show a unity. There is a unity of mind to which nothing on the physical side corresponds. Secondly, it is contended that whereas the mind is essentially teleological or purposive in nature, the body is mechanical in both structure and function, and there can be no parallelism between a teleological series and a mechanical series. But neither argument can hold its ground. On the one side, the mind is not a complete unity, and on the other, the brain shows a certain degree of unity in its working, in accordance with the integrative action of the nervous system. Again, there may be as much teleology or purposiveness in brain activity as there is in mental activity. "Mere mechanism" is a myth, handed down from 18th-century physics. In its place we should put an "organic" theory of the physical universe, such as that sketched out by A. N. Whitehead. In an organism or totality, the whole is greater than the sum of its parts. The entire system is likewise greater than the sum of its subsidiary totalities. There is at least a possibility that the whole physical universe is an organism. A more serious difficulty in Parallelism is that it definitely rules out the possibility of individual survival of bodily death. At death the brain disintegrates. If the mind is the reality of the brain, then the individual mind, the personality, must disappear at death. There are two objections to the acceptance of such a position. One is that it might in time be overturned by the discovery of definite facts, such as are claimed by spiritualists and others to be already in existence, viz., evidence of personal survival. The other is that it seems to run counter to our deepest convictions, and to be in conflict with the results of arguments based on the nature of our *value-experiences*.

Other Views.—Further arguments against parallelism, of a more materialistic trend, are to be found in the recent work of Henry Head on aphasia and of Pavlov on conditioned reflexes. Among alternative theories of the psycho-physical relation, space permits merely the mention of William James's "transmission

theory," and Bergson's view that the brain is solely a motor organ and that "pure" memory (as distinct from rote memory or habit) has no cerebral correlate. Despite the number and variety of the theories brought forward to explain the relation of body and mind, they all remain highly disputable. This probably means that the human mind has not yet succeeded in fashioning concepts adequate for use in so stupendous a task.

BODY-SNATCHING, the secret disinterring of dead bodies in churchyards in order to sell them for the purpose of dissection. Those who practised body-snatching were frequently called resurrectionists or resurrection-men. Previous to the passing of the Anatomy Act, 1832 (see *ANATOMY: History*), no licence was required in Great Britain for opening an anatomical school, and there was no provision for supplying subjects to students for anatomical purposes. Therefore, though body-snatching was a misdemeanour at common law, punishable with fine and imprisonment, it was a sufficiently lucrative business. Besides watching the grave for some time after burial, lest it should be violated, iron coffins were frequently used for burial, or the graves were protected by a framework of iron bars called *mortsafes*, well-preserved examples of which may still be seen in Greyfriars' churchyard, Edinburgh.

See *The Diary of a Resurrectionist*, edited by J. B. Bailey (1896), which also contains a full bibliography and the regulations in force abroad for the supply of bodies for anatomical purposes.

BODY TEMPERATURE: see *ANIMAL HEAT*.

BOECE or BOYCE, HECTOR (c. 1465–c. 1536), Scottish historian and humanist, was born at Dundee about 1465. He received his early education at Dundee and studied in the University of Paris, where he was appointed regent, or professor, of philosophy in the College of Montaigu; and there he was a contemporary and friend of Erasmus, who in two epistles has spoken of him in the highest terms. He was the chief adviser of William Elphinstone, bishop of Aberdeen, in the foundation of the University of Aberdeen, and its first principal. He was in Aberdeen about 1500 when lectures began in the new buildings, and he appears to have been well received by the canons of the cathedral, several of whom he has commemorated as men of learning. It was a part of his duty as principal to read lectures on divinity. He was in receipt (1527–34) of a small pension from the court, was a canon of Aberdeen, vicar of Tullynessle, and then rector of Tyrie.

His first work, *Episcoporum Murthlacensium et Aberdonensium per Hectorem Boetium Vitae*, was printed at the press of Jodocus Badius (Paris, 1522). The portion of the book in which he speaks of Bishop Elphinstone is of enduring merit; it includes an account of the foundation and constitution of the college, together with some notices of its earliest members. But Boece's fame rests on his history of Scotland, published in 1527 under the title *Scotorum Historiae a prima gentis origine cum aliarum et rerum et gentium illustratione non vulgari*. This edition contains 17 books. Another edition, containing the 18th book and a fragment of the 19th, was published by Ferrerius, who has added an appendix of 35 pages (Paris, 1574). Boece's history is no mere chronicle, for he knew and copied Livy. It is a glorification of the Scottish nation, based on legendary sources, and is more interesting as romance than as history. It was translated into Scots by Bellenden Holinshed borrowed extensively from it, and the plot of Shakespeare's *Macbeth* is traceable to it, via Holinshed. It had a wide currency abroad through its French translation, by Nicolas d'Arfeville, and undoubtedly coloured French ideas of Scottish history for a long period.

Boece professed to have obtained from the monastery of Icolmkill, through the good offices of the earl of Argyll, and his brother, John Campbell of Lundy, the treasurer, certain original histories

of Scotland, and among others that of Veremundus, of whose writings not a single vestige is now to be found.

Boece's history of Scotland was translated into Scots prose by John Bellenden (ed. Bannatyne Club, Edin., 1821), and into verse by William Stewart. The *Lives of the Bishops* was reprinted for the Bannatyne Club in 1825, in a limited edition of 60 copies, and edited and translated by J. Moir for the New Spalding Club (Aberdeen, 1894). A commonplace verse-rendering of the *Life of Bishop Elphinstone*, which was written by Alexander Gardyne in 1619, remains in ms.

BOECKH, (Böckh), PHILIPP AUGUST (1785–1867), German classical scholar, was born in Karlsruhe on Nov. 24, 1785. He studied under Wolf at Halle. In 1807 he established himself as *privatdozent* in the University of Heidelberg and was shortly afterwards appointed a professor extraordinarius, becoming professor two years later. In 1811 he removed to the new Berlin university, having been appointed professor of eloquence and classical literature. He remained there till his death on Aug. 3, 1867.

Böckh worked out the ideas of Wolf in regard to philology, and illustrated them by his practice. Discarding the old notion that philology consisted in a minute acquaintance with words and the exercise of the critical art, he regarded it as the entire knowledge of antiquity. He divides it into five parts: first, an inquiry into public acts, civil institutions, and law; second, an inquiry into private affairs; third, an exhibition of the religions and arts of the ancient nations; fourth, a history of all their moral and physical speculations and beliefs, and of their literatures; and fifth, a complete explanation of the language.

Böckh's works are.—(1) an edition of Pindar, the first volume of which (1811) contains the text of the Epincian odes; a treatise, *De Metris Pindari*, in three books; and *Notae Criticae*; the second (1819) contains the *Scholia*; and part ii of volume ii. (1821) contains a Latin translation, a commentary, the fragments and indices. It was especially the treatise on the metres which placed Böckh in the first rank of scholars. In it he pointed out the close connection between the music and the poetry of the Greeks. He investigated minutely the nature of Greek music and musical instruments, so far as it can be ascertained; and he explained the statements of the ancient Greek writers on rhythm. Thus he founded the scientific treatment of Greek metres. (2) *Die Staatshaushaltung der Athener* (1817; 2nd ed. 1851, with a supplementary volume *Urkunden über das Seewesen des attischen Staats*; 3rd ed. by Fraenkel, 1886), Eng. trans. by Sir George Cornewall Lewis (1828) *The Public Economy of Athens*. A work of a similar kind was his *Metrolologische Untersuchungen über Gewichte, Münzfüsse, und Masse des Alterthums* (1838). (3) Böckh was chosen as the principal editor of the *Corpus Inscriptionum Graecorum*. This great work (1828–77) is in four volumes, the third and fourth volumes being edited by J. Franz, E. Curtius, A. Kirchhoff and H. Roehl.

Böckh holds a prominent position amongst the investigators of ancient chronology. His principal works on this subject were: *Zur Geschichte der Mondcyclen der Hellenen* (1855), *Epigraphisch-chronologische Studien* (1856), *Über die vierjährigen Sonnenkreise der Alten* (1863), and several papers which he published in the *Transactions of the Berlin Academy*. Böckh also occupied himself with philosophy. *De Platonica corporis mundani fabrica* (1809) was followed by *De Platonico Systemate Caelestium globorum et de vera Indole Astronomiae Philolaeae* (1810), *Manetho und die Hundsternperiode* (1845) and *Untersuchungen über das kosmische System des Platon* (1852). Besides his edition of Pindar, Böckh published an edition of the Antigone of Sophocles (1843) with a poetical translation and essays. An early and important work on the Greek tragedians is his *Graecae Tragediae Principum . . . num ea quae supersunt et genuina omnia sint et forma primitiva servata* (1808).

Boeckh's *Gesammelte kleine Schriften* appeared 1858–74. His lectures, in the years 1809–65, were published by Bratuscheck under the title of *Encyklopädie und Methodologie der philologischen Wissenschaften* (2nd ed., Klusmann, 1886). His philological and scientific theories are set forth in C. F. Elze, *Über Philologie als System* (1845), and H. Reichardt, *Die Gliederung der Philologie entwickelt* (1846). His correspondence with Ottfried Müller appeared at Leipzig in 1883, further letters to Müller (Leipzig, 1908) and to Dissen (Leipzig, 1907). See Sachse, *Erinnerungen an August Böckh* (1868); Stark, in the *Verhandlungen der Würzburger Philologensammlung* (1868); Max Hoffmann, *August Böckh* (1901); and S. Reiter, in *Neue Jahrbücher für das klassische Altertum* (1902), p. 436; Sandys, *History of Classical Scholarship*, 3rd ed. (1921), iii. 96 et seq.

BOECKLIN, ARNOLD (1827-1901), Swiss painter, was born at Basle Oct. 16 1827, and died at San Domenico, near Florence, Jan. 16 1901. He studied at Düsseldorf, Antwerp, Brussels and Paris, but found his real inspiration in Italy, where he returned from time to time, and where the last years of his life were spent. Boecklin first won a reputation by his "Great Pan," exhibited at Munich in 1856, and bought for the Pinakothek, and from 1858 to 1861, taught at the Weimar academy, but the nostalgia of the Italian landscape pursued him, and after an interval, during which he completed his mythological frescoes for the decoration of the gallery at Basle, he returned to Italy. At Basle, and in almost all the great German galleries, there are many examples of his art. However, he was first and foremost a landscape painter. In his numerous mythological subjects he sought to express the soul of the landscape in the figures to which it gave birth. His influence on German painting, especially on the Munich school, was very great. His life has been written by Henri Mendelssohn.

BOEHM, SIR JOSEPH EDGAR, BART. (1834-1890), British sculptor, was born of Hungarian parentage on July 4, 1834, at Vienna, where his father was director of the imperial mint. After studying the plastic art in Italy and at Paris, he worked for a few years as a medallist in his native city. The colossal statue of Queen Victoria, executed in marble (1869) for Windsor Castle, and the monument of the duke of Kent in St. George's chapel, were his earliest considerable works. He was made A.R.A. in 1878, and produced soon afterwards the statue of Carlyle on the Thames embankment at Chelsea. In 1881 he was appointed sculptor in ordinary to the queen, and in the ensuing year became full academician. Among his important works in London are the sarcophagus of Dean Stanley in Westminster Abbey; the monument to General Gordon in St. Paul's cathedral; and the equestrian statue of the duke of Wellington at Hyde Park Corner. Boehm designed the coinage for the jubilee of Queen Victoria in 1887. He died suddenly in his studio at South Kensington on Dec. 12, 1890.

BOEHM VON BAWERK, EUGEN (1851-1914), Austrian economist and statesman, was born at Brunn on Feb. 12, 1851, and died at Vienna on Aug. 28 1914. He was professor of political economy at Innsbruck (1884), councillor of the Finance Ministry (1889), finance minister (1895, 1897-98 and 1900-06), and president of the Vienna Academy of Sciences. One of the leaders of the Austrian school of economists, Boehm von Bawerk criticized the classical theory of value.

His more important works are *Kapital und Kapitalzins* (Innsbruck, 1884-89), in two parts, translated by W. Smart, viz., *Capital and Interest* (part i, 1890) and *The Positive Theory of Capital* (part ii, 1891); *Karl Marx and the Close of his System* (trans. A. M. Macdonald, 1898); *Recent Literature on Interest* (trans. W. A. Scott and S. Feilbogen, 1903). His *Gesammelte Schriften* (1924) were edited by F. X. Weiss.

BOEHME (BEHMEN, BEEM, BEHMONT, etc.), **JAKOB** (1575-1624), German mystic, was born at Alt-Seidenberg in Upper Lusatia. After attending the town school of Seidenberg, he entered the shoemaking trade in 1589. In 1612 he gave up business and wrote *Aurora, oder die Morgenröte im Aufgang*. Gregory Richter, the pastor primarius of Görlitz, denounced the work as heretical and the municipal council seized the manuscript and charged Boehme to abstain from such writings. However, in 1618, Boehme began to produce a number of treatises, expository and polemical, but only a few selections on repentance, resignation, etc. were published as *Der Weg zu Christo* (1624) before clerical hostility was renewed. On his return from a visit to Dresden, he died on Nov. 17, 1624.

Boehme claimed that his speculative power came by a direct divine illumination which enabled him to see the root of all mysteries, the *Ungrund* or *Urgrund* whence issue all contrasts and discordant principles, hardness and softness, severity and mildness, love and sorrow, heaven and hell. These contrasts he attempted to describe in their issue and to reconcile in their eternal

result, an attempt often obscured by his puzzling phraseology, largely borrowed from the school of Paracelsus.

Boehme's speculations began with a study of God in Himself (*Aurora*), passed through a study of the manifestation of God in the structure of the world; and of man (*Die Drei Principien göttlichen Wesens; Vom dreifachen Leben der Menschen; Von der Menschwerdung Christi; Von der Geburt und Bezeichnung aller Wesen*), and culminated in his exposition of the life of God in the soul of man (*Von der Gnadenwahl; Mysterium Magnum, Von Christi Testamenten*).

God who is at once *Alles* and *Nichts*, because to think of His nature we must abstract from creatures, is characterized by will whose desire to become manifest results firstly in knowledge of Himself and secondly in the production of creatures. This production is not a creation, for out of nothing nothing comes; it is rather a generation from the eternal divine nature wherein all things dwell latently. The properties through which the divine energy operates in the procession of spiritual and corporeal beings from the *Ungrund* or Abyss, are firstly, Contraction, Diffusion, and their resultant, the Agony of the unmanifested Godhead. The transition is made; by an act of will the divine Spirit comes to light and immediately the manifested life appears as Love, Expression and their resultant Visible Variety. Hence the world is a manifestation of God who is both transcendent and immanent.

To account for evil, Boehme resorts neither to dualism nor to a repudiation of its existence. His consciousness of the difficulty is obvious from the progressive changes in his attempted solution of the problem. In the *Aurora* nothing save good proceeds from the *Ungrund*, though there is good that abides and good that falls—Christ and Lucifer. In the later works, the antithesis is directly generated, being given as factors of life and movement from the one creative source, the bottomless abyss. In the last writings, evil is a direct outcome of the primary principle of divine manifestation—it is the wrath side of God. Corresponding to these solutions, Boehme has different moral ends for the world's history. In the first stage it is created in remedy of a decline; in the second, for the adjustment of the balances of forces; in the third, to exhibit the eternal victory of good over evil, of love over wrath.

Fallen man has three factors, spirit, soul and body, spirit being the principle of light, soul of darkness, and body, which belongs to the world of sense, the resultant of spirit and soul. Man aspires, to a knowledge of God because all things tend towards their source, but a re-birth is necessary before he can have true self-knowledge, the *sine qua non* for a knowledge of God.

BIBLIOGRAPHY.—Boehme's works were published by H. Betke (1675), by J. G. Gichtel (1682), by K. W. Schiebler (Leipzig, 1831-1847). Between 1644 and 1662 they were translated by John Ellstone and John Sparrow, assisted by Durand Hotham and Humphrey Blunden. (At that time regular societies of *Behmenists* existed in England but later they merged into the Quaker movement.) In 1762-84 the translation was re-edited by George Ward and Thomas Langcake. J. Hamberger, *Die Lehre des deutschen Philosophen J. Boehmes* (1844); Alb. Peip, *J. Boehme der deutsche Philosoph* (1860); von Harless, *J. Boehme und die Alchimisten* (2nd ed. 1882); Erdmann, *Hist. of Philosophy* (Eng. trans. W. S. Hough, 1893). See also the *Memoirs* by Abraham von Frankenberg (d. 1652) trans. F. Okely (1870); H. A. Fechner, *J. Boehme, sein Leben und seine Schriften* (1857); H. L. Martensen, *J. Boehme, Theosophische Studien* (1881; Eng. trans. 1885); P. Deussen, *J. Boehme, über sein Leben und seine Philosophie* (Kiel, 1897); P. Hankamer, *Jakob Boehme* (Bonn, 1924); H. Bornkamm, *Luther u. Bohme* (Bonn, 1925).

BOELLMANN, LEON (1862-1897), French composer, was born at Ensisheim, Alsace, Sept. 25, 1862, and died in Paris Oct. 11, 1897. He studied at the *École de musique religieuse* in Paris and became organist at the church of St. Vincent de Paul, Paris. He composed some works for the organ, also church and chamber music. His best-known work is the *Variations Symphoniques* for violoncello and orchestra.

BOEOTIA, a district of central Greece, bounded by Phocis and Locris on the west and north, by Attica, Megaris and the Corinthian gulf on the south; and by the Strait of Euboea on the northeast; area, 1,100 square miles. In the north the basin of the Cephissus and Lake Copais lies between the watershed range of Parnassus (9,470 ft.) and Helicon (5,470 ft.) and the Locrian

ridges, which extend eastward from Mt. Oeta, and form with their landward spurs the pass and battlefield of Chaeronea, between the Cephissus valley and the Copais lake-land and also the south boundary of Copais, with other battle grounds at Coronea and Haliartus. Through this coast-range natural tunnels (*katavothra*) carried off the overflow from Copais. South of this, a wider lowland is divided by the low ridge of Teumessus into the Ismenian plain dominated by Thebes, and the valley of the Asopus which rises east of Helicon and flows eastward into the Euboean strait, under the steep north front of Cithaeron and Parnes. Though the Boeotian fenland has foggy winters and sultry summers, its rich soil, though liable to floods, is good for crops, plantations and pasture. The central position of Boeotia, the strength of its frontiers and the ease of internal communication enhanced its political importance. But the lack of harbours restricted trade and sea power. The Boeotians were proverbially as dull as their native air, but they were sturdy fighters, and produced men of such varied distinction as Hesiod, Pindar, Epaminondas, Pelopidas and Plutarch.

The two great centres of Boeotian legend, "Cadmeian" Thebes and "Minyan" Orchomenus, were outposts of the Minoan culture of Crete already in the 14th century B.C., and Orchomenus had passed through two periods of settlement already before its great "bee-hive" tomb (so called "Treasury of Minyas") was built. To its Minyan engineers are probably due the artificial conduits which supplemented the *katavothra* of the Copais. The quarrels of the Cadmeian dynasty with Orchomenus, and its disastrous wars with Argos (1230-1200) explain the complete replacement of these earlier régimes by the Boeotian immigrants, of northern Aeolic dialect, about 1120. But Orchomenus and also some marginal communities in the south, Plataea, Thespieae, Tanagra, never acquiesced in the political leadership of Thebes, whose central position and military strength might otherwise have made it a suitable capital, and realized the ambition of the Thebans to absorb other townships into a single state, as Athens had unified Attica (*q.v.*). But the outlying cities only tolerated a loose federation which in early times had a mainly religious character. Boeotia hardly figures in history before the late 6th century, when the resistance of Plataea to the federating policy of Thebes led to a long quarrel between Athens and Thebes.

During the Persian invasion of 480, Thebes assisted the invaders, but Plataea and some other States were on the patriot side, and for a time the presidency of the Boeotian League was taken away from Thebes. But in 457 the Spartans reinstated Thebes as a bulwark against Athenian aggression. Athens retaliated by a sudden advance upon Boeotia, and after the victory of Oenophyta the land remained for ten years under Athenian control, exercised through newly installed democracies; but in 447, after a reactionary victory at Coronea, the old constitutions were restored, and Thebes recovered its primacy in the league. In the Peloponnesian War the first blow was struck by Thebes against Plataea, and in 424 Boeotians decisively defeated Athenian forces at Delium. Though slightly estranged from Sparta after the peace of Nicias, they rendered good service at Syracuse and Arginusae and made possible the Spartan occupation of their outpost at Decelea in northern Attica. And at the close of the war, Athens might have been utterly destroyed had not Sparta restrained Theban animosity.

About this time the Boeotian League comprised 11 groups of sovereign cities and associated townships, each of which elected one Boeotarch or minister of war and foreign affairs, contributed 60 delegates to the federal council at Thebes, and supplied a contingent of about 1,000 foot and 100 horse to the federal army. A safeguard against encroachment by the central government was provided in councils of individual cities, to which all important questions of policy had to be submitted for ratification. These local councils, to which the propertied classes alone were eligible, were subdivided into four sections, resembling the *prytaneis* of the Athenian council, which took it in turns to take previous cognizance of all new measures. Thucydides (*v.* 38), in speaking of the "four councils of the Boeotians," is referring to the plenary bodies in the various states.

Boeotia was prominent in the Corinthian League against Sparta, especially at Haliartus and Coronea (395-394) because of resentment against foreign interference. Yet disaffection against Thebes was now growing rife, and Sparta fostered this feeling by stipulating for complete independence of all cities in the peace of Antalcidas (387). In 374 Pelopidas restored the Theban dominion. Boeotian contingents fought in all the campaigns of Epaminondas, and in the later wars against Phocis (356-346); while in the dealings with Philip of Macedon the other cities appear merely as the tools of Thebes. The prevalence of democracy made sovereign the popular assembly, which elected the Boeotarchs (between seven and 12 in number), and sanctioned all laws. After the battle of Chaeroneia, in which the Boeotian heavy infantry once again distinguished itself, the land never rose again to prosperity. The destruction of Thebes by Alexander (335) seems to have paralysed the political energy of the Boeotians, though it led to an improvement in the federal constitution, by which each city received an equal vote. Henceforth they never pursued an independent policy, but followed the lead of protecting powers. Though enrolled for a short time in the Aetolian League (about 245 B.C.) Boeotia was generally loyal to Macedonia, and supported its later kings against Rome. In return for the excesses of the democracies Rome dissolved the league, which, however, was allowed to revive under Augustus, and merged with the other central Greek federations in the Achaean synod. The death-blow to the country's prosperity was given by the devastations during the first Mithradatic War.

Save for a short period of prosperity under the Frankish rulers of Athens (A.D. 1205-1310), who repaired the *katavothra* and fostered agriculture, Boeotia long continued in a state of decay, aggravated by occasional barbarian incursions. Even in the 19th century a large part of the population was still Albanian. The first step towards the country's recovery was in 1895, when the outlets of Copais were again put into working order, reclaiming a large area for agriculture. Railway communication with Athens, Volo, and Salonica continues to develop the natural riches of the whole land. Boeotia is at present a province with Livadia (the old Turkish capital) for its centre; the other surviving townships are quite unimportant.

BOER, the Dutch form of the Eng. "boor," in its original signification of husbandman (Ger. *Bauer*), a name given to the Dutch farmers of South Africa, and especially to the Dutch population of the Transvaal and Orange River States. (See SOUTH AFRICA and TRANSVAAL.)

BOERHAAVE, HERMANN (1668-1738), Dutch physician and a famous professor of medicine, was born at Voorhout near Leyden on Dec. 31, 1668, and died at Leyden on Sept. 23, 1738. He graduated in philosophy at Leyden and in medicine at Harderwyck. He spent the whole of his professional life at Leyden, being professor of botany and medicine, rector of the university, professor of practical medicine and professor of chemistry. His genius so raised the fame of the university of Leyden, especially as a school of medicine, that it became a resort of strangers from every part of Europe. All the princes of Europe sent him disciples, who found in this skilful professor not only an indefatigable teacher, but an affectionate guardian. When Peter the Great went to Holland in 1715, to instruct himself in maritime affairs, he also took lessons from Boerhaave. A Chinese mandarin wrote him a letter directed "To the illustrious Boerhaave, physician in Europe," and it reached him in due course.

His principal works are *Institutiones medicae* (Leyden, 1708); *Aphorismi de cognoscendis et curandis morbis* (Leyden, 1709), on which his pupil and assistant, Gerard van Swieten (1700-72) published a commentary in 5 vols.; and *Elementa chemiae* (Paris, 1724).

BOERNE, KARL LUDWIG (1786–1837), German political writer and satirist, was born on May 6, 1786, at Frankfort-on-Main, where his father, Jakob Baruch, carried on the business of a banker. After wasting some years as a medical student, he turned to political science and took his doctor's degree at Giessen in 1811. Frankfort was at this time constituted as a grand duchy, and Boerne was appointed police actuary there; but old conditions were restored in 1815 and, as a Jew, he was dismissed from his office. Embittered by the oppression under which the Jews suffered in Germany, he engaged in journalism, and edited the Frankfort liberal newspapers, *Staatsristretto* and *Die Zeitschwingen*. In 1818 he became a convert to Lutheran Protestantism, changing his name from Loeb Baruch to Ludwig Boerne, in order to improve his social standing. From 1818 to 1821 he edited *Die Wage*, but the paper was suppressed by the police, and in 1821 he abandoned journalism for a time and led a retired life in Paris, Hamburg and Frankfort. After the July Revolution (1830), Boerne hurried to Paris, expecting to find the newly-constituted state of society somewhat in accordance with his ideas of freedom. Although to some extent disappointed in his hopes, he was not disposed to look any more kindly on the political condition of Germany; this lent additional zest to the brilliant satirical letters (*Briefe aus Paris*, 1830–33) which he began to publish in his last literary venture, *La Balance*, a revival under its French name of *Die Wage*. The *Briefe aus Paris* was his most important publication, and a landmark in the history of German journalism. Its appearance led him to be regarded as one of the leaders of the new literary party of "Young Germany."

Boerne's works are remarkable for brilliancy of style and for a thorough French vein of satire. His best criticism is to be found in his *Denkrede auf Jean Paul* (1826), his *Dramaturgische Blätter* (1829–34), and the witty satire, *Menzel der Franzosenfresser* (1837). He also wrote a number of short stories and sketches, of which the best known are the *Monographie der deutschen Postschnecke* (1829) and *Der Esskünstler* (1822).

BIBLIOGRAPHY—The first edition of his *Gesammelte Schriften* appeared at Hamburg (1829–34) in 14 volumes, followed by 6 volumes of *Nachgelassene Schriften* (Mannheim, 1844–50), more complete is the edition in 12 volumes (Hamburg, 1862–63), reprinted in 1868 and subsequently. The latest complete edition is that edited by A. Klaar (8 vols., Leipzig, 1900). For further biographical matter see M. Holzmänn, *L. Boerne, sein Leben und sein Wirken* (Berlin, 1888), *Bornes Briefe an Henriette Herz* (1802–07), first published in 1861, have been re-edited by L. Geiger (Oldenburg, 1905), who has also published Boerne's *Berliner Briefe* (1828) (Berlin, 1905). See also Heine's witty attack on Boerne (*Werke*, ed. Elster, vii), and the chapters in G. Brandes, *Hovedstrømninger i det 19de Aarhundredes Litteratur* vol. vi. (Copenhagen, 1890, German trans. 1891, English trans. 1905).

BOER WAR: see SOUTH AFRICAN WAR

BOETHIUS, a sculptor of the Hellenistic age, a native of Carthage (or possibly Chalcedon), who lived probably in the 2nd century B.C. He was noted for his representations of children, and especially for a group representing a boy struggling with a goose, of which several copies survive in museums.

BOETHIUS ANICIUS MANLIUS SEVERINUS (c. A.D. 480–524), philosopher and statesman, has been described as the last of the Romans and the first of the Scholastics. On the death of his father, who had been consul in 487, the young Boethius passed into the charge of the senator Q. Aur. Memmius Symmachus, whose daughter Rusticana he married. Through his intimacy with Theodoric, the Ostrogoth, ruler in Rome from 500, Boethius was made consul in 510, and his sons, while still young, held the same honour together (522). But his good fortune did not last, and he attributes the calamities that came upon him to the ill-will roused by his bold maintenance of justice and his opposition to every oppressive measure. Towards the end of the reign of Theodoric he was accused of treason, the charges being that he had conspired against the king, that he was anxious to maintain the integrity of the senate, and to restore Rome to liberty, and that for this purpose he had written to the emperor Justin. Justin had, no doubt, special reasons for wishing an end to the reign of Theodoric. Justin was orthodox, Theodoric was an Arian. The orthodox subjects of Theodoric were suspicious of their ruler; and many would gladly have joined in a plot to displace him. The knowledge of this fact may have rendered Theodoric suspicious. But Boethius denied the accusation in un-

equivocal terms. He did indeed wish the integrity of the senate. He would fain have desired liberty, but all hope of it was gone. The letters addressed by him to Justin were forgeries, and he had not been guilty of any conspiracy. Notwithstanding his innocence he was condemned and sent to the prison at Ticinum (Pavia). It was during his confinement there that he wrote the famous *De Consolatione Philosophiae*. He was put to death in 524, and in 900 Otho III. ordered his remains to be removed from Pavia to the church of S. Pietro in Ciel d'Oro.

The contemporaries of Boethius regarded him as a man of profound learning. Priscian the grammarian speaks of him as having attained the summit of honesty and of all sciences. Cassiodorus, *magister officiorum* under Theodoric and the intimate acquaintance of the philosopher, employs language equally strong, and Ennodius, the bishop of Pavia, knows no bounds for his admiration. During the middle ages, the influence of Boethius was exceedingly powerful, and rightly, for he had preserved for them the learned treatises of expiring antiquity. Although he had planned to translate all the works of Plato and of Aristotle and to reconcile their systems of philosophy, he did not fully accomplish this; but his work on Aristotle entitles him to the credit of having introduced that philosopher into the West. He translated into Latin Aristotle's *Categories* and his *Perihermenias*, and wrote a commentary on the first and a double commentary on the second. The translations of the *Analytica Priora et Posteriora*, the *Topica*, and *Elenchi Sophistici* ascribed to him in the Basle (1546) edition of his works (this was utilized by Migne, *Patrol. lat.* 64), are now regarded as spurious (cf. Ueberweg and Grabmann, works quoted below). He also produced commentaries on the *Isagoge* of Porphyry and the *Topica* of Cicero, as well as independent works on logic.—*Introductio ad Categoricos Syllogismos*, in one book; *De Syllogismis Categoricis*, in two books; *De Syllogismis Hypotheticis*, in two books; *De Divisione*, in one book; *De Differentiis Topicis*, in four books—all of which had great influence on the development of the terminology of logic in the West. His elementary treatises on arithmetic and music furnished manuals for the quadrivium of the schools, and that on music long remained a text-book in the universities of Oxford and Cambridge. The *Ars Geometriae* is regarded as spurious by many critics, though some incline to accept the *Interpretatio Euclidis*. But by far the most important and the most famous of the works of Boethius is his *De Consolatione Philosophiae*, its high reputation in mediaeval times being attested by the numerous translations, commentaries, and imitations which then appeared. Among others, Asser, the instructor of Alfred the Great, and Robert Grosseteste, bishop of Lincoln, commented on it. Alfred translated it into Anglo-Saxon and Chaucer into English. Versions of it appeared in German, French, Italian, Spanish, and Greek before the end of the 15th century.

This famous work, which is alternately in prose and verse, exhibits the neo-platonism and stoicism that Boethius had imbibed at Rome, and because it deals with natural theology only, ignores the possibility of finding consolation in any Christian belief. The first book opens with a few verses, in which Boethius describes how his sorrows had brought him to a premature old age. As he is thus lamenting, a majestic woman, whom he recognizes as his guardian Philosophy, appears. Resolving to apply the remedy for his grief, she questions him for that purpose. She finds that he believes that God rules the world, but does not know what he himself is; and this absence of self-knowledge is the cause of his weakness. In the second book Philosophy presents to Boethius Fortune, who enumerates the blessings he has enjoyed and then proceeds to discuss the unsatisfactory blessings that are bestowed by her. In the third book Philosophy promises to lead him to true happiness, which is to be found in God alone, for since God is the highest good, and the highest good is true happiness, God is true happiness. Nor can real evil exist, for God is all-powerful, and since He does not wish evil, evil must be non-existent. In the fourth book Boethius raises the question, Why, if the governor of the universe is good, do evils exist, and why is virtue often punished and vice rewarded? Philosophy proceeds to show that in fact vice is never unpunished nor virtue unrewarded. From this Philosophy passes on to a discussion of the nature of providence

and fate, and shows that every fortune is good. The fifth and last book raises the question of man's free will and God's foreknowledge, and, by an exposition of the nature of God, attempts to show that these doctrines are not inconsistent; the conclusion is that God remains a foreknowing spectator of all events, and that the ever-present eternity of his vision agrees with the future quality of our actions, dispensing rewards to the good and punishments to the wicked.

Of the five theological tractates ascribed to Boethius, it is now generally admitted that only the *De Fide Catholica* is spurious. This admission is based on a note in a Reichenau manuscript of the 10th century in which Cassiodorus ascribes to his friend Boethius "a book on the Trinity, some dogmatic chapters, and a book against Nestorius." (See *Anecdota Holderi*, ed. H. Usener Leipzig, 1877.) E. K. Rand, who formerly adopted this position, is now inclined to accept even the *De Fide Catholica*. (See his edition in the *Loeb Classical Series*, p. 52, 1918.) The first tractate, *De Sancta Trinitate*, is addressed to Symmachus, and the result of the short discussion, which is of an abstract nature, and deals partly with the ten categories, is that unity is predicated absolutely, or, in regard to the substance of the Deity, trinity is predicated relatively. The second treatise, *Utrum Pater et Filius et Spiritus Sanctus de divinitate substantialiter praedicentur*, is addressed to John the deacon, and arrives at the same conclusion as the first. The third treatise bears the title, *Quomodo substantiae in eo quod sint bonae sint cum non sint substantialia bona*, the fourth is the *De Fide Catholica*, and the fifth the *Contra Eutychen et Nestorium*, chapter iii. of which contains the famous definition of *persona: Persona est naturae rationalis individua substantia*.

BIBLIOGRAPHY.—(1) *Editions*. The first edition of the works of Boethius appeared at Venice in 1492, the last in Migne's *Patrol.*, lxxiii., lxiv. (1847). Of the numerous editions of the *De Consolatione* the best is that of R. Peiper (Leipzig, 1871). In addition to an account of the mss. used, it gives the Book of Lupus, "De Metris Boetii," the "Vita Boetii" contained in some mss., "Elogia Boetii," and a short list of the commentators, translators, and imitators of the *Consolatio*. The vol. also includes the five theological tractates. These, like the *Consolatio*, have been re-edited with an English translation by H. F. Stewart and E. K. Rand in the *Loeb Classical Library* (1918). The *De Institutione Arithmetica*, *De Institutione Musica*, and the doubtful *Geometria* were edited by G. Friedlein (Leipzig, 1867); the commentary on Aristotle's *Perihermeneas*, by C. Meiser (Leipzig, 1877-80), and on Porphyry's *Isagoge*, by S. Brandt (Vienna, 1906). For further editions and translations see Ueberweg, *Grundriss der Gesch. der Phil.* Teil. ii (1928).

(2) *Authorities*.—J. G. Sutterer, *Der letzte Römer* (Eichstätt, 1852); H. Usener, *Anecdota Holderi* (Leipzig, 1877); M. Grabmann, *Die Gesch. der scholast. Methode*, vol. i. (Freiburg i/B., 1909); Manitius, *Gesch. der lat. Lit. d. Mittelalters*, vol. i (Munich, 1911); Ueberweg, *op. cit.*; H. F. Stewart, *Boethius: an Essay* (1891); T. Hodgkin, *Italy and her Invaders*, iii. bk. iv. ch. xii. (1896). On the date and order of the works of Boethius see S. Brandt in *Philologus*, lxii. pp. 141-154, 234-279, and A. P. McKinlay, *Harvard Classical Studies* (1907).

BOG (from Ir. and Gael. *bogach*, *bog*, soft), soft, spongy, water-logged ground, composed of vegetation, chiefly mosses, in various stages of decomposition forming "peat" (*q.v.*). With very heavy rain there is danger of a "bog-slide," or "bog-burst," which may obliterate the neighbouring cultivated land with a deposit of the contents of the bog. Destructive bog-slides have occurred in Ireland, such as that at Kilmore, Co. Galway, in 1909, but on a smaller scale they have been experienced in several parts of the British Isles.

BOGALUSA, a city of Washington parish, Louisiana, U.S.A., in the south-eastern part of the State, near the Pearl river, on the New Orleans Great Northern Railroad, about 60m. N. by E. of New Orleans. The population in 1920 was 8,245, of whom 2,605 were negroes. The industries include hardwood lumber mills, one of which has 3,000 employes, paper mills, veneer and creosoting plants, a turpentine distillery, broom-handle factories, canneries and car shops. The State university has its forestry camp here, in a tract of 1,000 ac. which provides field practice for students in the science of forestry.

BOGARDUS, JAMES (1800-1874), American inventor, was born in Catskill, N.Y., on March 14, 1800. He was apprenticed to a watch-maker and his first inventions were in chrono-

metry. At 28 he produced the "ring flier" used in cotton-spinning and, shortly after, a grist-mill in which the stones followed the same direction at varying speeds. From 1831-39 he gave much attention to engraving and in the latter year submitted the prize-winning specifications in a postage-stamp manufacturing competition opened by the British Government. He also perfected a separate die process for making bank-notes. A dynamometer, a pyrometer, rubber-cutting, glass-pressing, deep-sea sounding and drilling machines were among his other inventions. In 1847 he erected for his New York factory a cast-iron building of five stories, the first of the kind in the United States; he later contracted for the erection of many other similar structures. He died in New York city on April 13, 1874.

BOG ASPHODEL: see ASPHODEL.

BOGATZKY, KARL HEINRICH VON (1690-1774), German hymn-writer, was born at Jankowe in Lower Silesia, on Sept. 7 1690. After living for a time at Köstritz, and from 1740-45 at the court of Christian Ernst, duke of Saxe-Coburg, at Saalfeld, he made his home at the Waisenhaus (orphanage) at Halle, where he engaged in spiritual work and in composing hymns and sacred songs, until his death on June 15, 1774. Bogatzky's chief works are *Guldenes Schatzkästlein der Kinder Gottes* (1718), which has reached more than sixty editions; and *Übung der Gottseligkeit in allerlei geistlichen Liedern* (1750).

See Bogatzky's autobiography—*Lebenslauf von ihm selbst geschrieben* (Halle, 1801; new ed., 1872); Kelly, C. H. *von Bogatzky's Life and Work* (1889).

BOGHHAZ KEUI, a small village in Asia Minor, north-west of Yuzgat in the Angora vilayet, remarkable for the ruins and rock-sculptures in its vicinity. The discovery of a rich store of cuneiform tablets during the early part of the 20th century has shown Boghaz Keui to have been the site of the Hattic capital during the 14th and 13th centuries B.C. Though the original site of the capital is thought to have been somewhere on the eastern edge of the Axylon plains, nevertheless when the Hittite empire included all Cappadocia, most of Syria and central Asia Minor, Boghaz Keui was the seat of authority. Many of the tablets are in native dialects, a factor which has caused difficulty in deciphering them. The finds indicate a high standard of legal, artistic and social life, and are the source of new and unexpected facts illustrating the early history of Asia Minor.

BOGIE, an under-carriage possessing freedom to move in such a way that wheels can turn or follow a track with the least effort and friction. Familiar examples are those of locomotives, and long carriages, vans, wagons, tenders, and tramcars. There may be two wheels only thus carried, if conditions of length impose restriction, or the weight does not require four wheels. This type, called a "pony" truck, has a triangular frame, terminating in a pivot some way from the axle, and connecting thus to the main framing. It is employed to a large extent for engines not requiring high speeds. Six-wheel bogies are fitted on very large tenders, and some of the heaviest carriages and vans, but the four-wheel meets ordinary requirements for rolling-stock and locomotives when the length is too much for rigid wheels. Tramcar bogies often have two pairs of wheels of unequal diameter, the driven axle carrying the larger pair, but in double-motor trucks (four motors per tram) all the wheels are of equal size.

The railway bogie was originated soon after 1830. Some of the first designs had ball-and-socket joints to form the union with the framing, but a pivot pin soon came into favour. Then the Adams bogie was invented, having the pin in a sliding-block controlled by rubber blocks, thus affording a little lateral freedom. This style, but with steel springs, is in great vogue. Another kind of bogie has a swinging link device for lateral play, instead of the sliding action. The "radial axle," with two wheels, is controlled by curved guides in the framing, without pivotal movement.

The diagram represents the features of a four-wheel bogie designed by Sir John Fowler, K.C.B., for L.M.S. express locomotives. The casting which turns around the pivot-pin has a cross-movement in between castings secured to the frame-plates of the bogie, four powerful springs tending to keep the pin central. The axle-boxes are not sprung with separate coiled springs, as in some

DIAGRAM SHOWING THE FEATURES OF FOUR-WHEEL BOGIE WITH STEAM BRAKES

This type is used for London Midland and Scottish express locomotives. The bogie is distinctive in having four 7-in. bore steam cylinders, operating links which move the brake-shoes on to the 3 ft. 3½-in. diameter wheels, the action taking place simultaneously with the application of the brake-shoes on the driving wheels

instances, but by two centrally-located leaf springs, controlling beams which reach over the boxes. This bogie is rather distinctive from the fact of having four 7-in-bore steam cylinders, operating links which move the brake-shoes on to the 3 ft. 3½-in. diameter wheels, the action taking place simultaneously with the application of the brake-shoes on the driving wheels

A bogie annealing furnace is a long unit into which piles of material for heat treatment may be carried on low bogies or trolleys, moved along on rails by an hydraulic ram or a crane. The bogies, after a certain period of heating, come out with their loads at the rear end of the furnace for cooling down

BOGNOR, urban district and seaside resort, Sussex, England, 66m S.S.W. from London by the Southern railway Pop. (1921) 13,302; a high figure because the census was taken in the tourist season. Pop. (1901) 6,180. The town possesses a pier and promenade, a theatre, assembly rooms, and numerous convalescent homes. The church of the mother parish of South Bersted is Norman and Early English, and retains a fresco of the 16th century.

BOGÓ, a municipality (with administration centre and 12 barrios or districts), of the province and island of Cebu, Philippine Islands, on Bogó Bay, at the mouth of the Bulac river in the north-east part of the island Pop. (1918), 23,464, of whom 11,694 were males and four whites. The climate is hot but healthy. The surrounding country is fertile, producing sugar, copra, corn, maguey, rice and various fruits Hats, baskets, cloths and rope are manufactured and exported to a limited extent The fisheries are of local importance In 1918 it had three manufacturing establishments, besides 289 household industry establishments with output valued at 73,900 pesos; and 16 schools, of which nine were public The language is Cebu-Bisayan

BOGODUKHOV, a town in the Kharkov province of the Ukrainian Socialist Soviet Republic. Lat. 50° 9' N, Long 35° 33' E Pop. (1926) 16,013. It is on the railway and has a radio-station. It is the centre of a market gardening area and trades in grain, cattle and fish and has koustar (peasant) leather industries. It was a settlement in 1571, and was captured by Menshikov and the Emperor Alexius in the Russo-Swedish war, 1709. Its cathedral was built 1793.

BOGOMILS, the name of an ancient religious community which had its origin in Bulgaria. It is a complicated task to determine the true character and the tenets of ancient sects of this kind, considering that almost all the information that has reached us has come from their opponents. Concerning the Bogomils something can be gathered from the information collected by Euthymius Zygadenus in the 12th century, and from the polemic *Against the Heretics* written in Slavonic by St. Kozma during the 10th century. The old Slavonic lists of forbidden books of the

15th and 16th centuries also give us a clue to the discovery of this heretical literature and of the means the Bogomils employed to carry on their propaganda. Taking as our starting-point the teaching of the heretical sects in Russia, notably those of the 14th century, which are a direct continuation of the doctrine held by the Bogomils, we find that they denied the divine birth of Christ, the personal co-existence of the Son with the Father and Holy Ghost, and the validity of sacraments and ceremonies The miracles performed by Jesus were interpreted in a spiritual sense, not as real material occurrences; the Church was the interior spiritual church in which all held equal share. Baptism was only to be practised on grown men and women. The Bogomils repudiated infant baptism, and considered the baptismal rite to be of a spiritual character neither by water nor by oil but by self-abnegation, prayers and chanting of hymns. Carp Strigolnik, who in the 14th century preached this doctrine in Novgorod, explained that St. Paul had taught that simple-minded men should instruct one another; therefore they elected their "teachers" from among themselves to be their spiritual guides, and had no special priests Prayers were to be said in private houses, not in separate buildings such as churches. Ordination was conferred by the congregation and not by any specially appointed minister The congregation were the "elect," and each member could obtain the perfection of Christ and become a Christ

These doctrines have survived in the great Russian sects, and can be traced back to the teachings and practice of the Bogomils. But in addition they held the Manichaean dualistic conception of the origin of the world

They taught that God had two sons, the elder Satanail and the younger Michael. The elder son rebelled against the father and became the evil spirit After his fall he created the lower heavens and the earth and tried in vain to create man; in the end he had to appeal to God to make man a living being. After creation Adam was allowed to till the ground on condition that he sold himself and his posterity to the owner of the earth Then Michael was sent in the form of a man; he became identified with Jesus, and was "elected" by God after the baptism in the Jordan. When the Holy Ghost (Michael) appeared in the shape of the dove, Jesus became Christ and received power to break the covenant in the form of a clay tablet (*hierographon*) held by Satanail from Adam. In this way he vanquished Satanail, and deprived him of the termination *-il*=God, in which his power resided Satanail was thus transformed into Satan. Through his machinations the crucifixion took place, and Satan was the originator of the whole Orthodox community with its churches, vestments, ceremonies, sacraments and fasts with its monks and priests

According to Slavonic documents the founder of this sect was a certain priest Bogumil, who "imbibed the Manichaean teaching and flourished at the time of the Bulgarian emperor Peter" (927-

968). According to another source the founder was called Jeremiah (or there was another priest associated with him by the name of Jeremiah). The Slavonic sources are unanimous on the point that his teaching was Manichaean. Zealous missionaries, clad like mendicant friars, carried his doctrines far and wide. In 1004, scarcely 15 years after the introduction of Christianity into Russia, we hear of a priest Adrian teaching the same doctrines as the Bogomils. In 1125 the Church in the south of Russia had to combat another heresiarch named Dmitri. The Church in Bulgaria also tried to extirpate Bogomilism but it survived for several centuries. The popes in Rome whilst leading the crusade against the Albigenses did not forget their counterpart in the Balkans and recommended the annihilation of the heretics.

The Bogomils first spread westwards, and settled in Serbia; but at the end of the 12th century Stephen Namanya, king of Serbia, persecuted them and expelled them from the country. Large numbers took refuge in Bosnia, where they were known under the name of Patarenes (*q.v.*). From Bosnia their influence extended into Italy (Piedmont). The Hungarians undertook many crusades against the heretics in Bosnia, but towards the close of the 15th century the conquest of that country by the Turks put an end to their persecution.

See the article "Bogomils" in Hastings' *Encyclopaedia of Religion and Ethics*; F. C. Conybeare, *The Key of Truth* (1898). The principal source of information on the doctrine of the Bogomils is the account given by Euthymius Zygadenus, in his work on 24 heresies (Migne, *Patrologia Graeca* vol. cxxx.; *Narratio de Bogomilis*, edit. by Gieseler).

BOGORODSK, the name of several Russian towns. The chief is a town 38m. E.N.E. of Moscow on the Klyazma river. Lat. 55° 52' N., Long. 38° 20' E. Pop. (1926) 34,905. It supplies electricity by cable to Moscow from the electric power station nearby, which has a workers' settlement of 5,500. It was formerly noted for gold brocade, and has small woollen, cotton, silk, chemical and dye works. Its experimental school is famous for pioneer educational work.

BOGOS, a pastoral race of mixed Hamitic descent, occupying the highlands immediately north of Abyssinia, now part of the Italian colony of Eritrea. The community is divided into two classes, the *Shumaglieh* or "elders" and *Tigré* or "clients." The latter are serfs of the former, who, however, cannot sell them. The *Tigré* goes with the land, and his master must protect him. In blood-money he is worth another *Tigré* or ninety-three cows, while an elder's life is valued at one hundred and fifty-eight cattle or one of his own caste. The eldest son of a *Shumaglieh* inherits his father's two-edged sword, white cows, lands and slaves, but the house goes to the youngest son. Female chastity is much valued, but women have no rights and inherit nothing. The *Bogo* husband never sees the face or pronounces the name of his mother-in-law, nor may a wife utter her husband's or father-in-law's name.

BOGOTÁ or SANTA FÉ DE BOGOTÁ, the capital of the republic of Colombia, and of the interior department of Cundinamarca. Pop. in 1918, 143,994. The city is on the eastern margin of a large elevated plateau 8,563ft. above sea-level. The plateau may be described as a great bench or shelf on the western slope of the eastern Cordilleras, about 70m. long and 30m. wide, with a low rim on its western margin and backed by a high ridge on the east. The plain forming the plateau appears to be an old lacustrine basin and has numerous small lakes remaining and many streams. These streams, one of which, the San Francisco, passes through the city, unite near the south-western extremity of the plateau and form the Rio Funza, or Bogotá, which finally plunges over the edge at Tequendama in a beautiful, perpendicular fall of about 475ft. The city is built upon a sloping plain at the base of two mountains, La Guadalupe and Monserrate, upon whose crests stand two imposing churches. From a broad avenue on the upper side, downward to the west, slope the streets, through which run streams of cool, fresh water from the mountains above. The north and south streets cross these at right angles, and the blocks thus formed are like great terraces. A number of handsomely laid out plazas, or squares, ornamented with gardens and statuary, have been preserved; on these face the principal public

buildings and churches. In Plaza Bolívar is a statue of Bolívar by Pietro Tenerani (1789-1869), a pupil of Canova, and in Plaza Santander is one of Gen. Francisco de Paula Santander (1792-1840). Facing on Plaza de la Constitución are the capitol and cathedral. Owing to the prevalence of earthquakes, private houses are usually of one storey, built of sun-dried bricks white-washed.

Short lines of railway connect Bogotá with Facatativá (24m.) on the road to Honda, and with Zipaquirá, where extensive salt mines are worked, and with Jirardot, at the head of navigation on the upper Magdalena. Bogotá is an archiepiscopal see, founded in 1561, and is one of the strongholds of mediaeval clericalism in South America. It has a cathedral, rebuilt in 1814, and some 30 other churches, together with many old conventual buildings now used for secular purposes, their religious communities having been dissolved by Mosquera and their revenues devoted in great measure to education. The capitol, which is occupied by the executive and legislative departments, is an elegant and spacious building, erected since 1875. The interest which Bogotá has always taken in education, and because of which she has been called the "Athens of South America," is shown in the number and character of her institutions of learning—a university, several colleges and schools, a public library, a national observatory, a natural history museum and a botanic garden. The city also possesses a well-equipped mint, little used in recent years. The plain surrounding the city is very fertile, intensively cultivated, and pastures cattle and produces cereals, vegetables and fruit in abundance. It was the centre of Chibcha civilization before the Spanish conquest and sustained a large population. The climate is mild.

Bogotá was founded in 1538 by Gonzalo Jiménez de Quesada and was named Santa Fé de Bogotá after his birthplace Santa Fé, and after the southern capital of the Chibchas, Bacatá (or Funza). It was made the capital of the viceroyalty of Nueva Granada, and soon became one of the centres of Spanish colonial power and civilization on the South American continent. In 1811 its citizens revolted against Spanish rule and set up a government of their own, but in 1816 the city was occupied by Pablo Morillo (1777-1838), the Spanish general, who subjected it to a ruthless military Government until 1819, when Bolívar's victory at Boyacá compelled its evacuation. On the creation of the republic of Colombia, Bogotá became its capital, and when that republic was dissolved into its three constituent parts it remained the capital of Nueva Granada. (A. J. L.)

BOGRA or BAGURA, a town and district of British India, in the Rajshahi division of Bengal. The town is situated on the right bank of the river Karatoya. Pop. (1921) 12,322. The district of Bogra lies west of the main channel of the Brahmaputra. It contains an area of 1,379sqm. and a population (1921) of 1,048,606: Mohammedans account for 82% of the population, the highest district percentage in Bengal. The district stretches out in a level plain, intersected by numerous streams and dotted with patches of jungle. The Karatoya river flows from north to south, dividing it into two portions, possessing distinct characteristics. The eastern tract consists of rich alluvial soil, well watered, and subject to fertilizing inundations; the western portion is high-lying. The principal rivers are formed by the different channels of the Brahmaputra, which river here bears the local name of the Daokoba or "hatchet-cut." The population is almost entirely agricultural, rice being the staple crop, and local industries are of small importance.

BOHEMIA, a province of Czechoslovakia. The early history of Bohemia is very obscure. The country derives its name from a tribe of uncertain origin, the Boii, conquered by the Teutonic Marcomanni about 12 B.C. It is probable that Slavic peoples, of whom the Cechs were most important, had entered the country by the first century A.D., but nothing is really known of the stages by which they became its masters, and it is hard to ascertain the historical basis which may underlie the traditions of their early kings, the founders of the Přemyslide dynasty.

The Přemyslide Dynasty.—The first attempts to introduce Christianity into Bohemia undoubtedly came from Germany.

They met with little success, as innate distrust of the Germans naturally rendered the Bohemians unfavourable to a creed which reached them from their western neighbours. Matters were different when Christianity approached them from Moravia, where its doctrine had been taught by Cyril and Methodius—Greek monks from Thessalonica. About the year 873 the Bohemian prince Bořivoj was baptized by Methodius, and the Bohemians now rapidly adopted the Christian faith. Of the rulers of Bohemia the most famous at this period was Wenzel, surnamed the Holy, who in 935 was murdered by his brother Boleslav, and was afterwards canonized by the Church of Rome. During the reigns of Boleslav and his son, Boleslav II., Bohemia extended its frontiers in several directions. Boleslav II. indeed established his rule not only over Bohemia and Moravia, but also over a large part of Silesia, and over that part of Poland which was included in the former Austrian province of Galicia. Like most Slavic States at this and even a later period, the great Bohemian empire of Boleslav II. did not endure long. Boleslav III., son of Boleslav II., lost all his foreign possessions to Boleslav the Great, king of Poland, and was ultimately dethroned in favour of the Polish prince Vladivoj, brother of Boleslav the Great. Vladivoj attempted to strengthen his hold over Bohemia by securing the aid of Germany. He consented not only to continue to pay the tribute which the Germans had already obtained from several previous rulers of Bohemia, but also to become a vassal of the German empire and to receive the German title of duke. This state continued when after the death of Vladivoj the Přemyslide dynasty was restored. The Přemyslide prince Břetislav I. (1037–55) again added Moravia, Silesia and a considerable part of Poland to the Bohemian dominions.

During the constant internal struggles of the next hundred years the German influence became stronger, and the power of the sovereign declined, as the nobility on whose support the competitors for the crown were obliged to rely constantly obtained new privileges. In 1197 Přemysl Ottakar became undisputed ruler of Bohemia, and was crowned as king in the following year. The royal title of the Bohemian sovereigns was continued uninterruptedly from that date. Wenzel I (1230–53) succeeded his father without opposition. His son Přemysl Ottakar II was one of the greatest of Bohemia's kings. He had during the lifetime of his father obtained possession of the archduchies of Austria, and, about the time of his accession to the Bohemian throne, the nobility of Styria also recognized him as their ruler. These extensions of his dominions involved him in repeated wars with Hungary. In 1260 he decisively defeated Bela, king of Hungary, in the great battle of Kressenbrunn and obtained possession of Carinthia, Istria and parts of northern Italy. His possessions extended from the Giant Mountains in Bohemia to the Adriatic, and included almost all the parts of the late Habsburg empire west of the Leitha. From political rather than racial causes Ottakar favoured the immigration of Germans into his dominions. He hoped to find in the German townsmen a counterpoise to the overwhelming power of the Bohemian nobility. In 1275 Rudolph, count of Habsburg, was elected king of the Romans. It is very probable that the German crown had previously been offered to Ottakar, but that he had refused it. His Slavic nationality was likely to render him obnoxious to the Germans. As Rudolph immediately claimed as vacant fiefs of the Empire most of the lands held by Ottakar, war was inevitable. Ottakar was deserted by many of his new subjects, and even by part of the Bohemian nobility. He was therefore obliged to surrender to Rudolph all his lands except Bohemia and Moravia, and to recognize him as his overlord. In 1278 Ottakar invaded the Austrian duchies, now under the rule of Rudolph, but was defeated and killed at Durnkrut on the Marchfeld. With the death of his grandson Wenzel III. the ancient Přemyslide dynasty came to an end (1306).

The Luxemburg Dynasty.—Albert, king of the Romans, declared that Bohemia was a vacant fief of the Empire, and, mainly by intimidation, induced the Bohemians to elect his son Rudolph as their sovereign; but Rudolph died after a reign of only one year. The Bohemians thereupon chose as king Henry, duke of

Carinthia, who had married a daughter of King Wenzel II. Henry soon became unpopular, and he was accused of unduly favouring the German settlers in Bohemia. He was deposed, and the choice of the Bohemians fell on John of Luxemburg, son of Henry, king of the Romans. The Luxemburg dynasty henceforth ruled over Bohemia until its extinction at the death of Sigismund (1437). Though king John married a daughter of Wenzel II., most of his life was spent in other lands than Bohemia, his campaigns ranging from Italy to Lithuania. He fell at Crécy (1346).

He was succeeded as king of Bohemia by his son Charles, whom the German electors had previously elected as their sovereign at Rense (1346). Charles proved one of the greatest rulers of Bohemia, where his memory is still revered. Prague was his favourite residence, and by the foundation of the *nové město* (new town) he greatly enlarged the city. He also added greatly to the importance of the city by founding the famous University of Prague. Charles succeeded in re-establishing order after the disorders of the reign of John. He also attempted to codify the obscure and contradictory laws of Bohemia; but this attempt failed through the resistance of the powerful nobility of the country. He died in 1378 at the age of 62.

Charles was succeeded by his son Wenzel, then aged 17. His reign marks the decline of the rule of the house of Luxemburg over Bohemia. By this time the reforming party was strong in Bohemia and almost the whole nation espoused the cause of Huss (*q.v.*). Huss was tried before the council of Constance (*q.v.*), to which he had proceeded with a letter of safe conduct given by Wenzel's brother Sigismund, king of the Romans. He was declared a heretic and burnt on July 6, 1415. The inevitable and immediate result of this event was the outbreak of civil war in Bohemia. From this time until 1436, when peace was made, Bohemian history is essentially the record of the Hussite Wars (*see* HUSSITES).

George of Poděbrad.—In the latter year Sigismund, who had inherited a claim to the Bohemian throne on Wenzel's death in 1419, proceeded to Prague and was accepted as king. He died in the following year (1437) and was succeeded by his son-in-law, Albert of Austria, whom the estates chose as their king. Albert died after he had reigned over Bohemia less than two years. Though it was known that Albert's widow Elizabeth would shortly give birth to a child, the question as to the succession to the throne again arose; for it was only in 1627 that the question whether the Bohemian crown was elective or hereditary was decided for ever. The nobles formed two parties, one of which, the national one, had George of Poděbrad (*q.v.*) as its leader. Ulrich of Rosenberg was the leader of the Roman or Austrian division of the nobility. The two parties finally came to an agreement known as the "Letter of Peace." Those who signed it pledged themselves to recognize the Compacts (*see* HUSSITES), and to support as archbishop of Prague, John of Rokycan, whom the Church of Rome refused to recognize. On Feb. 22, 1440, Queen Elizabeth gave birth to a son, who received the name of Ladislav. The Bohemians formally acknowledged him as their king, though only after their crown had been declined by Albert, duke of Bavaria. Ladislav remained in Austria under the guardianship of his uncle Frederick, duke of Styria, afterwards the emperor Frederick III., and Bohemia, still without regular government, continued to be the scene of constant conflicts between the rival parties of the nobility. In 1446 a general meeting of the estates of Bohemia together with those of Moravia, Silesia and Lusatia—the so-called "lands of the Bohemian crown"—took place. This meeting has exceptional importance for the constitutional history of Bohemia. It was decreed that at the meeting of the estates their members should be divided into three bodies—known as *curiae*—representing the nobles, the knights and the towns. These *curiae* were to deliberate separately and only to meet for a final decision. An attempt made at this meeting to appoint a regent was unsuccessful. Negotiations with the papal see led to no result, as the members of the Roman party used their influence at the papal court for the purpose of dissuading it from granting any concessions to their countrymen. Shortly after the termination of the diet of 1446 George of Poděbrad therefore determined to appeal

to the fortune of war. He assembled a considerable army at Kutna Hora and marched on Prague (1448). He occupied the town almost without resistance and assumed the regency over the kingdom. The diet in 1451 recognized his title, which was also sanctioned by the Emperor Frederick III., guardian of the young king. Poděbrad was none the less opposed, almost from the first, by the Romanists, who even concluded an alliance against him with their extreme opponents, Kolda of Zampach and the other remaining Taborites. In Oct. 1453 Ladislav arrived in Bohemia and was crowned king at Prague; but he died somewhat suddenly on Nov. 23, 1457. George of Poděbrad has from the first frequently been accused of having poisoned him, but historical research has proved that this accusation is entirely unfounded. The Bohemian throne was now again vacant, for, when electing Ladislav the estates had reaffirmed the elective character of the monarchy. Though there were several foreign candidates, the estates unanimously elected George of Poděbrad, who had now for some time administered the country. Though the Romanist lords, whom Poděbrad had for a time won over, also voted for him, the election was considered a great victory of the national party and was welcomed with enthusiasm by the citizens of Prague.

During the earlier and more prosperous part of his reign the policy of King George was founded on a firm alliance with Matthias Corvinus, king of Hungary, through whose influence he was crowned by the Romanist bishop of Waitzen. His principal supporters were the men of the smaller nobility and the towns. After a certain time, however, some of the Romanist nobles became hostile to the king, and, partly through their influence, he became involved in a protracted struggle with the papal see. It was in consequence of this struggle that some of George's far-reaching plans—he endeavoured for a time to obtain the supremacy over Germany—failed. After the negotiations with Rome had proved unsuccessful George assembled the estates at Prague in 1452 and declared that he would to his death remain true to the communion in both kinds, and that he was ready to risk his life and his crown in the defence of his faith. The Romanist party in Bohemia became yet more embittered against the king, and at a meeting at Zelena Hora (Grunberg) in 1465 many nobles of the Roman religion joined in a confederacy against him. In the following year Pope Paul II. granted his moral support to the confederates by pronouncing sentence of excommunication against George of Poděbrad and by releasing all Bohemians from their oath of allegiance to him. It was also through papal influence that King Matthias of Hungary, deserting his former ally, supported the lords of the league of Zelena Hora. Desultory warfare broke out between the two parties, in which George was at first successful; but fortune changed when the king of Hungary invaded Moravia and obtained possession of the Brunn, the capital of the country. At a meeting of the Catholic nobles of Bohemia and Moravia at Olmütz in Moravia, Matthias was proclaimed king of Bohemia (May 3, 1469). In the following year George obtained some successes over his rival, but died in 1471. George of Poděbrad, the only Hussite king of Bohemia, has always, with Charles IV., been the ruler of Bohemia whose memory has most endeared itself to his countrymen.

Vladislav of Poland.—After protracted negotiations Prince Vladislav of Poland was elected King at Kutna Hora, on May 27, 1471. This election was a victory of the national party, and may be considered as evidence of the strong anti-clerical feeling which then prevailed in Bohemia; for Matthias was an unconditional adherent of Rome, while the Polish envoys who represented Vladislav promised that he would maintain the Compacts. The new king was involved in a struggle with Matthias of Hungary until 1478, when a treaty concluded at Olmütz secured Bohemia to Vladislav, Matthias retaining Moravia, Silesia and Lusatia during his lifetime, which were to be restored to Bohemia after his death.

As regards matters of State the reign of Vladislav is marked by a decrease of the royal prerogative, while the power of the nobility attained an unprecedented height, at the expense, not only of the royal power, but also of the rights of the townsmen

and peasants. A decree of 1487 practically established serfdom in Bohemia, where it had hitherto been almost unknown. It is impossible to exaggerate the importance of this measure for the future of Bohemia. The rulers of the country were henceforth unable to rely on that numerous sturdy and independent peasantry of which earlier Bohemian armies had mainly consisted. Various enactments belonging to this reign also curtailed the rights of the Bohemian townsmen. A decree known as the "regulations of King Vladislav" codified these changes. It enumerated all the rights of the nobles and knights, but entirely ignored those of the towns. It was tacitly assumed that the townsmen had no inherent rights, but only such privileges as might be granted them by their sovereign with the consent of the nobles and knights. Civil discord was the inevitable consequence of these enactments. Several meetings of the diet took place at which the towns were not represented. The latter in 1513 formed a confederacy to defend their rights, and chose Prince Bartholomew of Münsterberg—a grandson of King George—as their leader.

The Diet of St. Wenceslas.—Vladislav was elected king of Hungary in 1490 and many of the events of his later life belong to the history of Hungary where he died in 1516. His successor was his son Louis, who had already been crowned as king of Bohemia at the age of three. According to the instructions of Vladislav, Sigismund, king of Poland, and the emperor Maximilian I. were to act as guardians of the young king. The Bohemian estates recognized this decision, but they refused to allow the guardians any right of interference in the affairs of Bohemia. The great Bohemian nobles, and in particular the supreme burgrave, Zdeněk Leo, lord of Rožmítal, ruled the country almost without control. The beginning of the nominal reign of King Louis is marked by an event which had great importance for the constitutional development of Bohemia. At a meeting of the estates in 1517 known as the diet of St. Wenceslas they settled the questions which had been the causes of discord. The citizens renounced certain privileges which they had hitherto claimed, while the two other estates recognized their municipal autonomy and tacitly sanctioned their presence at the meetings of the diet, to which they had already been informally readmitted since 1508. At the first sitting of this diet, on Oct. 24, it was declared that the three estates had agreed henceforth "to live together in friendly intercourse, as became men belonging to the same country and race." In 1522 Louis arrived in Bohemia from Hungary, of which country he had also been elected king. On his arrival at Prague he dismissed all the Bohemian State officials, including the powerful Leo of Rožmítal. He appointed Charles of Münsterberg a cousin of Prince Bartholomew and also a grandson of King George, as regent of Bohemia during his absences, and John of Wartenberg as burgrave. The new officials appear to have supported the more advanced Hussite party, while Rožmítal and the members of the town council of Prague who had acted in concert with him had been the allies of the Romanists and those Utraquists who were nearest to the Church of Rome. The new officials thus incurred the displeasure of King Louis, who was at that moment seeking the aid of the pope in his warfare with Turkey. The king therefore reinstated Leo of Rožmítal in his offices in 1525. Shortly afterwards Rožmítal became involved in a feud with the lords of Rosenberg; the feud became a civil war, in which most of the nobles and cities of Bohemia took sides. Meanwhile Louis, who had returned to Hungary, opened his campaign against the Turks. He requested aid from his Bohemian subjects, and this was granted by the Rosenberg faction, while Rožmítal and his party purposely delayed sending any forces to Hungary. There were, therefore, but few Bohemian troops at the battle of Mohács (Aug. 29, 1526) at which Louis was decisively defeated and perished. (X.)

1526-1740

The Accession of the Habsburgs.—The Crown left vacant by the death of Louis II. was claimed by the Archduke Ferdinand of Austria, by virtue of the hereditary rights invested in his wife Anna, Louis's sister, by the succession pacts concluded by Ferdinand's grandfather Maximilian. The Bohemian estates, however, denied these rights and claimed the exercise of their

prerogative to fill the vacant throne by election. Ferdinand acquiesced, outmanoeuvred and defeated his most dangerous rivals, the dukes of Bavaria, and was unanimously elected on Oct. 23, 1526. The adjunct lands of the Bohemian Crown, however (Moravia, Silesia and Lusatia), whom the Bohemian magnates had neglected to convoke for the electoral diet, revenged themselves by recognizing Anne and Ferdinand as their sovereigns by hereditary right. This national division enabled Ferdinand to refuse to sign the severest clauses of the electoral capitulation presented to him by the diet. In 1541, a fire having destroyed the State archives, he substituted, with the forced consent of the diet, an act recognizing his wife's hereditary right for the act registering his election, and in 1547 he exacted from the diet a fresh confirmation of this recognition.

Ferdinand I.—In consolidating and strengthening the unity of this monarchy, to make it a lasting and secure possession of the Habsburg dynasty, Ferdinand first set about restoring the much-diminished power of the monarch. The country had suffered so severely from anarchical conditions that it was in general grateful to a prince who could restore public order and security. Even the establishment of central authorities to direct the affairs common to all the sovereign's dominions (foreign relations, military organization, finance) encountered little opposition, as the measures decided by these authorities were executed in Bohemia only by the constitutional national authorities. Where the king and the nation clashed was on the religious question, and the defeat of the latter was due to its divisions. To check the advance of Lutheranism in Bohemia, Ferdinand, for purely political motives, supported the official "Utraquist" Church, which was slowly falling into decay and disunion, while the Unity of the Bohemian Brethren inclined increasingly towards Luther. Bohemia was drawn into the great duel in which the house of Austria was now engaged with German Protestantism. The Bohemian estates long wavered between resistance and obedience to the king, who summoned them to assist the cause of his house; finally (1547) the diet met unconvoked by the king, even despite his express prohibition, which made its action revolutionary, drew up a list of demands which would have given it all power and reduced the king to a figurehead, and nominated a provisional directory. The defeat of the German Protestants at Muhlberg suddenly reversed the situation; it was now Ferdinand who dictated. His rigour was directed chiefly against the towns, which he had long considered the chief hotbeds of rebellion and heresy, particularly Prague; their administrative autonomy was replaced by the authority of royal judges, and in Prague, of royal captains also; their judiciary autonomy by a new royal court of appeal, and under pretext of revising old privileges, they were deprived of most of their domains, which passed to the king (who, however, later restored much of them). These measures impoverished the burgesses and rendered them politically impotent; henceforward, administratively and in the diet, the towns were puppets of the king. The nobles and knights most compromised also had their estates confiscated, or reduced to fiefs. There were few death-sentences; only four persons (two nobles and two burgesses) were executed on the eve of the opening of the "Bloody Diet" (Aug. 22, 1547) which recorded Ferdinand's measures and again recognized the hereditary of the Crown. The nobles and knights had viewed without displeasure the humiliation of their old rivals, the towns; but this naturally increased their own dependence on the king. The latter was able partially and temporarily to repair his disorganized finances, out of the yield of the confiscated estates. Believing that he would easily master heresy in the Czech countries, Ferdinand proceeded with much rigour against the Bohemian Brethren, whom he regarded as the ringleaders, with the towns, in the revolt. Persecution, however, only enhanced the Brethren's courage and determination, and the diet of Moravia, where tolerance was general, opposed the king's demands. Ferdinand, suspecting his brother of wishing to rob him of the imperial Crown, became more conciliatory towards the German Protestants, and was forced to modify his attitude in Bohemia correspondingly. While Lutheranism increasingly penetrated the Utraquist Church, Ferdinand thought to recover here-

tics by persuading the pope to concede communion in both kinds to lay persons (1564). About the same time he introduced the Jesuits into Bohemia (1561) and their work, at first slow and difficult, prepared the generation which after the White Mountain realized Ferdinand's plans much more fully and boldly than he himself had conceived.

The Turkish advance had reduced the Habsburg territories in Hungary to the semi-circle bordering the western and northern frontier of the kingdom. The great majority of the population of these regions was Slavonic, Croat in the south, Slovak in the north; while Pressburg, the capital of royal Hungary, stood in Slovak territory. Conditions were favourable for a rapprochement between the Czechs and the Slovaks, who had been separated since the early 10th century by the Magyar domination in Hungary; but such a rapprochement could be neither far-reaching nor effective, given contemporary political and social conditions, and the mistrust and fear which it would have inspired in the Habsburgs, whose centralizing, and consequently Germanizing, policy was opposed to it.

Maximilian II.—To ensure respect for the hereditary principle Ferdinand had made the estates recognize his eldest son, Maximilian, in 1549. This custom of recognition of the heir presumptive during the king's lifetime was again followed in the cases of Maximilian's own three successors, his sons Rudolph and Matthias and his nephew Ferdinand. As a young man, Maximilian had appeared favourably inclined towards the Protestants; but after his election as emperor (1561) he had adopted his father's policy in a milder form. He readily accorded the diet the abrogation of the compacts which, originally a guarantee of religious liberty, had become under Ferdinand an obstacle to the free development of Protestantism in its various forms, including the Unity; but refused to authorize the Neo-Utraquists to adopt the Augsburg confession. In 1576 the Lutheran and Calvinist tendencies agreed on the text of a new confession, the "Bohemian confession." Maximilian managed to dissuade the estates from giving this legal sanction and to content themselves with his word of honour to respect religious liberty and with the right of electing 15 "defenders" to watch over the liberty of the Protestant faith; promises which Rudolph repeated on his recognition as king. Maximilian died shortly after, disappointed in his far-reaching international ambitions, and leaving the royal authority weaker and less respected than he found it.

Rudolph II.—In the middle of the 16th century about two-thirds of the population of Bohemia were Protestants (Neo-Utraquists or Lutherans); one-tenth United Brethren; rather more had remained Catholics, especially in southern Bohemia and Moravia, among the nobles, however, the proportion of Catholics was much higher (about one-fourth). As soon as the counter-reformation began, this Catholic minority gained in numbers and vigour, various nobles, including some great families reverted to the old faith; the Catholic magnates began to impose their religion throughout their domains, and intolerance grew widespread. While the old official Utraquist Church fell into final collapse, the United Brethren organized more strongly in a remarkable religious and intellectual movement, but they were too impractical to help the nation greatly in the impending life-struggle.

The religious struggles were partly the manifestation of social and national conflict. The economic evolution of the 16th century tended to enrich the magnates, who extended their great properties at the expense of the knights; while the cities lost their commerce and decayed in consequence of the shifting of the great trade routes. The economic condition of the peasants improved slightly, but their legal status grew worse, the growing need of labour inducing the magnates to restrict increasingly their liberty of movement. The spread of Protestantism in Bohemia had attracted thither German immigrants, who had advanced the linguistic frontier, and forced the estates, first of Moravia, then of Bohemia, to issue laws in the early 18th century protecting the use of the Czech language in public life.

Rudolph II., with his unstable, suspicious and melancholy character and narrow Spanish upbringing, was not the man to

pilot the kingdom through a formidable crisis. His arbitrary attempt to exterminate Protestantism in Hungary evoked Bocskay's formidable rebellion, which forced Matthias, the king's lieutenant in Hungary, to sign the peace of Vienna with the rebels and that of Zsitvatorök with the Turks (1606). On Rudolph's refusing ratification, Matthias, supported by the Hungarian and Bohemian magnates, rose against him; Moravia followed him, whereupon Bohemia remained faithful to Rudolph. The Peace of Liben (1608) left Matthias in possession of Moravia and Austria, and recognized him as future king of Bohemia. The fratricidal struggle had naturally profited the nobles of their estates; Matthias was curbed by a confederation of his new subjects, and Rudolph had to sign a series of articles, designed to exclude all foreign influence from Bohemia and vest all real power in the diet. He demurred only to the religious demands; but Matthias having yielded on this point, the diet of 1609 finally forced Rudolph to grant confessional liberty for the nobles and royal towns, liberty of conscience for all, a constitutional guarantee for the Bohemian confession, appointment of the consistory by the estates, and the control of the university by defenders chosen by them. This famous Charter-Majestat (July 9) was accompanied by an agreement between Catholics and Protestants, indubitably sincerely meant but so obscurely drafted that it afterwards formed the occasion of the disputes which developed into the rebellion of 1618. While the last remnants of the traditionalist Utraquist Church reverted to Catholicism, the new consistory was composed of Neo-Utraquists and Brethren, the latter closely allied with the Lutherans, and thanks to the wisdom of Budovec, the moral leader of the Union, the new régime opened smoothly. When Rudolph, whose sole thought was now revenge against Matthias, encouraged his cousin Leopold, bishop of Passau, whom he hoped to make his successor, to conspire with the Catholic magnates to cancel the *Majestat* and release his mercenaries upon Bohemia, which they invaded as far as Prague, the country rose against the invaders; Matthias came to the estates' assistance, and Rudolph, who had betrayed all parties, had to abdicate (April 1611), dying soon after (Jan. 1612).

The Revolt.—Under Rudolph, Prague had been the capital of the Austrian monarchy. Matthias removed the capital to Vienna, thereby confirming the estates in their suspicions and opposition. Nevertheless the diet of 1617 dared not refuse to recognize as their future king the Archduke Ferdinand of Styria, Matthias's nephew, a pupil and docile instrument of the Jesuits. For some years, however, the leaders of the Protestant party had been in communication abroad to prepare a revolt; Bohemia was also affected by the situation in Germany, where the conflict between the Catholic league and the Protestant union was growing acute. The violation of the promises contained in the *Majestat* regarding the royal and church domains and Matthias's action in entrusting the government to a council composed of fanatical Catholics brought the outbreak nearer. The rejection of the claims presented in March 1618 by the Protestant assembly legally convoked by the defenders in virtue of the *Majestat*, led in May to the famous defenestration of Prague, when the two most ardent Catholics of the council, Martinic and Slavata, were hurled into the moat of the castle (being, incidentally, only slightly injured). The diet appointed a council of 30 directors, decided to levy an army, decreed the expulsion of the Jesuits and confiscation of their property, and negotiated for an agreement with the other lands of the Bohemian Crown. They reached agreement with Silesia, at the price of relaxing the ties between that province and the Crown; the scruples of Zerotin delayed the adherence of Moravia until most of its importance was gone. The Protestant party itself was divided by the reappearance of old misunderstandings between Lutherans and Brethren, and the former were estranged when, on the death of Matthias, the diet again proclaimed the throne elective and invited a Calvinist, the Elector Palatine, Frederick V., to fill it (Aug. 1619). A young, inexperienced and weak sovereign; an undisciplined and selfish oligarchy; an inferior army and lack of foreign allies; exhaustion after the great effort of the 15th century; absence of self-confidence, especially the absence of what had been the nation's strength in the

Hussite wars—the enthusiasm of the peasant masses, now reduced to serfdom and consequently deaf to any sentiment beyond that of their misery and social hatred: these causes explain the defeat of the insurgents at the White mountain, at the gates of Prague (Nov. 8, 1620). Frederick, the "winter's king," fled, followed by many of the magnates, abandoning the country to Ferdinand, who had become emperor in Aug. 1619, and to the Jesuits.

The Reaction, 1620-27.—Lichtenstein, the new governor, presided over the political, the papal nuncio Carafa over the ecclesiastical, reaction. The execution of 27 real or alleged leaders of the revolt (three nobles, seven knights, 17 burgesses) preluded the general confiscation of the rebels' properties, whereby three-quarters of the estates (excluding those of king and church) changed hands; this gigantic expropriation, which was attended by scandalous corruption, substituted for the old aristocracy new families: Spaniards, Walloons, Germans, who had furnished the emperor's mercenary officers; one of the most greedy and best favoured of them was Waldstein. The concession of communion in both kinds was revoked, all pastors expelled, the ancient schools closed, and the ancient and glorious university, the entire conduct of public instruction, and the censorship (1622) delivered to the Jesuits. In 1625 the re-catholicization of the towns by fines, prison and bailiffs began; by 1626 it was complete, at least outwardly. In 1627 all nobles refusing to adopt Catholicism, which the new constitution proclaimed the sole recognized religion, were expelled. Revolts of the peasants against conversion were fairly easily repressed. The serfs had not the last resort of nobles and burgesses who refused conversion—emigration. Thirty thousand families emigrated, comprising nearly a quarter of the nobility and urban population of Bohemia, the moral and intellectual flower of the nation. In 1627 Ferdinand enacted a new Constitution. Absolute heredity was established, the practice of securing recognition for the future king disappearing; the estates were forbidden any legislative initiative on any important point; Catholicism was proclaimed the sole religion; the clergy were constituted as the leading estate in country and diet; and German was admitted beside Czech as the official language. Legally, the Bohemian lands preserved their independent identity; actually, they were absorbed in the Austrian monarchy, keeping their own administrative forms so long as it remained patrimonial, losing them increasingly as it was transformed into a modern state.

National Decline.—The Treaty of Westphalia ended the hopes of revenge which, thanks to Waldstein, had seemed for a moment practicable. The last light of Czech intellectual life went out when Comenius died in Holland in 1670. The exhausted country fell into misery and torpor. The peasant class, now sole representatives of the nation, were crushed under the yoke of the greedy and brutal foreigners, their new masters. The large landed properties, which formerly covered one-third of the country, now occupied two-thirds, while the estates of the knights and the towns had become insignificant. The population was reduced by 50% or more. The peasant, with three days of *corvée* a week under the law of 1680, rising to six at busy periods under that of 1738, his dues multiplied five-fold between 1660 and 1730, could hardly live, fell into debt, degenerated physically; frequent risings were brutally repressed. Czech fell to be a peasant tongue, German monopolizing polite society and public life. The old ties with Moravia, which gravitated increasingly towards Vienna, were relaxed. In Slovakia Czech gained a little ground, thanks to the Bohemian immigrants; and the Slovak peasants, with the Ruthene, formed the bulk of the forces raised by the Hungarian rebel chiefs against the Habsburgs; but they were led in the name of Hungarian liberty, for the benefit of Magyar nobles. The reconquest of Hungary from the Turks, the peace of Szatmár, and the adoption of the Pragmatic Sanction (1720 in Bohemia) further strengthened the position of the dynasty and consolidated the unity of the monarchy.

1740-1848

Period of Enlightened Despotism (1740-90).—In the first years of Maria Theresa's reign, the Bohemian Crown lost Silesia to Frederick II., by the treaties of Breslau (1742) and Dresden

(1745); while its independence and dignity were diminished by the various reforms (see AUSTRIA); measures which marked the beginning of centralization in Austria, and, Hungary not being included in them, held the germ of dualism. Local administration, hitherto divided between the sovereign and the estates, passed entirely to the sovereign (1751); while the decree fixing the contribution towards the upkeep of the army for ten years (1748) deprived the diet of the chance to exercise one of its few remaining powers. The undignified and cowardly attitude of the Bohemian nobles when Bohemia and Prague were occupied by Charles Albert's forces in 1741 (half the nobles did him homage) contrasted painfully with the Hungarian attitude at the diet of Pressburg and influenced, if not the principle of these reforms, at least the manner of their execution.

Against the potential injury to the Czech cause from this abolition of the last remnants of national independence and the retreat of the national language before German, which conquered successively the upper schools (1770-81), the university (1784) and the municipal administration of Prague, must be placed the beneficial effects of the economic and educative measures taken by Maria Theresa's Government, particularly the legislation for relief of the peasants; a maximum was fixed for their share of dues (one-third, later—1756—two-fifths of the total yield of the land) and their *corvée* obligations (Patent of 1756). They were still heavy, but the authority of the State now intervened against arbitrary extension of them. General prosperity increased rapidly. The first census (1754) showed 3,000,000 inhabitants in the lands of the Bohemian Crown; in 1781, this had risen to 4,500,000.

The more systematic and radical reforms of Joseph II did even more to raise the Czech nation; while the evolution of democracy broadened the basis of national life. Two supremely important measures were issued almost simultaneously: the edict of toleration (Oct. 13, 1781) which abolished the draconic dispositions which had throttled the nation's religious life since Ferdinand II's day, and allowed Protestants liberty to confess their faith and practise their religion; and the edict of Nov. 1, 1781, which restored to the peasants their personal liberty, leaving only their economic obligations towards their masters, and reducing even these by the edict of Feb. 10, 1789, which fixed the maximum dues on the peasants at 30% of the total yield of their land (12% for taxation, 18% for the landlord and the priest). Although the last-named measure was abrogated under Leopold II, the two chief edicts survived, and the Czech renaissance benefited from them more than it suffered from the new restrictions imposed on the activity of the diets or their committees, or the general introduction (for purely practical, not nationalist, reasons) of German as the language of administration.

The Reaction (1790-1848).—The opposition to Joseph's reforms was mainly feudal; but an instinctive adaptation to the spirit of the age led it to adopt liberal and constitutional formulas, while against Germanization it naturally took its stand on the national tongue. Although less vigorous than in Hungary, it was sufficiently stout in Bohemia, while Moravia remained, as usual, more timid, more conservative and more truly reactionary. Joseph's successor, Leopold II., re-established in the main the constitutional situation of the middle of Maria Theresa's reign and made peace with the nobles by sacrificing to them the edict of 1789 on *corvée*. He made, however, a first concession to the growing Czech national feeling among the upper and middle classes by founding a chair of Czech language at Prague university. From this moment the idea of Czech solidarity with the Serbs, of Pan-Slav solidarity, begins to appear; for example, in the great scholar and patriot, Dobrovsky.

The French wars of 1792-1815 suspended the normal political life of the shaken monarchy and reduced it to financial extremity. In the Bohemian countries the events in France awoke some faint echo in the peasant masses, while the passage of Russian troops stimulated somewhat Slav sentiment. The creation of the title of emperor of Austria (1804) strengthened centralizing tendencies, *de facto*, if not *de jure*. The first generation of "awakeners," on the other hand, with Dobrovsky and Jungmann, revived

the scientific study of the national language and antiquities, while the large industry which was to advance the country so enormously made its modest beginnings. After the restoration of 1815, the national movement, hitherto inspired mainly by 18th-century rationalism, came under the influence of German romanticism. The study of history now supplanted that of philology; Palacký began his great task of organizing the national effort, both in pure scholarship (foundation of the *Review of the Bohemian Museum*, 1827) and in the practical field (formation of the "Matice" publishing concern, 1830). He was helped by a little group of aristocrats, notably Count Sternberg, founder of the Bohemian museum (1818), provincial patriots, desirous to defend the individuality of Bohemia against Viennese centralism rather than the Czech nation for itself. The same provincial feeling animated the diet in its manifestations of growing opposition to the Government and, in 1847, inspired its programme of political demands, reminiscent of that which it had presented to Leopold II. 50 years earlier. Provincial patriotism again, although of a very different trend, wholly democratic, inspired the young German literature of Bohemia at that time. After the revolution of 1830 showed the weakness of the restoration, and the Polish insurrection of 1831 stimulated the sentiment of Slavonic solidarity towards the Poles (the Russophiles were only a small group), the national renaissance became more markedly political and liberal; Charles Havlicek, a liberal democrat, disciple of the French thinkers and writers, joined Palacký, the liberal conservative, as a moulder of Czech opinion.

All this movement was concentrated in Bohemia. Moravia was in general sluggish and indifferent, while Slovakia chose this moment for a linguistic secession. The Czech renaissance originated largely in Slovakia, doubtless because in Hungary Protestantism, protected by the Constitution, had preserved its liberty. Intellectual life there centred round the Pressburg Lyceum, which produced the great figures of Palacký, Šafařík and Kollár, the first apostle of Slav intellectual and moral solidarity. The more Slovakia formed the "Czech national reserve," as Havlicek said, the greater was the potential danger to the national forces of the linguistic separation which, after the first attempt made by Bernolák, 1790-1810, seemed definitely accomplished when Louis Štúr, a young teacher at Pressburg, raised the dialect of central Slovakia to the rank of a literary language in 1843. This apparent separatism was in each case rooted in a deep national sentiment. Bernolák had hoped to fight at once Protestantism, which was still attached to the Czech of the reformers, and the advance of German; Štúr to create a linguistic instrument common to the Slovaks of every district and every creed to resist the increasingly violent assaults of Magyarization.

1848-1918

The Revolution of 1848.—In 1848 the national leadership passed from the aristocracy to the new middle classes. Their programme comprised a Bohemia restored in its political individuality; i.e., with full internal autonomy, national equality, true constitutionalism and a strong, united monarchy (as Palacký said: "if Austria did not exist, she must be invented"). Proclaimed at the first revolutionary meeting (March 11), accepted in principle by an imperial cabinet order (April 8), thwarted by the counter-offensive of centralism (Austrian Constitution of April 25) and the increasingly separatist ambitions of Hungary, this programme was forced to reduce its claims when the Whitsun rising (June 12, 1848), which coincided with the meeting at Prague of a Slavonic Congress, brought the Austrian army under Windischgrätz its first victory over the revolution. The Czechs had to abandon their ambition of a constituent diet in Prague for the lands of the Bohemian Crown and concentrated their efforts on the Austrian parliament which met at Vienna in July. Their policy of loyalty to a federalist or autonomist Austria grew more marked. The course of events in Germany itself showed increasingly how right Palacký had been in April to answer the invitation to Frankfurt by declaring that Bohemia was not German, Austria not Germanic but super-national, and increasingly justified the Czechs' action in May in refusing to elect deputies for the lands of

the Bohemian Crown to the German parliament. The growth of extreme nationalism and separatism in Hungary, the violent refusal returned by the Pest Government to the moderate demands of the Slovaks, which thus drove them to armed resistance and civil war, the assumption by Jellačić, the Ban of Croatia, of the rôle of defender of the Slavs, naturally inclined Czech policy in this Austrophil direction. The parliament was about to commence discussion on a draft Constitution, based on mutual concession between the Germans and the Slavs, which it would certainly have passed, probably thereby changing the whole evolution of the Austrian question, when the Viennese Government abruptly dissolved parliament (March 7, 1849) and reintroduced an absolutism which was legally consecrated in Dec 1851.

Results of the Revolution.—The only gain of the revolution which was not questioned was the liberation of the peasants. No Austrian nationality profited more than the Czech from the law of Sept. 7, 1848, which abolished all old feudal burdens (*see AUSTRIA*). After the White Mountain the Czechs had sunk to be a peasant nation, with only the faint beginnings, in the 19th century, of a middle class; the establishment of peasant ownership enabled them to develop a real national wealth, while the restoration of personal liberty and dignity allowed them to develop their system of national education and thus create the elements of modern political life; in both fields they would now meet the competition of their rivals and compatriots, the Germans, and also profit by the industrial development which followed the abolition of tariff walls within the monarchy, the establishment of railways, the extension of industry and the expansion of modern capitalism. This new middle class, peasant-born, conquered successively the liberal professions and public offices, both at home and in the central departments in Vienna, thus gradually preparing the way for the future Czechoslovak State.

The effects of these developments could not, however, be felt at once, and the 20 years after the revolution formed for the Czechs and Slovaks a period of painful struggle, relieved only by rare rays of hope. One of these was the enactment—after ten years of centralist, absolutist and Germanizing rule—of the Oct (1860) Diploma, a compromise between the necessary unity of the monarchy and the historical autonomy of its parts. The February (1861) Patent, however, on the pretext of applying the principles of the Diploma, actually substituted for it a centralist and Germanic pseudo-institutionalism, the franchise being ingeniously calculated to favour the Germans enormously against the Czechs in the Bohemian lands, and still more, the higher aristocracy against the people of either nationality. The aristocracy was divided into two camps, differing rather by family rivalry than by political conviction, and united by their common will to maintain their privileges; a court party, soi-disant liberal, and a provincial and feudal, known as "historic." The Czech leaders, believing that they needed a link with the all-powerful Crown, allied themselves in 1860 with the "historic" party. Their policy thus became tinged with historicism and soon brought them into conflict with the national Hussite tradition and the economic evolution of the country. The February Constitution, discredited by the abstention of the Czechs, who ceased to attend parliament in 1863, and the hostility of the Magyars, was suspended in 1865. Again the outlook improved for Bohemia, the new leader of the Government, Belcredi, belonging to the party of "historic" nobility. But in 1867 Francis Joseph signed the compromise with Hungary embodying the Hungarian dualist programme. The recognition of Hungary as a sovereign State cut the Slovaks off from the Czechs and delivered them to Magyar domination, whereas the Constitution of the non-Hungarian territories in a single State, corresponding to the Hungarian State, was the crown and sanction of the long evolution commenced by the Constitution of 1627.

Struggle for Historic Rights.—Czech policy after 1860 had undoubtedly committed a great mistake in imitating too faithfully that of the Magyars. From the identity of the legal status of the two kingdoms with respect to the monarch during the century 1526–1627 they drew political deductions which ignored the actual differences between the situations and relative strengths

of the two countries and nations. The same idea dictated their attitude of passive opposition from 1867 to 1879, which gave a free hand to the centralist German "liberals" who formed the governments in Austria. The national language made, however, some progress during this period in public life, particularly in the schools; and the nation grew in wealth and culture, and thus, automatically, in national consciousness. After the creation of the German empire the Viennese court, fearing its attraction on the Germans of Austria, attempted to counter this danger by concessions to the Slavs; but Hungary's resistance to any modification, even nominal, of the Compromise, forced Francis Joseph to revoke the rescript of Sept. 12 by which he had invited the diet to present to him a new Bohemian Constitution, and to drop the "fundamental articles" which it had elaborated. The revised franchise of 1873 (*see AUSTRIA*) was another blow to the historic individuality of the lands of the Bohemian Crown, and weakened Czech resistance. In Moravia passive resistance ceased in 1874; the Czech deputies for Bohemia reappeared in the diet in 1878. When the opposition of the Germans to the annexation of Bosnia led the emperor to replace the German Liberal system by a Conservative régime, neutral towards the nationalities (Taaffe's Ministry, 1879), the policy of passivity ceased automatically.

The Czechs gained appreciable advantages from the new régime: the linguistic decrees of 1880 which, if not establishing an equality between Czech and German in public life, diminished the difference between them, the Czech university in Prague (1882), a more friendly, or less hostile, administration, ministers of their own nationality. But their own leaders were embarrassed by the need, as one of them said, of thus "picking up crumbs," of depending wholly on the Government and the "historic" nobility, which grew increasingly intransigent in their conservatism and Catholicism; while the power of the Young Czechs, the more advanced fraction, increased. The compromise concluded by the more conservative Old Czechs with the Germans in 1890, although bringing real and permanent advantages to the Czech cause, was denounced as treason because it left German the language of internal administration; at the 1891 elections they were swept away by the Young Czechs. This virtually ended Taaffe's régime (he resigned 1893).

Respect for the maxims of "historic" rights, and the Magyar example, naturally hindered the Czechs largely from defending the Slovaks against Magyarization, which was exerted with extreme brutality. Slovakia was represented in the Hungarian parliament only by Magyars or Germans; Slovak upper schools were closed on the pretext of Pan-Slav conspiracies (1874); the Slovak national cultural society, the Matica, was dissolved and its funds confiscated (1875).

New National Spirit (1890–1914).—From 1893–1905, political life seemed dominated by the language question. The tumultuous party and national conflict was only aggravated by the introduction of universal suffrage in 1907. In Bohemia both the diet (1908) and its executive committee, which was replaced provisionally in 1913 by a commission of officials, were paralysed, but in Moravia a compromise was achieved (1905) which assured the Czechs their rights as a majority, while safeguarding the German minority. The development of the Eastern crisis from 1908 on steadily increased the hostility of the Slavs to Austrian official policy, subordinated to Germany, and therefore anti-Slav, and increasingly dominated by the Magyars, whose power in the monarchy increased as Austria grew weaker. In Hungary the persecution of the Slovaks grew. First the schools were attacked (Apponyi's law of 1907, which made even the confessional schools, entirely supported by Slovak voluntary contributions, instruments of Magyarization), then the clergy, to enlist the influence of ecclesiastical authority in the service of Magyarization.

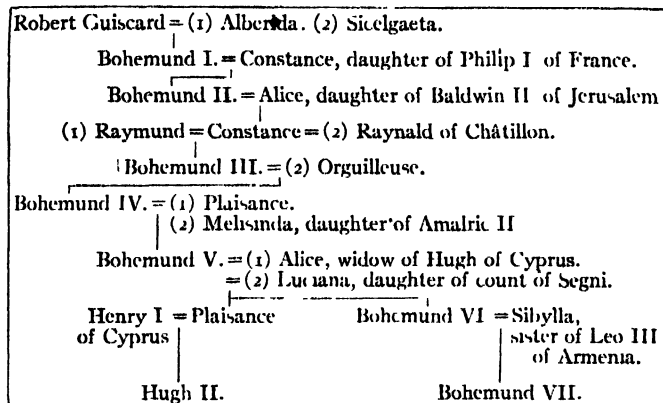

Below the surface of this political turbulence, a new spirit modern, critical and scientific, had been growing up since the foundation of Prague university. It found political expression in the foundation of a "realist" group, later party, under Professor Masaryk (*q v*). Masaryk gathered round him a group of young intellectuals who introduced new inspiration into the moral and

political life of the Czechs, and substituted among the Slovaks the idea of self-help for the old fatalist and Russophil mysticism. His courage and energy in the Agram and Friedjung trials gained him a unique authority among the Slavs of Europe, even in those parties whose old romantic errors he combated; and the Masaryk-Aerenthal duel became the symbol of the struggle in which the spirit of John Huss was to face the spirit of Ferdinand II. in the World War. (See CZECHOSLOVAKIA.)

BOHEMIAN LITERATURE: see CZECH LITERATURE

BOHEMUND, the name of a series of princes of Antioch, afterwards counts of Tripoli. Their connection is shown in the following table:—

BOHEMUND I (c. A.D. 1058-1111), prince of Otranto and afterwards of Antioch, was the eldest son of Robert Guiscard, by an early marriage contracted before 1059. He served with his father in the great attack on the East Roman empire (1080-85), and commanded the Normans during Guiscard's absence (1082-84), penetrating into Thessaly as far as Larissa, but being repulsed by Alexius Comnenus. This early hostility to Alexius had a great influence in determining the course of his future career, and thereby helped to determine the history of the First Crusade. On the death of Guiscard in 1085, his younger son Roger succeeded to the duchy of Apulia and Calabria, and a war arose between Bohemund and Duke Roger. The war was finally composed by the mediation of Urban II. and the award of Otranto and other possessions to Bohemund. In 1096 crusaders began to pass on their way through Italy to Constantinople, and Bohemund joined the crusade. He gathered a fine Norman army, at the head of which he crossed the Adriatic, and penetrated to Constantinople along the route he had tried to follow in 1082-84. At Constantinople he did homage to the emperor. From Constantinople to Antioch Bohemund was the real leader of the First Crusade. He took a great part in the siege of Antioch (1097-98), beating off the Mohammedan attempts at relief from the east, and connecting the besiegers on the west with the port of St Simeon and the Italian ships which lay there. The capture of Antioch was due to his connection with Firuz, one of the commanders in the city; but he would not bring matters to an issue until the possession of the city was assured him (May 1098), under the terror of the approach of Kerbogha with a great army of relief, and with a reservation in favour of Alexius, if Alexius should fulfil his promise to aid the crusaders. But Bohemund was not secure in the possession of Antioch, even after its surrender and the defeat of Kerbogha; he had to make good his claims against Raymund of Toulouse, whom he had alienated, and who was now the ally of Alexius. He obtained full possession in

Jan. 1099. Bohemund went to Jerusalem at Christmas 1099, and had Dagobert of Pisa elected as Patriarch, perhaps in order to check the growth of a strong Lotharingian power in the city. It might seem in 1100 that Bohemund was destined to found a great principality in Antioch, which would dwarf Jerusalem; he had a fine territory, a good strategical position and a strong army. But he had to face two great forces—the East Roman empire, which claimed the whole of his territories and was supported in its claim by Raymund of Toulouse, and the strong Mohammedan principalities in the north-east of Syria. Between these two forces he failed. In 1100 he was captured by Danishmend of Sivas, and he languished in prison till 1103. His nephew Tancred took his place; but meanwhile Raymund established himself with the aid of Alexius in Tripoli, and was able to check the expansion of Antioch to the south. Ransomed in 1103 by the generosity of an Armenian prince, Bohemund attacked the neighbouring Mohammedan powers in order to gain supplies, but was severely defeated at Balich, near Rakka on the Euphrates, and despairing of his own resources, returned to Europe for reinforcements. There he won the hand of Constance, the daughter of the French king, Philip I., and collected a large army. Instead of defending Antioch with this army he attacked Alexius, who, aided by the Venetians, proved too strong; and after the unsuccessful siege of Durazzo, Bohemund had to submit to a humiliating peace at Deabolis (1108), by which he became the vassal of Alexius, consented to receive his pay, with the title of *Sebastos*, and promised to cede disputed territories and to admit a Greek patriarch into Antioch. Bohemund was buried at Canossa in Apulia, in 1111.

BIBLIOGRAPHY.—The anonymous *Gesta Francorum* (ed. H. Hagene-meyer) is written by one of Bohemund's followers, and the *Alexiad* of Anna Comnena is a primary authority for the whole of his life. See also B. von Kugler, *Bohemund und Tancred* (Tübingen, 1862); L. von Heinemann, *Geschichte der Normannen in Sicilien und Unteritalien* (Leipzig, 1894); R. Rohricht, *Geschichte des Königreichs Jerusalem* (Innsbruck, 1898) and *Geschichte des ersten Kreuzzuges* (Innsbruck, 1901).

BOHEMUND II. (1108-1131), son of the great Bohemund by his marriage with Constance of France, came in 1126 from Apulia to Antioch (which, since the fall of Roger, the successor of Tancred, in 1119, had been under the regency of Baldwin II.); and in 1127 he married Alice, the younger daughter of Baldwin. After joining with Baldwin II. in an attack on Damascus (1127), he was slain on his northern frontier by a Mohammedan army (1131).

BOHEMUND III. (d. 1201), was the son of Constance, daughter of Bohemund II., by her first husband, Raymund of Antioch. He succeeded his mother in the principality of Antioch in 1163, and first appears prominently in 1164, as regent of the kingdom of Jerusalem during the expedition of Amalric I. to Egypt. During the absence of Amalric he was defeated and captured by Nuredin (Aug. 1164) at Harenc, to the east of Antioch. He was at once ransomed by his brother-in-law, the Emperor Manuel, and went to Constantinople, whence he returned with a Greek patriarch. In 1177 he made an unsuccessful attempt to recapture Harenc. In 1180 he deserted his second wife, the princess Orgueilleuse, for a certain Sibylla, and he was in consequence excommunicated. By Orgueilleuse he had had two sons, Raymund and Bohemund (the future Bohemund IV.). Raymund married Alice, a daughter of the Armenian prince Rhupen (Rupin), brother of Leo of Armenia, and died in 1197, leaving behind him a son, Raymund Rhupen; and the problem which occupied the last years of Bohemund III. was to determine whether his grandson, Raymund Rhupen, or his younger son, Bohemund, should succeed him in Antioch. Leo of Armenia championed his great-nephew, Raymund Rhupen. Bohemund the younger, however, prosecuted his claim with vigour, and even evicted his father from Antioch about 1199; but he was ousted by Leo (now king of Armenia by the grace of the emperor, Henry VI.), and Bohemund III. died in possession of his principality (1201).

BOHEMUND IV. (d. 1233), younger son of Bohemund III. by his second wife Orgueilleuse, became count of Tripoli in 1187, and succeeded his father in the principality of Antioch, to the exclusion of Raymund Rhupen, in 1201. After Raymund Rhupen's death in 1221, Bohemund reigned in Antioch and Tripoli till his

own death.

BOHEMUND V. (d. 1251), son of Bohemund IV. by his wife Plaisance (daughter of Hugh of Gibelet), succeeded his father in 1233, and carried on the struggle with Armenia till 1251, when the marriage of the future Bohemund VI to the sister of the Armenian king finally brought peace. By his first marriage in 1225 with Alice, the widow of Hugh I of Cyprus, Bohemund V. connected the history of Antioch for a time with that of Cyprus. He had resided chiefly at Tripoli, and under him Antioch was left to be governed by its bailiff and commune.

BOHEMUND VI (1237–1268), was the son of Bohemund V. by Luciana, a daughter of the count of Segni, nephew of Innocent III, and succeeded his father in 1251. His sister Plaisance had married in 1250 Henry I of Cyprus, the son of Hugh I.; and the Cypriot connection of Antioch, originally formed by the marriage of Bohemund V and Alice, the widow of Hugh I., was thus maintained. In 1252 Bohemund VI. established himself in Antioch, leaving Tripoli to itself, and in 1257 he procured the recognition of his nephew, Hugh II, the son of Henry I by Plaisance, as king of Jerusalem. In 1268 he lost Antioch to the Mamelukes under Bibars, and when he died in 1275 he was only count of Tripoli.

BOHEMUND VII (d. 1287), son of Bohemund VI. by Sibylla, sister of Leo III of Armenia, succeeded to the county of Tripoli in 1275, with his mother as regent. He had trouble with the Templars who were established in Tripoli; and in the very year of his death he lost Laodicea to the sultan of Egypt. He died without issue; and as, within two years of his death, Tripoli was captured, the county of Tripoli may be said to have become extinct with him.

See E. Rey, *Revue de l'Orient Latin* (1893 et seq.), vol. iv., "Resumé chronologique de l'histoire des princes d'Antioche," and vol. viii., "Les dignitaires de la principauté d'Antioche." See also R. Rohricht, *Geschichte des Königreichs Jerusalem* (Innsbruck, 1898).

BOHN, HENRY GEORGE (1796–1884), British publisher, son of a German bookbinder settled in England, was born in London on Jan. 4, 1796. In 1831 he started as a dealer in rare books and "remainders." In 1841 he issued his "Guinea" *Catalogue* of books, a monumental work containing 23,208 items. Bohn was noted for his book auction sales: one held in 1848 lasted four days, the catalogue comprising 20 folio pages. Printed on this catalogue was the information: "Dinner at 2 o'clock, dessert at 4, tea at 5, and supper at 10." The name of Bohn is principally remembered by the important *Libraries* which he inaugurated: these were begun in 1846 and comprised editions of standard works and translations, dealing with history, science, classics, theology and archaeology, consisting in all of 766 volumes. One of Bohn's most useful and laborious undertakings was his revision (6 vols 1864) of *The Bibliographer's Manual of English Literature* (1834) of W. T. Lowndes. Bohn collected pictures, china and ivories, and was a famous rose-grower. He died at Twickenham on Aug. 22, 1884.

BOHR, NIELS (1885–), Danish physicist, was born at Copenhagen, the son of Christian Bohr, professor of physiology at Copenhagen university. He studied at Copenhagen until 1911, in which year he took his doctor's degree. In the same year he proceeded to Cambridge, where he worked in the Cavendish laboratory under Sir J. J. Thomson, and in 1912 passed on to Sir Ernest Rutherford's laboratory at Manchester, where he came into intimate contact with those conceptions of atomic structure which he was later to turn to so brilliant account. After a year's sojourn in Copenhagen he returned to Manchester in 1914. In 1916 he was appointed professor of theoretical physics in the University of Copenhagen. Largely by his instrumentality an institute for theoretical physics was established at the university in 1920. Niels Bohr was appointed as its head. This institute has become one of the great intellectual centres of Europe and is visited by students from all over the world, including many men of mature performance. Much brilliant work on the subject of atomic structure, experimental as well as theoretical, has been carried out there.

Although Niels Bohr started his scientific life by an experimental investigation, which dealt with the determination of surface ten-

sion by means of oscillating jets of fluid, it is on his theoretical work in the field of atomic structure that his fame rests. In 1911 Rutherford had put forward the theory that the atom consists of an impenetrable nucleus, very small compared to the size of the atom itself, surrounded by electrons occupying the space which is, in ordinary parlance, the volume of the atom (see *ATOM*; *NUCLEUS*). Planck had shown how the assumption of a quantum, or unit, of radiant energy was necessary to explain the distribution of radiant energy in the spectrum, and the quantum theory had already come to occupy a very prominent place in theoretical physics. In 1913 Bohr, by a few bold yet simple assumptions, showed how the quantum theory could be applied to the problem of the structure of the atom. In three papers published in the *Philosophical Magazine* (1913 and 1915) he showed a series of important results, of which the most striking were a theoretical derivation of Balmer's formulae for the hydrogen series and an explanation of the line spectrum of ionized helium, which afterwards led to a remarkable quantitative confirmation of the theory. A fact which went far to convince the most sceptical that there was something in this theory was that Bohr obtained, on purely theoretical grounds, a value for the Rydberg constant *R*, which agreed very closely with that obtained experimentally. Two of the basic assumptions made in these early papers remain as fundamental for all modern theories of the atomic structure; namely, that the atom can exist in a series of *stationary states* each characterized by a certain value of the energy, and that when the atom passes from one stationary state to another a radiation is emitted, the frequency being given by a quantum condition. The exact ways in which the stationary states are to be fixed has been somewhat indefinite since the early days of the theory.

The great success of the Bohr theory, in explaining the simplest optical and X-ray spectra, inspired a large number of workers, and, in spite of the World War, there developed a new school of theoretical physics, in which the mechanism of the motions of electrons in an atom of the Bohr pattern was mathematically investigated, with the object of explaining details of spectral systems. Bohr himself made a great advance when he showed, by means of his so-called *correspondence principle* (see *ATOM*) how the quantum theory could be made to work in co-operation with the older theory of radiation, so that the useful results of both theories could be used to supplement one another. In 1921 and 1922 Bohr showed how his atomic theory could be applied to consideration of the physical and chemical properties of the elements considered in order. This work led directly to the discovery of the new element hafnium by Coster and Hevesy. More recently, at the Institute of Analytical Physics at Copenhagen, Bohr has inspired a number of experimental and theoretical investigations, which have led to valuable results, all on the subject of atomic structure. In 1922 Bohr was awarded the Nobel prize for physics, in 1921 the Hughes medal of the Royal Society, and in 1926 he was elected a foreign member of the Royal Society. (E. N. DA C. A.)

BÖHTLINGK, OTTO VON (1815–1904), German Sanskrit scholar, was born on May 30 (June 11, N.S.), 1815, at St. Petersburg (Leningrad). In 1868 he settled at Jena, and died at Leipzig on April 1, 1904. Böttlingk's works are of great value in Indian and comparative philology. His first great work was an edition of Panini's *Acht Bücher grammatischer Regeln* (Bonn, 1839–40), which was in reality a criticism of Franz Bopp's philological methods. This book Böttlingk again took up 47 years later, when he republished it with a complete translation under the title *Paninis Grammatik mit Übersetzung* (1887). The earlier edition was followed by *Vopadevas Grammatik* (1847); *Über die Sprache der Jakuten* (1851); *Indische Sprüche* (2nd ed., 1870–73, to which an index was published by Blau, 1893); and other works. But his *magnum opus* is his great Sanskrit dictionary, *Sanskrit-Wörterbuch* (1853–75; new ed., 1870–89), which, with the assistance of his two friends, Rudolf Roth (1821–95) and Albrecht Weber (b. 1825), was completed in 23 years.

BOHUN, the name of a family which plays an important part in English history during the 13th and 14th centuries; it was taken

from a village situated in the Cotentin between Coutances and the estuary of the Vire. The Bohuns came into England at, or shortly after, the Norman Conquest; but their early history there is obscure. The founder of their greatness was Humphrey III., who in the latter years of Henry I., appears as a *dapifer*, or steward, in the royal household. He married the daughter of Milo of Gloucester, and played an ambiguous part in Stephen's reign, siding at first with the king and afterwards with the empress. Humphrey III. lived until 1187, but his history is uneventful. He remained loyal to Henry II., and fought in 1173 at Farnham against the rebels of East Anglia. Outliving his eldest son, Humphrey IV., he was succeeded in the family estates by his grandson Henry. Henry was connected with the royal house of Scotland through his mother Margaret, a sister of William the Lion; an alliance which no doubt assisted him to obtain the earldom of Hereford from John (1199). The lands of the family lay chiefly on the Welsh Marches, and from this date the Bohuns take a foremost place among the Marcher barons. Henry de Bohun figures with the earls of Clare and Gloucester among the 25 barons who were elected by their fellows to enforce the terms of the Great Charter. In the subsequent civil war he fought on the side of Louis, and was captured at the battle of Lincoln (1217). He took the cross in the same year and died on his pilgrimage (June 1, 1220). Humphrey V., his son and heir, returned to the path of loyalty, and was permitted, some time before 1239, to inherit the earldom of Essex from his maternal uncle, William de Mandeville. But in 1258 this Humphrey fell away, like his father, from the royal to the baronial cause. He served as a nominee of the opposition on the committee of 24 which was appointed in the Oxford parliament of that year to reform the administration. It was only the alliance of Montfort with Llewelyn of North Wales that brought the earl of Hereford back to his allegiance. Humphrey V. headed the first secession of the Welsh Marchers from the party of the opposition (1263), and was amongst the captives whom the Montfortians took at Lewes. The earl's son and namesake was on the victorious side, and shared in the defeat of Evesham, which he did not long survive. Humphrey V. was, therefore, naturally selected as one of the 12 arbitrators to draw up the ban of Kenilworth (1266), by which the disinherited rebels were allowed to make their peace. Dying in 1275, he was succeeded by his grandson Humphrey VII. This Bohun was one of the recalcitrant barons of the year 1297, who extorted from Edward I. the *Confirmatio Cartarum*. The motives of the earl's defiance were not altogether disinterested. He had suffered twice from the chicanery of Edward's lawyers; in 1284 when a dispute between himself and the royal favourite, John Giffard, was decided in the latter's favour, and again in 1292 when he was punished with temporary imprisonment and sequestration for a technical, and apparently unwitting, contempt of the king's court. In company, therefore, with the earl of Norfolk he refused to render foreign service in Gascony, on the plea that they were only bound to serve with the king, who was himself bound for Flanders. Their attitude brought to a head the general discontent which Edward had excited by his arbitrary taxation; and Edward was obliged to make a surrender on all the subjects of complaint. At Falkirk (1298) Humphrey VII. redeemed his character for loyalty. His son, Humphrey VIII., who succeeded him in the same year, was allowed to marry one of the king's daughters, Eleanor, the widowed countess of Holland (1302). This close connection with the royal house did not prevent him, as it did not prevent Earl Thomas of Lancaster, from joining the opposition to the feeble Edward II. In 1310 Humphrey VIII. figured among the Lords Ordainers; though, with more patriotism than some of his fellow-commissioners, he afterwards followed the king to Bannockburn. He was taken captive in the battle, but exchanged for the wife of Robert Bruce. Subsequently he returned to the cause of his order, and fell on the side of Earl Thomas at the field of Boroughbridge (1322). With him, as with his father, the politics of the Marches had been the main consideration; his final change of side was due to jealousy of the younger Despenser, whose lordship of Glamorgan was too great for the comfort of the Bohuns in Brecon. With the death of Humphrey VIII. the fortunes of the family enter on a more

peaceful stage. Earl John (d. 1335) was inconspicuous; Humphrey IX. (d. 1361) merely distinguished himself as a captain in the Breton campaigns of the Hundred Years' War, winning the victories of Morlaix (1342) and La Roche Derrien (1347). His nephew and heir, Humphrey X., who inherited the earldom of Northampton from his father, was territorially the most important representative of the Bohuns. But the male line was extinguished by his death (1373). The three earldoms and the broad lands of the Bohuns were divided between two co-heiresses. Both married members of the royal house. The elder, Eleanor, was given in 1374 to Thomas of Woodstock, seventh son of Edward III.; the younger, Mary, to Henry, earl of Derby, son of John of Gaunt and afterwards Henry IV., in 1380 or 1381. From these two marriages sprang the houses of Lancaster and Stafford.

See J. E. Doyle's *Official Baronage of England* (1886), the *Complete Peerage* of G. E. Cokayne, (1887-98); T. F. Tout's "Wales and the March during the Barons' War," in *Owens College Historical Essays*, pp. 87-136 (1902); J. E. Morris' *Welsh Wars of King Edward I.*, chs. vi., viii. (1901). (H. W. C. D.)

BOIARDO, MATTEO MARIA, COUNT (1434-94), Italian poet, was born at Scandiano, one of the seignorial estates of his family, near Reggio di Modena, and was educated at the University of Ferrara. At the court of Ferrara he was entrusted with several honourable employments, and was named governor of Reggio, an appointment which he held in the year 1478. Three years afterwards he was elected captain of Modena, and reappointed governor of the town and citadel of Reggio, where he died.

Almost all Boiardo's works, and especially his great poem of the *Orlando Innamorato*, were composed for the amusement of Duke Hercules d'Este and his court. The *Orlando Innamorato* is considered as one of the most important poems in Italian literature, since it served as a model for Ariosto's *Orlando Furioso*. The subject-matter of the poem is derived from the *Fabulous Chronicle* of the pseudo-Turpin; though, with the exception of the names of Charlemagne, Roland, Oliver, and some other principal warriors, there is little resemblance between the detailed plot of the one and that of the other. The poem, which Boiardo did not live to finish, was printed at Scandiano the year after his death, but Niccolò degli Agostini, an indifferent poet, had the courage to continue the work commenced by Boiardo, adding to it three books, printed at Venice in 1526-31.

Boiardo's poem suffers from the incurable defect of a laboured and heavy style. His story is skilfully constructed, the characters are well drawn and sustained throughout; many of the incidents show a power and fertility of imagination not inferior to that of Ariosto, but the perfect workmanship indispensable for a great work of art is wanting. The poem in its original shape was not popular, and has been completely superseded by the *Rifacimento* of Francesco Berni (q.v.).

See Panizzi, *Boiardo* (1830-31) and E. W. Edwards, *The Orlando Furioso and its Predecessor* (1924).

BOIE, HEINRICH CHRISTIAN (1744-1806), German author, was born at Meldorf in the then Danish province of Schleswig-Holstein on July 19, 1744, and died there on March 3, 1806. After studying law at Jena he went, in 1769, to Göttingen, where he became one of the leading spirits in the Göttingen "Dichterbund" or "Hain." Together with F. W. Gotter he founded in 1770 the Göttingen *Musenalmannach*, which he directed and edited until 1775, when, in conjunction with C. W. von Dohm (1751-1820), he brought out *Das deutsche Museum*, which became one of the best literary periodicals of the day. In 1776 Boie became secretary to the commander-in-chief at Hanover, and in 1781 was appointed administrator of the province of Süderditmarschen in Holstein.

See K. Weinhold, *Heinrich Christian Boie* (Halle, 1868).

BOIELDIEU, FRANÇOIS ADRIEN (1775-1834), French composer of comic opera, was born at Rouen, Dec. 16, 1775. He began composing songs and chamber music at a very early age—his first opera, *La Fille coupable* (the libretto by his father), and his second opera, *Rosalie et Myrza*, being produced on the stage of Rouen in 1795. In 1796 *Les deux Lettres* was produced in Paris, where the composer had now settled, and in 1797 *La Famille suisse* was well received. Several other operas

followed in rapid succession, of which only *Le Calife de Bagdad* (1800) has escaped oblivion. Boieldieu, then recognizing the deficiencies of his earlier musical training, took lessons in counterpoint from Cherubini, the influence of that great master being clearly discernible in his pupil's later compositions. In 1802 Boieldieu went to St. Petersburg (Leningrad), where he composed a number of operas. He also set to music the choruses of Racine's *Athalie*, one of his few attempts at the tragic style of dramatic writing. In 1811 he returned to his own country, and in 1812 produced one of his finest works, *Jean de Paris*. He succeeded Méhul as professor of composition at the Conservatoire in 1817. *Le Petit Chaperon rouge* was produced with success in 1818. Boieldieu's second and greatest masterpiece was *La Dame blanche* (1825). The libretto, written by Scribe, was partly suggested by Walter Scott's *Monastery*, and several original Scottish tunes introduced by the composer add to the charm and local colour of the work. On the death of his wife in 1825, Boieldieu married the singer, Philis Desroyes. The Revolution of 1830 reduced him to poverty, but he was ultimately relieved by a pension. He died in Paris of consumption, 1834.

Lives of Boieldieu have been written by G. Hequet (1864), A. Pougny (1875) and Émile Duval (Geneva, 1883). See also P. L. Robert, *Une correspondance inédite de Boieldieu* (1910).

BOIGNE, BENOIT, COUNT (1751–1830), the first of the French military adventurers in India, was born at Chambéry, Savoy, March 8 1751. He joined the Irish Brigade in France in 1768, subsequently he entered the Russian service and was captured by the Turks. After serving for a short time in the East India Company, he resigned and joined Mahadji Sindhia in 1784. In the battles of Lalsot and Chaksana, Boigne and his two battalions proved their worth by holding the field when the rest of the Mahratta army was defeated by the Rajputs.

In the battle of Agra (1788) he restored the Mahratta fortunes, and made Mahadji Sindhia undisputed master of Hindustan. He was given the command of a brigade of ten battalions of infantry, with which he won the victories of Patan and Merta in 1790. Boigne was then allowed to raise two further brigades of disciplined infantry, and made commander-in-chief of Sindhia's army. In the battle of Lakhairi (1793) he defeated Holkar's army. In 1796 he returned to Europe with a fortune of £400,000.

See H. Compton, *European Military Adventurers of Hindustan* (1892).

BOIL, a Celtic people, whose original home was Gallia Transalpina. They were known to the Romans in the time of Plautus, as is shown by the reference in the *Captivi* (888). At an early date they split up into two groups, one of which made its way into Italy, the other into Germany. Some, however, appear to have stayed behind, since, during the second Punic war, Magalus, a Boian prince, offered to show Hannibal the way into Italy after he had crossed the Pyrenees. The first group of immigrants crossed the Pennine Alps (Great St. Bernard) into the valley of the Po, proceeded over the river, drove out the Etruscans and Umbrians, and established themselves as far as the Apennines in the modern Romagna. From the remains discovered in the tombs at Hallstatt, etc., they appear to have been fairly civilized.

Several wars took place between them and the Romans: in 224 B.C., after the battle of Telamon in Etruria, they were forced to submit. But they still cherished a hatred of the Romans, and during the second Punic war (218), irritated by the foundation of the Roman colonies of Cremona and Placentia, they rendered valuable assistance to Hannibal. They continued the struggle against Rome from 201 to 191 B.C., when they were subdued and deprived of nearly half their territory. There was a settlement of the Boii on the Danube from very early times, in part of the modern Bohemia (anc. *Boiohemum*, "land of the Boii"). Thirty-two thousand Boii joined the expedition of the Helvetians into Gaul, and shared their defeat near Bibracte (58 B.C.). They were subsequently allowed by Caesar to settle in the territory of the Aedui between the Loire and the Allier. Those who remained on the Danube were exterminated by the Dacian king, Boerebista, and the district they had occupied was afterwards called the "desert of the Boii" (Strabo vii. p. 292).

The Boii, as we know them, belonged almost certainly to the Early Iron Age. They used long iron swords for dealing cutting blows, and from the size of the handles they must have been a race of large men (cf. Polybius ii. 30).

BIBLIOGRAPHY.—For the ethnological affinities of the Boii and their possible connection with the Homeric Achaeans see W. Ridgeway's *Early Age of Greece* (vol. i, 1901); see also A. Desjardins, *Géographie historique de la Gaule romaine*, ii. (1876–93); T. R. Holmes, *Caesar's Conquest of Gaul*, 426–428 (1899); T. Mommsen, *Hist. of Rome*, ii. (Eng. trans., 1894), 373, note; M. Ihm in Pauly-Wissowa's *Realencyclopädie*, iii. pt. i. (1897).

BOIL, in medicine, a progressive local inflammation of the skin, taking the form of a hard suppurating mass with a core of dead tissue, resulting from infection by a microbe, *Staphylococcus pyogenes*, and commonly occurring in young persons, or as a complication in certain diseases. Usually an infected hair follicle is the starting point. Treatment is local and systemic, the latter being necessary since boils are apt to occur in persons who are "run down." In the English Bible, and also in popular medical terminology, "boil" is used of various forms of ulcerous affection. The boils which were one of the plagues in Egypt were apparently the bubonic plague. The terms Aleppo boil (or button), Delhi boil, Oriental boil, Biskra button, etc., have been given to a tropical epidemic characterized by ulcers on the face, due to a micro-organism (Leishmania).

BOILEAU-DESPRÉAUX, NICOLAS (1636–1711), French poet and critic, was born in the rue de Jérusalem, Paris, the 15th child of Gilles Boileau, a clerk in the parlement. Two of his brothers attained distinction: Gilles Boileau (1631–1669), who is the author of a translation of Epictetus; and Jacques Boileau, who became a canon of the Sainte Chapelle, and made valuable contributions to church history. His mother died when he was two years old; and Nicolas Boileau, who had a delicate constitution, seems to have suffered something from want of care. Sainte-Beuve puts down his somewhat hard and unsympathetic outlook quite as much to the uninspiring circumstances of these days as to the general character of his time. He studied at the Collège de Beauvais, and at the Sorbonne, and was called to the bar Dec. 4, 1656, but from 1657 onwards he devoted himself to letters.

The first piece in which his peculiar powers were displayed was the first satire (1660), in imitation of the third satire of Juvenal; it embodied the farewell of a poet to the city of Paris. This was quickly followed by eight others, and the number was at a later period increased to twelve. A twofold interest attaches to the satires. In the first place the author skilfully parodies and attacks writers who at the time were placed in the very first rank, such as Jean Chapelain, the abbé Charles Cotin, Philippe Quinault and Georges de Scudéry. In the second place he showed both by precept and practice what were the poetical capabilities of French verse. His admiration for Molière found expression in the stanzas addressed to him (1663), and in the second satire (1664). In 1664 he composed his prose *Dialogue des héros de roman*, a satire on the elaborate romances of the time, which may be said to have once for all abolished the lucubrations of La Calprenède, Mlle. de Scudéry and their fellows. Though fairly widely read in manuscript, the book was not published till 1713, out of regard, it is said, for Mlle. de Scudéry. To these early days belong the reunions at the *Mouton Blanc* and the *Pomme du Pin*, where Boileau, Molière, Racine, Chapelle and Antoine Furetière met to discuss literary questions.

In 1666, prompted by the publication of two unauthorized editions, he published *Satires du Sieur D. . .*, containing seven satires and the *Discours au roi*. From 1660 onwards appeared his epistles, graver in tone than the satires, maturer in thought, more exquisite and polished in style. The *Épîtres* gained for him the favour of Louis XIV., who desired his presence at court. The king asked him which he thought his best verses, whereupon Boileau diplomatically selected as his "least bad" some still unprinted lines in honour of the grand monarch and proceeded to recite them. He received forthwith a pension of 2,000 livres. In 1674 his two masterpieces, *L'Art Poétique* and *Le Lutrin*, were published with some earlier works as the *Oeuvres diverses du sieur*

D. . . . The first, in imitation of the *Ars Poetica* of Horace, lays down the code for all future French verse, and may be said to fill in French literature a parallel place to that held by its prototype in Latin.

On English literature the maxims of Boileau, through the translation revised by Dryden, and through the magnificent imitation of them in Pope's *Essay on Criticism*, have exercised no slight influence. Boileau does not merely lay down rules for the language of poetry, but analyses carefully the various kinds of verse composition, and enunciates the principles peculiar to each. Of the four books of *L'Art poétique*, the first and last consist of general precepts, inculcating mainly the great rule of *bon sens*; the second treats of the pastoral, the elegy, the ode, the epigram and satire; and the third of tragic and epic poetry. The *Lutrin*, a mock heroic poem, of which four cantos appeared in 1674, furnished Alexander Pope with a model for the *Rape of the Lock*, but the English poem is superior in richness of imagination and subtlety of invention. The fifth and sixth cantos, afterwards added by Boileau, rather detract from the beauty of the poem; the last canto in particular is quite unworthy of his genius. In 1674 appeared also his translation of Longinus *On the Sublime*.

Boileau was made historiographer to the king in 1677. From this time the amount of his production diminished. The satires had raised up a crowd of enemies against him. The 10th satire, on women, provoked an *Apologie des femmes* from Charles Perrault. Antoine Arnauld in the year of his death wrote a letter in defence of Boileau, but when, at the desire of his friends, he submitted his reply to Bossuet, the bishop pronounced all satire to be incompatible with the spirit of Christianity, and the 10th satire to be subversive of morality. The friends of Arnauld had declared that it was inconsistent with the dignity of a churchman to write on any subject so trivial as poetry. The epistle, *Sur l'amour de Dieu*, was a triumphant vindication on the part of Boileau of the dignity of his art. He was admitted to the Academy in 1684, and then only by the king's wish. In 1687 he retired to a country-house he had bought at Auteuil, which Racine, because of the numerous guests, called his *hôtellerie d'Auteuil*. In 1705 he sold his house and returned to Paris, where he lived with his confessor in the cloisters of Notre Dame. In the 12th satire, *Sur l'équivoque*, he attacked the Jesuits in verses which Sainte-Beuve called a recapitulation of the *Lettres provinciales* of Pascal. This was written about 1705. He then gave his attention to the arrangement of a complete and definitive edition of his works. But the Jesuit fathers obtained from Louis XIV the withdrawal of the privilege already granted for the publication, and demanded the suppression of the 12th satire. These annoyances are said to have hastened his death.

BIBLIOGRAPHY.—Numerous editions of Boileau's works were published during his lifetime. The last of these, *Oeuvres diverses* (1701), known as the "favourite" edition of the poet, was reprinted with variants and notes by Alphonse Pauly (1894). The critical text of his works was established by Berriat Saint-Prix, *Oeuvres de Boileau* (1830-37), who made use of some 350 editions. This text, edited with notes by Paul Chéron, with the *Bibliothèque de 1740*, and an essay by Sainte-Beuve, was reprinted by Garnier frères (1860).

BOILER MAKER, an operative who constructs new boilers and mends, patches or rebuilds old ones. His work includes shearing, clipping, riveting, tube setting, calking, bending plates and general repair of boilers. A knowledge of applied mathematics and mechanical drawing is helpful. The boiler maker must be thoroughly acquainted with boiler shop tools and machinery and be able to work from blue-prints. (See **BOILERS**)

BOILER-MAKING. This industry is remarkable for the immense amount of detail work to be performed, since nothing is really ready to be put together. The plates, angles, bars and other sections arrive in a fairly straight condition, and must be variously sheared, sawn, straightened, bent, flanged, dished, tapered or thinned, planed, turned, welded and drilled before any

kind of construction is possible. Then follows the closing up of hundreds of rivets, the caulking, the fitting of stays, gussets, tubes, and finally the attachment of the numerous mountings.

Each great class of boiler has its peculiar constructional features, necessitating the use of specialized types of machines and riveters. The Cornish and Lancashire boilers require a large quantity of plates, with consequent joints and rivets, and the flues involve rolling, welding, and riveting. The marine Scotch boilers

have a good deal of flue work also, as well as tubes and numerous stays, and the great size, as much as 18 ft diam., together with the thick plates, require the employment of the most massive shearing, bending, and riveting machines. In the case of locomotive boilers, the flat fire-box plates necessitate the fitting of a great number of stays to prevent collapse under the pressure; holes for these must be drilled and tapped, and the stays must be screwed in and riveted over. The fire-tubes likewise are many in number, while superheaters in these and other types often add to the work. Water-tube boilers, though possessing no large amount of plating, demand much attention in the preparation of the tubes and their connections.

Although plate flattening and bending are done cold, the shop must be equipped with furnaces for heating certain plates for flanging, thinning, or special bends, as well as angles, tees and bars for bending or forging. There are also smaller rivet-heating furnaces. Special sorts of cranes have to be installed, some to transport pieces from the furnaces and hold them in position

FIG 1—BOILER PLATES ARE CURVED BY PASSING THEM THROUGH POWERFULLY GEARED ROLLERS. THE TOP ROLL IS ADJUSTABLE TO CONTROL THE CURVATURE OF THE PLATE

FIG 2—FLANGING A BOILER END IN HYDRAULIC PRESS

The heated plate is placed on the vice-ram, which rises and holds it tightly against the top die. The main ram, carrying the matrix, rises and forces the edge of the plate all around the top die in one operation.

during a process, others to suspend portable riveters in various attitudes about a boiler, and yet others to suspend boilers over fixed riveters.

Shearing machines cut the plates to dimensions, the largest sizes being capable of shearing 12 ft at a stroke through 2 in cold plate. The shorn edge cannot be used thus, but must be planed on a long machine having a girder and jacks to hold the plate while a tool carriage travels up and down and planes the rough, slightly cracked edge into a smooth finish. This is a necessary preliminary to the caulking of the joints after riveting.

Some plates require flattening to take out the buckles and uneven tension; this is effected in a "mangle" with four, five or seven rollers. Bending can be done with three rolls, two driven ones, and a vertically adjustable bending one (fig. 1); the setting of this with screws in the end framings determines the degree of curvature. The thick heavy plates which make up the shells of Scotch marine boilers are often handled in vertical rolls, to avoid difficulties of floor space and handling with the crane; and there

FIG. 3—DIAGRAM OF A BOILER-END FLANGED AND DOMED IN DIES
Fig. 2 shows method of flanging to leave the face of the plate flat. In this, the face of the die is convex so as to impart the dome shape to the plate

are powerful hydraulic benders that press the plate bit by bit between dies, completing the curve more quickly than a rolling machine of the requisite size and driving power.

Flanging is performed in dies, with the exception of that for cylindrical flues, which are frequently put into a rotary machine with rollers that turn over the edge at one heat. Otherwise hydraulic presses are utilized that press the shape at one operation or, in the case of large plates, by a succession of squeezes, employing relatively small dies and a narrow machine. Fig. 2 depicts the arrangement of the dies for the first method, comprising a matrix, a fixed top die, and a holding or vice disc worked by a central ram. The holding disc is set level with the top surface of the matrix and the hot plate taken from the adjacent furnace and laid on in a central position. The vice ram rises and the plate becomes gripped against the top die, after which the main ram (or rams) actuating the platen with the matrix on causes the latter to ascend and gather in the edges of the plate, forming it up into a perfect flange. The power required ranges from 100 to

FIG. 4—150-TON HYDRAULIC RIVETER RIVETING A MARINE BOILER
SUSPENDED FROM CRANE

Some portions of boilers are riveted by means of portable riveters, but in making large marine-type boilers, they are slung from an overhead crane into position between the snaps of the big fixed machine

500 tons according to the diameter and thickness of plate. Differently-shaped dies are wanted for locomotive fire-box plates and other contours. Some parts of boilers, such as the ends of certain Cornish types, and of steam drums must be dished as well as flanged; this is seen in fig. 3. Proper finish to edges has to be imparted in a turning or sawing or milling machine, and some end plates have to go to a special machine which cuts large circular or elliptical holes.

Although some amount of drilling is done with portable electric or pneumatic drills, the bulk of the work goes to special fixed machines, either to those with a single spindle and devices for rapid transference from one spot to another, which do about 100 holes in an hour, or to those with multiple spindles driving a lot of drills simultaneously. The largest design of the latter will take a marine boiler shell up to 20 ft. diameter, upon rollers which revolve it as required to bring fresh portions of the periphery opposite the drills. Some machines drill and tap 2 in. stay holes through both shell and combustion-chamber plates and screw the stays into place, tap stay-tube holes up to 4 in. diameter through both plates and screw the tubes in.

Some details, as flues, are riveted up before insertion in a shell, but there is much awkward riveting to be carried on, this sometimes necessitating the employment of the hand-controlled pneumatic riveters. But all that is practicable goes preferably to the hydraulic riveters, or to the pneumatic yoke riveters, *i.e.*, those having a U-shaped frame carrying the riveting hammer at the termination of one arm and the holder-up at the other. The

FIG. 5—HOW THICK MARINE BOILER PLATES ARE SQUEEZED TOGETHER FOR RIVETING

The plates of marine boilers are not pliable enough to be ensured a close-fitting joint by the pressure of the powerful riveting snaps. Hence the hydraulic riveting machine has a secondary cylinder which jams the plates together with irresistible force as the riveting cylinder operates

large fixed hydraulic machines have a gap as deep as 23 ft., in which a locomotive boiler may be lowered and moved about to the various positions. Marine boiler riveters are built on a more massive scale in order to deal with the thick plates and large rivets, one about 1½ in. diameter requiring 150 tons pressure. The union of an end plate to the shell may be seen in fig. 4. As the plates are so thick and unyielding, and absolute tightness of joint is essential for the high steam pressures employed, a plate-closing device is incorporated, as represented in fig. 5. The closer touches the plate before the snap reaches the rivet tail, and squeezes with a force of from 30 to 50 tons, in opposition to the fixed snap at the back. Then the riveting snap advances and closes up the rivet.

There are many smaller kinds of portable hydraulic or pneumatic riveters slung from a crane and shaped to reach awkward situations, including corners and interiors. The screwed stays in locomotive fire-boxes are closed over by hand-manipulated pneumatic riveters, or with the help of a large U-shaped machine reaching inside the box and outside the shell.

The insertion of other stays and tubes occupies a good deal of time in the later stages. The tubes have to be expanded to fit tight by means of a power-driven tool carrying rollers that are forced hard against the interior of the tube as the expander revolves. Beading is accomplished with a hand or power-driven tool which forces over the projecting end of the tube to snug contact with the plate.

Caulking of the riveted seams, and of some rivets, is essential as a safeguard against leaks. A flat-nosed tool with matted face is driven against the plate edge with a hand hammer or more generally a pneumatic hammer, and burrs up the edge slightly, so that it makes intimate contact with its fellow. If, after testing the boiler with the hydraulic pump, leaks reveal themselves, the seams or rivets are marked at such spots; to be attended to again.

Attachment of the numerous mountings on a boiler means a lot of drilling, tapping and riveting, as well as the making of steam-tight joints in cases where detachment has to be provided for, for cleaning or inspection purposes. The final process consists in covering the shell with non-conducting composition, and fitting the bands and lagging sheets.

BOILERS. The origin of vessels for generating steam to supply the motive power of an engine was contemporaneous with the evolution of the steam engine itself, and even in the earliest days

VARIOUS TYPES OF WATER-TUBE STEAM-GENERATING BOILERS

1. A Yarrow water-tube 10,000 h.p. boiler, 250 lb sq in. pressure, high superheat
2. A Yarrow water-tube boiler of 3,750 h.p., with feed water admitted to lower drums
3. Wet bottom locomotive boilers
4. Horizontal tubular type electric steam boiler, 1,200 kw., 440 v. The doors are open, showing three-phase end view
5. First unit at Kips Bay station, N.Y. City, for burning pulverized fuel
6. Convection type Elesco superheater in a Hedges-Walsh-Weldner longitudinal drum (box header) boiler
7. Horizontal tubular type electric steam boiler, 1,200 kw., 440 v., showing three-phase side view
8. Oil burning locomotive boiler, with a heating surface of 7,142 sq ft and a grate area of 108 sq. ft.
9. At right, a 300 h.p. cylindrical boiler (single furnace) and at left, a 3,000 h.p. cylindrical boiler, double ended (four furnaces)

of steam it was recognized that they should be fitted with safety valves and have a considerable margin of safety. They were made of cast-iron with leaden or even wooden tops and often with flat surfaces. These iron tanks were set in brickwork and the fire was lighted underneath. The Watts "wagon" boiler marked a striking improvement in practice, for it was constructed of wrought iron with an internal furnace flue passing through it from back to front. As this was flat sided it became generally known as the "marine box boiler." The interior surfaces were stayed with iron rods, which added to its strength, but the average working pressure was very low, being generally in the neighbourhood of 10 lb. The advent of the compound engine revolutionized the construction of boilers, especially for marine use, as pressures were increased to 25 lb. and upwards. A further impetus was given to progress when in the 1850's the steamship "Lima," of the Pacific steam navigation company, by using higher steam pressure, reduced her coal consumption from 1½ tons to one ton per hour.

Two Great Classes of Boilers.—Boilers fall into two classes: tank or shell boilers, which contain relatively large quantities of water, and water tube boilers, in which a small quantity of water is contained in numerous and comparatively small tubes. The outstanding examples of the former are the Cornish or single-flued boiler, the Lancashire, which is usually double-flued, the Scotch marine and the locomotive types, while the best known examples of the water-tube boiler are the Babcock and Wilcox and the Yarrow. For mercantile marine use this class of boiler has made good headway consequent upon the demand for higher steam pressures, but in the British Navy the type was adopted in 1894, when the first torpedo boat destroyer, H M S. "Hornet," built by Messrs. Yarrow at Poplar, was fitted with eight small water tube boilers having copper generating tubes, for which, however, steel ones were very soon substituted. Subsequent destroyers were fitted with Thornycroft, White, Reed, Blechenden, or Yarrow boilers, while more recently it has been the practice to fit the Yarrow type in all the latest t.b.d.'s of the British fleet. In cruisers and battleships the water tube boiler first installed was the Belleville, but this has now disappeared. The battleships "Nelson" and "Rodney," as well as the post-war 10,000 ton cruisers, were equipped with Yarrow boilers working at a pressure of 250 lb. with a superheat of 200° Fahrenheit. In the case of destroyers, pressure has increased to 300 lb. and is likely to go to 400 lb., though since the Belleville boiler, with its 300 lb. pressure, went out, it was not usual until quite recently for naval boilers to exceed a pressure of 250 lb. The "King George V.," the Clyde-built passenger steamer, has Yarrow boilers designed for a pressure of 550 lb. per sq. inch.

Cornish Boilers.—This type of steam raiser has played a very important part in industry, but it has certain disadvantages which militate against its use when high pressure, efficiency, and space economy are desiderata. Circulation is slow, and therefore a long time is required to raise steam, and the tendency is for the water at the top to become hot before the boiler is equally heated at the bottom. Consequently, the strains to which the material is subjected are increased. The fact, too, that the heating surface is not ideal for breaking up the hot gases of combustion, so that heat is only absorbed slowly, means that the boiler is efficient at only a slow rate of working. A modification of the old type is that in which the flue is eccentric. This facilitates cleaning, but it does not remove the inherent disabilities attaching to the type.

The Lancashire Boiler.—The advantages of this type have been so widely recognized by steam users that many improvements have been made with a view to increasing its efficiency and overcoming the limitations of relatively narrow furnace flues and small combustion chamber volume. One of these includes mechanical forced draught with hand firing, special heat-resisting firebars and air heating, the combination of which enables low grade fuel with a high moisture content to be consumed without any difficulty. With Lancashire boilers, now operated with narrow furnace flues and small combustion chamber volume, wear and tear and maintenance costs are items of the greatest importance in relation to any appliances that may be used. Further, it

is not always possible to have the most scientific supervision, especially on smaller plants. An extremely interesting combination consists of mechanical forced draught, hand firing, an ordinary design of firebars constructed of special heat-resisting alloy, and air heating, especially when high moisture content or other difficult fuel is under consideration. Efficient combustion, with an intensely hot fire and the maximum emission of radiant heat, can be obtained even with the worst material, the disadvantages of natural draught being eliminated. In many cases also it is not essential to use feed water economizers, especially when the water can be raised in temperature by means of exhaust steam or other source of waste heat.

The "Usco" hand-fired forced draught furnace (fig. 1) consists essentially of entirely closed furnace fronts with suitable trunking leading to a brick conduit passing along under the boiler footplates, at the end of which is a forced draught fan. The firing is carried out as usual, and when the firedoors are opened the blast is automatically shut off. Part of the air passes up through the furnace fronts behind the liners of the firedoors, thus keeping the whole arrangement extremely cool, while at the same time

FIG. 1—"USCO" IMPELLED DRAUGHT SYSTEM APPLIED TO A LANCASHIRE BOILER

Direction and attachment of air pipe to furnace is shown. The average saving is from 10-20% in fuel bill

supplying a comparatively small amount of secondary heated air over the top of the fires, the main part of the volume, of course, passing underneath the bars in the ordinary way. A large amount of fuel can be burned per square foot of grate area and the forced draught is completely controlled by the fireman by means of a simple damper arrangement. Forced draught has the advantage not only of supplying air in a cool condition, but also of "localizing" the heat in the boiler, which is of particular importance for many inferior fuels of low specific gravity, such as wood material, brown coal, peat, and general factory refuse. The design of the air heater consists essentially of a series of flat multiple thin metal plates, fixed close together in a casing, the outgoing hot gases and the incoming cold air, flowing in opposite directions on the contra-flow principle, being split up vertically into alternate extremely long segments or channels of cold air and hot gases about ¼ in wide, travelling at high speed. This gives an extremely intimate contact between the air and the hot gases through the metal walls which are about 12 wire gauge thick, resulting in high efficiency of heat transmission, while there is a negligible resistance to the passage of both the air and the gases, the flow throughout—including the entry and discharge—being on the stream line principle without any eddies or back pressure. The saving in coal obtained depends, of course, on the size of the heater and the saving already made by the feed water economizers and superheaters, if these are fitted. Even under the latter conditions, however, the average additional saving is from 10 to 12% in the fuel bill. This combination of air heater, mechanical forced draught with closed fronts, and hand firing, is highly advantageous for a large proportion of Lancashire boiler plants, extremely efficient results being obtained in continuous operation.

Locomotive Boilers.—These boilers may be classified as of the dry bottom or wet bottom type. The ordinary locomotive boiler has a copper firebox and copper stays at the sides. The roof stays and shell are of steel and the tubes of copper. In construction, the front plates, back tube plates, and throat plates are usually pressed in one operation, and the workmanship must be of the best. The top plate of the furnace is sometimes made joggled to allow for expansion and the roof stays are of special design with solid heads screwed in from inside and nutted on the top, the face of the stay head being made with a V projection to

increase the efficiency of the connection between stay and copper plate. The foundation ring in the dry bottom boiler is a difficult forging, and great care must be taken to get a perfect shape and weld. The highest boiler pressure used is about 215 lb. per sq. inch.

The Scotch Boiler.—For the "marine" or cylindrical return tube boilers, which are commonly styled Scotch boilers, the British mercantile marine is indebted to the genius of the firm of Randolph Elder, now the Fairfield Shipbuilding and Engineering Company, who as far back as 1862 installed them in the s.s. "Velasquez" and "Murillo." Their advent created a revolution in existent beliefs as to the pressures possible in steamship propulsion. The old rectangular boilers, which prior to that date had been known as "marine" boilers, but which usually worked up to a maximum pressure of only about 20 lb., were quickly superseded. Pressures were at once raised to 50 or even 55 lb., and by steady evolution they have advanced to 250 lb. and upwards.

It has always been a principle of Scotch boiler practice that the furnaces, combustion chamber, and nests of tubes which return the hot gases to the front of the boiler should be surrounded by water—an admirable feature. But in spite of its many advantages and the great work which this class of boiler has done for the shipping industry, it has certain imperfections, which would almost seem to be impossible of elimination. Combustion is never perfect, as witness the volume of smoke which issues from the funnels of steamers, the unconsumed fuel which passes into the tubes, and in some cases the re-ignition of the gases at the base of the funnel. All this suggests waste, and in spite of many improvements and exhaustive tests the waste continues. Oil firing, however, has done much to reduce these shortcomings.

The Yarrow Boiler.—The outstanding characteristics of the Yarrow water tube boiler are lightness combined with simplicity. In the case of H.M.S. "Hornet," in which, as already mentioned, eight boilers were fitted in 1894. Copper was used as the tube material, though that metal was being almost universally abandoned for such purpose. Previously Mr Yarrow, as he then was, had used steel. He had, however, been able to obtain special copper tubes which could stand internal pressure without developing the faults of which other boiler makers complained. Subsequently, he returned to steel.

The specifications for the materials for a Yarrow boiler are very severe. Steel plates, bars, and rivets must satisfy all the tests and inspections laid down in accordance with the British engineering standards specification, while the conditions respecting the manufacture of the tubes are very exacting. They must be straight, smooth, cylindrical, and of uniform sectional thickness and equal diameter throughout, while they are also required to be free from scale, longitudinal seaming, grooving, or blistering either internally or externally. They must successfully stand temper, flattening, bell-mouthing, and maximum pressure tests, together with a water pressure test in the case of a seamless tube of 2 in. or less external diameter, of 2,500 lb per square inch. All plates which may be subject to stress in the boilers must be pickled in a dilute liquid of hydrochloric acid to remove oxide or scale. Hydraulic flanging is insisted upon, and great importance is attached to subsequent annealing. Ultimate tensile strength and the percentage of elongation are carefully measured. It is therefore very rarely that trouble is experienced with boiler tubes, and great attention is also given to the U-shaped tubes used in the superheaters. High pressures and temperatures have been rendered possible by this care in manufacture, with the result that steam pressures of 500 to 600 lb. per sq. in. and superheat of 700° to 750° Fahr. are common in land practice, and there seems no reason why they should not be extensively adopted at sea. There are certain fundamental factors common to both problems, among them being suitable materials and workmanship. The better and more uniform materials now in use and the improved metallurgical and manufacturing methods adopted remove from the designer's mind any anxiety as to materials. Copper, wrought-iron, and cast-iron have been discarded in the manufacture of water tube boilers of high pressures. Steel is in common use, and its uniformity leaves little to be desired. Certain of the non-ferrous alloys which are now used also contribute to that security which characterizes

modern installations. There is, however, one difference between land and marine practice, viz., that in the latter there is always the risk of a leaky condenser allowing salt to enter the system, although it must be remembered that there are many electric power stations where the condensing water is by no means entirely free from salt.

The design of the boiler which is illustrated (fig. 2) has been passed by the Board of Trade, whose officers have offered many

FIG. 2.—YARROW HIGH-PRESSURE WATER-TUBE BOILER (MERCANTILE TYPE) FOR 575 LB PER SQ INCH PRESSURE

This type has a heating surface of 3,420 sq. ft.; a superheating surface of 870 sq. ft., and in addition, 2,200 sq. ft. air heating surface for pre-heating air prior to admission to closed ashpit

valuable suggestions. The boiler has a total heating surface of 3,420sq.ft., of which the superheating surface is 870sq ft.; in addition, there are 2,200sq ft. of air-heating surface for preheating the air prior to its admission to the closed ashpit. The safety valves are set to 575 lb pressure, and the final temperature will be from 700° to 750° Fahrenheit. The test pressure is 913 lb. The design generally, while not unlike that used in the navy, has been based on mercantile practice, and more closely follows the design of the Yarrow land type boiler now in use at a number of electric power stations. The boiler consists of a forged steam drum connected to the three forged water drums by means of straight tubes expanded and bell-mouthed in accordance with the usual practice. Between the two water drums on the right-hand side is a superheater, consisting of a forged drum with a number of U tubes and placed between the two generating elements. The gases all pass up one side of the boiler and through the air-heater situated above the boiler to the funnel. The reason for adopting a single-flow type of boiler, where all the gases pass through one side, is that this design makes in this particular case a somewhat better arrangement in the ship than the double-flow type, where the gases pass equally through each side. The generating element on the left-hand side of the boiler absorbs a considerable portion of the heat from the furnace by direct radiation, and it will be

noted that the proportion of the total surface of the boiler subject to direct radiation is considerable—an important feature in modern water-tube boiler design, not only increasing the output and efficiency of the unit, but also providing a large amount of comparatively cool surface adjacent to the combustion chamber, which lengthens the life of the brickwork. The admission of air for combustion is secured by the cool air in the stokehold entering an opening between the inner and outer casings at the front of the boiler about 6ft. up from the firing-floor, passing up the double casing through the air-heater, down the double casing at the back of the boiler into the closed ashpit, and so through the fire-bars. The efficiency of the unit is naturally increased by the air-heater, which extracts heat from the flue gases; moreover, the air in its passage to the combustion chamber takes up a certain amount of heat which would otherwise be lost owing to radiation, and incidentally keeps the stokehold cool. Also, the circulation of air in close proximity to the furnace lining helps to keep the brickwork at a temperature which ensures low cost of upkeep.

For controlling the supply of steam—especially as, unlike an oil-burning boiler, the supply of fuel cannot be quickly cut off—various means of regulation have been provided. A damper is fitted in the uptake at the side of the top of the air-heater. When this is in its horizontal position the air passes through the air-heater to the combustion chamber. When, however, the damper is brought to a vertical position the air from the fan passes straight up to the funnel, thereby short-circuiting the air-heater and entirely stopping the supply of air for combustion. This arrangement would be used when the engines are stopped suddenly. Provision is also made for controlling the speed of the forced draught fan, thereby limiting the amount of air for combustion. A still further control is to by-pass the steam direct from the boiler to the condenser by the silent blow-off.

FIG 3—SECTION OF A BABCOCK AND WILCOX WATER-TUBE BOILER
The arrows indicate the direction taken by the gases. The main tubes are at an angle of 22° with the horizontal. The boilers are constructed sectionally to facilitate transport

Babcock and Wilcox Boiler.—The original boiler of this type was patented in 1867; since then over 40 water-tube or sectional boilers have been put on the market, the great majority of which have disappeared. The land type boiler, which has attained world-wide popularity, is of the longitudinal drum standard type; it is built up in sections and has distinguishing features as follows: (1) horizontal drum; (2) inclined section headers (staggered); (3) inclined straight tubes. The tubes, usually 4in. in diameter and 18 to 20ft in length, are arranged in vertical and horizontal rows and are expanded into pressed steel headers.

Two vertical rows are fitted to each other and are staggered. The headers are connected with the steam drum by short tubes expanded into a cross box, which in turn is connected to the drum. Each tube is accessible through individual handhole openings. These openings are elliptical in shape in the vertical headers because of the inclination of the tubes, the shape being necessary to provide for the insertion and removal of the tubes. The elliptical openings are closed by inside fitting forged covers, held in position by steel clamps and bolts. The circular openings—where circular handholes are used in incline headers—are closed on the outside by forged steel caps, milled and ground and held in place by clamps and bolts. Jointing rings or gaskets are required with the inside elliptical covers, but not with the outside circular plates. The main tubes are inclined at an angle of 22° with the horizontal. The rear headers are connected at the bottom to a rectangular forged steel mud-drum by means of nipples expanded into counterbored seats. The boiler is supported by steel girders resting on suitable columns independent of the brick setting. The feed water enters the front of the drum. All these water-tube boilers are constructed on the sectional principle, *i.e.*, they may be shipped in sections and erected at the power station. In the marine boiler, to save weight, it is usual to fit only one (or sometimes two) rows of 4in. tubes, the remainder being 1½ in. in diameter. The land type boiler is fitted with revolving mechanical chain grate stoker automatically fired and with economizer feedheater and superheater.

The Babcock and Wilcox boiler is by far the most popular land type boiler of the present day. At sea it has been fitted in battleships and battle cruisers and also in certain mercantile ships, but it is not, owing to its circulation, recognized as a boiler that can be forced greatly. With water-tube boilers it is of the greatest importance to use nothing but distilled water, and great care must be exercised in the selection of material for condenser tubes. It has recently been shown that a cupro-nickel tube is likely to be the tube of the future. Pure nickel would be the most reliable metal, but the difficulty of manufacture has not yet been overcome. A composition, however, of 70 parts of copper to 30 of nickel gives excellent results. (See fig 3.)

Cochran Boiler.—The Cochran boiler is remarkably efficient, durable, and adaptable. It is manufactured in 22 standardized sizes up to 8ft 6in diameter and 1,000sq ft heating surface. It takes up comparatively little space and is economical to install. A special feature is the patent seamless furnace, which has a large ratio of heating surface to grate area, and provides easy facilities for cleaning or inspection purposes. The bricklined combustion chamber has a large thermal storage capacity, and the boiler has the additional recommendation of being readily adaptable to any class of fuel—coal, oil, coke, or wood, town, producer, or water gas.

Beardmore Blake Boiler.—This is of the vertical multi-tubular type, occupies very little ground space, and requires no brick settings. It may be fired either by coal or oil and has been designed with a view to utilizing waste heat from furnaces. Other features are general compactness and a large wet-back combustion chamber. One of these boilers, 7ft in diameter with a height of 18ft, and a heating surface of 582sq ft, using two oil burners, has evaporated 4,107 lb of water per hour on a consumption of 328.6 lb. of oil when working at a pressure of 105 lb per sq inch. Its general utility is shown by its suitability for auxiliary purposes on board ship, for steam heating and also for supplying the motive power for steam cranes.

Howden High Pressure Boiler.—This combines the advantages of the cylindrical and water-tube boilers by ensuring that there is a large amount of water in circulation and also an ample steam space. There are no stays or stay nuts in contact with the flames, and although designed for the high pressures of marine service, the thickness of the shell plate is kept within practicable limits. Another feature is that the water-tubes are not subjected to intense heat, as the flames first operate on the cylindrical portion of the boiler, the tubes coming into contact only with the combustion chamber gases. The temperature drop from the forward portion of the cylindrical furnace to the water-tubes is

approximately 700° to 800° Fahrenheit. All parts of this boiler are readily accessible both from the front through the furnaces and from the sides through the combustion chamber, and observation can be made of the flame during the whole time the boiler is in operation. Installations of this type do not require the space occupied by a battery of marine boilers, while the weights are 40% less than those of Scotch boilers of the same capacity. Any mud or scale is deposited in the lower water-tube drum, which is not subjected to flame and whence it can be removed easily. An oil-burning boiler of this description with a heating surface of 420sq.ft. in the cylindrical portion and 2,580sq.ft. in the water tubes, with a steam pressure of 305.6 lb. per sq. inch, evaporated 16 lb. of water per hour per lb. of oil used. The total weight of the boiler with water was 60 tons and the efficiency worked out at 87.78%.

Superheaters.—In order to increase the working efficiency of the boiler many devices have been invented and much importance attaches to the superheater, which may be defined as an apparatus for increasing the temperature of steam without augmenting the pressure. It consists of a system of tubular units or elements with the steam flowing inside and hot gases outside. One end of each tube or unit is connected to a distributor or saturated steam heater, the other end to a collector or superheated steam heater. In the locomotive and Scotch marine boilers the fire tube type superheater is the usual design. The "integral" superheater is installed within the boiler setting and receives heat from the same flue gases and the same furnace as the boiler. They are usually of the convection type, absorbing heat from the gases of combustion which sweep over them. In some cases, in locomotive and Scotch marine types, the superheaters are located in the uptake, but the degree of superheat here is limited to about 50° F, whereas the fire tube superheater gives 200° to 300°. In some instances superheaters have to be provided with their own furnace, *e.g.*, when the design of the boiler does not permit the installation of an integral superheater. The most remarkable improvement in the steam locomotive since its invention has been the introduction and use of superheated steam. Practically no locomotive is built to-day without superheaters

FIG 4—WALLSEND-HOWDEN PATENT LIQUID FUEL BURNER

This extremely simple and strong type of burner, requires only a few seconds to change, replace and light

The "elesco" fire tube superheater consists of loops of tubing forming units which extend into the boiler flues.

Liquid Fuel.—The use of liquid fuel, especially under marine boilers, is a notable feature of modern development in boiler practice. The advantages are reduction in engine room staff, increase in cargo carrying capacity, and more steady steaming. Fuel oils, as used for steam-raising purposes, are the residuals which remain after the lighter fractions have been removed from the crude oil. The result is that most fuel oils are heavy viscous liquids which would not be satisfactory if methods of oil firing had not greatly improved. One advantage, however, arises from the use of these residuals, *viz.*, that in bulk they are not inflammable, and therefore can be stored with safety. The oil is drawn

through the suction strainer by the oil fuel pump and discharged to the heater in which its temperature is raised to reduce the viscosity of the oil sufficiently to enable a very fine spray to be obtained at the burner. After leaving the heater the oil is passed through a discharge strainer in which it is very finely strained. The fittings and their accessories are generally mounted on an oil-tight tray to form a complete unit. From the pumping and heating

FIG. 5.—FURNACE ARRANGEMENT OF THE WALLSEND-HOWDEN PATENT LIQUID FUEL BURNING SYSTEM

unit the oil travels through the discharge pipe to the burners, one of which is illustrated. The burner (fig. 4) is extremely simple and strong, and consists of only four parts—*viz.*, the body, cap, nozzle, and diaphragm. Holes are drilled nearly tangentially through the diaphragm, causing the oil to spin rapidly in the swirling chamber, so that on issuing from the nozzle it opens out in the form of a fine conical mist-like spray, due to the centrifugal effect of the spinning motion. The burner is held in its carrier by a clamp, a mitre joint being formed between the burner and an adapter screwed into the carrier. This makes a perfectly oil-

FIG. 6—HOWDEN-LJUNGSTROM AIR PREHEATER, WITH PART OF CASING REMOVED TO SHOW THE CONTRA-FLOW PRINCIPLE USED IN THIS TYPE OF CONTINUOUS AIR-REGENERATOR

tight joint and enables a burner to be removed without breaking pipe joints. The time required to change the burner, replace it by another, and light it up is a matter of a few seconds only.

In the Wallsend-Howden liquid fuel burning system, the furnace arrangement allows (1) burning coal only (2) burning oil only or (3) burning coal and oil together (fig. 5).

Preheated Air.—Preheated air gives better combustion, and with high temperatures the intensity of any chemical reaction becomes greater. It also increases the temperature of combustion.

FIG. 7 — LARGE SIZE CENTRAL STATION BOILER WITH 42,370 FT. OF TESTING SURFACE. IT IS OF THE INCLINED CURVED-TUBE, MULTI-DRUM TWIN TYPE

The Howden-Ljungstrom air preheater (fig 6) differs from others, inasmuch as it is constructed as a continuous regenerator and uses the contra-flow principle. The air enters the preheater through the forced draught fan and passes downwards through the rotor to be delivered through steel ducts to the boiler furnace. The flue gases pass through the rotor in the opposite direction, being drawn by the induced draught fan and delivered to the chimney. These fans are of the axial type, the upper part of the preheater shell being adapted as the fan casing.

Use of Pulverized Fuel.—Considerable experiment and research has been devoted to discovering the best means of using pulverized coal both for land and marine boilers, and the difficulties of the problem now seem to be overcome. Coal dust, together with the requisite quantity of air, is introduced into the combustion chamber, and as each particle of fuel is surrounded by the necessary air, combustion is instantaneous and complete.

Successful experiments have been carried out by the United States shipping board, which show there is no difficulty not only in burning pulverized coal under boilers, but in performing the requisite pulverizing on board ship. The advantages of the system are: higher temperature of combustion; complete combustion and therefore no carbon loss in ash; ability to use any class of coal, increased flexibility of operation, so that the fuel supply can be immediately cut off or automatically adjusted to the load; reduced costs; and elimination of wastage from smoke (W O.)

UNITED STATES

Advances in boiler practice in the United States during the ten years ending in 1928 have been made primarily in the size of boiler units used, in the pressures for which they have been built and operated, in the ultimate steam temperatures used and in the capacities or rates of evaporation developed from a given amount of heating surface.

Boiler Sizes.—Twenty years ago the average boiler in power plant service contained some 2,500 sq ft. of heating surface while the maximum sized unit contained approximately 6,000 sq.ft. The average sized boiler in central station work now contains from 12,000 to 14,000 sq.ft. of heating surface, the largest boiler yet built containing 42,370 sq ft. This unit is of the inclined, curved tube design (fig. 7); the largest boiler of the straight tube type

BY COURTESY OF THE BABCOCK & WILCOX COMPANY

FIG. 8—HORIZONTAL WATER TUBE CROSS DRUM BOILER

contains 35,449 sq ft. of heating surface exclusive of furnace wall cooling tubes. This unit is of the horizontal sectional heater water tube type (fig. 8).

The increase in size of individual boiler units has followed naturally the increase in size of prime movers, the desire to cut down boiler-room labour and to reduce the unit cost of power. The limitation on the physical size of boiler units would seem to be set by a combination of boiler design and boiler-shop equipment.

Capacities.—While the maximum amount of heating surface possible in a single unit is a question of physical size and the ability to build any particular design of boiler to such maximum, the maximum amount of steam to be generated by any given amount of heating surface is dependent upon a great number of factors. Almost regardless of the design of any particular combination of furnace, boiler, economizer or air heater, or both, because of the great number of these factors involved, it is impossible to state what rate of output per sq ft. of surface represents the best rate for the best commercial return. The limitation is set not by the maximum thermal efficiency obtainable so much as by the return on the capital invested and by problems of operation. With first cost eliminated, it would always be possible to obtain efficiencies at very high rates of boiler output comparable with those obtainable at normally high rates simply by the addition of economizer or air pre-heater surface. It is the operating factor that has the greater bearing. In one plant the

maximum output per boiler unit may be limited by the class of coal used, as affecting slag troubles either on the furnace walls or on the boiler tubes. Much has been done in the development of the so-called slag screens, formed by certain of the boiler tubes, to minimize the latter trouble. This has been accomplished by the use of an arrangement of the boiler tubes which the products of combustion first strike in such manner as to give greater gas flow areas, and lower gas velocities, into the boiler heating surfaces. A sufficient number of tubes are so arranged as to cool the gases below the temperature at which the ash will fuse to the tubes before the gases strike the main portion of the heating surface of the boiler. The development of water-cooled furnaces, discussed hereafter, has tended to minimize any slagging trouble with the furnace walls.

In another plant, where refractory furnaces are used, the limiting factor may be the life of the furnace brickwork as affected by the rate of driving. This factor too is becoming of less importance through the increased use of water walls in high duty boilers. In a third plant the load factor may have the greatest bearing on the rate of output; *i.e.*, at peak load periods, rates might be justifiable from the standpoint of slag or brickwork trouble that would not be allowable in steady operation.

FIG. 9—HORIZONTAL WATER TUBE, CROSS DRUM, STEAM ECONOMIZER TYPE BOILER

Twenty years ago rates of evaporation of 5 or 6 lb. per sq ft. of boiler heating surface were considered high. Such rates were limited not so much by the lack of ability of the boiler to absorb heat as by the limitations of the combustion apparatus available. With the developments in combustion apparatus, improvements in furnace design, and the increase in use of water-cooled furnaces, such rates to-day are considered moderate and continuous rates of 9 or 10 lb. per sq.ft. of boiler heating surface are common in central station practice, while somewhat lower rates are common in industrial plants.

The highest rates of evaporation expressed in pounds per square foot of heating surface have been obtained with a boiler of a late design in which a large proportion of total heat absorption is through direct radiation. A boiler of this type, illustrated in fig 9, is divided in heating surface as follows—Boiler, 5,938 sq ft.; furnace walls and floor, 2,460 sq ft.; economizer, 8,365 sq ft.; total water surface, 16,763 sq ft.; air heater, 41,700 sq ft.

This boiler has been operated at a capacity of somewhat over 290,000 lb. output per hour. Such a rate would mean an evaporation per square foot of boiler and furnace wall surface of 34.5 lb. or of total water surface including economizer of 17.3 lb. While the economizer is designed to permit steaming, the amount of steam made in the economizer, even at the high rates of output, is not great, and the actual evaporation per square foot of boiler and furnace wall surface is much closer to the first figure than the second. Another design of boiler in which the major proportion of the total heat absorption is through direct radiation, and for which a rate of evaporation of 24.6 lb per sq.ft. of surface per hour is reported, is shown in fig 10. Of the boilers absorbing heat largely through convection, the maximum total evaporation is largely a function of the fuel burning equipment, while the maximum evaporation per square foot of heating surface will decrease as the heating surface per foot of furnace width increases. Of the convection absorption boilers of the general design illustrated in fig. 8 the maximum evaporation per square foot of heating surface is from 15.1 lb. per hour for a boiler 18 tubes high to 22.5 lb per hour for a boiler 11 tubes high.

The maximum evaporation reported with multidrum boilers of the design illustrated in fig 7 is 20.5 lb. per hour. With continued developments in furnace design, combustion apparatus, and possibly some modification in the arrangement of heating surface relative to furnace, these rates may be exceeded. It is to be understood that these high rates of steam output are only possible with the very best feed water, and it is becoming more and more thoroughly appreciated in the United States that the best of feed water is essential to proper central station operation.

Pressures.—Twenty years ago the average boiler pressure used in central station work was 200 or 225 lb., though some few stations were equipped with 350 lb boiler units. In 1926, two 650-lb pressure plants were placed in operation. In 1928 there were 18 different stations either in operation or in course of erection, utilizing pressures of 650 lb. or over. There are to-day, in operation or in course of erection, seven different stations utilizing pressures of from 1,200 to 1,400 lb., the latter being the highest pressure for which boilers have as yet been built for commercial service in the United States. Experimental boilers have been built for pressures higher than 1,400 pounds.

Riveted drums have been used for pressures up to 730 lb per sq in. Boilers built for pressures above this have been equipped with seamless forged steel drums. In the more or less unstable state of the art it is useless to attempt to predict what pressure will ultimately be accepted as representing the best practice. The efficiency of the steam cycle increases very slowly with increased steam pressures above 600 lb., and the problems of reheating—it is generally accepted that reheating is necessary at pressures of about 550 lb and above—feed pumps and the like must be carefully weighed against the increased first cost and the increased skill necessary in operation resulting from added complication. Maintenance costs are apparently no higher with high than with moderate pressures. The number of plants in service and in contemplation perhaps best indicate that under proper conditions the so-called super-pressures are justifiable. Most engineers have felt that the use of such pressures could only be justified for a base load plant where fuel costs were high. On the other hand at least one plant is being built for 1,400 lb that will not be a base load plant and where fuel costs are reasonably low, and the engineers responsible for the design have been able to justify the installation.

An attractive field for the use of the very high pressure boiler would seem to be in the older and less efficient plants. Here the high pressure turbine can be made to exhaust at existing line pressure and the overall plant efficiency be raised appreciably.

The tendency toward the use of higher steam pressures is not limited to central station practice. Industrial plants within the past few years have also been adopting higher pressures though not the super-pressures. Many industrial plants are utilizing 450 lb. pressure and one plant has gone to 800 lb. The use of high pressures in industrial plants is particularly of advantage where process steam is used, the steam being bled from the turbine at one or more stages at such pressure or pressures as are used in process work.

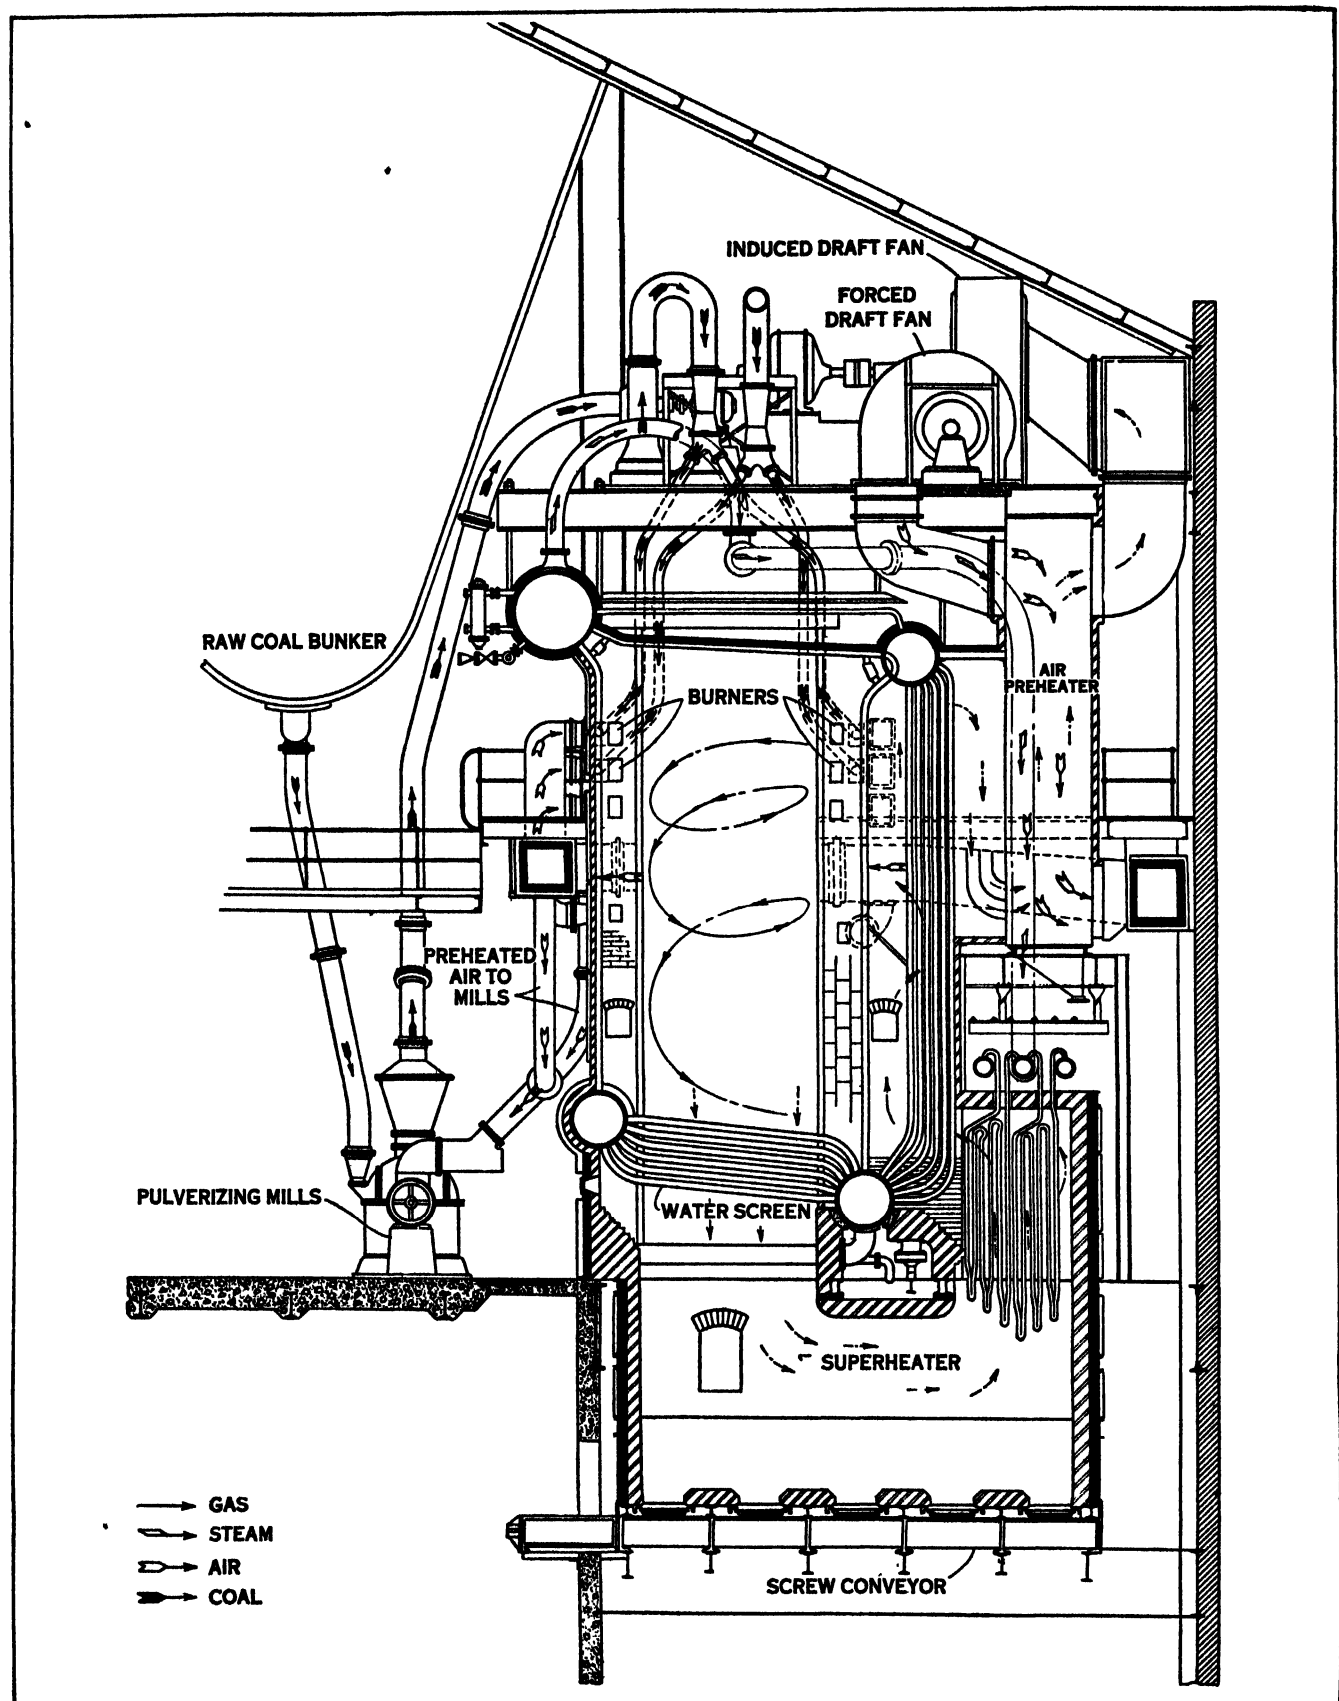

Superheat.—Twenty years ago when the average central station pressures were 200 to 225 lb., the steam temperatures required and used were rarely over 550° F—approximately 150° of superheat. This ultimate temperature has been gradually increased until to-day temperatures of from 700 to 750° are generally accepted as representing best central station practice. A superheater designed to give 750° ultimate temperature may under certain conditions of operation give for short intervals temperatures of, say, 800°, but in the United States 750° has as yet been considered the maximum allowable for steady operating conditions. It is probable, however, that higher temperatures will be demanded and that the demand will be met by the use of special alloy steels in the hot portion of the superheater. One manufacturer at least is at the present time using such steel in the hot end of the superheater where ultimate temperatures of 725° and over are required. The limiting factor is tube temperature. It is to be remembered that the temperature of the tube metal is appreciably higher than the temperature of the steam within, particularly where the superheater is located in a hot gas temperature zone. This tube temperature may be as much as 150° above steam temperature, which would mean for an ultimate steam temperature of 750° a tube temperature of 900°. For this reason it is essential in superheater design that steam velocities be used to keep the tube temperatures as near that of the steam as possible and to assure a proper distribution of steam to all superheater tubes.

Both convection and radiant heat superheaters are in use in the United States and in some instances a combination of the two put. Radiant heat superheaters show a falling superheat curve; i.e., an increase of superheat with increased rates of steam output. Radiant heat superheaters show a falling superheat curve; i.e., a decrease in superheat with increased rates of steam output. A properly designed combination convection and radiant heat superheater should give the desirable flat superheat curve, i.e., a constant degree of superheat regardless of rate of output. The principal objection to the combination type as so far designed has been a total pressure drop that at high rates of output might be considered excessive.

The so-called interdeck superheater such as is shown in fig 8, where the superheater is placed closer to the furnace than was formerly standard practice with this type of boiler, is in effect a combination convection and radiant heat superheater in that the gases pass over it and it absorbs a certain amount of heat by radiation through the lanes between the tubes below it.

Reheat.—As steam pressures and turbine sizes increased, turbine operating difficulties were encountered that were not experienced with low or moderate pressures. These difficulties resulted from a loss in superheat at some stage of the turbine and the formation of moisture in the lower stages. This condensation, appearing as a mixture of water and gaseous steam, increased blade surface friction and led to a loss in blade efficiency in these lower stages. Since with the metals available it was not possible to overcome this difficulty through the use of higher initial steam temperatures, the so-called reheat cycle was adopted. It has not been definitely determined at what pressure reheat becomes necessary but it is generally accepted to-day that such pressure is approximately 500 lb. Future modifications in turbine design may change this pressure.

The increase in thermal efficiency due to reheat is not great—some 2½ to 3%, depending upon the initial steam temperature and pressure. The increase in the mechanical efficiency of the machine, however, due to the elimination of moisture in the lower stages, is sufficient to bring the total saving due to reheat

BY COURTESY OF THE BABCOCK & WILCOX COMPANY

FIG 10—A LARGE-CAPACITY BOILER DESIGNED TO ALLOW HEAT ABSORPTION THROUGH DIRECT RADIATION IN WHICH A RATE OF EVAPORATION PER SQ FT. OF BOILER AND FURNACE-WALL SURFACES OF 24.6 LB HAS BEEN ESTABLISHED. THIS BOILER USES PULVERIZED FUEL AND IS ONE OF THE WATER-TUBE TYPE, COMPLETE WITH SUPERHEATER AND HAS ASH REMOVAL SCREW CONVEYOR. ARROWS SHOW THE DIRECTION OF FLOW OF THE GAS, STEAM, AIR AND COAL, EXPLAINING THE COMBUSTION AND ABSORPTION OF THE HEAT

to some 6 or 7%, again depending upon initial temperature and pressure and the stage at which the steam to be reheated is taken from the turbine.

Two different systems of the reheat cycle are at present in use in the United States. In the first installation made, steam was taken from the primary superheaters of all the boilers serving a single machine, was exhausted at approximately 150 lb. and

that may more than offset the lower overall thermal efficiency.

In the convection and radiant heat reheaters installed up to the present time the ultimate reheat temperatures have ordinarily been approximately the same as the initial temperature to the turbine—725 or 750° F. Higher reheat temperatures are being considered. With live steam reheaters the ultimate reheat temperature possible without going to very special construction is some 20° lower than the temperature of the high pressure steam used as a heating medium.

Furnaces.—Improvements in combustion apparatus and the high duties demanded and required from a given amount of heating surface brought about changes in furnace design much more radical than in boiler design. This has been true with all classes of fuel and methods of firing, but the most radical changes have come with increased size and capacity of stokers and particularly with the development of pulverized fuel burning equipment. With the increased amounts of fuel that had to be burned to give the desired rates of steam output, furnace volumes have been greatly increased. In 1920 the average furnace volume per 10 sq. ft. of boiler heating surface in 24 representative stoker fired installations was 1.9 cu. ft. In 1926 a similar average for 24 stoker installations had increased to 3.85 cu. ft., while in 14 large pulverized fuel installations the average had increased to 8.0 cu. ft. In several of the most modern stoker fired installations the furnace volume supplied has been as great as is general with

pulverized fuel. In the earlier pulverized coal furnaces, while the volumes used were large the rate of heat liberation per cubic foot was relatively low—from 10,000 to 12,000 British thermal units. In present practice the large volumes are retained but such volumes are utilized much more effectively. This has been made possible by the development in pulverized fuel burners. By the use of the principle of turbulence in mixture of coal and air, combustion takes place with much greater rapidity than in early practice and a B T U liberation of 30,000 to 35,000 per cubic foot of furnace volume is now common practice. It is possible that as further improvements are made in burner design this B T U. release per cubic foot may be still further increased. This would result in a greater steam output from a given boiler and furnace or an equal steam output with a reduction in furnace volume.

BY COURTESY OF THE BARCOCK & WILCOX COMPANY

FIG. 12.—CROSS DRUM REHEATER UNIT. THE REHEATER HANDLES STEAM GENERATED BY A SINGLE UNIT

tures and corresponding higher efficiencies. The increased use of air preheaters also tended toward higher furnace temperatures.

With the possibility of developing these higher furnace temperatures, the limiting factor in boiler output became generally accepted as furnace refractory upkeep cost, and because of the desirability of such high furnace temperatures it became necessary to develop some method of reducing furnace upkeep cost. The remedy developed was the use of furnace wall cooling, either by air or by water-cooled surface. The earlier cooled furnaces

BY COURTESY OF THE BARCOCK & WILCOX COMPANY

FIG. 11.—CROSS DRUM REHEATER UNIT. THE REHEATER HANDLES STEAM FROM THREE BOILERS

still being slightly superheated, was all returned to a special reheater boiler unit, reheated in this unit to approximately the original ultimate temperature, and then returned to the same turbine at the stage next beyond that from which it was exhausted. Fig. 11 represents a design of reheat boiler of this type.

In the second reheat system, which was developed with the superpressure boilers, a high pressure turbine is used simply as a reducing valve. In this system, steam is taken from the primary superheater to a high pressure turbine which exhausts at a pressure of some 350 or 400 lb. per sq. in., or if the installation is made in an existing plant at the existing main steam line pressure. From the high pressure turbine exhaust the steam is returned to a reheater element integral with the high pressure boiler, is reheated and returned to a lower pressure machine, or in the case of existing plants in which this class of installation is made, to the main station steam lines. Reheaters of this design have been of both the convection and radiant heat types. Fig. 12 and fig. 13 illustrate convection and radiation reheater units as used in the United States.

Live steam reheaters have also been used to a limited extent. The use of convection or radiant heat reheaters lead to a somewhat better overall plant thermal efficiency due to the fact that any desired reheat temperature may be obtained, whereas with live steam reheating the ultimate temperature is limited by the steam pressure available. On the other hand, the live steam reheater brings a simplification of piping and a saving in space

were air-cooled and to an extent air-cooling is used satisfactorily to-day though generally with the smaller boiler units and where the B.T.U. liberation is appreciably lower than that demanded in central station practice. Water-cooled furnaces developed rapidly. As now used they consist either of bare tubes, so-called fin tubes, and tubes protected by refractory lined metal blocks.

In the case of plain bare tubes, these are usually set in recesses in the brickwork of the furnace walls though in some instances the tubes have been set out from the inside face of the walls. In one design of bare tube wall, the tubes are made to enter the headers in such manner that adjacent tubes touch, offering an all metal surface to the furnace. The fin tube furnace is made up of tubes on the sides of which steel fins are welded longitudinally and the tubes are so placed that the fins of one tube touch the fins of adjacent tubes presenting an all metal furnace wall. Another type of all metal furnace wall is made up of tubes on which blocks are cast.

Of the refractory lined water walls the Bailey wall has been most highly developed. This consists of vertical tubes to which are clamped metal blocks so ground as to give an absolute contact between block and tube. The inside face of the blocks is lined with refractory material, this refractory being used as the bottom of the mould in which the block is cast. Experience would seem to indicate that the refractory protected tube would stand a greater amount of punishment than would bare tubes, and higher rates of heat liberation in the furnace are possible with the former than with the latter. In most designs of water-cooled furnaces the combination of tubes and headers are connected directly to the circulation of the boiler thus becoming an integral part of the boiler. In a few instances the furnace water cooling surface has been made a separate boiler with its own feed line and water level. For the insulation of water walls various types of tile or commercial cements are being used with satisfactory results. The earlier water-cooled furnaces were comparatively small in volume and because of a lowering of flame temperature combustion could not be completed before the products of combustion entered the boiler heating surface proper. The flame temperatures were lowered, owing to the presence of a large amount of comparatively cold surface in the furnace.

As has been indicated furnace volumes were very generally increased due to the demands for increased total B.T.U. liberation corresponding to increased rates of steam output. With such increase in volume, together with improvements in stoker design and pulverized fuel burning equipment, the effect of furnace cooling surface on temperature was lessened. The development of refractory covered cooling tubes also tended toward increased furnace temperature. Further, a better understanding of the laws of heat absorption through radiation by furnace cooling tubes and boiler tubes exposed to radiation made it possible to properly correlate radiant heat absorbing surface and convection absorption surface. This was particularly true in the case of pulverized fuel where turbulent burners gave a great rapidity of combustion.

Economizers.—Engineers are not in entire agreement as to the advisability of economizer installations. With pressures above 350 lb. it is generally accepted that steel tube economizers are necessary. This brings up the question of interior corrosion due to dissolved oxygen in the feed water and to obviate such corrosion it is generally accepted that deaeration is necessary. At first the degree of deaeration required was not considered great, but to-day it is felt that the oxygen content of the feed to steel tube economizers should not be in excess of 0.1 cu. cm. per litre and preferably 0.0 cu. cm. Until recently it has been common economizer practice to limit the feed temperature leaving the economizer to 50° below that due to the pressure of the boiler it serves. This was to prevent the possibility of steaming in the economizer under adverse conditions with the danger of water hammer.

With the introduction and development of bleeder steam feed heating in multiple stages, the initial feed temperature to economizers became higher and higher, and the temperature range through which the economizer could function, if the feed temperature leaving the economizer was limited as described, became

less. The amount of economizer surface that could be installed thus became small and the justification for such installation became questionable.

As pressures increased above 350 lb.—to 650–800 and 1,200 and above—the steam temperatures due to such pressures correspondingly increased. With such pressures the upper limit of feed temperature leaving the economizer was raised to a point such that, even with the maximum incoming feed temperature to the economizer resulting from three or four stage bleeder heating, the temperature range through which the economizer could function became sufficient in many instances to warrant the installation of an economizer of normal size. More recently a design of economizer has been developed in which steaming is permissible. Such a design with its boiler is shown in fig. 9. Economizers as now in use are in general of the counterflow type and with either plain tubes or extended surface tubes, this extended surface being in the nature of fins. In one of the latter designs the surface is lead coated to minimize exterior corrosion. Transfer rates to be expected in economizers for a given set of temperature conditions and a given amount of surface are largely dependent upon gas velocities over the surface. The gas velocity in turn deter-

BY COURTESY OF THE BABCOCK & WILCOX COMPANY

FIG 13—THREE DRUM CURVE TUBE TYPE BOILER WITH RADIANT HEAT SUPER HEATER AND REHEATER

mines the draft loss through the economizer. The allowable draft loss therefore is in most instances the governing factor in the amount and arrangement of economizer surface to be installed for a given set of conditions. Obviously there is some maximum gas velocity with its corresponding maximum heat transfer rate above which the added gross efficiency due to the economizer installation would be more than offset by the power required to overcome the additional frictional resistance of the gases over the surface. No general statement can be made as to where this point of maximum allowable transfer rate should be set, and it is necessary to consider each individual set of conditions as a separate engineering problem.

Air Preheaters.—As higher and higher rates of evaporation per square foot of boiler heating surface were demanded and as pressures were increased, exit gas temperatures became higher than were allowable from the standpoint of boiler room efficiency. Even where economizers were installed, if bleeder heating in multiple stages was used, the gas temperatures leaving the economizers were higher than allowable, due to high inlet feed temperatures. In order to reduce these exit gas temperatures to a point representing proper overall efficiency it became necessary to introduce some additional heat absorption apparatus and the solution was the development of the air preheaters. Air heaters are not new. They were used as early as 1829 in connection with metallurgical furnaces. While such heaters have been used in Europe and in marine practice for a number of years it is only within the past few years that attention has been given them in the United States. Development in this field has been slower in the United States than abroad primarily because of the relatively low fuel costs. With increasing cost of fuel, however, and with the demands for high efficiencies, and the maintaining of such efficiencies at high rates of steam output, it became necessary to develop this class of apparatus.

The ideal air heater is one that will give a maximum heat transfer rate, minimum draft loss, minimum leakage, occupy the least space and be most readily cleaned. The first two of these factors are intimately related. While the form of gas and air channels have a bearing on the transfer rate, such rate is primarily a function of gas and air velocities, and such velocities in turn govern the draft loss on both the gas and air sides. As in the case of economizers there is some velocity and corresponding transfer rate that cannot be exceeded because of excessive power required to produce the draft. The questions of space occupied, ability to clean and tightness, are features of mechanical design and vary in the preheaters of different manufacturers. Air heaters as now used in the United States may be classed under two types—tubular and plate. The regenerative design is a form of plate heater.

The question of maximum temperature of air for combustion advisable or allowable is intimately connected with that which furnace refractories or stoker or other fuel burning apparatus can withstand from the standpoint of upkeep costs—outage and replacements. The development in water-cooled furnaces has largely solved the problem of trouble with refractories resulting from high furnace temperatures, which in part, at least, are the result of the use of preheated air. Just what the limit of preheat that may safely be used with stokers has not as yet been definitely determined. Temperatures as high as 500° have been used with one type of stoker and no particular trouble reported. With another type and a particular grade of coal trouble was encountered with temperatures considerably lower than this, though such trouble was due to the action of the coal on the grates and not stoker maintenance. With pulverized coal the limit of air temperature, assuming a properly cooled furnace, would appear to be the limit of temperature under which the metal of the air heater would stand. This statement applies to the secondary air since the primary air temperature will be limited by the mills and the burners. Theoretically, the increase in overall efficiency due to the use of preheat should be higher than that represented by the gas temperature drop through the air heater. This results from the fact that the increased furnace temperatures and more rapid combustion resulting from the use of preheat will add to the efficiency represented by the temperature drop. Further, with stokers, the use of preheat has been shown to result in a reduction in the loss through unconsumed carbon in the ash.

The amount of air heater surface installed in terms of boiler heating surface has varied widely. Such amounts where economizers have been used, except in the case of steaming economizers, has ordinarily been from 80 to 120%. In one installation where no economizer was used and the air heater set directly next the boiler this percentage has been as high as 353%. In the case of the steaming economizer unit designs, the percentage of air heater surface to boiler and water-cooled furnace surface has been as high as 495%. (A. D. P.)

BOILING-POINT, the temperature, for any given liquid, at which the application of heat ceases to raise the temperature of the liquid and instead converts the liquid into its vapour. The boiling-point of water under normal pressure (barometric height, corrected for temperature and latitude, 760mm. mercury) is 100° C or 212° F. The effect of increasing the pressure is to raise the boiling-point; the presence of dissolved impurities also raises the boiling-point, but to a much less marked extent. (See VAPORIZATION.)

BOILING TO DEATH, a punishment once common both in England and on the Continent. The *Chronicles of the Grey Friars* (Camden Society, 1852) have an account of boiling for poisoning at Smithfield in the year 1522, the man being fastened to a chain and lowered into boiling water several times until he died. The preamble of the statute of Henry VIII. (which made poisoning treason) in 1531 recites that one Richard Roose (or Coke), a cook, by putting poison in some food intended for the household of the bishop of Rochester and for the poor of the parish of Lambeth, killed a man and woman. He was found guilty of treason and sentenced to be boiled to death without benefit of clergy. He was publicly boiled at Smithfield. In 1547 the act was repealed.

See W. Andrews, *Old Time Punishments* (Hull, 1890); *Notes and Queries*, vol. i. (1862), vol. ix. (1867); Du Cange (*s.v. Caldarii decoquere*).

BOISE, the capital and largest city of Idaho, United States, and the county seat of Ada county; in the south-west part of the state, 2,700ft. above sea-level and surrounded by peaks of the Boise range; on the Boise river, the Lincoln highway and the Oregon Short Line of the Union Pacific railway system. It has a municipal airport and air-mail service. The population was 5,957 in 1900; 21,393 in 1920, after several annexations of territory; and was estimated locally at 25,671 in 1927.

Boise is a local headquarters of the Federal Government as well as the administrative centre of the State, and is the trade centre for a large irrigated region, shipping chiefly wool, hides and fruit. There is a United States assay office and a land office, Federal courts (circuit and district), and a veterans' hospital, which occupies the former military post of Ft. Boise. The State school for the deaf and blind, the state soldiers' home and the state

VIEW OF THE STATE CAPITOL BUILDING AND GROUNDS AT BOISE

Boise, established in 1860 when the discovery of gold brought prospectors to the vicinity, steadily grew from a frontier town to State capital. To-day it is the chief trade and manufacturing centre of south-western Idaho

penitentiary are located here. The annual wholesale business of the city is estimated at \$16,000,000, and the bank clearings amount to \$63,000,000 a year. There are great quarries of fine sandstone near by, which have furnished material for the Capitol and other buildings. Hot water (175°) from artesian wells supplies heat for residences and public buildings and water for a swimming pool 60ft. by 25ft. in area and 3ft. to 16ft deep. A polo tournament is held annually. The Arrowrock dam, 22m. E., is 348.5ft. high (the highest in the world), with a capacity of 340,000,000 tons of water, and has a driveway across the crest.

Boise was founded in 1863, when Major Lugenbeel of the United States Army camped on what is now Government Island and began the construction of Camp Boise. It was incorporated in

1864. Between 1900 and 1910 it grew rapidly, following the extensive irrigation projects undertaken in southern Idaho.

BOISGOBEY, FORTUNÉ ABRAHAM DU (1824–1891), French writer of fiction, whose real surname was Castille, was born at Granville (Manche) on Sept. 11, 1824, and died Feb. 26, 1891. He served in the army pay department in Algeria from 1844 to 1848, and extended his travels to the East. Among the many famous police stories written by him are: *Les Mystères du nouveau Paris* (1876), *Le Demi-Monde sous la Terreur* (1877), *Les Nuits de Constantinople* (1882), *Le Cri du sang* (1885), *La Main froide* (1889).

BOISGUILBERT, PIERRE LE PESANT, SIEUR DE (1676–1714), French economist, was born at Rouen of an ancient noble family of Normandy, allied to that of Corneille. As judge at Montivilliers near Havre, and then as president of the *bailliage* of Rouen, he made a close study of local economic conditions. He was thus led to consider the misery of the people under the burden of taxation. In 1695 he published his principal work, *Le Détail de la France, la cause de la diminution de ses biens, et la facilité du remède*. . . . In it he drew a picture of the general ruin of all classes of Frenchmen caused by the bad economic régime. In opposition to Colbert's views he held that the wealth of a country consists not in the abundance of money which it possesses but in what it produces and exchanges. The remedy for the evils of the time was not so much the reduction as the equalization of the imposts, which would allow the poor to consume more, raise the production and add to the general wealth. In his *Factum de la France*, published in 1705 or 1706, he gave a more concise résumé of his ideas. But his proposal to substitute for all aides and customs duties a single capitation tax of a tenth of the revenue of all property was naturally opposed by the farmers of taxes and found little support. Upon the disgrace of Vauban, whose *Dime royale* had much in common with Boisguilbert's plan, Boisguilbert violently attacked the controller in a pamphlet, *Supplément au détail de la France*. The book was seized and condemned, and its author exiled for a time to Auvergne.

In 1712 appeared a *Testament politique de M. de Vauban*, which is simply Boisguilbert's *Détail de la France*. Vauban's *Dime royale* was formerly wrongly attributed to him. Boisguilbert's works were collected by Daure in the first volume of the *Collection des grands économistes*. His letters are in the *Correspondance des contrôleurs généraux*, vol. i., published by M. de Boishisle.

BOISROBERT, FRANÇOIS LE METEL DE (1592–1602), French poet, was born at Caen and died in Paris. He was introduced to Richelieu in 1623, and by his humour and his talent as a raconteur soon made himself indispensable to the cardinal. Boisrobert became one of the five poets who carried out Richelieu's dramatic ideas. It was Boisrobert who formally suggested the first plan of the Academy, and he was one of its earliest and most active members. He wrote a number of comedies, to one of which, *La Belle Plaideuse*, Molière's *L'Avare* is said to owe something.

BOISSARD, JEAN JACQUES (1528–1602), French antiquary and Latin poet, was born at Besançon. He studied at Louvain and, on leaving, went to Italy, where he remained for many years. He became interested in antiquities, and formed a large collection. He returned to France, but, not being allowed to profess publicly the Protestant religion, which he had embraced some time before, he withdrew to Metz, where he died on Oct. 30 1602.

His most important works are: *Poemata* (1574); *Emblemata* (1584); *Icones Virorum Illustrium* (1597); *Vitae et Icones Sultanorum Turcorum*, etc. (1597); *Theatrum Vitae Humanae* (1596); *Romanae Urbis Topographia* (1597–1602), now very rare; *De Divinatione et Magicis Praestigiis* (1605); *Habitus Variarum Orbis Gentium* (1581), ornamented with 70 illuminated figures.

BOISSIER, MARIE LOUIS ANTOINE GASTON (1823–1908), French classical scholar, was born at Nîmes on Aug. 15, 1823. After 10 years at Angoulême, Boissier was appointed professor at the Lycée Charlemagne in Paris, and in 1861 became professor of Latin oratory at the Collège de France. He was elected a member of the French Academy in 1875, and appointed perpetual secretary in 1895. He died in June 1908. His great theme was the reconstruction of Roman society.

See *Studies on Attius* (1857) and Varro (1861); *Cicéron et ses amis* (1865) (Eng. trans. by A. D. Jones, 1867); *La Religion Romaine d'Auguste aux Antonins* (1874); *L'Opposition sous les Césars* (1875); *Promenades archéologiques: Rome et Pompéi* (1880; second series, 1886); *L'Afrique romaine, promenades archéologiques* (1901); *La Fin du paganisme* (1891); *Le Conjurateur de Catilina* (1905); *Tarite* (1903, Eng. trans. by W. G. Hutchinson, 1906); *Madame de Sévigné* (1887); *Saint-Simon* (1892). See also P. Thoulouze, *Gaston Boissier* (1923).

BOISSONADE DE FONTARABIE, JEAN FRANÇOIS (1774–1857), French classical scholar, was born at Paris Aug. 12 1774. He was in the public service 1792–95, and was restored by Lucien Bonaparte, during whose time of office he served as secretary to the prefecture of the Upper Marne. He then devoted himself to the study of Greek. From 1800–28 he was professor of Greek at the faculty of letters at Paris. In 1828 he succeeded to the chair of Greek at the Collège de France. He was librarian of the Bibliothèque du Roi, and perpetual secretary of the Académie des Inscriptions. He died Sept. 8 1857.

He produced editions of many later Greek authors, of which the chief were: Philostratus, *Heroica* (1806) and *Epistolae* (1842); Marinus, *Vita procli* (1814); Tiberius Rhetor, *De Figuris* (1815); Nicetas Eugenianus, *Drosilla et Charicles* (1819); Herodian, *Partitiones* (1810); Aristaenetus, *Epistolae* (1822); Eunapius, *Vitae Sophistarum* (1822); Babrius, *Fables* (1844); Tzetzes, *Allegoriae Iliados* (1851); and a *Collection of Greek Poets*. The *Anecdota Graeca* (1829–33) and *Anecdota Nova* (1844) are important for Byzantine history and the Greek grammarians.

A selection of his papers was published by F. Colincamp, *Critique littéraire sous le premier Empire* (1863), vol. i. of which contains a complete list of his works, and a "Notice Historique sur Monsieur B.," by Naudet.

BOISSY D'ANGLAS, FRANÇOIS ANTOINE DE (1756–1826), French statesman, was born at Saint Jean la Chambre (Ardèche), Dec. 8, 1756, and died in Paris, Oct. 20, 1826. He was elected in 1789 by the third estate of the *sénéchaussée* of Annonay as deputy to the states-general. During the Legislative Assembly he was *procureur général syndic* for the directory of the department of Ardèche. Elected to the Convention in 1792 he sat in the centre, "*le Marais*," voting in the trial of Louis XVI. for his detention until deportation should be judged expedient for the state. During the Terror he supported Robespierre; but he was gained over by the members of the Mountain hostile to Robespierre, and his support, along with that of some other leaders of the *Marais*, made possible the ninth Thermidor. He was then elected a member of the Committee of Public Safety. He presented the report supporting the decree of the 3rd Ventose of the year III which established liberty of worship. In the critical days of Germinal and Prairial of the year III he showed great courage. On the first Prairial he presided over the Convention and remained unmoved by the insults and menaces of the insurgents. When the head of the deputy, Jean Féraud, was presented to him on the end of a pike, he saluted it impassively. He was reporter of the committee which drew up the constitution of the year III., and his report shows keen apprehension of a return of the Reign of Terror. His proposal (Aug. 27, 1795) to lessen the severity of the revolutionary laws, and the eulogies he received from several Paris sections suspected of disloyalty to the republic, resulted in his being obliged to justify himself (Oct. 15, 1795). As a member of the Council of the Five Hundred he became more and more suspected of royalism. He was proscribed on the 18th Fructidor, and lived in England until the Consulate. In 1801 he was made a member of the Tribunate, and in 1805 a senator. In 1814 he voted for Napoleon's abdication, which won for him a seat in the chamber of peers; but during the Hundred Days he served Napoleon, and in consequence on the second Restoration, was for a short while excluded. In the chamber he still sought to obtain liberty for the press—a theme upon which he published a volume of his speeches (Paris, 1817). He was a member of the institute from its foundation, and in 1816, at the reorganization, became a member of the Académie des Inscriptions et Belles-Lettres. He published in 1819–21 a two-volume *Essai sur la vie et les opinions de M. de Malesherbes*.

See F. A. Aulard, *Les Orateurs de la Révolution* (1906); L. Sciout, *Le Directoire* (1895); and the "Notice sur la vie et les oeuvres de M. Boissy d'Anglas" in the *Mémoires de l'Académie des Inscriptions*, ix.

BOÏTO, ARRIGO, Italian poet and composer, was born at Padua on Feb. 24, 1842, and died at Milan on June 10, 1918. While still very young he went to Milan and entered the Conservatoire, where he studied under Muzzaccato. Here he made friends also with Franco Faccio, who collaborated with him in writing a cantata, *The Fourth of June*, and a mystery, *The Sisters of Italy*, performed at the Conservatoire in 1861 and 1862. Imbued with the "advanced" tendencies of Wagner, Liszt and others, he fell much under the influence at Milan of Emilio Praga, a leading modernist of the day, alike in poetry and music. And here he projected and in due course achieved one of the most important and characteristic of his own productions in the shape of his *Mefistofele*, whose reception however by the public on its first production in 1868 was anything but favourable. Seven years later it was revived successfully at Bologna. Boïto treated the Faust legend in a spirit far more nearly akin to the conception of Goethe than is found in Gounod's "Faust," but, in spite of some attractive pages, his opera lacks cohesion and dramatic interest and suggests little real inspiration. Nor can much more be said for his only other opera, *Nero*, which having been withheld from the public by the fastidious composer for years and years was finally produced at Milan (six years after his death), in 1924. For here again the high aim and ambition of the composer are more apparent in his work than any really genuine and noteworthy creative power. Much happier were Boïto's achievements as a librettist in which capacity he takes rank second to none. Of unsurpassable excellence are the "books" of *Otello* and *Falstaff* with which he provided his friend Verdi, while those of Ponchielli's *La Gioconda* and Faccio's *Hamlet* were also from his pen. His fine translations of *Rienzi* and *Tristan* and his admirable original verse and other writings testify to the exceptional powers of his mind. Both Oxford and Cambridge universities gave Boïto the honorary degree of Doctor of Music.

BOK, EDWARD WILLIAM (1863—), American editor and author, was born at Helder, Holland, Oct. 9, 1863, and brought to the United States when six years old. Educated in the Brooklyn public schools, he became an office boy with the Western Union Telegraph Company. Continuing his education at a night school, he entered the employ of Henry Holt & Co., publishers, in 1882, and two years later became associated with Charles Scribner's Sons, publishers, eventually becoming advertising manager. He acted as editor of the *Brooklyn Magazine* from 1882 to 1884. In 1886 he founded the Bok Syndicate Press, the success of which led to the offer of the editorship of the *Ladies' Home Journal* in 1889; under his management this magazine became one of the most successful publications in America. After 30 years as editor he retired in 1919. A year later he published *The Americanization of Edward Bok*, which won the year's award of the Joseph Pulitzer prize for the best biography, and the gold medal of the Academy of Political and Social Science. In 1923 he created the American Peace award, providing \$100,000 for the best practicable plan by which the United States might co-operate with other nations to achieve and preserve the peace of the world, one-half to be paid upon the acceptance of the plan by a selected jury, and the balance upon its acceptance by the Senate. The plan submitted by Dr. C. A. Livermore, of the New York Peace Society, won the award.

In addition to his autobiography Mr. Bok published, among other works: *Successward* (1895), *The Young Man in Business* (1900), *Two Persons* (1922), *A Man from Maine* (1923), *Twice Thirty* (1925), *You, a Personal Message* (1926), and *Perhaps I Am* (1928).

BOKANOWSKI, MAURICE (1879–1928), French politician. After practising as an advocate in Paris he was elected a member of the Chamber of Deputies in 1919 for the department of the Seine. He quickly became recognized as an expert on economic and financial questions and was appointed president of the finance commission of the Chamber. In 1928 he became Minister for Commerce in the Poincaré cabinet, but was killed in an aeroplane accident in September of that year.

BOKENAM, OSBERN (1393?–1447?), English author, was born, by his own account on Oct. 6, 1393. Dr. Horstmann suggests that he may have been a native of Bokham, now Bookham, in Surrey, and derived his name from the place. In a concluding note to his *Lives of the Saints* he is described as "a Suffolke man, frere Austyn of Stoke Clare." He travelled in Italy on at least two occasions, and in 1445 was a pilgrim to Santiago de Compostela. He wrote a series of legends of holy maidens and women. These are written chiefly in seven- and eight-lined stanzas, and nine of them are preceded by prologues. Bokenam was a follower of Chaucer and Lydgate, and doubtless had in mind Chaucer's *Legend of Good Women*. His chief, but by no means his only, source was the *Legenda Aurea* of Jacobus de Voragine, archbishop of Genoa, whom he cites as "Januence." The first of the legends, *Vita Scae Margaretae, virginis et martiris*, was written for his friend, Thomas Burgh, a Cambridge monk; others are dedicated to pious ladies who desired the history of their name-saints. The Arundel ms. 327 (British Museum) is a unique copy of Bokenam's work; it was finished, according to the concluding note, in 1447, and presented by the scribe, Thomas Burgh, to a convent unnamed "that the nuns may remember him and his sister, Dame Betrice Burgh." The poems were edited (1835) for the Roxburghe Club with the title *Lyvys of Seyntys* . . . and by Dr. Carl Horstmann as *Osbern Bokenams Legenden* (Heilbronn, 1883), in E. Kolbing's *Altengl. Bibliothek*, vol. i.

BOKSBURG, a town in South Africa 15m east of Johannesburg. Pop. (1922) 12,416 whites, 25,563 coloured. It is the chief centre of the East Rand gold and coal mining. The collieries extend 11m. eastward from the town. The Boksburg park and lake, where boating and bathing facilities are provided, form one of the chief pleasure resorts of the eastern Witwatersrand.

BOLA, a Portuguese Guinea people related to the Bagnun, Balante, Mandjak and Papel, between the Cacheu and Geba rivers and on the island of Bolama.

See Dr. Maclaud, "Distribution des races sur la côte occidentale de l'Afrique." *Bulletin Géogr. Hist. descript* (1906).

BOLAN PASS, an important pass on the Baluch frontier, connecting Jacobabad and Sibi with Quetta, important in the recent history of Afghanistan. By the treaty of Gandamak (1879), the Bolan route was brought directly under British control, and it was selected for the first alignment of the Sind-Pishin railway from the plains to the plateau. From Sibi the line runs west skirting the hills to Rindli, and originally followed the course of the Bolan stream. Destructive floods, however, led to its abandonment, and the railway now follows the Mashkaf valley (which debouches into the plains close to Sibi), to a junction with the Bolan at Mach. The Harnai valley to the north-east of Sibi provides another route to Quetta which, although longer, is used for ordinary traffic, the Bolan loop being reserved for emergencies. The passage between the limestone rocks is in places extremely narrow, and the pass is subject to extremes of temperature, the ice-cold wind rushing down in winter often being destructive to life.

BOLAS (plural of Span. *bola*, ball), a South American Indian weapon of war and the chase, consisting of balls of stone attached to the ends of a rope of twisted or braided hide or hemp. Charles Darwin thus describes them in his *Voyage of the Beagle*: "The *bolas*, or balls, are of two kinds: the simplest, which is used chiefly for catching ostriches [rheas], consists of two round stones, covered with leather, and united by a thin, plaited thong, about 8ft. long. The other kind differs only in having three balls united by thongs to a common centre. The Gaucho (native of Spanish descent) holds the smallest of the three in his hand, and whirls the other two around his head; then, taking aim, sends them like chain shot revolving through the air. The balls no sooner strike any object, than, winding round it, they cross each other and become firmly hitched."

BOLBEC, town, France, department of Seine-Inférieure, on the Bolbec, 19m. E.N.E. of Havre by rail, at the junction of four small valleys. Pop. (1926) 9,794. The town was enthusiastically Protestant in the 16th century and still has a number of Protestants. It was burned almost to the ground in 1765. Bolbec is

important for its cotton spinning, weaving, dyeing and printing, and for the manufacture of sugar.

BOLCKOW, VAUGHAN & CO. LTD. This British steel company is associated with one of the most important inventions in the iron and steel industry, the "Thomas-Gilchrist" process, which was invented as recently as 1879. This process enables steel to be made from the phosphoric ores which form by far the greater part of the world's supplies of iron ore. The phosphoric slag from this process gave to agriculture the valuable fertilizer known as basic slag.

The firm was founded in 1841 by H. W. F. Bolckow, who was born in Sulten, Mecklenburg, in 1806 and came to Great Britain in 1827, and John Vaughan, who had had experience in the iron works at Dowlais. They chose the site for their engineering works at Middlesbrough under the advice of John Harris, engineer to the Stockton and Darlington Railway, and became builders and ultimately owners of blast furnaces. In 1843 the first steamboat built at Stockton, "The English Rose," was engined by Bolckow and Vaughan. In 1846 the firm erected four blast furnaces at Witton Park, and by 1864 the firm owned ironstone mines in Cleveland, four collieries in Durham (and it is interesting to record that coal was then being raised from one of the collieries at a cost of only 3s. 4d. per ton), 17 blast furnaces at Cleveland, Middlesbrough and elsewhere, plate mills and bar iron works at Witton Park and Middlesbrough, and foundries at Cleveland and Middlesbrough.

It was in 1864 that a public issue of shares was made and the company formed. The first Directors were H. W. F. Bolckow, John Vaughan, Benjamin Whitworth and H. D. Pochin; the only connecting link in 1928 on the Board was the Hon. H. D. McLaren, a grandson of the last named. The circular of the solicitors to the promoters stated that "the production of iron during the year 1863 from 16 blast furnaces amounted to 180,000 tons of pigs. From the rolling mills about 40 tons of bar, plate, sheet iron and hoops and 38,000 tons of rails, and from the foundries about 20,000 tons of castings."

In the following years various other properties were acquired, and in 1871 the company obtained a licence from Henry Bessemer and Robert Longsdon to work under the Bessemer patents. The growing demand for steel was the reason for this purchase. It had already been decided to move the works at Witton Park to the south bank of the Tees, where the new blast furnaces were smelting the ironstone from the Cleveland hills. Steelworks were to be erected at Eston (where the works still stood in 1928), and the works at Gorton, near Manchester, were acquired to fulfil orders for steel pending the completion of the new works, where steel was produced by the acid Bessemer process, for which a pig-iron free from phosphorus was required. Iron ore properties in Spain were acquired in 1872. By 1877 the market for iron rails had disappeared and the company was making a thousand tons of steel rails a week. In 1876 the Gorton Works were sold to the Standard Iron and Steel Company, in which John Bright and other eminent men were interested, and were later acquired by Beyer Peacock and Co., Limited.

In 1878 Windsor Richards, then general manager, met Sydney Gilchrist Thomas on a visit of the Iron and Steel Institute to the Creusot Works, and experimental work was undertaken at Eston on the famous Thomas-Gilchrist process. These experiments were successful, and by 1880 four 15-ton Bessemer converters were making steel from the phosphoric Cleveland pig-iron, with an output of 3,500 tons per week. In 1884 the company began to make steel plates and adopted the Siemens open hearth acid process in 1886. In 1899 the basic open hearth furnace began to supersede the basic Bessemer converter. In 1900 the blast furnace gases were used to fire boilers, the steam going partly to mixed pressure turbines and partly to the large mill engines, whose exhaust was also utilized to drive the turbines. By this method power was generated to blow the furnaces and drive lighting and auxiliary plant and a surplus was left for pumping and traction purposes. In 1922, to find further outlets for steel, the constructional firm of Redpath Brown & Co., Ltd., was acquired.

In 1887 the number of men employed was 13,000 with a wages bill of £820,000, and in 1927 11,500 men were employed, excluding employees of subsidiary companies, and were paid £1,618,000 in wages. In 1928 the properties and plant of the company consisted of 15 open hearth furnaces, 16 blast furnaces, rail, plate and section mills, sleeper and soleplate plants, collieries, coke oven and by-product plants, ironstone mines, limestone quarries, and mines in Spain. (L. C. M.)

BOLE, an aluminous or ferruginous clay, allied to bauxite and laterite (*qq.v.*). It occurs as partings between successive ancient lava flows, as for example in Antrim, Ireland, the west of Scotland and in the Deccan, India, probably representing the soils formed by weathering during intervals between eruptions.

In the sense of stem or trunk of a tree "bole" is from the O. Norwegian *bolr*, *cf.* German *Bohle*, a plank. It is probably connected with a large number of words, such as "boll," "ball," "bowl" denoting a round object.

BOLERO, a lively Spanish dance, in 3-4 time with a strongly marked rhythm of which, however, the precise nature is often varied; also the music to which it is danced and other compositions cast in the same form. As danced in Spain the bolero is usually accompanied by the castanets and sometimes also by singing. In classical music the best known example is that of Chopin for pianoforte solo (op. 19). The term is also applied by ladies' dressmakers to a short sleeveless coat similar to those worn by the Spanish peasantry.

BOLESLAV I., called "Chrobry" (the Mighty), king of Poland (reigned 992-1025), was the son of Mieszko, first Christian prince of Poland, and the Bohemian princess Dobrawa, or Bona, whose chaplain, Jordan, converted the court from paganism to Catholicism. He succeeded his father in 992. A born warrior, he raised the little struggling Polish principality on the Vistula to the rank of a great power. In 996 he gained a seaboard by seizing Pomerania, and then took advantage of the troubles in Bohemia to occupy Cracow, previously a Czech city. At Gnesen Boleslav in the year 1000 entertained Otto III. so magnificently that the emperor is said to have given him the title of king, though 25 years later, in the last year of his life, Boleslav thought it necessary to crown himself king a second time. He still remained a vassal of the empire, but ecclesiastically Poland was independent when Gnesen became a metropolitan see by the favour of Pope Sylvester II. On the death of Otto, Boleslav invaded Germany, penetrated to the Elbe, occupying Stralsund and Meissen on his way, and extended his dominions to the Elster and the Saale. Henry II, however, at the diet of Merseburg, declined the money offered by Boleslav for the retention of Meissen, and from that time Boleslav was the enemy of the German king. He seized the opportunity of a revolt in Bohemia to intervene there to re-establish his cousin Boleslav the Red as duke, then enticed him to Poland, caused him to be blinded, and got the Bohemians to accept himself as duke. He found allies against Henry in Germany itself, and then, in 1004, attacked Bavaria, but without much success. His German allies sought Henry's pardon. On Henry's return from his Italian expedition he marched against Boleslav, who was expelled from Prague and made peace in 1005. A third Polish war ended in 1018 by the peace of Bautzen, greatly to the advantage of Boleslav, who retained Lusatia. He then turned his arms against Jaroslav, grand duke of Kiev, whom he routed on the banks of the Bug, then the boundary between Russia and Poland. At his death in 1025 he left Poland one of the mightiest states of Europe, extending from the Bug to the Elbe, and from the Baltic to the Danube, and possessing besides the overlordship of Russia.

See J. N. Pawlovski, *St. Adalbert* (Danzig, 1860); *Chronica Nestoris* (Vienna, 1860); Heinrich R. von Zeissberg, *Die Kriege Kaiser Heinrichs II. mit Herzog Boleslaw I.* (1868).

BOLESLAV II., called "Smially" (The Bold), king of Poland (1039-1081), eldest son of Casimir I., succeeded his father in 1058. Poland had shrunk territorially since the age of his grandfather Boleslav I., and Boleslav II. sought to restore her dignity and importance. Boleslav's first Bohemian war proved unsuccessful, and was terminated by the marriage of his sister

Swatawa with the Czech king Wratislav II. On the other hand Boleslav's ally, the fugitive Magyar prince Bela, succeeded with Polish assistance in winning the crown of Hungary. In the east Boleslav was more successful. In 1069 he succeeded in placing Izaslav on the throne of Kiev, obtaining, in return, Ruthenia, or "Red Russia." He proceeded then to attack his other enemies, including Bohemia, but its ruler, Wratislav, speedily appealed to the emperor for help, and a war between Poland and the Empire was prevented only by the sudden rupture of Henry IV. with the Holy See and the momentous events which led to the humiliating surrender of the emperor at Canossa. There is nothing to show that Boleslav took any part in this struggle, though at this time he was on the best of terms with Gregory VII. On Dec. 26, 1076 Boleslav was crowned by the papal legates, a striking proof that the Polish kings did not even yet consider their title quite secure. A second successful expedition to Kiev to reinstate his *protégé* Izaslav, is Boleslav's last recorded exploit. The nobles formed a conspiracy against him, which was joined by Stanislaw, bishop of Cracow, and leader of the clerical party which was strong in Poland. Boleslav, in revenge, had the bishop murdered while he was saying mass in his cathedral. Pope Gregory VII. excommunicated Boleslav, and in 1079 he and his sons were forced to flee to Hungary, where the king died in obscurity, probably in 1081.

See Maksymilian Gumpłowicz, *Zur Geschichte Polens im Mittelalter* (Innsbruck, 1898), W. P. Augerstein, *Der Konflikt des polnischen Königs Boleslaw II. mit dem Bischof Stanislaw* (Thorn, 1895).

BOLESLAV III., called "the Wry-mouthed," king of Poland (1086–1139), the son of Wladislaw I. and Judith of Bohemia, succeeded his father in 1102. His earlier years were troubled continually by the intrigues of his natural half-brother Zbigniew, who, till he was imprisoned and blinded, involved Boleslav in frequent contests with Bohemia and the emperor Henry V. The first of the German wars began in 1100, when Henry, materially assisted by the Bohemians, invaded Silesia. The Poles avoided an encounter in the open field, but harried the Germans so successfully around Breslau that the plain was covered with corpses. The chief political result of this great disaster was the complete independence of Poland for the next quarter of a century. It was during this respite that Boleslav devoted himself to the main business of his life—the subjugation of Pomerania (*i.e.*, the maritime province) with the view of gaining access to the sea. The struggle began in 1100, when Boleslav inflicted a terrible defeat on the Pomeranians at Nackel which compelled their temporary submission. In 1120–24 the rebellion of his vassal Prince Warceslav of Stettin again brought Boleslav into the country, but the resistance was as stout as ever, and only after 18,000 of his followers had fallen and 8,000 more had been expatriated did Warceslav submit to his conqueror. The obstinacy of the resistance convinced Boleslav that Pomerania must be Christianized before it could be completely subdued; and this important work was partially accomplished by St. Otto, bishop of Bamberg, an old friend of Boleslav's father, who knew the Slavonic languages. In his later years Boleslav waged an unsuccessful war with Hungary and Bohemia. He died in 1139, leaving four sons, between whom the kingdom was to be divided, the eldest son having overlordship of the whole.

See Gallus, *Chronicon*, ed. Finkal (Cracow, 1899); Maksymilian Gumpłowicz, *Zur Geschichte Polens im Mittelalter* (Innsbruck, 1898).

BOLETUS, a well-marked genus of fungi (order Polyporeae, family Basidiomycetes); characterized by the central stem, the cap or pileus, the soft, fleshy tissue, and the vertical, closely-packed tubes or pores which cover the under surface of the pileus and are easily detachable. The species all grow on the ground, in woods or under trees in the early autumn. They are brown, red or yellow in colour; the pores also vary in colour from pure white to brown, red, yellow or green, and are from one or two lines to nearly an inch long. A few are poisonous; several are good for eating. One of the greatest favourites for the table is *Boletus edulis*, recognized by its brown cap and white pores which become green when old. It is the *ceps* of the continental European markets. There are about 60 British species of *Boletus*.

BOLEYN (or BULLEN), ANNE (c. 1507–1536), queen of Henry VIII. of England, daughter of Sir Thomas Boleyn, afterwards earl of Wiltshire and Ormonde, and of Elizabeth, daughter of Thomas Howard, earl of Surrey, afterwards duke of Norfolk, was born, according to Camden, in 1507, but an earlier date (1502 or 1501) is given by some later writers. She visited France with her father about 1519, and was attached to the service of Queen Claude for a short time. She returned in 1521 or 1522 to England. Among her admirers was the poet Sir Thomas Wyatt, and among her definite suitors was Henry Percy, heir of the earl of Northumberland. A series of grants and favours bestowed by Henry on her father between 1522 and 1525 have been regarded, with little justification, as a symptom of the king's affections. Anne, however, had no intention of being the king's mistress; she meant to be his queen. There is no absolute proof that Henry's passion was anterior to the proceedings taken for the divorce in May 1527, the celebrated love letters being undated. After the king's final separation from his wife in July 1531, Anne accompanied Henry on the visit to Francis I. in 1532, while Catherine was left at home neglected and practically a prisoner. Henry married her about Jan. 25, 1533 (the exact date is unknown), their union not being made public till the following Easter. Subsequently, on May 28, their marriage was declared valid and that with Catherine null, and in June Anne was crowned at Westminster Hall.

A weak, giddy woman of no stability of character, her success turned her head and caused her to behave with insolence and impropriety, in strong contrast with Catherine's quiet dignity under her misfortunes. She, and not the king, probably was the author of the petty persecutions inflicted upon Catherine and upon the princess Mary, and her jealousy of the latter showed itself in spiteful malice. She incurred the remonstrances of the privy council and alienated her own friends and relations. But there were soon signs that Henry's affection, which had before been a genuine passion, had cooled or ceased. He resented her arrogance, and a few months after the marriage he gave her cause for jealousy, and disputes arose. Fate had prepared for Anne the same domestic griefs that had ruined Catherine. In Sept. 1533 the birth of a daughter, afterwards Queen Elizabeth, instead of the long-hoped-for son, was a heavy disappointment; next year there was a miscarriage, and on Jan. 29, 1536, the day of Catherine's funeral, she gave birth to a dead male child.

On May 1 it became known that several of Anne's reputed lovers had been arrested. On the 2nd Anne herself was committed to the Tower on a charge of adultery with various persons, including her own brother, Lord Rochford. On the 12th Sir Francis Weston, Henry Norris, William Brereton, and Mark Smeaton were declared guilty of high treason, while Anne herself and Lord Rochford were condemned unanimously by an assembly of 26 peers on the 15th. Her uncle, the duke of Norfolk, presided as lord steward, and gave sentence, weeping, that his niece was to be burned or beheaded as pleased the king. Her former lover, the earl of Northumberland, left the court, seized with sudden illness. Her father had declared his conviction of his daughter's guilt at the trial of her reputed lovers. On the 16th Anne informed Cranmer of a certain supposed impediment to her marriage with the king—according to some accounts a previous marriage with Northumberland, though the latter solemnly and positively denied it—which was never disclosed, but was pronounced, on the 17th, sufficient to invalidate her marriage. The same day all her reputed lovers were executed, and on the 19th she herself suffered death on Tower Green, her head being struck off with a sword by the executioner of Calais brought to England for the purpose. She had regarded the prospect of death with courage and almost with levity, laughing heartily as she put her hands about her "little neck" and recalled the skill of the executioner. "I have seen many men" (wrote Sir William Kingston, governor of the Tower) "and also women executed, and all they have been in great sorrow, and to my knowledge this lady has much joy and pleasure in death." On the following day Henry was betrothed to Jane Seymour.

Anne Boleyn's guilt remains unproved. To Sir William King-

ston she protested her entire innocence, and on the scaffold, while expressing her submission, she made no confession. A principal witness for the charge of incest was Rochford's own wife, a woman of infamous character, afterwards executed for complicity in the intrigues of Catherine Howard. The discovery of Anne's misdeeds coincided in an extraordinary manner with Henry's disappointment in not obtaining by her a male heir, while the king's despotic power and the universal unpopularity of Anne both tended to hinder the administration of pure justice. But it is almost incredible that two grand juries, a petty jury, and a tribunal consisting of nearly all the lay peers of England, with the evidence before them which we do not now possess, should have all unanimously passed a sentence of guilt contrary to the facts and their convictions, and that such a sentence should have been supported by Anne's own father and uncle. Anne is described as "not one of the handsomest women in the world; she is of a middling stature, swarthy complexion, long neck, wide mouth, bosom not much raised, and in fact has nothing but the English king's great appetite, and her eyes which are black and beautiful, and take great effect."

BOLGARI or BOLGARY, an area in the Autonomous Tatar S.S.R. south of Kazan, 4m from the left bank of the Volga, 55° 3' N., 48° 5' E. It consists of the ruins of the supposed ancient capital of the Bulgarians from the 5th to the 15th centuries, with walls, towers and numerous kurgans or burial mounds which have Arabic (1222–1341), Armenian (557, 984 and 986) and also Turki inscriptions. The tombs contained weapons, implements, utensils and silver and copper coins, bearing inscriptions, some in Arabic and others in Kufic (a kind of epigraph Arabic). Antiquities from Bolgari are preserved in museums in Kazan, Moscow and Leningrad. The city was destroyed by the Mongols in 1238 and again by Tamerlane in the 14th century; afterwards it became the capital of the Khans of the Mongol Golden Horde. In the 15th century it became part of the Kazan principality. The ruins were discovered in the time of Peter the Great and described by Pallas and Humboldt. Ibn Haukal (the Arab geographer) states that it had 10,000 inhabitants in his time (end of the 10th century).

See Ibn Fadhlān, *Nachrichten über die Wolga Bulgaren* (Ger. trans. by Frähn, St. Petersburg, 1832).

BOLI, the chief town of a vilayet of the same name in Asia Minor, altitude 2,500ft., situated in a rich plain watered by the Boli Su, a tributary of the Filiyas Chai (*Billaus*). Pop. (1927) 56,133. Cotton and leather are manufactured; the country around is fertile, and in the neighbourhood are large forests of oak, beech, elm, chestnut and pine, the timber of which is partly used locally and partly exported to Constantinople. Three miles east of Boli, at Eskihissar, are the ruins of Bithynium, the birthplace of Antinous, also called Antinoopolis, and in Byzantine times Claudio-

polis. In and around Boli are numerous marbles with Greek inscriptions, chiefly sepulchral, and architectural fragments. At Ilija, south of the town, are warm springs much prized for their medicinal properties.

BOLINGBROKE, HENRY ST. JOHN (1678–1751), English statesman and writer, son of Sir Henry St. John, Bart. (afterwards 1st Viscount St. John) and of Mary Rich, daughter of the 2nd earl of Warwick, was educated at Eton, and travelled abroad in 1698 and 1699. In 1700 he married Frances Winchcombe. Notorious in youth for his dissipation and extravagance, he desired, according to his friend Swift, to be thought the Alcibiades or Petronius of his age. When he entered Parliament in 1701 he declared himself a Tory, attached himself to Harley (afterwards Lord Oxford), then speaker, and soon gained an extraordinary ascendancy over the House of Commons. In May he had charge of the bill for securing the Protestant succession; he took part in the impeachment of the Whig lords for their conduct concerning the Partition treaties, and opposed the oath abjuring the Pretender. In March 1702 he was chosen commissioner for taking the public accounts. After Anne's accession he supported the bills in 1702 and 1704 against occasional conformity, and took a leading part in the disputes which arose between the two houses. In 1704 St. John took office with Harley as secretary at war, thus being brought into intimate relations with Marlborough, by whom he was treated with paternal partiality. In 1708 he quitted office with Harley on the failure of the latter's intrigue, and retired to the country till 1710, when he became a privy councillor and secretary of state in Harley's new ministry. The first business of the new Tory ministry was to make peace with France. In 1711 St. John began negotiating with Torcy, the French foreign minister, in secret, for a separate peace, and military pressure was slackened in the Netherlands. Marlborough was dismissed in Dec. 1711, and in June 1712 the duke of Ormonde, who had succeeded him in command, was ordered to withdraw the English troops from the field, leaving the Dutch and Austrians to be defeated at Denain. In August St. John, who had been created Viscount Bolingbroke, went to France, to conduct negotiations, and on March 31, 1713, the treaty of Utrecht was signed by all the allies except the emperor.

From the moment he came into office, realizing that the only hope of the survival of the Tory party after Anne's death lay in its putting the old Pretender, James III., on the English throne, St. John had set to work to bring about the repeal of the Act of Settlement by which the succession passed to Sophia, electress of Hanover, and her descendants. In 1710 Anne was persuaded to create 12 new Tory peers; the Whig influence of the dissenters in Parliament was undermined by the Act of Occasional Conformity; and Bolingbroke made an unsuccessful attempt to propitiate the Whig merchant interest by negotiating, at the Treaty of Utrecht, for commercial concessions from France and Spain. By 1712 he was corresponding with James, though he was never able to persuade him to become Protestant—a necessary step before the Tories would turn Jacobite. Meanwhile the friendship between Bolingbroke and Harley had been gradually dissolved; the former had been disappointed, in July 1711, at receiving only his viscountcy instead of the earldom lately extinct in his family, whereas Harley had been made earl of Oxford and lord treasurer. In May; Lady Masham quarrelled with Oxford, and identified herself with Bolingbroke's interests in 1714, and the latter gradually superseded Oxford in the leadership of the party. Finally there was a split in the cabinet on July 27, and Oxford was forced to resign. Bolingbroke now thought his triumph had come, and that it was time to press for the repeal of the Act of Settlement. All important military and civil posts were placed in the hands of Tories, and a new ministry was projected. But on July 28 Anne was taken ill, and on Aug. 1 she died. The Act of Settlement had not been repealed, the Tory plans were confused, and the privy council, in which Bolingbroke had never troubled to procure a Tory majority, met and proclaimed George king.

On the accession of George I. the illuminations and bonfire at Lord Bolingbroke's house in Golden square were "particularly fine and remarkable," but he was immediately dismissed from

office. He retired to Bucklebury, and is said to have now written the answer to the *Secret History of the White Staff* accusing him of Jacobitism. In March 1715 he in vain attempted to defend the late ministry in the new parliament; and on the announcement of Walpole's intended attack upon the authors of the Treaty of Utrecht he fled in disguise (March 28, 1715) to Paris, where he was well received, after having addressed a letter to Lord Lansdowne from Dover protesting his innocence and challenging "the most inveterate of his enemies to produce any instance of his criminal correspondence." Bolingbroke in July entirely identified himself with the interest of the Pretender, whose secretary he became, and on Sept. 10 he was attainted. But his counsel was neglected for that of ignorant refugees and Irish priests. The expedition of 1715 was resolved upon against his advice. He drew up James's declaration, but the assurances he had inserted concerning the security of the Church of England were cancelled by the priests. He remained at Paris, and endeavoured to establish relations with the regent. On the return of James, as the result of petty intrigues and jealousies, Bolingbroke was dismissed from his office.

In March 1716 he declared his final abandonment of the Pretender and promised to use his influence to secure the withdrawal of his friends; but he refused to betray individuals. In 1717 Bolingbroke formed a liaison with Marie Claire Deschamps de Marcilly, widow of the marquis de Villette, whom he married in 1720 after the death in 1718, of Lady Bolingbroke, whom he had treated with cruel neglect. He bought and resided at the estate of La Source, near Orleans, studied philosophy, criticized the chronology of the Bible, and was visited amongst others by Voltaire, who expressed unbounded admiration for his learning and politeness. In 1723, through the medium of the king's mistress, the duchess of Kendal, he at last received his pardon, returned to London in June or July, and placed his services at the disposal of Walpole, by whom, however, his offers to procure the accession of several Tories to the administration were received very coldly. During the following winter he made himself useful in France in gaining information for the Government. In 1725 an act was passed enabling him to hold real estate, but without power of alienating it. But Walpole succeeded in maintaining his exclusion from the House of Lords. He now bought an estate at Dawley, near Uxbridge, where he renewed his intimacy with Pope, Swift and Voltaire, took part in Pope's literary squabbles, and wrote the philosophy for the *Essay on Man*. On the first occasion which offered itself, that of Pulteney's rupture with Walpole in 1726, he tried to organize an opposition in conjunction with Pulteney and Windham; and in 1727 began his celebrated series of letters to the *Craftsman*, attacking the Walpoles, signed an "Occasional Writer." He won over the duchess of Kendal with a bribe of £11,000 from his wife's estates, and with Walpole's approval obtained an audience with George. His success seemed imminent, and Walpole prepared for dismissal. But by the king's death in June Bolingbroke's projects and hopes were ruined once more. Further papers from his pen signed "John Trot" appeared in the *Craftsman* in 1728, and in 1730 followed *Remarks on the History of England by Humphrey Oldcastle*, attacking the Walpoles' policy. The assault on the Government prompted by Bolingbroke was continued in the House of Commons by Windham, and great efforts were made to establish the alliance between the Tories and the Opposition Whigs. But the whole movement collapsed after the new elections, which returned Walpole to power in 1735 with a large majority.

Baffled and disappointed, Bolingbroke retired to France in June, residing principally at the château of Argeville, near Fontainebleau. He now wrote his *Letters on the Study of History* (printed privately before his death and published in 1752) and the *True Use of Retirement*. In 1738 he visited England, became one of the leading friends and advisers of Frederick, prince of Wales, who now headed the opposition, and although he was excluded from Parliament, was the real chief of the party of Patriots. He exercised great influence over the education of Prince George, afterwards George III, who was brought up on his *Patriot King*. This work, together with a previous essay, *The Spirit of Patriot-*

ism, and *The State of Parties at the Accession of George I.*, was entrusted to Pope and not published. Bolingbroke returned to France in 1739, and subsequently sold Dawley. In 1742 and 1743 he again visited England and quarrelled with Warburton. In 1744 he settled finally at Battersea with his friend, Hugh Hume, 3rd earl of Marchmont, and was present at Pope's death in May. The discovery that the poet had printed secretly 1,500 copies of *The Patriot King* caused him to publish a correct version in 1749, and stirred up a further altercation with Warburton, who defended his friend against Bolingbroke's bitter aspersions, the latter, whose conduct was generally reprehended, publishing a *Familiar Epistle to the most Impudent Man Living*. In 1744 he had been very busy assisting in the negotiations for the establishment of the new "broad bottom" administration, and showed no sympathy for the Jacobite expedition in 1745. About 1749 he wrote the *Present State of the Nation*, an unfinished pamphlet. He died on Dec. 12, 1751.

The writings and career of Bolingbroke make a far weaker impression upon posterity than they made on contemporaries. His genius and character were superficial. Burke wrote his *Vindication of Natural Society* in imitation of Bolingbroke's style, but in refutation of his principles; and in the *Reflections on the French Revolution* he exclaims, "Who now reads Bolingbroke, who ever read him through?" His most brilliant gift was his eloquence, which, according to Swift, was acknowledged by men of all factions to be unrivalled. None of his great orations has survived, a loss regretted by Pitt more than that of the missing books of Livy and Tacitus. His political works, in which the expression is often splendidly eloquent, spirited and dignified, are for the most part exceedingly rhetorical in style.

BIBLIOGRAPHY.—Bolingbroke's collected works, including his chief political writings already mentioned and his philosophical essays *Concerning the Nature, Extent and Reality of Human Knowledge, On the Folly and Presumption of Philosophers, On the Rise and Progress of Monotheism and On Authority in Matters of Religion*, were first published in Mallet's faulty edition in 1754 (according to Johnson's well-known denunciation, "the blunderbuss charged against religion and morality"), and subsequently in 1778, 1809 and 1841. *A Collection of Political Tracts* by Bolingbroke was published in 1748. His *Letters* were published by G. Parke in 1798, and by Grimoard, *Lettres historiques, politiques, philosophiques*, etc., in 1808; for others see Pope's and Swift's *Correspondence*; W. Coxe's *Walpole*; Phillimore's *Life of Lyttelton*; *Hardwicke Papers*, vol. ii.; *Marchmont Papers*, ed. by Sir G. H. Rose (1831); "Letters to Lord Chancellor Hardwicke" in *Add. mss. Brit. Museum* (see Index, 1894-99), mostly transcribed by W. Sichel; *Hist. mss. Comm.*, mss. of Marquis of Bath, Duke of Portland at Welbeck; while a further collection of his letters relating to the Treaty of Utrecht is in the British Museum. For his attempts at verse see Walpole's *Royal and Noble Authors* (1806), iv. 200 *et seq.* See also bibliography of his works in Sichel, ii. 456, 249.

A life of Bolingbroke appeared in his lifetime, 1740, entitled *Authentic Memoirs* (in the Grenville Library, Brit. Mus.), which recounted his escapades; other contemporary accounts were published in 1752 and 1754, and a life by Goldsmith in 1770. The standard biography of Bolingbroke is that by Walter Sichel (1901-02).

BOLIVAR, SIMON (1783-1830), soldier and statesman, leader of the revolutions which resulted in the independence from Spain of what are now Venezuela, Colombia, Ecuador, Panama, Peru and Bolivia, was born in Caracas, Venezuela, on July 24, 1783, and died, at the age of 47, near Santa Marta, in the republic of Colombia. Officially invested with the title of *Libertador* by the congresses of all of the above countries, founder of Greater Colombia, which he created out of the revolted colonies, hero of over 200 bloody battles, dictator president of the nation whose name (Bolivia) was adopted during his lifetime, Bolivar's life presents one of history's most colossal personal canvases of adventure and tragedy, glory and defeat. His activities covered an immense area of untracked wilderness, whose mere crossing with his armies entailed problems that would give pause to the ablest modern general with every facility at his command. Bolivar's written records, in his various addresses, proclamations and letters present the clearest picture of the conditions of the Spanish colonies at the time of the revolution that are to be found in any historical record; his analyses of the conditions of the colonials and of their political needs and destiny mark him as the wisest of the observers of his time, and a prophet who foresaw with rare precision the trend of the struggle for democracy in every political

unit of the old Spanish empire in America. His plans of government were far in advance of his time and to this day offer some of the clearest solutions of the needs and difficulties of government in the countries he freed. While violently criticized both during his life and since his death, Bolivar is recognized as one of the world geniuses of the revolutionary era of the late 18th and early 19th centuries; although perhaps not a military commander of the first order, his political acumen decided the time and manner of the

FOUNTAIN IN THE PATIO OF THE HOME AT CARACAS WHERE SIMON BOLIVAR, SOUTH AMERICAN LIBERATOR, WAS BORN, 1783

attacks which other military leaders of the revolutions in northern South America carried through to ultimate success. His use of the limited facilities in officers, men and materials which were available to him in the thinly populated wilderness of northern South America make his achievements, both in war and statecraft, the marvel of those who read his history.

Bolivar was born to aristocracy and wealth, on July 24, 1783, in Caracas, Venezuela, his father being Juan Vicente Bolivar y Ponte, and his mother Maria de la Concepcion Palacios y Blanco. His father, who was of the nobility of Spain and owner of large tracts of land and many slaves in Venezuela, died when Simon Bolivar was very young; his mother died when he was 15. His uncle and guardian, Carlos Palacios, then sent him to study in Madrid, Spain, where, in 1801, he was married to Maria Teresa Toro, niece of the marquis of Toro, a resident of Caracas and a friend of the Bolivar family. Ten months after their return to Venezuela his wife died of yellow fever, in Jan. 1803.

After her death Bolivar returned again to Europe, where, in 1805, on Mount Aventin at Rome, he pledged himself to his old friend and tutor, Simon Rodriguez, to devote his life to the freeing of Venezuela from Spain. He returned to Venezuela by way of the United States, visiting the eastern cities and meeting many Americans. He arrived in Caracas at the end of 1806. The Venezuelan revolution against Spain, like many of the revolutions in the Spanish colonies, had its genesis in the bitter quarrel between King Charles IV. and his son, Ferdinand VII., out of which Napoleon profited so largely. Bolivar and friends of his social group were the members of the Caracas junta favouring the restoration of Ferdinand after the crowning of Joseph Bonaparte as King of Spain. This junta, on April 19, 1810, forced the captain general, Vicente Emparan, to abdicate and thereupon formed the first locally chosen government in Spanish America.

Bolivar was sent to England as the diplomatic representative of the new Government. On his return he brought with him Francisco Miranda, the Venezuelan soldier of fortune who had fought under Washington and in the campaigns of Napoleon, and who held the rank of general in the emperor's armies. Miranda took an active part in the early campaigns of the Venezuelan revolution, while Bolivar entered at once into the political arena, and in one of his earliest recorded addresses advocated the change in objective which resulted in the declaration of Venezuelan independence (July 5, 1811). The adoption of a federal (or decentralized) type of republic, although opposed by Bolivar, took place within a few

months, and the name of Colombia was chosen for the federation of freed colonies that was yet to be.

The Liberator.—Bolivar, in 1811, became a refugee on the island of Curaçao, meeting many of his helpers of later years. From Curaçao he went to Cartagena, in Nueva Granada (now Colombia), where he joined the revolutionary group of that viceroyalty, and published (Dec. 15, 1812), the first of the remarkable documents which are now the classics of the revolutionary literature of Spanish America. He urged upon the revolutionary bodies of Nueva Granada the necessity of destroying the power of Spain in Venezuela in order to guarantee their own success. In the field he aided in opening the Magdalena river (by the capture of Tenerife) and followed with the capture of Cucuta and Pamplona, close to the Venezuelan border. The revolutionary Government authorized him, then, to proceed against Venezuela and he started with 800 men on May 15, 1813. Opposing him were 15,000 royalists, scattered through the country, but he took both Merida and Trujillo in the face of severe odds, and at Trujillo, on June 15, 1813, proclaimed the "War to the Death to the Spaniards," for which he is bitterly criticized, although Bolivar justified the move as a military measure of the highest value.

On Aug. 6, 1813, Bolivar marched into Caracas, after covering 1,200km., fighting six pitched battles, destroying five royalist military units, and capturing 50 cannon and three ammunition depots in a period of 90 days. In Caracas he announced for the first time the personal position which he repeated many times afterward—that he sought no office and would accept none excepting "the post of danger at the head of the soldiers." Bolivar was given the official title of "Liberator" and himself established the "Military Order of the Liberators of Venezuela," in honour of his fellow revolutionaries.

The months following the successful campaign into Venezuela were filled with bloody and heroic battles. Ghastly reprisals, on both sides, took place, the bitterest opponents of the revolutionaries being the *llaneros* or plainsmen from the Orinoco led by a former pirate who called himself Boves. The battle of Araure, on Dec. 5, 1813, closed a year of notable successes for Bolivar with the virtual destruction of the royalist army of 3,500 men. The dispersed royalist units faded away, but the army of the plains, led by Boves, was an element which brought on the disasters of the year 1814. Boves was defeated in his first attack against an entrenched force of revolutionaries, at La Victoria, Feb. 12, 1814, but the discovery, after the repulse, of the horrors which his men had committed in defenceless villages apparently caused the order issued by Bolivar for the execution of 886 Spanish prisoners at La Guaira, an act which has been the subject of severest criticism, although defended by Bolivar's admirers as a justified reprisal.

The two battles of San Mateo came in March of 1814, and resulted in victories for Bolivar. Bolivar returned to the coast, where he met the Spaniards and royalists in the first battle of Carabobo, fought on May 28, 1814. It was a notable, but not a decisive, victory for Bolivar for the victory was followed quickly by a defeat at the first battle of La Puerta, on June 15, 1814, when Boves obtained his revenge for San Mateo in a victory which scattered the revolutionaries and led finally to Boves entering Caracas. He followed his atrocities there with the massacre of 3,500 of the refugees from the capital at Aragua after defeating Bolivar and his army of 3,000 with a force estimated to have numbered 8,000 to 10,000. Bolivar, in disgrace and amidst the insults of his officers, left Venezuela for Cartagena, leaving, however, a proclamation analyzing the basis of the failure, that is, the opposition of the very native-born to whom he sought to give independence. Meanwhile, Venezuela was again completely in the hands of the Spaniards.

Bolivar arrived in Cartagena on Sept. 25, 1814. He proceeded to Tunja, the seat of the revolutionary Government of Nueva Granada, to report the success, and later failure, of his campaign in Venezuela. He was received with honours everywhere.

Congress entrusted Bolivar with the task of liberating Santa Fé de Bogota, which he carried by assault and turned over to the congress, which moved from Tunja to the beautiful city that is still the capital of modern Colombia. Bolivar was then ordered

to proceed again to the coast and to capture Santa Marta, the last stronghold of the Spaniards in Nueva Granada. Delays and intrigues interfered, and the attack was not made until Spanish reinforcements had arrived, and Bolivar was defeated with the loss of 1,000 men and 100 guns.

Disgusted and disappointed, Bolivar resigned his command and sailed for Jamaica, again issuing a proclamation in which he warned against the disunion of the revolutionaries, pointing out that "No tyrant has been destroyed by your arms; they have been stained with the blood of brothers in two struggles that have produced in us an equal sorrow." While in exile in Jamaica, Bolivar wrote, on Sept. 6, 1815, the famous "Jamaica letter," which analyzes the causes of failure, and sets down the reasons for his hope for final success.

Negro President's Help.—In Jamaica a former slave of the Liberator by error stabbed to death another man sleeping in the hammock where Bolivar was accustomed to lie. From Kingston, whose authorities frowned on revolutionary activities, because of the relations of Great Britain with the Holy Alliance, Bolivar sailed to Haiti, where President Alexandre Petion gave him asylum and aid and support in his plans to return to Venezuela. In Nov. 1815 he set sail with 250 men for the island of Margarita, landed on the mainland and at Ocumare de la Costa, on July 6, 1816, proclaimed the cessation of the War to the Death and the freedom of all the slaves, thus fulfilling the promise he had made to the negro president of Haiti. He was forced to return to Haiti for help, but on Jan. 1, 1817, landed in Venezuela.

The following months were crowded with intrigue in the revolutionary ranks. Bolivar retired to Venezuelan Guiana, where a few loyal followers (including Antonio José Sucre, one day to be his ablest officer and most loyal friend and hero of the great decisive battle of Ayacucho) surrounded him. The fall of Angostura, on the Orinoco, placed Bolivar in a favourable position, and, more important, he found the tables turned, with the *llaneros* (Boves was now dead) following José Antonio Páez to the support of the revolutionary cause. Angostura now became the capital of the revolutionary Government, and Bolivar, as its head, organized a skeleton of civil administration. Small engagements and heroic and colourful skirmishes took place, with Bolivar living the life of the *llaneros* and finally penetrating into La Victoria, between Valencia and Caracas, where he called all able-bodied men to his colours. The Spanish commander, Pablo Morillo (whose arrival in Nueva Granada over three years before had brought about Bolivar's defeat and his exile to Jamaica) forced Bolivar to battle at La Puerta, on March 15, 1818, and in this second battle there defeated the revolutionary army and routed it, Bolivar himself being wounded. This was the darkest hour of the revolution in Venezuela, but Bolivar took the occasion to write to the revolutionaries of Argentina his hope and expectation that Venezuela would yet invite them to join her in the "Unity of South America," and to send a message to Nueva Granada, promising the revolutionaries there the aid of the Venezuelans in expelling the Spaniards, who were again in control in the viceroyalty.

On May 25, 1819, Bolivar set out on another of the exploits which mark his career. With the newly formed but well-disciplined "foreign legion" composed largely of British and Irish veterans of the European wars, and with a reduced army of Venezuelans (in all about 2,500 men) Bolivar started across the Andes towards Nueva Granada, to fulfil his promise of aid and rescue. Leaving the tropic plains along a route now covered by an automobile road but then passable on foot and hardly at all with animals, the "Army of Liberation" climbed to the freezing Andean passes where the icy "paramo" blows beneath the burning sun. The soldiers, their clothing worn or torn from them in crossing the flooded plains of the rainy season of the Orinoco basin, passed through the tortures of this march and arrived, worn and wasted, in the sunny savannas of Nueva Granada, only to learn that a royalist army of 5,000 men was on its way to meet them. With three days to prepare, Bolivar found arms and horses, met and routed the advance guards of the enemy and finally, at Boyaca, on Aug. 7, 1819, defeated decisively the main Spanish force. Boyaca proved the blow that broke the hold of Spain on Nueva Granada.

In Bogota, Bolivar was received with tumultuous acclaim. Money and men were put at his disposal for the relief of Venezuela, and he was officially invested with the title of Liberator of Nueva Granada. The whole of the former viceroyalty was cleared of royalist control in a relatively rapid succession of victories and surrenders. Francisco de Paula Santander, the great Colombian hero, was appointed vice-president of Nueva Granada under Bolivar. Meanwhile, Bolivar, learning of dissensions and disloyalties in Angostura, returned over the same difficult road to the Venezuelan revolutionary capital, appeared before the Venezuelan congress on Dec. 14, to report formally the results of the expedition to Nueva Granada and to urge the proclamation of the new republic of Colombia, including Nueva Granada and Venezuela. On Dec. 17, 1819, the republic was proclaimed, with Venezuela, Nueva Granada and Quito (now Ecuador) as its constituent parts, and Bolivar as its president.

The Armistice.—In Jan. 1820 Bolivar at Bogota proclaimed the union of Greater Colombia. Meanwhile, the Spanish Government had authorized Morillo to open negotiations for peace. Bolivar declined to consider any peace except that based on a recognition of the independence of the colonies, but the negotiations led to a six months' armistice and the drawing up of a treaty for the prosecution of any war that might follow on the lines of civilized warfare and on the principle of the inviolability of the lives and property of non-combatants.

At this juncture Maracaibo, long the stronghold of the royalists, openly declared its adherence to the revolution, and Manuel de Latorre, the Spanish commander who had succeeded Morillo on the latter's voluntary retirement, believed that Bolivar had broken the armistice by working to bring about the defection of Maracaibo. This was denied by Bolivar, and arbitration was offered, but refused by the Spanish commander. Events then led rapidly to the decisive battle of the Venezuelan revolution. Bolivar summoned his forces and moved against Caracas. The two armies met on the plains of Carabobo for the second time, Bolivar attacking at 11 A.M. on June 24, 1821. In one hour's battle the Spaniards were defeated, the foreign legion and the *llaneros* playing decisive rôles in the final result. The second battle of Carabobo was recognized, even then, as the turning point of the struggle for Venezuelan independence, as Boyaca was in the war in Nueva Granada.

Meanwhile, a new Colombian congress had convened at Cucuta and again Bolivar offered his resignation as president and again was refused, although he declared at that time he feared peace more than war (owing to looming discords and the necessity of finding employment for the active leaders of war). He also proposed treaties to the other Latin-American republics, recognizing the former lines of the colonial divisions as the national boundaries, maintaining the sovereignty of the new States but uniting them in "perpetual confederation" and establishing an assembly of plenipotentiaries which should serve as a council, a point of contact, and as an "arbitral judge and conciliator of their disputes and differences."

During this time the tide of battle turned southward. Bolivar had sent Sucre by sea to Guayaquil, which was not included in the armistice, and now he himself planned to march overland to Quito, to complete the liberation of what is now Ecuador. En route south for this purpose he received word of the liberation of Panama, the last province of Nueva Granada to overthrow the Spanish rule. Bolivar began his march southward from Cali on March 8, 1822, with 2,000 men. The Spaniards, from the fortified town of Pasto, met the revolutionary army with a force slightly superior, at Bombona, on April 7, 1822. The revolutionaries were victorious in a battle which lasted into the night, and Pasto was occupied on June 8. On May 24, 1822, Sucre had fought the decisive battle of Pichincha and had entered Quito the following day. Bolivar joined Sucre in Quito, but on July 11 departed for Guayaquil, where some unrest was manifest in the revolutionary groups, as the issue was already joined as to whether Quito and Guayaquil should join Colombia, remain independent or join Peru.

José de San Martín (*q.v.*), the hero of the independence of Argentine and Chile and "Protector" of Peru, on July 26, arrived

at Guayaquil to meet and confer with Bolívar. What transpired at that conference was never known, but when San Martín returned to Peru, he resigned his post as "Protector" of Peru, withdrew from Lima, sailed for Chile and thence proceeded to Argentina, never again to appear in revolutionary annals. San Martín's withdrawal from Peru as well as Guayaquil was apparently a surprise to Bolívar, and on the repeated invitations of the local revolutionaries Bolívar finally sailed southward, arriving at Callao on Sept. 1, 1823. There he was again invested with the title of "Liberator," and called upon to lead the struggle against the Spanish viceroy, who was said to have 36,000 European troops at his command. Bolívar waited for his Colombians to cross the Andes and took time to train, partially, an army of some 4,000 Peruvians, giving him a total of between 8,000 and 10,000 men. The Spaniards were about 9,000 in number, 2,000 being cavalry. The battle of Junín was joined at 4 o'clock in the afternoon of Aug. 6, 1824, and was fought entirely by cavalry with sabres, not a shot being fired. The result was a bloody victory for the revolutionaries, Junín being regarded as the turning point of the struggle for the control of Peru.

Bolívar and the Supreme Power.—The decisive victory which ended forever the domination of Spain in the New World, was won on Dec. 9, 1824, at Ayacucho, Peru, under the command of Sucre, Bolívar having departed for Lima, to organize the civil Government of the republic. Following Ayacucho, Bolívar called a constitutional convention for Feb. 8, 1825. He resigned once more his supreme power in Colombia and in Peru, refused a gift from Peru of 1,000,000 pesos (then about £200,000), and later made a triumphal visit to Upper Peru, the liberation of which he had proclaimed on May 16, 1825, at Arequipa, and which had taken the name of República Bolívar (later to become Bolivia) in honour of the Liberator. The military victories had been won by Sucre, to whom Bolívar gave unstinted praise and honour, but Bolívar spent the time he remained in Bolivia in giving the new republic its first political organization, establishing schools, ordering a study of irrigation possibilities, removing the duty on mining machinery and distributing land to the Indians.

In Jan. 1826 Bolívar returned to Peru, reported to the congress on his work in the south, and after a short stay, started on his return to Colombia. There, in the defection of the commanders he had left in Venezuela, had already begun the long series of civil wars which were to mar the first half century of Latin American independence. He arrived in Bogotá in the middle of November. He remained only two days, and continued on his way to Venezuela. En route he called a Venezuelan constitutional congress to meet in Valencia on Jan. 15, 1827. Páez, the leader of the revolt against the union and Bolívar, accepted the offer of amnesty and friendship from Bolívar, the clouds passed, and the Liberator again entered Caracas in triumph. His leniency toward Páez irritated Nueva Granada, and the movement to break up Colombia into its original parts gained headway in Nueva Granada as well as in Venezuela. Finally, in 1828, after 14 years as supreme chief and president of Nueva Granada, Bolívar's resignation was accepted by congress, at his request and in the face of criticism and intrigue by his enemies and others ambitious for power.

Bolívar's resignation did not quiet the opposition, and threats from many quarters, including Santander himself, caused Bolívar to return to Bogotá at the head of an army and again assume the supreme power, a step which has given weight to the assertions of his enemies that he clung to his power for personal reasons. He arrived in Bogotá on Sept. 10, 1828, and called a general convention to meet in Ocaña. This assembled on April 9, and despite Bolívar's appeals and efforts for unity, his own followers withdrew leaving the convention without a quorum. Bogotá remained loyal to the Liberator and various cities of Nueva Granada, Guayaquil and Venezuela sent memorials asking that he retain his office in order to maintain the union. On Sept. 25, 1828, a plot against Bolívar's life was hatched in Bogotá, the Liberator escaping but some of his guards falling in his defence. Santander and others were arrested and sentenced to death as leaders of the conspiracy, but were banished instead, through the mediation of Bolívar.

The year 1829 opened with plans for an expedition into Peru, which had turned on Colombia, after ousting Sucre from Bolivia. Marching southward once more, Bolívar met Sucre at Quito, and at Guayaquil recovered the territory taken by Peru without fighting, owing to changes in the attitude of the revolutionaries in Lima, and the recall of La Mar, the leader of the expedition against Colombia. Meanwhile, however, trouble was brewing again in Nueva Granada and Venezuela, and Bolívar, who had been critically ill in Guayaquil, turned back northward for the last time. He reached Bogotá on Jan. 1830, and there turned over the presidency to Sucre. Páez, in Venezuela, had in the meantime begun a new agitation for separation from Colombia, and war was urged against Bolívar as the proposer and creator of the Colombian union. A peace commission, headed by Sucre, was not allowed to pass the Venezuelan border and Páez prepared for a campaign to "free" Nueva Granada from the grasp of the "tyrant" Bolívar. On April 27, 1830, Bolívar resigned, again, the supreme power which he had temporarily assumed in the hope of pacifying the Venezuelans. His resignation was accepted and on May 8, 1830, he left Bogotá for Cartagena, intending to take ship there for Jamaica or Europe.

He passed from town to town, honoured and fêted, but was forced to wait in Cartagena, because of lack of funds to pay his passage on shipboard, his great personal fortune having been finally dissipated in the cause of the revolution. At Cartagena he heard of the murder of Sucre on June 4, this information being probably the last blow to the rapidly failing chieftain. Tuberculosis, which had long been developing, was given new impetus by a severe cold. Still, calls came for him to assume leadership once more against the elements that were breaking up the union for which he had fought and planned. Finally, seeking a change of climate, he went to a country place, San Pedro Alejandrino, three miles outside Santa Marta, where he died—after issuing one more proclamation from his deathbed—on Dec. 17, 1830.

Twelve years after his death, Bolívar's remains were carried to Caracas, where they lie in the national pantheon, on one side the empty tomb commemorating Francisco Miranda, and on the other that in which the remains of Sucre are to rest when they are returned by Ecuador to Venezuela.

BIBLIOGRAPHY.—In English, *Simon Bolívar*, by Guillermo Sherwell, published by the author for the Venezuelan Government in Washington, 1921 (also issued in Spanish) gives an excellent if highly appreciative presentation of the subject in brief form. The bibliography in Spanish is almost endless, excellent "lives" being those by Larrazabal, Aristide Rojas and, particularly, a compendium of studies issued in Madrid and Buenos Aires in 1914 under the title *Bolívar—por los mas grandes escritores Americanos, procedido de un estudio por Miguel de Unamuno*. F. Lorrain Petre is a severe critic of Bolívar, and presents the entire controversy over Bolívar's patriotism or self-aggrandizement in a judicious if not unprejudiced manner. The Venezuelan Government has published 22 volumes of the historical records bearing on Bolívar's life. His correspondence has been published in full. Simon B. O'Leary, a commander of Bolívar's foreign legion, wrote his memoirs in English, and they have also been published in Spanish. (W. TH.)

BOLÍVAR, a department of Colombia, on the Caribbean sea. It has an area of 22,320 sq.m., composed in great part of low, alluvial plains, densely wooded, slightly cultivated and unsuited for north European labour. The population, estimated in 1918 at 457,111, is composed largely of mixed races (white and negro); in some localities the inhabitants of mixed race are estimated to constitute four-fifths of the population. The capital, Cartagena on the Caribbean coast, was once the principal commercial entrepôt of Colombia. Other important towns are Magangué, pop. (1918) 14,076 and Mompox, pop. (1918) 15,435, on the Magdalena river, and Corozal, pop. (1918) 11,907; Sincelejo, pop. (about 14,000), and Lórica, pop. (1918) 19,955, near the western coast. The department has only one railway, the line from Cartagena to Calamar, 65m. in length, serving to connect the port of Cartagena with the Magdalena river.

BOLÍVAR, an inland State of Venezuela, lying south of the Orinoco, with the Delta-Amacuro territory and British Guiana on the east, the Coroni river forming the boundary, and the Amazonas territory and Brazil on the south. Frequent political changes in Venezuela have led to various modifications in the size and out-

lines of this State, which comprises large areas of uninhabited territory. It is a country of extensive plains (*llanos*) covered in the rainy season with nutritious grass which disappears completely in the dry season, and of great forests and numerous rivers. Its area is 91,891 sq. m. and its population in 1920 was 65,852, and in 1924 was estimated at 68,323. The capital is Ciudad Bolívar, formerly called Angostura, which is situated on the right bank of the Orinoco about 240 m. above its mouth; pop. 19,712. Vessels of light draught easily ascend the Orinoco to this point, and a considerable trade is carried on, the exports being gold (from the famous El Callao mines), hides, balatá and other forest products.

BOLIVAR, the monetary unit of Venezuela. It is equivalent at par to a franc, so that one bolivar equals 10.295 cents, and 25.22 bolivars equal one pound. It is divided into 100 centimes, while commercial accounts are kept as a rule in "pesos sencillos," an imaginary coin equivalent to four bolivars. A former unit called the Venezolano is equal to five bolivars.

The bolivar, from the geographical situation of Venezuela, has its main link with the dollar, but it is also quoted regularly in London. Immediately after the World War, it stood below par, falling to 16 cents in early 1921. Since 1923, it has been back at par with the dollar. Notes are issued by the Bank of Venezuela and by certain other banks, but the former possesses the bulk of the issue and practically all the country's stock of gold and gold assets. This last rose from 11.5 million bolivars in 1913 to 69.2 millions in 1926, but it is impossible to say how much was actual gold, and how much was "gold exchange," etc. See also CURRENCY.

BOLIVIA, an inland republic of South America, once a part of the Inca empire and later of the Spanish viceroyalty of Peru and known as the province of Charcas or Upper Peru. It is the fourth largest political division of the continent, and extends, approximately, from 9° 44' to 23° S, and from 58° to 70° W. It is bounded north and east by Brazil, east by Paraguay, south by Argentina and west by Chile and Peru. The boundaries are not clearly defined, large districts being in dispute, particularly with Paraguay. The area is estimated at 514,464 square miles.

Physiography.—Although three-fifths of Bolivia's area consists of vast low plains, the remainder, the western part, is one of the highest inhabited districts in the world and constitutes the real Bolivia. The Andes here attain their greatest breadth and are divided into two great parallel chains enclosing a plateau whose surface lies but a few thousand feet below the summits of the mountains themselves (see *ANDES*). Between these chains lies the Altiplanicie, or Altiplano, of Bolivia, a relatively flat-floored depression 500 m. long by 80 broad, with an elevation of about 12,000 ft., constituting the Lake Titicaca basin. The floor of this great depression, mostly composed of water-laid deposits from the bordering mountains, and appearing quite level, slopes gently southward, the southern end being about 400 ft. lower than the surface (Lake Titicaca) in the north. Its evenness is also broken by occasional hills and ridges. The margins of the basin, particularly on the east, are marked by numerous interlocking alluvial fans which have built up an almost continuous piedmont plain of fairly gentle grade. The northern and eastern sections, or fully three-fifths of Bolivia, are composed of low alluvial plains, great swamps and flooded bottom-lands, and gently undulating forest regions. In the extreme south are the Bolivian Chaco and the Llanos (open grassy plains) of Manzo, while above these in eastern Chuquisaca and southern Santa Cruz are extensive swamps and low-lying plains, subject to periodic inundations and of little value for agriculture or grazing. Considerable areas, however, which lie above the floods are rich grazing lands. Between the Sierra de Chiquitos and the Andes are the Llanos de Chiquitos, which have a higher general elevation and a more diversified surface. North of this elevation, are the Llanos of Guarayos and Mojos, occupying an extensive region traversed, but poorly drained, by the Guaporé, San Miguel, Guapay, Mamoré, Yacuma, Beni and Madre de Dios rivers and containing large undrained areas, like that of Lake Rojoagua (or Roguaguado). It includes districts rich in agricultural possibilities and extensive open plains where cattle have been successfully raised since colonial times. Toward the north-west, where the plains blend into the lower

slopes of the Andes, are heavy forests. Better drained than the lowlands, this region, the Yungas, is more salubrious and constitutes one of the most attractive districts of Bolivia. Though still sparsely inhabited and difficult of access, it could sustain a large population.

Hydrography.—The rivers fall into three distinct systems: Amazon (*q.v.*), Plata (*q.v.*) and Lake Titicaca. The eastern lowlands of Bolivia have many lakes, most of them little known. The great swampy plains along the Beni and the Mamoré con-

STREET SCENE IN LA PAZ, THE PLATEAU CAPITAL OF BOLIVIA

La Paz, a city of some 100,000 inhabitants, founded in 1548 by the Spaniards, has many narrow, ill-paved streets. The climate is healthy and, because of its great height above sea-level, it is often intensely cold at night.

tain several lakes and lagoons, some of them large. Lake Rojoagua, whose waters probably find their way into the Beni, covers a large area, as do other little known lagoons and marshes near the Mamoré. Lake Concepción, in the Chiquitos mountains, belongs to the same hydrographic system. In the south-east there are several large shallow lakes whose character and size change with the seasons. Along the Paraguay there are several such lakes, partly produced by obstructed outlets, such as Bahía Negra, Cáceres, Mandioré, Gaiba and Uberaba, some of them navigable by small craft. Above these are the great Zarayes swamps. This region, like that of the north, is subject to inundations during the summer (November to May) when traffic is possible only by the use of boats.

The third draining system is that of the great central plateau. This is one of the most elevated of all inland basins lying at over 12,000 feet. It comprises Lake Titicaca near the north end; the Desaguadero, its outlet; Lake Pampa Aullagas or Poopó into which the Desaguadero flows; the Lake or Salt Marsh of Coipasa (connected with Poopó by the Lacahahuira, the small outlet of the latter); and the great Salar de Uyuni, independent of the rest of the system but receiving the waters of an extensive, though very arid region, at the south end. Into this system enter many short streams from the neighbouring heights, chiefly the Cordillera Real, with its immense snow fields. Having no outlet to the sea the water of this extensive basin is wholly absorbed by the dry soil and by excessive evaporation. Lake Titicaca, the most important feature of the plateau system, at an elevation of 12,507 ft., is one of the highest large lakes in the world. It is about 125 m. long and has a maximum width of 69 (total area about 3,200 sq. m.). The indented shore offers much topographic variety, sometimes rising abruptly, sometimes running back in low gentle slopes. It is divided into two main parts by the peninsulas of Copacabana and Huata, the narrow strait of Tiquina, between these peninsulas, connecting the two almost separated bodies of water. The southern arm, covering approximately one-fifth of the total area, is known as the Laguna de Uinamarca, the name Titicaca being applied sometimes only to the larger body. Over much of its extent, particularly in Uinamarca, the lake is so shallow that small steamers often run aground, but toward its eastern side there is a long trough 892 ft. deep at its deepest point. The level fluctuates seasonally, summer rains and melting snows accounting for a rise of 5 to 6 feet. Many islands dot the sur-

face of the lake. The largest of these, the Isla del Sol, also sometimes called Titicaca, contains highly interesting archaeological monuments, principally the ruins of well-constructed stone buildings and paved roads, remnants of the skilled workmanship of Inca or pre-Inca peoples. This island is generally considered to have been the cradle of Inca civilization, or better, perhaps, the refuge of survivors from the earlier civilization that apparently centred about the very ancient metropolis of Tiahuanaco, just east of the lake, where are extensive ruins of admirable stone constructions. From this island the founders of Cuzco and of the Inca empire are thought to have migrated. On the smaller Island of the Moon (or Coati) impressive ruins also exist. Having an outlet and a fairly constant inflow, largely of melted snow, the water of Lake Titicaca is fresh, except in the shallower parts where rapid evaporation leaves it slightly brackish. The temperature of the water is very low, being little above freezing during much of the year, but never low enough to form ice. Strong winds are often encountered and squalls are frequent during the summer thunder-storms. Where the margins of the lake are shallow the shore is fringed with a border of bull-rush (*totora*) that is excellent forage for cattle and supplies material for building reed boats, making mats and thatching. There are several excellent kinds of fish, while ducks and other water fowl abound in the shallower portions. Lake Titicaca belongs partly to Bolivia and partly to Peru, the boundary crossing near the middle from the north-east to south-west. Transportation is carried by many small native *totora* craft, by boats of imported lumber and by several small steamers. On the north-west side a railway reaches the Peruvian port of Puno, and on the south-east side a line from La Paz extends to the Bolivian port of Huaqui (or Guaqui), steamers connecting these rail heads. Only one bridge has been built across the river, at the point where it emerges from the lake, but mule trains and caravans of llamas ford it at many points. Several important old roads along which the silver, gold and other products of this region reached the Pacific coast for four centuries cross the Desaguadero in this fashion.

Lake Pampa Aullagas (Poopó) is quite different in character from Lake Titicaca. It occupies a very shallow depression in the plateau only a few feet below the general level of the surrounding land and is nowhere more than 15 ft. deep at normal stage. However, it covers about 1,000 sq m. at low stage, and the surrounding land is so flat that the lake reaches sometimes almost to Oruro, fully 30 m. from the low-water shore. During low stage Poopó receives daily (chiefly from the Desaguadero) about 775 cu ft. per second, while it discharges through its outlet but a little over 210 cu ft. per second, the difference representing its apparent loss by evaporation. The Lacahahuira, the only visible outlet of Lake Poopó, moves underneath the sand and empties into the Salar de Coipasa which, at high water, covers about the same area as Lake Poopó at low water, but usually consists only of wide, marshy, salt-encrusted wastes, with a small permanent body of water in the lowest part. There is no outlet. The Salar de Uyuni is of a similar character but much larger than Coipasa. It covers not far from 3,500 sq m., and consists wholly of salt-encrusted swamp, except as pools of water form at times in the lower places. Like Coipasa, it has no outlet. The Río Grande de Lípez is its most important affluent; the district is almost rainless.

Climate.—Though Bolivia lies wholly within the tropics it possesses every gradation of temperature from that of equatorial lowlands to the arctic cold which prevails on the summits of the snow capped Andes

The *yungas* climatic zone comprises all the lowlands and the mountain valleys up to an elevation of 5,000 feet. The atmosphere is exceedingly humid. The mean temperature is about 77° F, with no great departures from this, and the rainfall, occurring throughout the year, is heavy (30–50 in. at least). The *valle* zone includes the deep valleys from 5,000 to 9,500 ft., has a warm climate with moderate variations in temperature and no cold weather and is semi-tropical in character and productions. The *cabecera de valle*, as the name indicates, includes the heads of the deep valleys above the *valle* zone, with elevations ranging

from 9,500 to 11,000 ft.; its climate is temperate, though subject to an occasional frost in winter, and is favourable to the production of cereals and vegetables. Both in the *valle* and the *cabecera de valle* there is likely to be a scarcity of rain but there is in most cases an abundant supply of water for irrigation. The *puna*, which lies between 11,000 and 12,500 ft., includes the great central plateau. It is always cool and shows little difference between summer and winter, except in the matter of rainfall, the former season bringing only rain, while occasional snow falls in winter. The air is too cold for crops except potatoes, barley and a few others. Mean temperature is estimated at 50.4° F (La Paz). The *puna brava* extends from 12,500 ft. up to the snow limit (about 18,000 ft.) and covers a bleak, inhospitable territory, inhabited only by shepherds and miners. Above this is an Arctic zone within the tropics. In general, the tropical and temperate regions are healthful and agreeable, and have varied and abundant products. It is in these two zones that most of the white people live, as well as many of the Indians. On the *puna*, however, particularly about the borders of Lake Titicaca, there are districts of dense Indian population, some with over 100 people per square mile. Most of the distinctly Indian settlements are now found above 11,000 feet. It was here that the great cities of the Inca and pre-Inca period were situated, such as Cuzco and Tiahuanaco. Since the peoples who built them were predominantly pastoral and largely dependent upon the llama and the alpaca, they lived in the high cold zone of grass-lands inhabited by these animals. The high rate of mortality among the natives of this region is due in large part to unsanitary habits and diet rather than to climate. In the tropical *yungas* the ground is covered with decaying vegetation, and there are many good breeding places for mosquitoes; hence malaria and fevers are common. Precipitation is as varied as the temperature. East of the Cordillera Oriental, rains fall throughout the year. On the west side of this Cordillera, which extracts the moisture from the prevailing easterly winds, the elevated plateaux have a limited rainfall in the north (21 in. at La Paz), which comes only during the summer months and diminishes toward the south until the surface becomes absolutely barren. Brief and furious thunder-storms, resulting from intense convection, sometimes sweep the northern plateau and Lake Titicaca in summer.

Fauna.—The indigenous fauna corresponds closely to that of the neighbouring districts of Argentina, Brazil and Peru. Numerous species of monkeys inhabit the forests of the tropical region, together with the puma, jaguar, wildcat, coati, tapir or *anta*, sloth, ant-bear, paca (*Coelogenys paca*) and capybara. The rare *Ursus ornatus* (spectacled bear) is found among the wooded Andean foot-hills. The chinchilla (*C. laniger*) inhabits the colder plateau regions and is prized for its fur. The plateau species of the viscacha (*Lagidium cuvieri*) and the widely distributed South American otter (*Lutra paranensis*) are also hunted for their skins. The peccary, which prefers a partially open country, ranges from the Chaco to the densely wooded districts of the north. There are two or three species of deer, the most common, though not numerous, being the large marsh deer of the Chaco. The armadillo, opossum, ferret and skunk are widely distributed. Alligators are found in the tributaries of the Paraguay, lizards and turtles are numerous, and the batrachians are represented by several species. Snakes are also numerous, including rattle-snakes and the great boa-constrictors of the Amazon region. On the plateau and in the high mountains there are few reptiles.

The most important of all the Bolivian animals, however, are the guanaco (*q.v.*) and its congeners, the llama (*q.v.*), alpaca (*q.v.*), and vicuña inhabiting the mountainous regions. So dependent is the Indian upon the llama and the alpaca that the habit of these animals very largely determined the bounds of the Inca and pre-Inca civilization. The rearing of llamas and alpacas is a recognized industry in the highlands and is wholly in the hands of the Indians, who alone seem to understand the habits and peculiarities of these interesting animals. A small domesticated variety of the cavy ("guinea pig") is very numerous and has long been raised by the natives, who are particularly fond of its flesh.

Of birds and insects the genera and species are very numerous and interesting. The high sierras are frequented by condors and eagles of the largest size, and the whole country by the common vulture, while the American ostrich (*Rhea americana*) and a species of large stork (the *bata* or *jibirú*, *Mycteria americana*; maximum height, 8 ft.; spread of wings, 8 ft. 6 in.) inhabits the tropical plains and valleys. Water-fowl are numerous both in the lowlands and on the plateau. Among the highland lakes are geese, ducks, grebes, and coots, divers, cormorants and gulls and rosy flamingoes. Some of the forests of the warm valleys and plains are filled with birds of beautiful plumage. Many species of humming-birds are found even far up in the mountains, and great numbers of parrots, macaws and toucans, brilliant of feather but harsh of voice, enliven the forests of the lowlands. Insect life is abundant and varied at the lower levels, but from 10,000 ft. up is largely lacking. Silkworms have been bred with success in some departments.

Like other South American States, Bolivia benefited greatly from the introduction of European animals. Horses, cattle, donkeys, sheep, goats, swine and poultry were introduced, and are now sources of food and wealth to a large part of the population. The horses and mules are largely imported from the Argentine pampas, since the plateau where most of them are used is too high for their successful breeding.

Flora.—Owing to the diversities in altitude the flora of Bolivia represents every climatic zone, from the scanty Arctic vegetation of the lofty Cordilleras to the luxuriant tropical forests of the Amazon basin. Between these extremes the diversity in vegetable life is as great as that of climate and soil. The flora has been little studied because of the inaccessibility of the inland regions. The plateau is primarily a grass-land. Above 10,000 ft. few trees are found, but where there is even a light rainfall the hill-sides and the high plains support a scant growth of coarse bunch grass (*Stipa Ychu*) which is the principal pasture of domestic stock. This grows up to the snow line. *Ychu* grass is widely used for mats and thatching. Two other economically important plants are the *tola* and the *yareta*; the former a low shrub, the latter a highly resinous moss-like plant which grows in a compact fibrous mass. Both of these are used extensively for fuel. Among the more important cultivated plants of the *puna* region are the potato, oca (*Oxalis tuberosa*), and quinoa (*Chenopodium quinoa*) is widely grown for fodder but does not mature on the *puna*, while wheat can seldom be grown above 10,000 feet. It is now generally agreed that the highland district about Lake Titicaca was the native home of the potato, which constitutes the staple food, particularly above 11,000 ft., the usual limit of grains. Indian corn was cultivated in the temperate regions long before the advent of Europeans, and in such districts still is grown extensively. Wheat, barley, rye, oats, beans, peas and many vegetables, introduced from the Old World, have found suitable habitats, each at its own level. Among the indigenous plants in the semi-tropical and tropical zones are the sweet-potato, cassava (*Manihot utilissima* and *M. Aipi*), peanuts, pineapple, guava, chirimoya, pawpaw (*Carica papaya*), ipecacuanha, sarsaparilla, vanilla, false jalap (*Mirabilis jalapa*), copaiba, tolu (*Myroxylon toluiferum*), rubber-producing trees, dyewoods, cotton and a great number of beautiful hardwoods, such as jacarandá, mahogany, rosewood, quebracho, colo, cedar and walnut. Among the fruits many of the most common are exotics, as the orange, lemon, lime, fig, date and grape, while others as the banana, caju or cashew and the avocado or alligator pear, have a disputed origin. Coca, one of the most important plants native to the country, is cultivated on the eastern slopes at 5,000 ft. to 6,000 ft. altitude, where the temperature is uniform and frosts are unknown. Quina (*Cinchona calisaya*), from which quinine is extracted, is found at 3,000 ft. to 9,000 feet. Cinchona bark forms an item of export. The most important indigenous forest product is rubber, derived principally from the *Hevea guayanensis*, which grows along river courses in the lowland regions of the north. The competition of plantation products has seriously affected the native rubber industry in these forests. Sugar-cane and rice are cultivated in the warm districts.

Population.—Two-fifths of the territory (the highlands) contain three-fourths of the inhabitants. All of the large cities, and all of the large settled areas lie above 8,000 ft., many of them above 12,000. Below 6,000 ft. Santa Cruz is the only city with over 10,000 people, while the plains, as a whole, probably contain less than two people per square mile. The population in 1900 was roughly 1,816,000, including the Littoral department, now belonging to Chile (49,820) and the wild Indians of the forests (91,000). Of this total, 50.7% were classed as Indians, 12.8% as whites, 26.8% as *mestizos*, 0.3% as negroes, and 9.4% as unknown. In 1927 an official estimate made the population 3,464,945, but all census estimates are uncertain. The Indian population is largely composed of the so-called civilized tribes of the Andean highlands, and those of the lowland Indians in the eastern forests and grass-lands. The former are chiefly Aymaras (see *AYMARAN*) and Quichuas (*q.v.*).

The Mojos and the Chiquitos who live on the border between the forests and the grass-lands of far eastern Bolivia, were organized into industrial communities by the Jesuit missions in the 17th century, and have retained something of the culture then imparted to them. Inhabiting the southern plain are the Chiriguano, a detached tribe of the Guaranis (*q.v.*). The remaining native tribes have made little progress. Those who live in the deep forests of the Amazon valley have little contact with the whites, except as boatmen along the rivers or as forced gatherers of rubber. The Tobas and Lenguas of the Gran Chaco have successfully repelled every attempt at exploration in the interior of that district. The white population is descended in great part from the early Spanish adventurers and there are some Spanish and Portuguese Americans from neighbouring republics. This group, numbering only 250,000, completely dominates the country. There has been no large recent immigration from Europe and the percentage of whites therefore does not increase. The *mestizos* as a rule are ignorant, unprogressive and apathetic. Most of the small scale commerce is carried on by this class; they do most of the skilled labour, and serve as foremen and minor civil servants.

Divisions and Towns.—There are eight departments and three territories, and these are subdivided into provinces. They are as follows:—

Departments and territories	Area: square miles	Census 1900	Estimated 1915
La Paz (La Paz)	40,686	445,616	726,357
Cochabamba (Cochabamba)	25,288	328,163	534,901
Potosí (Potosí)	45,031	325,615	530,748
Santa Cruz (Santa Cruz)	144,941	209,592	341,640
Chuquisaca (Sucre)	36,132	204,434	333,226
Tarija (Tarija)	31,567	102,887	164,704
Oruro (Oruro)	20,657	86,081	140,891
El Beni (Trinidad)	95,354	32,180	52,450
El Chaco (Villa Montes)	40,501		13,085
Colonial Territories (Riberalta)	27,038	10,000	51,968
Total	514,155	1,744,568	2,880,970

The following are the principal cities with their population as estimated in 1924. La Paz, 118,250, Cochabamba 34,281, Oruro, 32,908; Potosí, 30,122, Santa Cruz, 18,315; Sucre, 16,194; Tarija, 10,843; Trinidad, 6,269. Although Sucre is the legal capital, La Paz, the commercial metropolis, has been the seat of government since the revolution of 1898. Prominent smaller towns are the Huanchaca silver mining centre of Pulacayo (4,000) and Uyuni (5,000), an important railway and highway junction; Viacha (3,000), an important railway town, being the junction of the lines from La Paz to Mollendo, to Arica, and to Oruro and Antofagasta; Quillacollo (10,000), Punata (8,000) and Tarata (4,681), trading centres in the department of Cochabamba, and Huari, a small village east of Lake Poopó, the seat of an annual fair at which traders gather from all parts of the highlands, from the low hot lands to the east and even from the pampas of the Argentine, making it for a week or so after Easter a city of 10,000 or over.

Communications.—In 1892 the first railway, that from Antofagasta to Oruro, was completed. A line 54 m. long was laid to connect the Alto de La Paz with Huaqui, on Lake Titicaca. Communications were thus established, through steamers (1902), with the Peruvian railway from Puno to Mollendo on the coast. In 1909 the Antofagasta-Bolivia railway was extended to Viacha, connecting there with the line to the Alto de La Paz. In 1912 a line was opened from Río Mulato to the Cordillera Oriental, reaching the height of 15,813 ft. at Crucero Alto, and then descending to Potosí. A railway from Arica to La Paz (308 m.) was provided for by the treaty between Chile and Bolivia (1904) and was completed in 1913. A railway 131 m. long was also completed (1917) from Oruro over the Banderani Pass (13,543 ft.) to Cochabamba. An additional international connection was built in 1925, when the Bolivian section, extended to meet the Argentine railway at La Quiaca, was opened. A line was also laid from La Paz over the heavily travelled high Huacuyo Pass (15,223 ft.) into the upper Yungas valleys. There are a few other short railways. The total length of the Bolivia railways in 1922 was 1,401 m., with 256 additional miles under construction. There are 6,843 m. of cart roads between the larger plateau cities and to some frontier points, and subsidized stage coaches run on some of them. Most of these roads are rough and at times almost impassable. There are few good bridges. Motor roads are being built between some of the more important points, such as Potosí and Sucre. There is a weekly aeroplane service between Cochabamba and Santa Cruz, carrying mail and passengers and making the trip in a few hours, whereas by mule it requires ten days or over.

There are thousands of miles of navigable waters in the forested lowlands, furnishing almost the only means of transportation. Many of these streams are obstructed by rapids and fallen trees and light-draught snag-boats patrol some of them. The Madeira-Mamoré railway was built to avoid the most dangerous of the rapids, but because of the decline of rubber production the road proved unprofitable. As no maritime port can be reached without transshipment in foreign territory, Bolivia is excluded from direct commercial intercourse with other nations. Traffic rights over these routes have, however, been secured by treaties. Bolivia's outlet to the Amazon is restricted to the Madeira river, the navigation of which is interrupted by the series of falls. The Bolivian port of entry for this trade, Villa Bella, is just above the falls of the Madeira and is reached from the lower river by the Madeira-Mamoré railway. Connected with the upper Paraguay are Puerto Pacheco on Bahía Negra and Puerto Suárez (about 1,600 m. from Buenos Aires by river) on Lake Cáceres, through which passes the bulk of Bolivian trade in that direction. Puerto Suárez is connected by steam launch with the Brazilian port of Corumbá, at the end of the railway leading across Matto Grosso to São Paulo.

Telegraph service dates from 1880, and in 1926 there were 4,090 m. in operation, of which the greater part belonged to the State. The Government also maintains several wireless stations.

Industries.—Mining is the most important industry of Bolivia. Most attention is given to copper and tin, Bolivia producing about one-fourth of the world's tin. Silver, gold, tungsten, bismuth, lead, antimony and zinc are less important products. Around Santa Cruz some petroleum is produced by crude methods for local consumption, and extensive exploration work has been carried on along the eastern base of the Andes, but difficulty of access has delayed development here. There are strong British, Chilean, French and American as well as Bolivian mining companies. The development of mining is having a marked effect upon the economic status of the Aymara and Quichua Indians, drawing them away from the farms and promising to ameliorate their condition of peonage.

The Indians of the plateau grass-lands have been herdsmen from time immemorial and are skilful in small-scale sheep raising. Horses, formerly raised in the north, have not flourished there since the introduction of a *peste* from Brazil. The Jesuit founders of the Mojos missions stocked the Mojos and Chiquitos llanos with cattle, thus giving an unfailing supply of beef for the neighbouring inland markets; but their inaccessibility has prevented development. Farther south the llanos of Chuquisaca and Tarija

also sustain large herds of cattle on the more elevated districts, and on the well-watered plains of the Chaco. The fur-bearing chinchilla, a native of the higher plateaux, is also bred.

Agricultural products are chiefly for domestic supply. Cereals, fruits and many vegetables are limited to the temperate intermediate valleys of the eastern Andes, where there is not sufficient tillable land to supply even local demands. Food resources therefore consist largely of indigenous plants suited to the unusual conditions of the region where most of the people live. Of these native crops, the potato, still found growing wild on the hillsides about Lake Titicaca, has probably always been the staple food for the Indians of the plateau and highlands. It is grown between heights of 11,000 and 14,500 feet. At nearly the same elevation is another indigenous plant, *quinua* (*Chenopodium quinua*), apparently not grown elsewhere, which furnishes a nutritious seed used by the Indians. Maize is seldom found above 11,000 ft., but is important in the high valleys below that level. Coca (*Erythroxylon coca*) is extensively cultivated in the Yungas valleys of Cochabamba and La Paz. Wheat and barley, as well as many fruits and vegetables, were introduced by the Spaniards, and are grown in the temperate and warm valleys, but only for domestic needs. Sugar-cane also was introduced at an early date, but as the demand for sugar was limited, it was, and is, used chiefly to manufacture rum. Rice is another exotic grown on a small scale in the eastern tropical districts. Tobacco of a fair quality is raised in the warmer regions, while excellent coffee is produced around La Paz and Cochabamba.

The most prominent of the forest industries is rubber-collecting, begun between 1880 and 1890, and reaching a registered annual output of nearly 3,500 metric tons just before the best rubber forests became Brazilian territory in 1903. There still remain extensive rubber areas on the Beni and Madre de Dios. Rubber exports in 1926 were valued at Bs. 5,484,010. The collection of cinchona bark is one of the oldest forest industries, and the product is of the best. The industry is destructive in method, but there are probably large areas of virgin forest to draw upon.

There is a modern match factory in La Paz, a shoe factory and breweries in Oruro and flour mills in Cochabamba. Small plants make woollen goods, leather, soap, candles, earthenware, cigars, cigarettes, hats, gloves, starch and cheese. Spinning and weaving are Indian household occupations, and exceptionally substantial fabrics are made from llama fleece, cotton and wool. Finer fabrics are woven from alpaca and vicuña wool, sometimes mixed with silk or lamb's wool. The Indians are skilled dyers, tanners and saddlers. There is much water-power, and there are electric light and power plants at La Paz, Cochabamba and elsewhere.

Commerce.—The course of trade in recent years is shown as follows:—

	Imports Bs.	Exports Bs.
1910 . . .	48,802,304	75,622,146
1913 . . .	54,762,833	93,721,513
1918 . . .	34,909,886	182,612,850
1923 . . .	62,914,000	107,693,000
1924 . . .	62,570,000	115,191,500
1925 . . .	68,065,121	119,286,371
1926 . . .	70,831,469	122,681,287

Of the exports in 1926, metals were the largest item (Bs. 113,041,100). Of this sum tin represented approximately 75%, with silver, lead and copper following in this order. Rubber, hides and coca were other exports, while live animals, alpaca wool, quinine, llama wool and coffee were shipped in smaller quantities. These exports went largely to Great Britain (78% in value) and the United States (9%). The Antofagasta route carried 59% of the total exports by tonnage and 75% by value, Arica ranking second. Rubber was the one item that was shipped eastward in quantities (most of the 3,105 metric tons exported in 1926, valued at Bs. 5,484,010, going out via the Amazon route). In the same year the new Argentine route (via La Quiaca) handled a larger amount of exports (15,858 metric tons, valued at Bs. 5,848,133) than did the Peruvian route via Mollendo (5,075 metric tons, of Bs. 2,200,075 value). Wheat flour was the largest single item of

import, with cotton and woollen fabrics, mining machinery, refined sugar, rice, automobiles, live animals, electrical machinery, hats and confections following. Imports (1926) came chiefly from the United States (29% in values), Great Britain (22%), Germany (11%), and Chile (11%). The Arica-La Paz route carried the largest amount of imports (41% in value), while 25% were brought in via Mollendo and Lake Titicaca and 23% via Antofagasta.

Finances.—Revenue comes mainly from mineral export duties, from import tariffs, the Government monopolies of alcohol and tobacco, and the Government's share in the income of the railways. Export duties (1926) were Bs. 8,920,947 and import duties were estimated at Bs. 12,000,000. In 1926 the principal expenditures were: public debt, Bs. 19,375,880; defence, Bs. 8,492,950; public instruction, Bs. 3,892,246; department of interior, Bs. 3,466,082; communications, Bs. 2,171,844; justice, Bs. 2,006,361. The revenue rose from Bs. 12,583,232 in 1910 to Bs. 49,135,126 in 1927. Surpluses of Bs. 816,667 and Bs. 1,368,540 were realized in 1918 and 1924 respectively, but in the ten years 1915-1924, the net deficits amounted to Bs. 39,512,416. In 1927 there was a surplus of Bs. 171,999. On Jan. 1, 1925, the national debt was Bs. 127,834,844; it consisted of an external debt of Bs. 92,970,000, internal debt of Bs. 20,647,355, and a floating debt of Bs. 14,217,489. On June 30, 1927, the public debt was estimated as being Bs. 172,544,762.

Money and Banking.—In 1908 Bolivia virtually adopted the gold standard. The monetary unit is the silver boliviano, given a value of Bs. 12.50 to English and Peruvian pounds, both of which are legal tender. In 1920 United States gold coins were also declared legal tender, the boliviano having a par value to the dollar of \$0.3893. After 1914 practically all the silver coins were exported, and in 1925 the currency was nickel and paper. In 1911 a semi-State bank, the Banco de la Nación Boliviano, was established. Its original capital was Bs. 15,937,500, of which half was subscribed by the Government. This bank absorbed the Banco de Bolivia y Londres, the Banco Agrícola and the Banco Industrial. All national banks operating in Bolivia must subscribe 20% of their capital to the Banco de la Nación, though foreign banks may place this quota in national bonds. The paid-up capital of the Banco de la Nación on Dec. 31, 1924, was Bs. 22,000,000, and the republic then held 114,738 of the total of 176,000 shares. A German bank, the Banco Alemán Transatlántico, is the only foreign institution in Bolivia, though banking operations are also conducted through several large foreign mercantile concerns. There are two nationally constituted mortgage banks, the Crédito Hipotecario de Bolivia and the Banco Hipotecario Nacional. In 1914 a law was passed confining the right to issue paper currency to the Banco de la Nación. Department revenues are from excise and land taxes, mining grants, tithes, inheritance taxes, tolls, stamp taxes, subsidies from the national treasury and other small taxes. Expenditures are chiefly for justice, police, public works, public instruction and the church. The many trade taxes recall the old colonial *alcabala* tax, and augment prices in much the same way, if in lesser degree.

Education.—Although there is free and compulsory education, little progress has been made save in larger cities. Spanish is the language of the dominant minority, but Quichua and Aymara are spoken by the natives and many Indians do not understand Spanish and refuse to learn it. Illiteracy, however, which was 84% in 1900, was lowered to about 60% by 1925. The amount spent on education rose from Bs. 1,497,643 in 1910 to Bs. 3,892,246 in 1926. In 1926 there were 1,598 primary schools with 2,765 teachers and 79,973 pupils, as against 733 schools, 938 teachers and 41,587 pupils in 1911. There were in the same year 37 institutions of secondary instruction (including 17 *colegios nacionales*), with 403 instructors and 4,213 students.

The schools are largely under the control of the municipalities, although nearly half of them are maintained by the nation, church and private agencies. The universities at La Paz and Sucre are the only ones teaching any subject but law. The University of La Paz furnishes instruction in law, medicine, theology, obstetrics, pharmacy and dentistry. There are national schools of mines, agriculture and animal husbandry, commerce, bacteriology, agronomy and veterinary science, music, and several normal schools, with a superior normal institute at La Paz, schools of arts and crafts being founded in the principal cities and an institute of applied arts being maintained at La Paz.

Religion.—The State religion is Roman Catholicism, but there is freedom of worship. Roman Catholics numbered 1,609,365 in 1900. There are six bishoprics and an archbishopric. Indian missions are entrusted to the *Propaganda Fide*. An annual appropriation of about Bs. 121,000 goes to the church, Bs. 23,800 being devoted to the Indian missions, which have charge of fully 20,000 Indians. The religious orders, which have never been suppressed, maintain several convents.

Defence.—All males between 19 and 50 are liable to military service. Actually only a limited number are taken into the army, lots being drawn to fill the annual quota for training. A law of Dec. 15, 1915, provided for a permanent force of 3,577 men. There was an immediate reserve of 15,000, though in 1925 there were also available about 200,000 with some training. There are four regiments of infantry and one each, of cavalry, field artillery and mountain artillery and a machine gun corps of 150 men, Bs. 8,492,950 were spent on defence in 1926.

Government is of a unitary or centralized republican type, representative in form, but autocratic in some important particulars. The Constitution in force (1928) was adopted in 1880. The executive branch is presided over by a president and two vice-presidents elected by direct popular vote for four years, and not eligible to re-election for the succeeding term. The president is assisted by ministers of foreign relations and worship; finance and industry; interior and justice; agriculture and public instruction; war and colonization; public works and communication. Every executive act must be countersigned by a minister of State, who is held responsible for its character and enforcement, and may be prosecuted before the supreme court for its illegality and effects. The legislative branch is a congress of two houses—a senate and chamber of deputies. The senate has 16 members, two from each department, who are elected by direct popular vote for a period of six years, one-third retiring every two years. The chamber of deputies has 70 members, elected for four years, one-half retiring every two years. In impeachment trials the chamber prosecutes and the senate sits as a court. One of the duties of the chamber is to elect the justices of the supreme court. Congress meets annually for 60 days, which may be extended to 90. The chambers have separate and concurrent powers. Male citizens 21 years of age or over, if single, and 18 years or over, if married, who can read and write and own real estate or have an income of 200 bolivianos a year not for services as a servant may vote. The electoral body is therefore small, and is under the control of a political oligarchy which practically rules the country, whichever party is in power.

The supreme administrator of a department is a prefect appointed by and responsible solely to the president. As the prefect appoints subordinate officials, the authority of the national executive is wide-spread and may easily become autocratic. There are no legislative assemblies in the departments, and their government rests with the national executive and congress. Subordinate to the prefects are the sub-prefects in the provinces, the *corregidores* in the cantons and the *alcaldes* in the rural districts—all appointed officials. The territories adjacent to Brazil, Paraguay and Peru are governed by three *delegados nacionales*, appointees of the president. The department capitals have municipal councils with jurisdiction over certain local affairs, and over the construction and maintenance of some of the highways, which will be further developed.

The judiciary consists of a national supreme court, eight superior district courts, lower district courts, and *juzgados de instrucción* for the investigation and preparation of cases. The *corregi-*

ON LAKE TITICACA IN BOLIVIA

Justices and alcaldes also exercise the functions of justice of the peace. The supreme court is composed of seven justices chosen by the chamber of deputies from lists of three names for each seat sent in by the senate. A justice can be removed only by impeachment by the senate.

History.—After the defeat of the Incas by the Spaniards in the 16th century the natives were reduced to virtual serfdom and their territory was reorganized as a dependency of the Viceroyalty of Peru and known as Alto Peru or, politically, the Audiencia of Charcas. The seat of government was Sucre. In 1776 this whole area was detached from the Viceroyalty of Peru and made a part of the newly created Viceroyalty of Buenos Aires. In 1780–82 occurred the uprising of the Indians, led by Tupac Amaru, in an attempt (one of many) to drive out or exterminate the Europeans. The movement was conducted with great cruelty on both sides and resulted in the complete defeat of the Indians and the execution of their leader. The Indians remained entirely neutral in the colonial revolt against Spain.

The inhabitants of Alto Peru joined with the other Spanish American colonies in the effort to secure political independence from Spain and to break the dominance of the European-born group. When the patriots of Buenos Aires had succeeded in liberating the interior provinces of the Río de la Plata, they turned their arms against their enemies in Upper Peru. From July 1809 till Aug. 1825 almost uninterrupted warfare was waged in the Argentine provinces of Salta and Jujuy and around Titicaca. Upper Peru was invaded by the army of Buenos Aires, which, after twice defeating the Spanish troops, was able to celebrate the first anniversary of independence near Lake Titicaca, in May 1811. Soon, however, the patriot army, owing to the dissolute conduct and negligence of its leaders, was defeated, in July 1811, by the Spanish and driven back into Jujuy. Four years of warfare were ended in 1815 by the total rout of the patriots in a battle which took place between Potosí and Oruro. Then came a revolt of the Indians of the southern provinces of Peru, and the object being the independence of the whole country, it was joined by numerous creoles. This insurrection was speedily put down by the royalists. In 1816 the Spanish general La Serna, having been appointed commander-in-chief of Upper Peru, attempted to invade the Argentine provinces in a march on Buenos Aires, but he was forced to retire by the irregular *gaucho* troops of Salta and Jujuy. For six years there was guerrilla warfare between the patriots of Upper Peru, who had taken refuge in the mountains, chiefly of the province of Yungas, and the royalist troops. In June 1823 the expedition of Gen. Santa Cruz, prepared with great zeal and activity at Lima, marched in two divisions upon Upper Peru, and in the following months of July and August the whole country between La Paz and Oruro was occupied by his forces; but later he permitted a retreat to be made before a smaller royalist army, and a severe storm converted this movement into a precipitate flight, only a remnant of the expedition again reaching Lima. In 1824, after the victory of Ayacucho, Gen. Sucre, whose valour had contributed so much to it, marched with a part of the army into Upper Peru. On the news of the victory a universal rising of the patriots took place, and before Sucre had reached Oruro and Puno, in Feb. 1825, La Paz was already in their possession, and the royalist garrisons of several towns had gone over to their side. The Spanish general Olañeta, with a diminished army of 2,000 men, was confined to the province of Potosí, where he held out till March 1825, when he was mortally wounded in an action with some of his own revolted troops. Gen. Sucre was now invested with the supreme command in Upper Peru, until the requisite measures could be taken to establish in that country a regular and constitutional government. Fifty-four provincial deputies assembled at Chuquisaca, the capital, to decide, upon the invitation of the Government of the Argentine provinces, whether they would or would not remain separate from that country. In Aug. 1825 they decided that Upper Peru should in future constitute a distinct nation, for which they chose the name Bolivia and issued at the same time a formal declaration of independence.

The first general assembly of deputies dissolved on Oct. 6, 1825, and a new congress was installed at Chuquisaca on May 25, 1826,

to take into consideration the Constitution prepared by Bolívar for the new republic. A favourable committee report was made upon it and it was approved by the congress as the Constitution of the republic. Gen. Sucre was chosen president for life, according to the Constitution, but only accepted the appointment for the space of two years, and on the express condition that 2,000 Colombian troops should be permitted to remain with him. The independence did not secure a peaceful future. Repeated risings occurred, till in the end of 1827 Gen. Sucre and his Colombian troops were driven from La Paz. A new congress was formed at Chuquisaca in April 1828, which modified the Constitution given by Bolívar, and chose Marshal Santa Cruz for president; but only a year later a revolution, led by Gen. Blanco, for a time overthrown the Government. Quiet being again restored in 1831, Santa Cruz promulgated the code of laws which bore his name, and brought financial affairs into some order; he also concluded a treaty of commerce with Peru. In 1835, when a struggle for the chief power had made two factions in the neighbouring republic of Peru, Santa Cruz was induced to take a part in the contest; he marched into that country, and after defeating Gen. Gamarra, the leader of one of the opposing parties, completed the pacification of Peru in the spring of 1836, named himself its protector, and had in view a confederation of the two countries. At this juncture the Government of Chile interfered actively, and espousing the cause of Gamarra, sent troops into Peru. Three years of fighting ensued till in a battle at Yungay in June 1839 Santa Cruz was defeated and exiled, Gamarra became president of Peru, and Gen. Velasco provisional chief in Bolivia. The Santa Cruz party, however, remained strong in Bolivia, and soon revolted successfully against the new head of the Government, ultimately installing Gen. Ballivián in the chief power. Taking advantage of the disturbed condition of Bolivia, Gamarra attempted to annex the rich province of La Paz, invading it in Aug. 1841 and besieging the capital; but in a battle with Ballivián his army was totally routed, and Gamarra himself was killed. The Bolivian general was now in turn to invade Peru, when Chile again interfered to prevent him. Ballivián remained in the presidency till 1848, when he retired to Valparaíso, and in the end of that year Gen. Belzú, after leading a successful military revolution, took the chief power, and during his presidency endeavoured to promote agriculture, industry and trade. Gen. Jorge Córdova succeeded him, but had not been long in office when a new revolt in Sept. 1857, originating with the garrison of Oruro, compelled him to quit the country. His place was taken by Dr. José María Linares, the originator of the revolution, who, taking into his own hands all the powers of government, and acting with the greatest severity, caused himself to be proclaimed dictator in March 1858. Fresh disturbances led to the deposition of Linares in 1861, when Dr. María de Achá was chosen president. New causes of disagreement with Chile had arisen in the discovery of rich beds of nitrate and guano on the coast-land of the desert of Atacama, which threatened warfare, and were only set at rest by the treaty of Aug. 1866, in which the 24th parallel of latitude was adopted as the boundary between the two republics. A new military revolution, led by José María Melgarejo, broke out in 1865, and in February of that year the troops of President Achá were defeated in a battle near Potosí, when Melgarejo took the dominion of the country. After defeating two revolutions, in 1865 and 1866, the new president declared a political amnesty, and in 1869, after imposing a revised Constitution on the country, he became its dictator.

Recent History.—In Jan. 1871 President Melgarejo was in his turn expelled by a revolution headed by Col. Augustín Morales. The latter, becoming president, was himself murdered in Nov. 1872 and was succeeded by Col. Adolfo Ballivián, who died in 1874. Under this president Bolivia entered upon a secret agreement with Peru which was destined to have grave consequences for both countries. By the treaty of 1866 between Bolivia and Chile, Bolivia, besides conceding the 24th parallel as the boundary of Chilean territory, agreed that Chile should have a half share of the customs and full facilities for trading on the coast that lay between the 23rd and 24th parallels, Chile at that time being largely interested in the trade of that region. It was also agreed that Chile

should be allowed to mine and export the products of this district without tax or hindrance on the part of Bolivia. In 1870, in further consideration of the sum of \$50,000, Bolivia granted to an Anglo-Chilean company the right of working certain nitrate deposits north of the 24th parallel. The great wealth which was passing into Chilean hands owing to these compacts created no little discontent in Bolivia, nor was Peru any better pleased with the hold that Chilean capital was establishing in the rich district of Tarapacá. On Feb. 6, 1873 Bolivia entered upon a secret agreement with Peru, the ostensible object of which was the preservation of their territorial integrity and their mutual defence against exterior aggression. There can be no doubt that the aggression contemplated as possible by both countries was a further encroachment on the part of Chile.

Upon the death of Adolfo Ballivián, immediately after the conclusion of this treaty with Peru, Dr. Tomás Frías became president. He signed yet another treaty with Chile, by which the latter agreed to withdraw her claim to half the duties levied in Bolivian ports on condition that all Chilean industries established in Bolivian territory should be free from duty for 25 years. This treaty was never ratified, and four years later Gen. Hilarión Daza, who had succeeded Dr. Frías as president in 1876, demanded as the price of Bolivia's consent that a tax of ten cents per quintal should be paid on all nitrates exported from the country, further declaring that, unless this levy was paid, nitrates in the hands of the exporters would be seized by the Bolivian Government. As an answer to these demands, and in order to protect the property of Chilean subjects, the Chilean fleet was sent to blockade the ports of Antofagasta, Cobija and Tocopilla. On Feb. 14, 1879 the Chilean colonel Sotomayor occupied Antofagasta, and on March 1, a fortnight later, the Bolivian Government declared war.

An offer on the part of Peru to act as mediator met with no favour from Chile. The existence of the secret treaty, well known to the Chilean Government, rendered the intervention of Peru more than questionable, and the law passed by the latter in 1875, which practically created a monopoly of the Tarapacá nitrate beds to the serious prejudice of Chilean enterprise, offered no guarantee of her good faith. Chile replied by curtly demanding the annulment of the secret treaty and an assurance of Peruvian neutrality. Both demands being refused, she declared war upon Peru. The superiority of the Chileans at sea, though checked for some time by the heroic gallantry of the Peruvians, soon enabled them to land a sufficient number of troops to meet the allied forces which had concentrated at Arica and other points in the south. The Bolivian ports were already in Chilean hands, and a sea attack upon Pisagua surprised and routed the troops under the Peruvian general Buendia and opened the way into the southern territory of Peru. Gen. Daza, who should have co-operated with Buendia, turned back, on receiving news of the Peruvian defeat, and led the Bolivian troops to Tacna in a hasty and somewhat disorderly retreat. The fall of San Francisco followed, and Iquique, which was evacuated by the allies without a struggle, was occupied. Severe fighting took place before Tarapacá surrendered, but the end of 1879 saw the Chileans in complete possession of the province.

Meanwhile a double revolution took place in Peru and Bolivia. In the former country Gen. Prado was deposed and Col. Piérola proclaimed dictator. The Bolivians followed the example of their allies. The troops at Tacna, indignant at the inglorious part they had been condemned to play by the incompetence or cowardice of their president, deprived him of their command and elected Col. Camacho to lead them. At the same time a revolution in La Paz proclaimed Gen. Narciso Campero president, and he was elected to that post in the following June by the ordinary procedure of the Constitution. During 1880 the war was chiefly maintained at sea between Chile and Peru, Bolivia taking little or no part in the struggle. In Jan. 1881 were fought the battles of Chorillos and Miraflores, attended by heavy slaughter and savage excesses on the part of the Chilean troops. They were followed almost immediately by the surrender of Lima and Callao, which left the Chileans practically masters of Peru. In the interior, however, where the Peruvian admiral Montero had formed a provisional

government, the war still lingered, and in Sept. 1882 a conference took place between the latter and President Campero, at which it was decided that they should hold out for better terms. But the Peruvians soon wearied of the useless struggle. On Oct. 20, 1883 they concluded a treaty of peace with Chile (the treaty of Ancón); the troops at Arequipa, under Admiral Montero, surrendered that town, and Montero himself, coldly received in Bolivia, whither he had fled for refuge, withdrew from the country to Europe. On Nov. 9, the Chilean army of occupation was concentrated at Arequipa, while what remained of the Bolivian army lay at Oruro. Negotiations were opened, and on Dec. 11, a truce was signed between Chile and Bolivia. By this treaty Bolivia agreed to the occupation by Chile of the whole of its sea-coast, including the port of Cobija.

On May 18, 1895, a treaty was signed at Santiago between Chile and Bolivia, "with a view to strengthening the bonds of friendship which unite the two countries," and, "in accord with the higher necessity that the future development and commercial prosperity of Bolivia require her free access to the sea." By this treaty Chile declared that if, in consequence of the plebiscite (to take place under the treaty of Ancón with Peru), or by virtue of direct arrangement, she should "acquire dominion and permanent sovereignty over the territories of Tacna and Arica, she undertakes to transfer them to Bolivia in the same form and to the same extent as she may acquire them"; the republic of Bolivia paying as an indemnity for that transfer \$5,000,000 silver. If this cession should be effected, Chile should advance her own frontier north of Camerones to Vitor, from the sea up to the frontier which actually separates that district from Bolivia. Chile also pledged herself to use her utmost endeavour, either separately or jointly with Bolivia, to obtain possession of Tacna and Arica. If she failed, she bound herself to cede to Bolivia the roadstead (*caleta*) of Vitor, or another analogous one, and \$5,000,000 silver. Supplementary protocols to this treaty stipulated that the port to be ceded must "fully satisfy the present and future requirements" of the commerce of Bolivia.

On May 23, 1895, further treaties of peace and commerce were signed with Chile. During those ten years of Bolivia's recovery from the war, the presidency was held by Dr. Pacheco, who succeeded Campero, and held office for the full term; by Dr. Aniceto Arce, who held it until 1892, and by Dr. Mariano Bautista, his successor. In 1896 Dr. Severo Alonso became president, and during his tenure of office diplomatic relations were resumed with Great Britain, Señor Aramayo being sent to London as minister plenipotentiary in July 1897. As an outcome of his mission an extradition treaty was concluded with Great Britain in March 1898.

In December an attempt was made to pass a law creating Sucre the perpetual capital. Until this time Sucre had taken its turn with La Paz, Cochabamba and Oruro. La Paz rose in open revolt. On Jan. 17 of the following year a battle was fought some 40 m. from La Paz between the insurgents and the Government forces, in which the latter were defeated with the loss of a colonel and forty-three men. Col. Pando, the insurgent leader, having gained a strong following, marched upon Oruro, and entered that town on April 11, 1899, after completely defeating the Government troops. Dr. Severo Alonso took refuge in Chilean territory; and Col. Pando formed a provisional government. He had no difficulty in obtaining his election to the presidency without opposition. He entered upon office on Oct. 26, and proved himself strong and capable. He had to deal with two difficult settlements as to boundaries with Chile and Brazil, and to improve communication in order to revive mining and other industries. The dispute with Brazil over the rich Acre rubber-producing territory was accentuated because the majority of those engaged in the rubber industry were Brazilians who resented the attempts of Bolivian officials to exercise authority in the district. This led to a declaration of independence on the part of the State of Acre, and the despatch of a body of Bolivian troops in 1900 to restore order. There was no desire, however, on the part of President Pando to involve himself in hostilities with Brazil, and in a spirit of concession the dispute was settled amicably by diplomatic means, and a treaty signed in Nov. 1903. A new boundary line was drawn, and a portion of the

Acre province ceded to Brazil in consideration of a cash indemnity of \$10,000,000.

The long-standing dispute with Chile with regard to its occupation of the former Bolivian province of Antofagasta under the Pacto de Tregua (Pact of Truce) of April 4, 1884 was more difficult to arrange satisfactorily. In 1895 there had been some prospect of Chile's conceding an outlet on the sea in exchange for a recognition of the Chilean ownership of Tacna and Arica. The discovery, however, of secret negotiations between Bolivia and Argentina caused Chile to change its conciliatory attitude. Bolivia was in no position to venture upon hostilities or to compel the Chileans to make concessions, and the final settlement of the boundary dispute between Argentina and Chile deprived the Bolivians of the hope of obtaining the support of the Argentines. President Pando and his successor, Ismael Montes, who became president in 1904, saw that it was necessary to yield, and to make the best terms they could. A treaty was accordingly ratified in 1905, which was in many ways advantageous to Bolivia, though the republic was compelled definitely to cede to Chile the maritime provinces occupied by the latter power since the war, and to do without a seaport. The Government of Chile undertook to construct a railway at its own cost from Arica to the Bolivian capital, La Paz, and to give the Bolivians free transit through Chilean territory to certain towns on the coast. Chile further agreed to pay Bolivia a cash indemnity and lend certain pecuniary assistance to the construction of other necessary railways.

On Aug. 6, 1909 President Montes was succeeded by Señor Eliodoro Villazón. During their administrations the progress of Bolivia was marked and to the end of 1927 conditions in the republic were much more stable, both economically and politically, than ever before. Gen. Montes assumed office for a second term on Aug. 6, 1913, and remained President until 1917. The World War had a considerable influence upon the trade of Bolivia: imports decreased, while her exports, mainly minerals, increased very considerably in value. The country proclaimed its neutrality in 1914, but departed from this attitude in consequence of Germany's submarine policy. Diplomatic relations with Germany were severed on April 13, 1917, the reason for this action being that a German submarine had torpedoed in neutral waters a ship with the Bolivian minister to Berlin on board. The republic took no direct part in the War on the side of the Allies, but all her resources in metals were at their disposal.

Montes relinquished office on Aug. 6, 1917, and was succeeded by his former Minister of Finance, Señor José Gutiérrez Guerra. Shortly after this the agitation for an outlet to the Pacific reached an acute stage. The policy of President Guerra was apparently aimed at a *rapprochement* with Chile over the long-standing grievance resulting from the loss of Bolivia's coastal territories. Popular indignation against this attitude led to demonstrations: Guerra was forced to resign, and was escorted out of the country to Arica. Meanwhile the World War had ended. Bolivia was represented at the Versailles Conference, and signed the Peace Treaty of 1919 and became an original member of the League of Nations. Following the deposition in July 1920 of President Guerra, the provisional Government of Bolivia prosecuted the popular demand for a revision of the situation in regard to her lost territory (see TACNA-ARICA).

The presidency of Dr. Bautista Saavedra (elected 1920) was productive of marked economic progress. Nevertheless some measure of political unrest was experienced both in 1924 and 1925. A revolutionary movement took place in July 1924 but was promptly suppressed by the Government. Ostensibly the object was to promote the secession of the province of Santa Cruz to the neighbouring republic of Brazil, but active opposition to the policy of the Saavedra Government was really the purpose of the disturbance. In Jan. 1925 Dr. José C. Villanueva, a physician who had been serving as minister of public instruction and agriculture, and Abdón Saavedra, a brother of the President, were nominated as Republican candidates for President and Vice-president. The Liberal party nominated Dr. Salamanca for the presidency. After a vigorous electoral campaign the Republican candidates were elected on May 2 by an overwhelming majority.

The successful candidate for the presidency should have taken office on Aug. 6, but Congress refused to ratify his election on the ground that it was invalid because he had not resigned public office, as required by the Constitution, at least six months before election. Meanwhile Saavedra continued in office. On Sept. 1, Congress formally declared the election of May 2 null and void. President Saavedra transferred his office to Dr. Felipe Guzmán, president of the Senate, to administer the Government provisionally, pending a new election. In December the new election was held and Dr. Hernando Siles, a Republican, was elected. He was installed in office in Jan. 1926.

In 1927 Bolivia and Paraguay re-opened negotiations in an attempt to settle their boundary dispute in the Gran Chaco. By a protocol adopted April 22 of that year, the two nations agreed to arbitrate the question. The commission which was set up began its sessions in an atmosphere of optimism, but by December it had reached a state of impasse over questions of interpretation. Intermittent meetings in 1928 likewise failed, and an open clash on Dec. 6 between armed forces of Bolivia and Paraguay brought the question to an acute stage. Both nations mobilized for war and further clashes followed. However, on Dec. 17th Paraguay, and on Dec. 18th Bolivia, agreed to accept the mediation offer of the International Conference of American States on Conciliation and Arbitration then in session in Washington.

- BOLKHOV**, a town in the Orlov province of the Russian Socialist Federal Soviet Republic. Lat. 53° 25' N, Long 36° E. Pop. (1926) 17,532. It is a trading centre for hemp products and cattle, situated in an orchard district. It has a cathedral and near it are the ruins of the Optina Pustyn monastery.
- BOLL**, a botanical term for a fruit-pod, particularly of the cotton plant. The word is in O E. *bolla*, which is also represented in "bowl," a round vessel for liquids, a variant due to "bowl," ball, which is from the Fr. *boule*. "Boll" is also used, chiefly in Scotland and the north of England, as a measure of weight for flour=140 lb., and of capacity for grain, 16 pecks=1 boll. In the United States the word has become familiar through the depredations of the boll weevil (*q v.*).
- BOLLANDISTS**, the Belgian Jesuits who publish the *Acta Sanctorum*, the great collection of biographies and legends of the saints, arranged by days, in the order of the calendar. The original idea was conceived by a Jesuit father, Heribert Rosweyde (see HAGIOLOGY). His intention was to publish in 18 volumes the lives of the saints compiled from the mss., at the same time adding sober notes. At the time of his death (1629) he had collected a large amount of material, but had not been able actually to begin the work. A Jesuit father, John Bolland, was appointed to carry on the project. In 1635 Henschenius (Godfried Henschen) was associated with Bolland, and publication began in 1643. From 1659 Papebroch (Daniel van Papenbroeck) collaborated. This was the most brilliant period in the history of the *Acta Sanctorum*. The freedom of Papebroch's criticism made him many enemies, and he had often to defend himself against their attacks. The work was continued—with some inequalities, but always in the same spirit—until the suppression of the Society of Jesus in 1773. The last volume published was vol. iii. of October which appeared in 1770.
- On the dispersion of the Jesuits the Bollandists were authorized to continue their work, and remained at Antwerp until 1778, when they were transferred to Brussels, to the monastery of canons regular of Coudenberg. Here they published vol. iv. of October in 1780, and vol. v. of October in 1786, when the monastery of Coudenberg was suppressed. In 1788 the work of the Bollandists ceased. The remains of their library were acquired by the Premonstratensians of Tongerlo, who endeavoured to continue the work, and in their abbey vol. vi. of October appeared in 1794.
- After the re-establishment of the Society of Jesus in Belgium the work was again taken up in 1837, at the suggestion of the Académie Royale of Belgium and with the support of the Belgian Government, and the Bollandists were installed at the college of St. Michael in Brussels. In 1845 appeared vol. vii. of October, the first of the new series, which reached vol. xiii. of October in 1883.
- In 1882 the activities of the Bollandists were exerted in a new direction with a view to bringing the work more into line with the progress of historical methods. A quarterly review was established under the title of *Analecta Bollandiana* by the Jesuit fathers C. de Smedt, G. van Hooff and J. de Backer. This reached its 25th volume in 1906, and was edited by the Bollandists de Smedt, F.

van Ontroy, H. Delehaye, A. Porcelet and P. Peeters. This review contains studies in preparation for the continuation and remoulding of the *Acta Sanctorum*, inedited texts, dissertations, and, since 1892, a *Bulletin des publications hagiographiques*, containing criticisms of recent works on hagiographic questions. In addition to this review, the Bollandists undertook the analysis of the hagiographic mss. in the principal libraries. Besides numerous library catalogues published in the *Analecta* (e.g. those of Chartres, Namur, Ghent, Messina, Venice, etc.), separate volumes were devoted to the Latin mss. in the Bibliothèque Royale at Brussels (2 vols., 1886-89), to the Latin and Greek mss. in the Bibliothèque Nationale at Paris (5 vols., 1889-96), to the Greek mss. in the Vatican (1899), and to the Latin mss. in the libraries of Rome (1905 seq.). They also prepared inventories of the hagiographic texts hitherto published, and of these there have appeared the *Bibliotheca hagiographica graeca* (1895), the *Bibliotheca hagiographica latina* (1899) and the *Bibliotheca hagiographica Orientalis*. These indispensable works delayed the publication of the principal collection, but tended to give it a more solid basis and a strictly scientific stamp. In 1887 appeared vol. i. for November; in 1894, vol. ii., preceded by the *Martyrologium Hieronymianum* by J. B. de Rossi and the abbé Louis Duchesne; in 1902, the *Propylaeum ad Acta Sanctorum Novembris*; and in 1910 vol. iii. of November was published.

There are three editions of the *Acta Sanctorum*: the original edition (Antwerp, Tongerlo and Brussels, 65 vols., 1643-1910; the Venice edition, stopping at vol. v. of September (1734-70) and the Paris edition, stopping at vol. xiii. of October (61 vols., 1863-83).

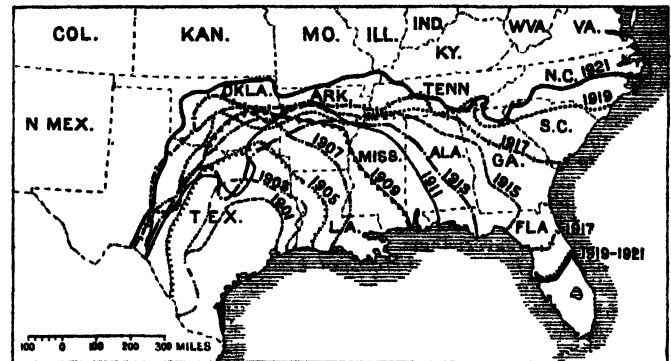

See H. Delehaye, *The work of the Bollandists* (Princeton, U.S.A., and London, 1922), an excellent compendium of information; de Smedt, Art., "Bollandists," *Catholic Encyclopaedia*, vol. ii.; J. B. Pètra, *Études sur la collection des Actes des Saints* (1880).

BOLLEY, HENRY LUKE (1865-), American botanist, was born in Dearborn county, Ind., on Feb. 1, 1865. He graduated at Purdue university in 1888 and was assistant botanist at the Indiana State experiment station from 1889-90, when he was named botanist and zoologist in the North Dakota agricultural college and experiment station. From 1909 he was dean of biology in the college, botanist and plant pathologist in the experiment station and State seed commissioner. He devoted himself chiefly to plant pathology, and originated various methods of disinfection for grains and also several new varieties of flax. In 1908 he published *The North Dakota Pure Seed Law* in explanation of legislation which he had originated. He also proposed a system of crop rotation based upon "the planting in series of genetically non-related crops, so distantly non-related that they do not bear each other's disease factors." He published a *List of Seed-bearing Plants of North Dakota* (1900), *Seed Disinfection and Crop Production* (1910) and numerous bulletins on potato scab, wheat rust, grain smuts, flax wilt, weed control and similar subjects.

BOLL WEEVIL, COTTON. The first home of the cotton boll weevil was undoubtedly in the plateau region of Mexico or Central America. Before 1892 it had spread throughout the larger portion of Mexico. It occurs southward to Guatemala and Costa Rica, and in the east half of Cuba. About 1892 it crossed the Río Grande near Brownsville, Texas, and entered U.S. territory. By 1894 it had spread to half a dozen counties in southern Texas, and since has extended its range annually until in 1928, almost all of the most important cotton-producing sections had become infested. Practically the only territory remaining uninfested was the semi-arid zone along the western margin of the cotton belt. The 1921 estimate of the U.S. department of agriculture of the potential production of cotton prevented by weevils was 6,277,000 bales.

The adult boll weevil is about $\frac{1}{4}$ in. long, varying from $\frac{1}{4}$ to $\frac{3}{4}$ in., with a breadth about one-third of its length. This measurement includes the snout, which is approximately half the length of the body. Variation in size is due to the amount of food the insect has obtained in the larval stage. Individuals from bolls (unripe pods containing lint and seed) are therefore nearly always larger

than those from squares (fruit buds). Recently emerged individuals are light yellowish in colour, but this changes to a grey or nearly black shade in a few weeks' time. In the field, the most conspicuous indication of the presence of the boll weevil is the flaring and falling of numbers of squares or buds. Unfavourable climatic conditions and careless cultivation, however, frequently cause great shedding of the fruit, which is often mistaken for

FROM THE DEPARTMENT OF AGRICULTURE YEAR BOOK

MAP SHOWING THE BIENNIAL SPREAD OF BOLL WEEVIL IN THE SOUTH. Beginning in Texas in 1901, the boll weevil scourge expanded until in 20 years it had infested practically all of the cotton producing area.

weevil damage. If excessive shedding be noted and the squares upon being cut open show a white, curved grub that has fed upon the contents, there is little doubt that the boll weevil is the insect causing the damage.

The boll weevil passes the winter as an adult or beetle. With the advent of autumn weather the adult boll weevils in cotton-fields begin to seek protection against the winter. They fly in every direction, although their movements are governed partially by the prevailing winds. They may fly into hedges, woods, corn-fields, haystacks, farm buildings or other places. A number of weevils also obtain hibernating quarters without leaving the cotton-fields. These may crawl into cracks in the ground, under grass, weeds or other trash, and into the burs from which the cotton has been picked. During the winter the weevils take no food, and remain practically dormant; on warm days they may move about to a certain extent. Emergence from hibernation depends primarily upon temperature and rainfall in the spring, although some minor factors are concerned. In the southern portions of the cotton belt emergence usually begins from the first to the middle of March, but farther north it is somewhat later. Emergence has been prolonged from the middle of March to June 28, and in more extreme cases from the middle of February to about the first of July.

In the spring and throughout the fruiting season of cotton, the eggs are deposited by the female weevils in cavities formed by eating into the buds and fruit of the plant. An egg hatches under normal conditions in about three days, and the grub immediately begins to feed. In from 7 to 12 days the larva or grub passes into its pupal stage, corresponding to the cocoon of butterflies and moths. This stage lasts from three to five days. Then the adult issues, and in about five days begins to breed. Climatic conditions cause considerable variation in the duration of the stages, but on an average it requires from two to three weeks for the weevil to develop from the egg to the adult. The males feed upon the squares and bolls without moving until the food begins to deteriorate. The females refrain, throughout most of the season, from depositing eggs in squares visited by other females, but late in the autumn, when all of the fruit has become infested, several eggs may be placed in a single square or boll. As many as 15 larvae have been found in a boll. The squares are greatly preferred as food and as places for depositing eggs. As long as a large supply of squares is present the bolls are not generally damaged to any serious extent. The bolls, therefore, have a fair chance to develop as long as squares are being formed. The weevil, so far as at present known, breeds in no plants other than cotton and a wild plant related to cotton found in the mountains of Arizona.

In spite of the many complexities involved in the problem of weevil control, efficient methods (*see* CORRON) have been developed for reducing its damage, which are of practical use to growers. These are described in Farmers' *Bulletin* No. 1329, procurable on request from the U.S. department of agriculture, Washington, D.C. (B. R. C.)

BOLOGNA, GIOVANNI DA (1524-1608) (Ital. for his real name, JEAN BOLOGNE or BOULLONGNE), Flemish sculptor, was born at Douai in 1524. He settled, in 1553, in Florence, where his best works still remain. The most celebrated are the single bronze figure of Mercury, poised on one foot, resting on the head of a zephyr, as if in the act of springing into the air (in the Bargello gallery), and the marble group known as the "Rape of the Sabinus," which was executed for Francesco de' Medici. It is now in the Loggia de Lanzi of the ducal piazza. Giovanni was also employed at Genoa, where he executed various excellent works, chiefly in bronze. His great fountain at Bologna (1563-66) is remarkable for beauty of proportion. Noteworthy also are his two fountains in the Boboli gardens, one completed in 1576 and the other in 1585. He also cast the fine bronze equestrian statue of Cosimo de' Medici at Florence and the very richly decorated west door of Pisa cathedral.

See La Vie et l'oeuvre de Jean Bologne, par Abel Desjardins, d'après les manuscrits recueillis par Fouques de Vagnonville (1883, numerous illustrations; list of works).

BOLOGNA (ancient *Bononia*, *qv*), archiepiscopal see of Emilia, Italy, capital of province of Bologna, headquarters of the VI. army corps. It is at the edge of the plain of Emilia, 180ft. above sea-level at the base of the Apennines, 82m. N. of Florence by rail, 63m. by road and 50m. direct, and 134m. S.E. of Milan by rail. Pop. (1901), town, 102,122; (1921) 162,111; (1901), commune, 153,501; (1921) 211,157. The Roman city, orientated on the points of the compass, with streets at right angles, can be distinguished from the outer city, fortified in 1206. The streets leading to the gates of the latter radiate from the outskirts, and not from the centre, of the former. S. Stefano, S. Giovanni in Monte and SS. Vitale ed Agricola, among the oldest churches, lie in the outer city. S. Stefano is a group of seven buildings, of different dates; the earliest, the former cathedral of SS. Pietro e Paolo, built in the middle of the 4th century with debris of Roman buildings; while S. Sepolcro (6th-7th centuries) is a circular church with ornamentation in brick and an imitation of *opus reticulatum*. The present cathedral (S. Pietro), first erected in 910, is now baroque. The largest church (Gothic) of Bologna is that of S. Petronio, the city's patron saint, begun 1390; only nave and aisles as far as the transepts were completed, measuring 384ft long and 157ft. wide, whereas the projected length of the whole (a cruciform basilica) was over 700ft., with a breadth across the transepts of 460ft., and a dome 500ft. high over the crossing. S. Domenico contains the body of the saint, who died there in 1221. The beautiful S. Francesco (1246-60), has a fine brick campanile (end of 14th century). It was restored to sacred uses in 1887, and has been carefully liberated from later alterations. Piazza Vittorio Emanuele (formerly Piazza Maggiore), and Piazza del Nettuno lie at the centre at right angles to one another. Here are the church of S. Petronio, the massive Palazzo Comunale (1245), the Palazzo del Podestà (1245), Palazzo del Re Enzo, recently restored, and the fine bronze statue of Neptune by Giovanni da Bologna (Jean Bologne of Douai).

The famous university of Bologna was founded in the 11th century (*see* UNIVERSITIES). The students numbered between three and five thousand in the 12th to the 15th century, and in 1262, it is said, nearly ten thousand (among them were both Dante and Petrarch). Though autonomous, the university had no fixed residence; professors lectured in their own houses, or later in rooms hired or lent by the civic authorities. Only in 1520 were professors of law given apartments in a building belonging to S. Petronio; and in 1562, by order of Pius IV., the university itself was built by Carlo Borromeo, then cardinal legate. In 1564, Tasso was a student there, and was tried for writing a satirical poem. One of the most famous professors was Marcello Malpighi. The building has served as the communal library since

1838. Its courtyard contains the arms of students elected as representatives of their respective nations or faculties. The university, since 1803, is housed in part in the (16th century) Palazzo Poggi. It now has four faculties. Among its professors women have more than once been numbered.

The Museo Civico contains especially fine collections of antiquities from the neighbourhood. The important picture gallery surveys both the earlier Bolognese paintings and the works of the Bolognese eclectics (16th and 17th centuries) the Caracci, Guido Reni, Domenichino, Guercino, etc. The works of Francesco Francia (1450-1517) and Lorenzo Costa of Ferrara (1460-1535), are also of considerable merit. The great treasure is Raphael's S. Cecilia, painted for the church of S. Giovanni in Monte about 1515.

The Torre Asinelli (1109) and the Torre Garisenda (1110) are square brick towers, the former 320ft. in height and 4ft. out of the perpendicular, the latter (unfinished) 163ft high and 10ft out of the perpendicular. The town contains many fine private palaces (13th century onwards), mostly in brick. The streets are as a rule arcaded, and this feature has been preserved in modern additions.

Bologna prepares sausages (*mortadella*), macaroni (*tortellini*), and liqueurs, refines sugar, hulls rice, and makes railway material.

It is an important railway centre, just as the ancient Bononia was a meeting-point of important roads. Here the main line from Milan divides, one portion going on parallel to the ancient Via Aemilia (which it has followed from Piacenza downwards) to Rimini, thence to Ancona and Brindisi, and the other through the Apennines to Pistoia and Florence and thence to Rome. A shorter line to Florence via Prato is under construction. Another line runs to Ferrara and Padua, another to Verona and a third to Budrio and Portomaggiore (a station on the line from Ferrara to Ravenna). Steam tramways run to Vignola, Pieve di Cento and Malalbergo.

Bologna, briefly held by the Lombards, remained generally under the exarchate of Ravenna, until this was given by Pippin (756) to the papacy. It was sacked by Hungarians in 902, but its early history is little known, and it is uncertain when it acquired its freedom and its motto *Libertas*. The first "constitution" of the commune of Bologna (1123) shows it to be free and independent. It strongly supported the Guelph cause against Frederick II. and against the neighbouring cities of Romagna and Emilia; indeed, the Bolognese kept Enzo, the emperor's son, prisoner, from 1249 till his death. But Guelph and Ghibelline struggles in Bologna itself so weakened the commune that for the next two centuries it fell under various masters, until Pope Julius II. in 1506 brought it under the papacy, where it remained (except in the Napoleonic period between 1796 and 1815 and during the revolutions of 1821 and 1831) until in 1860 it became part of the kingdom of Italy.

Among the most illustrious natives of Bologna may be noted Luigi Galvani and Prospero Lambertini (Pope Benedict XIV.). Giosuè Carducci, the poet, lived here for many years, and died here in 1907.

BOLOMETER, an instrument for measuring radiation by means of the rise in temperature of a blackened metal strip in one of the arms of a resistance bridge. In the first bolometer, invented by Langley, a Wheatstone bridge (*qv*) was used in conjunction with a galvanometer which showed a deflection proportional to the intensity of radiation (when the deflection was not great). Lummer and Kurlbaum's bolometer consists of four platinum gratings (each of which is made of a series of strips) inserted in the arms of a Callendar-Griffiths bridge (*qv*); two of these gratings, in opposite arms of the bridge, are placed one behind another, so that the openings of one are opposite the strips of the other, and are exposed to the radiation, the other opposite pair being shielded; this arrangement doubles the effect on the galvanometer, and also compensates any extraneous temperature changes. The *spectrum bolometer* consists of a single strip set on edge, in an arm of a bridge; it is used for exploring the distribution of intensity of radiation in a spectrum (*see* RADIATION, THEORY OF, and SPECTROSCOPY).

BOLSENA (anc. *Volsinii*)¹, province of Viterbo, Italy, 12m. W.S.W. of Orvieto by road, on north-east bank of Lake Bolsena. Pop. 2,821 (town) 3,635 (commune). The town is dominated by a picturesque mediaeval castle. The 11th century church of S. Christina (martyred in 278 by drowning in the lake according to the legend) has a fine Renaissance façade, constructed about 1490 by Cardinal Giovanni de' Medici (afterwards Pope Leo X.), and some good terra cottas by the Della Robbia; in catacombs beneath is the tomb of the saint. A Bohemian priest, sceptical of the doctrine of transubstantiation, was convinced by the appearance of drops of blood on the host he was consecrating on an altar of the crypt (1263). In commemoration of this Pope Urban IV. instituted the festival of Corpus Christi, and ordered the erection of the cathedral of Orvieto.

Lake Bolsena (anc. *Lacus Volsiniensis*), 1,000ft. above sea-level, 71sq.m. in area, and 480ft. deep, is almost circular, and was the centre of a large volcanic district, though probably not itself an extinct crater. Its sides show fine basaltic formation. It contains two islands, Bisentina and Martana, the latter containing remains of the castle where Amalasuntha, daughter of Theodoric, was strangled.

BOLSHEVISM, the doctrine professed by the extreme left wing of the Russian Social Democratic Party. The name is derived from the fact that at a conference of the party held in Brussels and London in 1902-3, a majority ("Bolsheviki") secured the acceptance of views urged by their leader Nikolai Lenin, the minority ("Mensheviki") largely withdrawing from control of the party's operations.

I. The Origins of Bolshevism.—The effective origins of Bolshevism may be traced back to the foundation, in 1883, of the *Group for the Emancipation of Labour* by Plekhanov and Axelrod. The latter, deeply influenced by the doctrines of Marx, which were now beginning to exercise a wide influence on Russian Socialism, broke with the older Narodniki who had counted upon a peasant revolution as the source of Russian emancipation. The group preached the doctrine that the main pivot of revolutionary success must be the organized working-class; and its consequent emphasis upon the class-structure of society makes it legitimate to regard it as the first Marxian organization in Russia.

The history of the party from 1883 until 1903 may conveniently be divided, as by Lenin, into three periods. The first, which extends until 1894, is the period of gestation; the second, which goes down to 1898, is the period of adolescence; the third, which ends with the Brussels-London conference of 1903, is the period in which the party assumed definiteness of form and outlook. In the first period, the party was mainly occupied with self-discovery and exercised comparatively insignificant influence on the working-class. Discussion circles were formed, books and pamphlets were published, the men who were subsequently to reveal themselves as leaders appeared. But the party consisted of leaders without a following. Industrial organization was too backward in Russia for a working-class movement to be possible. The leaders were convincing one another; and the discussion circles like that formed by the Bulgarian Blagoev at St. Petersburg in 1887, had considerable influence. But the party cannot be said to have awakened any general knowledge of its significance. The second period, however, saw a large development. Having attained some clarity of doctrine, and having finally separated itself from the influence of the Narodniki, the party began to organize definite relations with the working-class. The growth of industry led to strikes on an increasing scale. District and regional committees were founded; and men of the standing of Lenin, Krassin, Martov, joined the party. Workers' Social Democratic Circles were founded in most considerable towns. By 1898 it was clear, both from the degree of organization, and the immense literary output, that the party was making its way as a national institution and had an assured future.

¹According to the theory now generally adopted, the Etruscan *Volsinii* occupied the site of Orvieto, which was hence called *Urbs vetus* in late classical and mediaeval times, while the Roman *Volsinii* was transferred to Bolsena (see *Volsinii*).

Two other events contributed to its development. In 1897 was founded the Bund, the union of Jewish workers in Poland and Lithuania. This body was given coherency and strength by the fact that its members suffered not merely economic, but also religious oppression. They engaged in revolutionary activity upon a large scale, and their energy made them the spear-head of the party. To it was due the organization in 1898, of the first party conference at Minsk. Nine members met there. They formed a definite organization, elected a central committee, and published an historic manifesto actually drawn up by P. Struve, who, later, deserted the party and became a reactionary.

It was not yet, however, clearly known what method the party was to follow. There were different strands of thought visible. Some members of the party believed that the first essential work was to win working-class adherents by pushing their economic claims to better industrial conditions; the vaster task of capturing the state was, in their judgment, not yet ripe. Others, of whom Lenin was the most outstanding, insisted that economic discontent must be from the outset merely the base from which the capture of the bourgeois state by the working-class is organized. The first group (Struve, Prokopovitch, Kouskova) insisted that the overthrow of tsarism was not a working-class duty; the latter should occupy itself with matters like the hours of labour and the rate of wages. From this, they were called *economists*. Their opponents (Lenin, Martov, Plekhanov), were known later as *Iskrists* from the title of their journal *Iskra* (founded in 1900).

The period from 1898 until 1903 was the most critical in the history of the party. Its numbers grew by leaps and bounds. Students poured into it from every university and technical school. Groups of every shade of socialist opinion came into existence. The growth in numbers naturally multiplied the winds of doctrine in the party. The development, moreover, of liberal bodies like the *Union for Liberation* of which Miliukov was leader, raised in an acute form the question of the relationship of the Social Democrats to the radical bourgeoisie. There were problems, further, as to how far it was desirable to encourage those isolated acts of terrorism of which Russian history at this period was so full. The party, in short, at this period was a loosely confederated system of semi-autonomous groups, doctrinally united upon the ultimate goal, but with no clear view either of method, or of order of priority in objectives. When *Iskra* was founded in 1900 the meaning of these varieties of opinion became clear.

II. The Separation of Doctrine.—The editors of *Iskra*, of whom Lenin, Plekhanov, Martov and Axelrod were the best known, set themselves certain definite tasks. Above all, they aimed at combating economism. Secondly, they set themselves clearly to distinguish between Socialists willing to use all the currents of opposition to tsarism, and those who sought to act solely through a proletarian party. In 1902, Lenin published his *What must we do?* in which, with great power, he argued for the concentration of all revolutionary energy into a centralized party of which each member should have his definitely allotted function and act as a soldier in an army. He sought to organize a revolutionary élite from which all spontaneous and individual action should have been cut away, to be replaced by a corps of professionals whose function should be directed by a central committee of strategy. Events precipitated the full discussion of this view. A growing resort to the strike weapon (sometimes, as at Kiev in 1901 successfully) and increased activity against the Socialists led to the need for a new orientation of policy. A provisional programme was drawn up, not without difficulty, and in 1902 the second congress of the party assembled in Brussels. The police interfered with its proceedings; and it was transferred after a few days to London.

The second Congress was a representative body of some 60 delegates. Most of the leading figures in the movement were there; and the discussions went to the very heart of the problems confronting it. From the outset, it was clear that there were two decisively opposed strands of opinion. The demand of the Bund for the maintenance of a separate Jewish national organization within the party, raised squarely the issue whether its

basis should be purely that of class. For the Bund, a federal structure in the party was fundamental; to Lenin and his supporters federalism simply spelt strategic weakness and a proletarian victory was impossible if organization was to take account of national differences. Upon this issue Lenin, and the future leader of the Mensheviks, Martov, were united in opposition.

But grave differences appeared. On party procedure, Lenin on the one side and Martov and Axelrod on the other took widely different views. For the former, party membership was to be reserved only for those who participated fully in its organization and fulfilled the orders it issued. For Martov, sympathetic adherence was sufficient. To Lenin, a party was meaningless unless it was a firmly coherent organization built up of authentic and similarly-minded partisans who moved along a single front to their goal. Martov took the view that this would deprive the party of the services of many, professors and students, for example, who could not fulfil the rigid demands Lenin was prepared to enforce. It cannot be said that, at the moment, the significance of the conflict was understood. Plekhanov, for instance, at that time perhaps the first of the party's theorists, did not treat it as a serious issue; and in the actual voting Martov's more liberal formula of adhesion prevailed. But the next difference went deeper still. Martov and his allies were prepared for a period of co-operation with the Liberals, on the condition that the latter should pronounce for universal suffrage. Lenin and Plekhanov protested against this view. What is vital, they urged, is the proletarian revolution. The Liberals would use the Socialists to overthrow the tsar and then take no further interest in the revolution. The Socialist must stand alone; only in that way was a Socialist revolution possible. Again the conference was undecided. It was yet significant that Martov and Lenin, thus far allies, were now on opposite sides upon fundamental questions of tactics. Their divergence was again revealed when, questions of nationalism apart, Lenin demanded a centralized, and Martov, a federal party structure. They were opposed again on the question of editorial control of *Iskra* where Lenin sought a decisive voice. He was successful by 25 votes to 23, and the two sides now took the names of Bolsheviks and Mensheviks.

These differences were not merely upon tactics. When the programme of the party was discussed, it was clear that the Mensheviks laid great store by such matters as universal suffrage and the Constituent Assembly and its character. To Lenin and Plekhanov (at that time a Bolshevik) these were secondary issues. What was important was the Bolshevik revolution, and to its success all other considerations must be subordinate. The hegemony of the proletariat, said Plekhanov, is fundamental. To its maintenance it may be necessary to sacrifice the freedom of the bourgeoisie and the existence of a democratically elected assembly. A successful revolution, in other words, must confront the necessity of dictatorship. For that reason the Bolsheviks refused to accept Martov's demand for the abolition of the death sentence. Their view was put by Plekhanov in a single, prophetic phrase, "Do you think," he asked, "that one can leave Nicholas II. alive? If for him alone, the death penalty must be maintained."

III. The First Schism.—The necessary result of these differences was schism. The conference elected a central committee composed entirely of Lenin's supporters; and the control of *Iskra* remained exclusively in their hands. Martov returned to Russia where he founded a special bureau for his own faction and proceeded to boycott the Bolshevik Committee, while a bitter pamphlet warfare between the two sections commenced. Everything was thus ready for complete antagonism. The Russo-Japanese War and then the abortive revolution of 1905 completed the separation of the two groups. But, before its outbreak, Lenin lost control of his machine. The conversion of Plekhanov and others of the Central Committee to the Mensheviks, the arrest of other members, and the co-option of Mensheviks in their place, transferred the domination of the party to Martov and his supporters. The schism then became complete. Lenin founded a separate bureau, with a journal of its own (*Forward*) and a system of regional committees. It was to a revolutionary party

thus rent in twain that there came, with dramatic suddenness, the Revolution of October 1905.

In that effort the two parties had different plans, and they drew from it different conclusions. Lenin insisted that a provisional revolutionary government must be set up to achieve the proletarian revolution. The Mensheviks denied that the proletarian hour had struck. For them, at the moment, the replacement of autocracy by constitutionalism was the maximum possible achievement; and they were therefore prepared to support the Liberal bourgeoisie under Miliukov's leadership. For Lenin, the event meant that a general strike and armed insurrection were the basis of revolutionary tactics; for the Mensheviks both were premature as weapons unsuited to a class not yet conscious of its ultimate mission. The Mensheviks were prepared to sit in the Duma; the Bolsheviks proposed not only to boycott it but to call upon the masses to mobilize against its convocation. And from the actual events, each insisted that its own view had been vindicated. The Mensheviks believed that the Soviets (councils of workers) born spontaneously in the workshops of St. Petersburg proved the value of the administrative autonomy on which they relied as a principle of organization. The Bolsheviks, on the contrary, drew the inference that the spontaneity shewed (1) the class-consciousness of the workers, but also (2) the necessity of giving it point by rigid direction. For Lenin, too, the soviets of 1905 were inadequate because they were confined to the industrial workers, and did not combine with the soldiers and the peasants. To the Mensheviks, the root of the failure of 1905 was the exaggerated claims of the proletariat, which they ascribed to Bolshevik demagoguery; to Lenin, however, the failure lay, not in the claims made, but in the inadequate way in which force was applied to their exploitation. Revolution, moreover, would only succeed as the outcome of a suitable international situation. It would be necessary, further, to have the sympathy of the peasants and rigorously to prevent the betrayal of victory by the bourgeoisie. Already, that is to say, 1905 had, for Lenin, laid down the fundamental basis of the Revolution of November, 1917.

IV. The Effects of 1905.—The chief result of 1905 was to create an impassable abyss between Bolsheviks and Mensheviks. Yet, for a time, there was a loose collaboration between them. The Triple Entente gave the Russian autocracy a new lease of life; and the existence of the Duma created a platform which, however feeble, they were driven by opinion to use in common. Yet joint action only intensified disagreement. A party grew up within the Mensheviks who believed in ending illegal action; and, among the Bolsheviks, there were those who drew from the futility of the Duma the inference that the revolutionary elements should withdraw from participation therein. For a time, the scene was dominated by the Mensheviks. They took the view, in the phrase of the time, that Russia had arrived at 1840, not 1847. The way now lay direct to constitutional monarchy—as in the rest of Western Europe—and the Russian social democracy must tread the path of its European neighbours. They were agreed in insisting that the awakening of the peasant was more important than they had hitherto imagined; but they were agreed in little else. The Mensheviks believed that Russia had settled down to a gradual change towards parliamentary democracy; Lenin and his followers argued that new conflict was imminent. When the Cadets dominated the first elections to the Duma, the Mensheviks were enthusiastic; they demanded a responsible Cadet ministry on the European model; and they conducted a strong campaign in its favour. The Bolsheviks were indifferent or hostile; and in the London Conference of 1907 it became clear that effective co-operation was impossible. Lenin was prepared to take part in parliamentary systems; and he attacked their opponents on the ground that it was essential to disabuse the workers of their value by experience of them. But he urged participation only the more surely to destroy. After the Paris meeting of 1910, the two sections no longer made even the pretence of collaboration. When 1917 came, the divergent paths they followed had been made inevitable by the differences of 15 years.

V. The Consolidation of Doctrine.—The history of the Bolshevik party after the first Revolution of 1917 is the history of Russia itself. Here it is necessary to explain how the evolution thus far summarized has issued in a corpus of doctrine. Broadly, it may be said that they start from the Marxist assumptions which they inherited from the pioneers of 1883 and give to them the connotation suggested by their special Russian experience. They start from the belief in the inevitable triumph of the working-class. The battle between the workers and the bourgeoisie is inevitable because these classes have nothing in common. War between them is thus the logic of the facts; and its inevitability arises from the fact that no class is ever persuaded peacefully to abdicate. Nor can the fight be waged constitutionally. Such a struggle only leaves intact the heart of the capitalist citadel. The concessions won by peaceful conflict never go to the root of the matter. A democratic community is unreal so long as the machinery of the state and the means of production are in the hands of the bourgeoisie. The business, therefore, of the workers is to separate from the latter and to fight it. That is their essential historic mission. By doing so, they realize themselves and make possible the destruction of the capitalist state.

Bolshevism must, however, be carefully distinguished from Blanquism and terrorism. The former pinned its faith to sudden mass-action without regard to time and place; the latter had confidence in the exemplary value of isolated acts such as assassination. The Bolshevik is more realistic. A successful revolution, in his view, was the outcome of careful preparation applied to a suitable conjuncture of circumstances. Insurrection, as Marx said, is an art; and Lenin laid down five rules as its guiding principles. Insurrection, first, must never be played with; once it has begun, it must be carried on to the bitter end. When, secondly, the time has been chosen, the revolutionists must mass at the proper place forces superior to those of the enemy; otherwise they will be overwhelmed. Once begun, thirdly, the offensive is fundamental, because, as Marx pointed out, "the defensive is death to the insurrection." Surprise, fourthly, is fundamental; and the moment to choose is when the forces of government are scattered. Moral superiority, finally, is vital; and the announcement of daily, even hourly, successes has great importance in depressing the enemy, in consolidating the offensive, and in keeping the masses on your side. Surrounding all must be the ultimate perspective of audacity without which supreme success is impossible. Revolution, therefore, may be said, from the angle of Socialism, to depend on three conditions. First, it must be not a conspiracy, nor a party-move, but the rise of the revolutionary working-class. Secondly, it must have the masses on its side, and must therefore build its appeal on their most urgent demands. Thirdly, it must break out at the crux of rising activity among the friends of revolutionary change, and at the moment of greatest indecision on the part of the enemy.

The working-class is thus brought to power. The Bolshevik insists that the preservation of power involves the Dictatorship of the Proletariat. It is essential to crush out opposition and to shatter the institutions of the defeated regime. Revolution is war, and until there is complete acquiescence in the victor's terms, the methods of war alone are suitable to it. "The enemy," says Trotsky, "must be made harmless, and this means he must, in wartime, be destroyed." For, willing the end, the Bolshevik cannot wipe his hands of the means. Hesitation, weakness, pity, a false worship of democracy, only stimulate the forces of counter-revolution and prevent the consolidation of the new regime. The dictatorship is exercised by the Communist party because (1) its members have been tried and can be trusted and (2) they represent the real will of the workers which has been suppressed and obscured by capitalism. The dictatorship is a trust for the revolution which, in its turn, is a fulfilment of the mission to which the working-class is historically called.

Violence therefore wins the revolution and dictatorship consolidates it. The transition to Socialism is accomplished in two stages. In the first, the oppression of classes disappears, and, with it, the state which is merely the instrument of class-oppres-

sion. The proletariat seizes power and by using it to destroy the class-structure of society ceases to be a proletariat. The instruments of production are socialized. But coercive power is still necessary because the minds and hearts of men are not easily accustomed to the new regime. Government therefore continues, though growing acceptance of the new society means growing democratization of social processes. This, however, does not mean parliamentarism, which is merely a bourgeois form of government, but the Soviet system (a council of soldiers, workers, and poorer peasants) which combines the advantages of the territorial with the virtues of producers' representation. Formal democracy is replaced in the first stage by what the Bolshevik calls "the revolutionary dynamic of living forces"; which means that all elements in society except the working-class are deliberately excluded from power. Great industrial enterprises, the banks, the means of communication, and the large landed estates must be confiscated. Wholesale commerce should be nationalized; foreign trade must become a government monopoly. The means of propaganda, the press and education, must be confined to working-class direction. Small business may be left untouched, because it is futile to think that Communism can be established at a stroke. Measures must be taken to associate intellectual technicians with the new order and to neutralize the peasant classes by organizing the poorer, while repressing sternly the antagonism of the richer peasants. So, *mutatis mutandis*, with the poorer bourgeoisie of the towns.

Bolshevism cannot be said to have any clear view of the ultimate social order it proposes to establish. It has taken over from Marx phrases like the demand "from each according to his powers, to each according to his needs," and the "administration of things instead of the administration of persons." But it is mainly occupied with the immediate revolutionary task. It conceives, moreover, of the revolution thus established as a world-revolution made in each country on similar conditions to those in Russia. For this purpose the formation of a world Communist Party rigorously directed from a single centre and sternly disciplined from above is fundamental. To advance the revolution advantage must be taken of national, racial and economic discontent where these exist; but propaganda in relation to them must seek always to move them to significance in terms of the class-war. Union should be sought with the reformist working-class parties, but always on the understanding that they are bound to fail, and that if they arrive in power the Communist must separate from them and fight them. Finally, it is to be noted that Bolshevism regards religion as a capitalist instrument used as an anodyne for the workers and seeks wherever possible to destroy its influence.

VI. Conclusion.—Upon the wisdom or rightness of these views it is not necessary here to pronounce. They have been put into operation in Russia; they have been attempted elsewhere; and history alone can give a verdict upon them. Here it is only necessary to remark two things. Bolshevism accepted the general outlines of the Marxian philosophy (historic materialism, the theory of class-war, the inevitability of a proletarian revolution as the outcome of capitalist exploitation of surplus value) and developed them in detail in terms of the special Russian experience. At every point, the deductions made by Lenin and his disciples are, clearly enough, less general principles of universal validity than special assumptions built upon a special environment they profoundly knew. They ignore most of the things that Western Europe has sought for as desirable; personal freedom, government according to law, the subordination of the executive to the judiciary, the national choice of the government. They attribute no special worth to human personality as such; and they conceive of violence as sanctified by the use to which it is put. Its adherents are moved by a profound faith in the unquestionable rightness of their cause; and its history has been as full as any of self-sacrifice and martyrdom. It proceeds in the conviction that it is based on a number of incontrovertible truths; of which the human and eternal passion for equality is ultimately the most profound. To give effect to that passion, it seeks to make an entirely new re-assessment of human

motives, in which what is the predominant fact is the relegation of the pecuniary incentive to a comparatively subordinate place. It assumes that violence sufficiently prolonged can give birth to acceptance of its principles; and that fraternity is the outcome of violence. It argues that there is an inevitable logic in history which makes the transference of social power to the working-class inescapable. Obviously, the appeal it makes is great to all who, from economic, or racial, or religious reason feel themselves unjustly oppressed. It is characterized by the optimism which is the mark of all intensely dogmatic creeds, and that optimism gives a self-confidence to its adherents to which few competing systems can pretend. How far it is a passing phase, how far a necessary part, of social change it is too early to pronounce. Quite obviously, as the experience of Russia has shown, experiment with it is costly; and it is not clear that a nation without the means of self-sufficiency could survive an attempt at its application. Its origins, moreover, in a period when autocracy had to be fought, and its success in a period of military defeat, have given its theses an inelasticity, on the one hand, and a special colour, on the other, which are both extremely important and too little considered by Bolshevik writers themselves. But it is the historic nature of all particulars to seek to prove that they are universal by nature.

BIBLIOGRAPHY.—An adequate history of the Russian Communist Party before 1905 does not exist. The following books, pamphlets and journals are of importance in determining the character and evolution of its doctrines: G. Plekhanov, *Socialism and the Political Struggle* (1883); *Our Differences* (1884); N. Lenin, *What the "Friends of the People" are* (1894); *The Development of Capitalism in Russia* 1899; **What must we do?* (1905); **The State and Revolution* (1917); **The Proletarian Revolution* (1918); **The Infantile Malady of Communism* (1918); **On the Road to Insurrection* (1917); L. Trotsky; **1905* (1909); N. Lentzner, *The Revolution of 1905* (1919); G. Zinoviev, *History of the Russian Communist Party* (1925); Martov, *The Party in a State of Siege* (1903); *History of the Russian Social Democracy* (1922); B. Pares, **Russia and Reform* (1907); Mavor, **An Economic History of Russia* (1914); Struve and others, *Signposts* (1906); A. Tscherevanin, *The Proletariat and the Russian Revolution* (1908); H. J. Laski, **Communism* (1927); Nestroev, *Pages from the Diary of a Bolshevik* (1910). The periodicals *Iskra*, *Pravda*, *Zvezda*, *Vperiod* are of great importance, but complete files are rare outside the Marx-Lenin Institute in Moscow. A fuller Bibliography will be found in Laski's *Communism* above. The books marked with an asterisk are available in English. (H. J. L.)

BOLSOVER, urban district, Derbyshire, England, 5½ m. E. of Chesterfield, on branch lines of the L.M.S. and L.N.E. railways. Pop. (1921) 11,475. It lies at a considerable height on a sharp slope above a stream tributary to the river Rother. The castle round which the town grew up was founded shortly after the Conquest by William Peveril, but the existing building, a fine castellated residence, was erected on its site in 1613. The town itself was fortified, and traces of early works remain. The church of St. Mary is of Norman and later date; it contains some interesting early stone-carving, and monuments to the family of Cavendish, who acquired the castle in the 16th century. Coal-mining and quarrying are carried on in the neighbourhood.

BOLSWARD, town, province of Friesland, Holland, 6½ m. W.N.W. of Sneek. Pop. (1927) 6,978. The town is mentioned in 725, when it was situated on the Middle sea. When this receded, a canal was cut to the Zuider Zee and in 1422 it was made a Hansa town. The mediaeval constitution of Bolsward was in some ways peculiar. The Jongema family had certain hereditary rights in the administration, defined in the charter of 1464; e.g., the head of the family sat for two years with the *scabini* and the third year with the councillors. An influential position was assigned in civic legislation and administration to the clergy. The Great Church of St. Martins (1446-66) contains some good carving. The so-called Small church dates from c. 1280, and is the remnant of a Franciscan convent. Bolsward also possesses a Renaissance town hall (1614-18). It trades in agricultural produce, especially butter.

BOLT, an O.Eng. word (cf. Ger. *Bolz*, an arrow), for a "quarrel" or cross-bow shaft, or the pin which fastened a door. From the swift flight of an arrow comes the verb "to bolt," as applied to a horse, to bolting food, etc., and such expressions as "bolt upright"; also the American use of "bolt" for refusing to

support a candidate nominated by one's own party. From the sense of "fastening together" is derived the use of the word "bolt" as a definite length (in a roll) of a fabric (40ft. of canvas).

From another "bolt" or "boul," to sift (O Fr. *buleter*, from the Med.Lat. *buretare* or *buletare*), come such expressions as in Shakespeare's *Winter's Tale*, "The fann'd snow, That's bolted by the northern blasts twice o'er."

Bolt in Engineering.—In engineering a bolt is a pin or bar which serves to lock or unite parts, at the same time permitting of easy disconnection, as distinct from a rivet. Bolts occur in locks, safes and strong-room doors, being sometimes movable, sometimes fixed, and form a portion of the mechanism of a rifle, certain automatic pistols and other articles. A soldering-iron is called a bolt. Bolts for purposes of union of wood and metal objects are used in many millions per year, and a big industry is engaged in the production, with machines for forging, turning, screwing and finishing, as well as making the nuts. Black bolts are those screwed, but otherwise left as forged, bright bolts are finished all over, while for extra strength high-tensile steel is employed, and case-hardening is applied when wear must be defeated, as against frequent applications of the spanner, or if the bolt acts as a pivot. The smallest bolts are those for accurate scale models, about 3/32 in. diameter; the largest hold the heads and bases of armour-plate forging presses together, those on a Davy Brothers 12,000-ton press being 29 in. diameter by 35 ft. long and each weighing 38 tons. An ingenious method is adopted to tighten some big bolts which hold the frames of hydraulic riveters and shearing machines together, instead of relying on mechanical means alone. The bolts are heated before the final assembly and the nuts run down. On cooling, each bolt shrinks in length, giving an immense tightening effect, fit to withstand the enormous pressures, from 12,000 to 14,000 tons.

Most industries have their special bolts, but the diagram shows main types for general purposes in wood-work, engineering structures and machines, building, agricultural machinery, stoves, etc. A has square head and nut, B hexagon, for easier application of the wrench in confined places. Round heads are often used instead of hexagon, as for connecting-rods. C is the cup-head or coach-bolt, also made with conical head, and required in wood or metal. The countersink or tyre, D, leaves a flush surface, a frequent necessity. The cheese or deck bolt, E, has its round head sunk into wood for a similar reason, F, the fang-bolt, has a large nut with spikes to sink into wood, whilst the bolt head is turned round. For thin metal work, shutes, galvanized iron and stoves, G and H are employed, the one being a mushroom

TYPES OF BOLTS IN GENERAL USE FOR WOOD AND METAL-WORK

- | | |
|---------------------------|-------------------|
| A. Square-head | F. Fang-bolt |
| B. Hexagon-head | G. Mushroom-head |
| C. Cup-head or coach-bolt | H. Stove or spout |
| D. Countersink or tyre | J. Ball-bolt |
| E. Cheese-head or deck | K. Hook-bolt |

head, the other stove or spout. The second type, when with square head, is a plough bolt. In the conveying industry thin large diameter heads of these shapes are forged with spikes underneath, called then band or elevator bolts. If a swivel movement is necessary a bolt or nut will be finished with a curve, or a ball bolt, J, is applied. The hook-bolt, K, holds parts if a hole cannot be put through one member, or variations in position are wanted from time to time. The eye-bolt, L, screws into heavy parts of machinery to be lifted by the crane. M is also an eye-bolt, but fitted to swivel on a pin, and so throw the bolt away through a slot in a cover or other top detail, for rapid disconnection. If the threaded part is longer, a straining-bolt results, for tightening wires or stays. The tee-head bolt N slides in a tee-

slot in one member to be united. O is a stud-bolt, permanently screwed in by the tail, while P, the collar-bolt, is a form of stud secured through a plate by the lower nut. The hook-bolt, Q, mainly for suspension purposes, may be double, forming a U-bolt. For attachment to the sides of timber and other work, the strap-bolt, R, has two or three holes. The term rag, or lewis-bolt, applies to S, grouting or lead being poured in the hole to secure the head,

L. Eye-bolt
M. Swivel eye-bolt (or, if longer, straining-bolt)
N. Tee-head
O. Stud-bolt
P. Collar-bolt
Q. Hook-bolt (for suspension)
R. Strap-bolt
S. Rag or Lewis-bolt
T. Lewis-bolt
U. Cotter or anchor-bolt

for attachment of iron work walls or foundations. T is also a lewis-bolt, inserted in a slot cut with dovetail side, and the packing-strip added, so that tightening the nut locks the whole. An expansion bolt (to go in walls) has a springy casing with spikes, that expands by a taper when the head is screwed home. The cotter or anchor-bolt U also serves chiefly for foundations, a large iron plate lying above the slot into which a cotter is inserted. The stay-bolt is really a rivet, screwed into boilers to unite the fire-box and shell, and then rivetted over permanently.

BOLTON, DUKES OF. The title of duke of Bolton was held in the family of Powlett or Paulet from 1689 to 1794. CHARLES POWLETT, the 1st duke (c. 1625–1699), who became 6th marquis of Winchester on his father's death in 1675, had been member of parliament for Winchester and then for Hampshire from 1660 to 1675. An ardent Whig in Charles II.'s reign, he supported William of Orange in 1688 and was restored to the office of lord-lieutenant of Hampshire and created duke of Bolton in April 1689. He was an eccentric man, famed for his grotesque extravagances. He died in Feb. 1699, and was succeeded by his elder son, CHARLES, 2nd duke of Bolton (1661–1722), who had also been a supporter of William of Orange. He was lord-lieutenant of Hampshire and of Dorsetshire, a commissioner to arrange the union of England and Scotland and was lord justice in 1696, and lord-lieutenant of Ireland, 1717–22. His third wife was Henrietta (d. 1730), a natural daughter of James, duke of Monmouth. According to Swift, this duke was "a great booby." His eldest son, CHARLES, 3rd duke of Bolton (1685–1754), filled many public offices and attained high rank in the British army. His opposition to Sir Robert Walpole deprived him of several of his offices in 1733; but some of them were afterwards restored to him, and he raised a regiment for service against the Jacobites in 1745. He was a famous gallant, and his second wife was the singer, Lavinia Fenton (d. 1760), who had previously been his mistress.

BOLTON or BOULTON, EDMUND (1575?–1633?), English historian and poet, brought up a Roman Catholic and educated at Trinity Hall, Cambridge, afterwards residing in London at the Inner Temple. In 1600 he contributed to *England's Helicon*. He was a retainer of the duke of Buckingham, and through his influence secured a small place at the court of James I. The most important of his numerous works are *Hypercritica* (1618?), a short critical treatise valuable for its notices of contemporary authors, reprinted in Joseph Haslewood's *Ancient Critical Essays* (vol. ii., 1815); *The Roman Histories of Lucius Iulius Florus* (translated, 1618); *Nero Caesar, or Monarchie Depraved* (1624), with special note of British affairs.

BOLTON (BOLTON-LE-MOORS), municipal, county and parliamentary borough, Lancashire, England, 11 m. N.W. of Manchester. Pop. (1891) 146,487; (1921) 178,683. It is served by

the L.M.S. railway, and divided by the Croal, a small tributary of the Irwell, into Great and Little Bolton; while, as the full name implies, it is surrounded by high moorland. Although of early origin, its appearance, like that of other great manufacturing towns of the vicinity, is wholly modern. The earliest form of the name is Bodleton or Botheltun. The manor was granted by William I. to Roger de Poitou, and passed through the families of Ferrers and Pilkington to the Hartingtons of Hornby Castle, who lost it with their other estates for their adherence to Richard III. In 1485 Henry VII. granted it to the first earl of Derby. The manor of Little Bolton seems to have been, at least from Henry III.'s reign, distinct from that of Great Bolton, and was held till the 17th century by the Botheltons or Boltons. The site of the church of St. Peter has long been occupied by a parish church (there was one there in the 12th century), but the existing building dates only from 1870. In 1251 William de Ferrers obtained from the crown a charter for a weekly market and a yearly fair, but gradually this annual fair was replaced by four others chiefly for horses and cattle. The New Year and Whitsuntide Show fairs arose only during the 19th century. During the Civil War Bolton sided with the parliament, and in 1643 and 1644 the royalist forces assaulted the town.

From early days Bolton was famous for its woollen manufactures. In Richard I.'s reign an aulneger, whose duty it was to measure and stamp all bundles of woollen goods, was appointed. The industry flourished so greatly that when, in 1566, deputies were appointed to assist the aulnegers, Bolton is again named Leland in his *Itinerary* (1558) recorded the fact that Bolton made cottons, which were in reality woollen goods. Real cotton goods were not made in Lancashire till 1641, when Bolton is named as the chief seat of the manufacture of fustians, vermilions and dimities. Velvets were first made here about 1756, by Jeremiah Clarke, and muslins and cotton quiltings in 1763. The inventors of spinning machinery, Arkwright and Crompton, were both born in the parish. Spinning factories were erected, the first in Bolton about 1780. In 1851 there were 66 cotton mills with 860,000 throstle spindles at work. The cognate industry of bleaching has been carried on since early in the 18th century, and large iron-works grew up in the latter half of the 19th century. In 1791 a canal was constructed from Manchester to Bolton, and by an act of parliament (1792) Bolton Moor was enclosed.

BOLTON ABBEY, village West Riding of Yorkshire, England, 22m N.W. of Leeds and 5½m. from Ilkley by the L.M.S. railway. Pop. of parish (1921) 186. It takes its name, inaccurately, from the great foundation of Bolton Priory, the ruins of which stand near the right bank of the upper Wharfe in a valley beautifully wooded and closely enclosed by hills. Part is transitional Norman; the nave, which is perfect, is Early English and Decorated. Transepts and choir are ruined, and remains of domestic buildings are slight. The manor of Bolton Abbey with the rest of the district of Craven was granted by William the Conqueror to Robert de Romili, who evidently held it in 1086, although no mention is made in the Domesday survey. William de Meschines and Cicely de Romili, his wife, heiress of Robert, founded and endowed a priory at Embsay or Emmesay, near Skipton, in 1120, but it was moved here in 1151 by their daughter Alice de Romili, wife of William FitzDuncan. The manor was sold in 1542 to Henry Clifford, 2nd earl of Cumberland, whose descendants, the dukes of Devonshire, now hold it.

BOLTRAFFIO (BELTRAFFIO), GIOVANNI ANTONIO (1467–1516), Italian painter of the Lombard school, influenced by Leonardo da Vinci. He belonged to a distinguished Milanese family and occupied important civic posts in his native town, painting as an accomplished amateur, rather than as an artist by profession. His epitaph, which was removed from S. Paolo in Compito in Milan to the Archaeological museum, states that in his early youth he studied painting, but in his later years was occupied with other work besides art. Leonardo came to Milan in 1485, and Boltraffio became one of his ardent followers, conforming closely to his master's designs in his early work. He was a distinguished portraitist. In 1500 he was commissioned to paint an altarpiece (now in the Louvre) for the church of the

Misericordia, near Bologna, by Giacomo Casio, a merchant and poet, whose portrait Boltraffio painted several times (Chatsworth, England; Brera Gallery, City of Milan). The National Gallery, London, possesses a "Madonna and Child" which, according to Morelli, is the master's best work, two pictures from the Salting Bequest and a portrait from the Mond Collection. Other works are in Milan (Brera Gallery and Poldi-Pezzoli Collection), Bergamo and in the Borromean palace on the Isola Bella. In Rome he painted a fresco in the church of S. Onofrio representing the "Madonna with the Founder" (1513). In the Nuns' Choir of San Maurizio, Milan, are 26 medallions of holy women painted in fresco by Boltraffio. His drawings can be studied in the Ambrosiana, Milan.

See G. Vasari, *Le Vite de' . . . pittori* (Munich, 1911; Eng. trans. 1912); I. Lermoloeff (Morelli), *Galleria Borghese e Doria Pamfili* (1890); G. Carotti, *Le Gallerie Nazionali Italiane IV.* (1899); J. P. Richter, *Mond Collection* (1910); F. Malaguzzi Valeri, *La Corte di Lodovico il Moro* (1923).

BOLTZMANN, LUDWIG (1844–1906), Austrian physicist, was born on Feb. 14, 1844. He was educated at Linz and then at Vienna, where he obtained his doctorate in 1867 and was appointed assistant in the Physical Institute of the university. In 1876 Boltzmann was appointed professor at Graz where he stayed until 1891, when he went to Munich. He held the appointment of Professor of Physics at Vienna with the exception of a short period in 1904 when he went to Leipzig, from 1895 until Sept. 5, 1906 when he committed suicide at Duino.

Boltzmann's most important work was on molecular mathematical physics; he was one of the most important contributors to the development of the kinetic theory of gases (see KINETIC THEORY OF MATTER). His first paper, published in the *Wiener Berichte* (1866), was on the second law of thermodynamics (*q.v.*); this was followed by three papers (1868, 1872 and 1892) on the partition of energy. These papers attempted to put on a more satisfactory basis the work already started by Maxwell; the second paper contained what is now known as Boltzmann's H-theorem; and in 1877 he began to apply the theory of probability to the above problem. Boltzmann wrote a number of papers on the integration of the equations of molecular motion, on viscosity and diffusion of gases, on Maxwell's electromagnetic theory (*q.v.*) and on Hertz's experiments. He also gave a theoretical proof of Stefan's law for the energy radiated by a black-body (see RADIATION). These papers were published in the Viennese, German and English scientific periodicals.

His *Vorlesungen über Maxwell's Theorie der Elektrizität und des Lichtes* was published at Leipzig (1891–93), and his *Vorlesungen über Gastheorie* was first published in 1895.

BOLZANO, BERNHARD (1781–1848), Austrian priest and philosopher, was born at Prague on Oct. 5, 1781, and died there on Dec. 18, 1848. He was professor of the philosophy of religion at Prague from 1805 to 1820, but was compelled to resign in that year, and was suspended from his priestly functions. The most important of his numerous works are the *Wissenschaftslehre, oder Versuch einer neuen Darstellung der Logik*, advocating a scientific method in the study of logic (4. vols. Sulzbach, 1837); the *Lehrbuch der Religionswissenschaft* (4. vols. Sulzbach, 1834), a philosophic representation of all the dogmas of Roman Catholic theology; and *Athanasia, oder Gründe für die Unsterblichkeit der Seele* (2nd ed., Mainz, 1838). In philosophy he followed Reinhard in ethics and the monadology of Leibnitz, though he was also influenced by Kant.

See *Lebensbeschreibung des Dr. Bolzano* (an autobiography, 1836); Wisshaupt, *Skizzen aus dem Leben Dr. Bolzanos* (1850); Palágy, *Kant und Bolzano* (Halle, 1902).

BOLZANO (formerly BOTZEN), provincial capital of Venezia Tridentina, Italy, at the confluence of Talavera and Isarco, above the junction of the latter with the Adige. It lies at a height of 869ft., on the Brenner railway, 58m. S. of that pass and 35m. N. of Trento. Pop. (1921) 22,659 (town), 32,812 (commune). Bolzano boasts of a fine Gothic 14th and 15th century cathedral. The famous *Minnesänger*, Walther von der Vogelweide, according to some accounts, was born (c. 1170) at a farm above Ponte

all'Isarco, 14m. to the north. Situated at the junction of the Brenner route from Germany to Italy with that from Switzerland down the Upper Adige valley, Bolzano has always had very considerable transit trade (it has four large fairs annually). There are railways to Mendola, Collalbo and Merano.

The *pons Drusi* (probably over the Adige just below Bolzano) is mentioned in the 4th century by the Peutinger Table. In the 7th to 8th centuries Bolzano was held by Bavarian counts. In 1027, with the rest of the diocese of Trent, it was given by emperor Conrad II. to the bishop of Trent. From 1028 the local counts were vassals of the bishops, but after Tirol fell to the Habsburgs (1363) their power grew at the expense of that of the bishops. In 1381 Leopold granted the privilege of a town council; in 1462 the bishops resigned all jurisdiction to the Habsburgs and it was merged with the Tirol till 1918.

BOMA (properly MBOMA), port on the north bank of the Congo about 60m. from its mouth, the administrative capital of Belgian Congo up to 1927. Pop. about 400 whites and 2,500 natives. It was founded as a slave mart and entrepôt for the lower Congo in the 16th century, chiefly by the Dutch, though British, French and Portuguese had factories and the last put forward claims to sovereignty (see AFRICA). In 1884 the natives of Boma granted a protectorate of their country to the International Association of the Congo.

See H. M. Stanley, *The Congo and the Founding of its Free State* (London, 1885).

BOMB, a term formerly used for an explosive shell (see AMMUNITION) fired by artillery. The word is derived from the Gr *βουβος*, a hammering, buzzing noise, cf. "bombard" (*q.v.*). At the present day it is most frequently used of a shattering or incendiary grenade (*q.v.*), or an explosive vessel actuated by clockwork or trip mechanism, employed to destroy life or property. In naval warfare, before the introduction of the shell gun, explosive projectiles were carried principally by special vessels known as bomb-vessels, bombards or, colloquially, bombs.

In geology, the name "bomb" is given to certain masses of lava which have been hurled forth from a volcanic vent by explosive action. In shape they are spheroidal, ellipsoidal or discoidal; in structure they may be solid, hollow or more or less cavernous; whilst in size they vary from that of a walnut to masses weighing several tons. It is generally held that the form is partly due to rotation of the mass during its aerial flight, and in some cases the bomb becomes twisted by a gyratory movement. According, however, to Dr. H. J. Johnston-Lavis, many of the so-called bombs of Vesuvius are not projectiles, but merely globular masses formed in a stream of lava; and in like manner Prof. J. D. Duna showed that what were regarded as bombs in Hawaii are in many cases merely lava-balls that have not been hurled through the air.

BOMBARD, the name in various forms, of a mediaeval musical instrument ("bombard," "bumhart," "pumhart," "pommer"), the forerunner of the base oboe or schalmey. A small primitive oboe called *bombarde*, with eight holes but no keys, is still used among the Breton peasants.

Also a primitive type of cannon used in the middle ages—whence the verb "to bombard" and "bombardment."

BOMBARDIER, originally an artilleryman in charge of a bombard, now the lowest grade of non-commissioned officer in the artillery of the British army, ranking below a corporal.

BOMBARDMENT, the concentration of artillery fire against fortifications, troops in position or towns and buildings. In its strict sense the term was formerly applied only to the bombardment of defenceless or undefended objects, houses, public buildings, etc., the object of the assailant being to dishearten his opponent, and specially to force the civil population and authorities of a besieged place to persuade the military commandant to capitulate before the actual defences of the place have been reduced to impotence. The term was loosely employed to describe artillery attacks upon forts or fortified positions in preparation for assaults by infantry, and this use has now become customary and authoritative. The object of such a bombardment, preliminary to the assault, is to destroy the defences, to destroy or neutralize the weapons of the defence and to demoralize the defenders.

BOMBARDON or **BASS TUBA**, the name given to the bass and contrabass of the brass wind in military bands, called in the orchestra bass tuba. The bombardon was the very first bass wind instrument fitted with valves and was the outcome of the application of valves to the bugle family whereby the saxhorns were also produced. The radical difference between the saxhorns and the tubas (including the bombardon) is that the latter have a sufficiently wide conical bore to allow of the production of fundamental sounds in a rich, full quality of immense power. When the brass wind instruments with conical bore and cup-shaped mouthpiece first came into use, it was a well-understood principle that the tube of each instrument must theoretically be made twice as long as an organ pipe giving the same note; for example, the French horn sounding the 8ft. C of an 8ft. organ pipe, must have a tube 16ft. long. After the introduction of pistons, instrument makers experimenting with the bugle, which has a conical bore of very wide diameter in proportion to the length, found that baritone and bass instruments constructed on the same principle gave out the fundamental full and clear. A new era in the construction of brass wind instruments was thus inaugurated. The bombardons possess a chromatic compass of $3\frac{1}{2}$ to 4 octaves but the lowest notes produced by the valves are very difficult to obtain, for the lips seldom have sufficient power to set in vibration a column of air of such immense length, at a rate of vibration slow enough to synchronize with that of notes of such deep pitch.

BOMBAY, capital of Bombay Presidency, standing at the southern end of Bombay island, $18^{\circ} 55' N.$, $72^{\circ} 54' E.$ The island, running roughly north and south is 11m. long by 3m. broad. It is separated at the northern end from Salsette only by a tidal creek crossed by causeways. At the southern end of the island is the well-known Back bay, a shallow basin 2m. across and 3m. deep; and around this lies Bombay.

The shape of this end of the island is roughly that of a thumb and long index finger, pointing downwards, and bent slightly inwards. The thumb, on the west side of the bay, is a rocky ridge, some 200ft. high, named Malabar hill. At the extreme point is Government House, with its luxuriant grounds, the cold weather residence of the governor of the presidency. Along the ridge and on its slopes are the beautiful residences of the wealthier citizens of Bombay, both European and Indian, commanding superb views east and west.

The other side of the bay is a long tapering tongue of land terminating in a lighthouse. The upper end is linked to the bazaar, or Indian city proper; then comes the Fort, now merely a memory, naming the area containing the great business houses, banks, shipping offices, etc.; finally comes Colaba, the cantonments, or military quarters of Bombay. Between this side of the island and the mainland is the great waterway constituting Bombay harbour, 7m. wide at the opening and narrowing as it runs north to the creek.

There are few more beautiful and impressive sights than the approach to Bombay from the sea up this noble waterway studded with mountainous islands, the stately buildings of the city on the left, and away to the right the palm-fringed shore of the mainland, rising gradually to the peaks of the western Ghats in the distance. No city in the world has a finer waterfront than Bombay. The great public offices looking over Back bay are not individually distinguished for architectural merit, but they have a cumulative effect of great dignity.

Bombay's position, as the gateway of India, its magnificent natural harbour, and the enterprise of its inhabitants, have made Bombay one of the first cities of the world. The Indian city, or bazaar, is well built and unusually handsome, with fine wide thoroughfares, a perfect hive of industry. In the Fort area, the commercial buildings will compare with those in most other cities, while of really outstanding merit are the Victoria railway terminus, the post office, the museum and the Royal Institute of Science.

University.—Modelled upon the plan of London university, the University of Bombay was originally constituted as only an examining body in 1857. In 1913 lectures were added for post-graduate students in history, economics, philosophy, Sanskrit and

Persian. In 1919 a school of sociology and economics was established for research. New buildings costing over eight lakhs of rupees were completed in 1923. The university is still mainly concerned with examinations and has affiliated to it a number of institutions in Ahmadabad, Baroda, Bombay, Dharwar, Junagarh, Karachi, Poona, Sangli and Surat.

According to the 1921 census the population of Bombay was 1,175,914. It includes, besides Europeans, Mahrattas, a relatively small but highly influential group of Parsees, Arab traders from the

THE TOWN HALL AT BOMBAY, THE GATEWAY TO INDIA

Bombay, situated on a small island off the coast of western India, has long been an important point of contact between the East and West. Railroads serve as a medium for local trade, while its splendid port facilities, organized by the East India company in 1668, make it a centre of international commerce. Its bazaars are famous for the richness and variety of their display

Persian gulf, Afghans, Sikhs, Tibetans, Cingalese and many others including Baghdad Jews. There is quite a considerable Japanese colony, chiefly interested in cotton, and large enough to have a club of its own, but Chinese have not yet settled there in any number. The two languages of Bombay are Marathi and Gujarati, but most people understand and speak the *lingua franca*, generally known as *Bombay Bât*, a colloquial and ungrammatical form of Hindustani, containing an admixture of local and even of English words. The Parsees number only 100,000 and occupy a position of influence out of all proportion to their numbers, being endowed with great natural ability, combined with a thoroughly Western initiative and progressiveness. The names of Tata, Wadia, Petit, Jijibhoy, etc., are of world wide repute in the spheres of commerce and philanthropy, and many of the greatest business houses of Bombay are owned by them.

The dockyard, originally built in 1736, has a sea-face of nearly 700yd. and an area of about 200 acres. There are five graving docks, three of which together make one large dock 648ft. long, while the other two make a single dock 582ft. long. There are also four building slips opposite the Apollo Bandar (landing place) on the south-east side of the enclosure. Bombay is the only Indian port with tides large enough to permit of docks

on the great scale. Prince's dock (1875-79), Victoria dock (1887-88), Alexandra dock (begun 1905), are important features of the port's accommodation. In recent years a deep-water pier has been built for the discharge of bulk petrol, with a pipe connection at Sewri, and the sea wall of the Alexandra dock has been extended for 1,500ft., forming the new Ballard pier, or mole. Steamers now come alongside the mole, whence passengers can reach the centre of the city in a few minutes, or can step into well-equipped trains waiting on the mole, and can proceed, without changing, northwards to Delhi and Peshawar, eastwards to Calcutta, and south-east to Madras.

The harbour defences have been remodelled and supplied with the heaviest guns. Docks are to be built on a large area of reclaimed land to the north of the present docks. Other recent activities of the Bombay Port Trust include the building of a line to connect the great Indian Peninsular and the Bombay, Baroda, and Central India railways at a point 6m. from the city, to take over traffic and convey it direct to the docks and depots as required. The total length with sidings is over 100 miles.

Electric Power.—The remarkable electric power works of the Tata hydroelectric scheme were opened in 1915. The monsoon rainfall in the western Ghats is impounded in three lakes at Lonavla, and falls to a general station where 40,000 h.p. is generated by five turbines and more power will be available as the scheme develops. It is conveyed for 42m. by aerial transmission cables to a receiving station on Bombay island, whence it is distributed to mills and other customers. Further hydroelectric developments are in progress near the present lakes, where the Andhra river has been dammed to form a lake 12m. long. Power is supplied not only to the Bombay mills but also to the Bombay tramways and suburban railways.

It is estimated that before many years are past about 150,000 h.p. will be absorbed locally.

Trade and Commerce.—Bombay suffered to a smaller extent than any other Indian port from the World War, though shipping was seriously affected by mines. It is the centre of the cotton and textile industry; there are 72,266 looms and 3,456,233 spindles in Bombay island, and 153,000 hands are employed in the 82 spinning and weaving mills. The preponderating share of trade is in Indian hands and most of the mills have Indian managers. Bombay is also the chief distributing centre in western India for imported cotton goods. Other industries are dyeing, tanning, and brass and silver work.

Bombay's position on the west coast and her magnificent natural harbour have resulted in the development of a great sea-borne trade. The principal exports are raw cotton, grain and seeds, and the principal imports piece goods, metals and machinery.

Local Government.—The port of Bombay is administered by the Bombay Port Trust, consisting of a board of trustees, some nominated by Government and the others elected by the Chamber of Commerce, Indian Merchants Chamber, Municipality and Millowners' Association. Two hundred vessels of a total tonnage of 713,973 used the two dry docks in 1925-26. The Municipal Corporation consists of 72 members, of whom 16 are nominated by Government, 36 are elected by the wards, and 20 are elected by the Chamber of Commerce, etc. Europeans and Indians are on an equal footing as regards eligibility. Bombay is the seat of a thriving university, established in 1857. It is an examining body and has faculties in arts, law, medicine and engineering. It also confers a degree of commerce. The Improvement Trust deals with town planning and the general improvement of the city.

History.—The name of the island and city of Bombay is derived from Mumba (a form of Parvati), the goddess of the Kolis, a race of husbandmen and fishermen who were the earliest known inhabitants, having occupied the island probably about the beginning of the Christian era. Bombay originally consisted of seven islands (the *Heptanesia* of Ptolemy) and formed an outlying portion of the dominions of successive dynasties dominant in western India; Satavahanas, Mauryas, Chalukyas and Rashtrakutas. In the Maurya and Chalukya period (450-750) the city of Puri on Elephanta island was the principal place in Bom-

bay harbour. The first town built on Bombay island was Mahikavati (Mahim), founded by King Bhima, probably a member of the house of the Yadavas of Deogiri, as a result of Ala-ud-din Khilji's raid into the Deccan in 1294. It remained under Hindu rule until 1348, when it was captured by a Mohammedan force from Gujarat; and the islands remained part of the province (later kingdom) of Gujarat till 1534, when they were ceded by Sultan Bahadur to the Portuguese.

BY COURTESY OF THE CANADIAN PACIFIC STEAMSHIP CO

NATIVE LABOURER IN THE STREETS OF BOMBAY

The island did not prosper under the feudal rule of the Portuguese and it had a population of only 10,000 when ceded to the British, who had fought for it in 1614-15 and in 1626, while the directors of the East India company had urged Cromwell to buy Bombay in 1654 because of its excellent harbour and protection from land attacks. It finally came into British hands as part of the dowry of the infanta Catherine of Portugal, on her marriage to Charles II. The Bombay Portuguese, especially the religious orders, resisted the cession, and the British occupied it only in 1665. In 1668 the Crown transferred it to the East India company, which placed it under the factory of Surat.

Gerald Aungier (or Angier), who succeeded Sir George Oxenden as president of Surat in 1669 and died in 1677, was the pioneer of modern developments. He succeeded in fortifying town and shore against threatened attacks from the mainland by Mahrattas, and from the sea by Malabar and Dutch seamen, and he also had to cope with Portuguese who still occupied Salsette island and had established a customs barrier in the channel between Bombay and the shore. In 1672 Aungier transferred his headquarters to Bombay and promulgated a liberal scheme of administration, including protection of all castes in the celebration of their religious ceremonies and prohibition of any compulsion of natives to carry burdens against their will. Bombay increased rapidly; Hindu capitalists (*banyas*) soon needed a special quarter and Parsis and Armenians flocked to the place. In eight years the population grew from 10,000 to 60,000 and diseases of crowded areas spread, so Aungier, in 1675, initiated works for draining the foul tidal swamps and, failing the consent of the company to the erection of a regular hospital, he turned the law court into an infirmary. He also established a scheme of courts.

Even under Aungier the Siddi admirals of the Moguls had asserted their right to use Bombay harbour as winter quarters for their fleet, though they had failed to secure it as a base against the Mahrattas. Under his weak successor (Rolt, 1677-82), the English waters, the value of which had now been proved, became the battle-ground between the rival navies, and for some years Bombay lay at the mercy of both. The company's rule, moreover, was exposed to another danger. The niggardly policy of the board of directors, more intent on peaceful dividends than on warlike rule, could not but be galling to soldiers of fortune. A mutiny at Bombay in 1674 had only been suppressed by the execution of the ringleader; and in 1683 a more formidable movement took place under Richard Keigwin, a naval officer who had been appointed governor of St Helena in reward for the part played by him in the capture of the island from the Dutch in 1673. Keigwin, elected governor of Bombay by popular vote, issued a proclamation in the king's name, citing the "intolerable extortions, oppressions and exactions" of the company, and declaring his Government under the immediate authority of the Crown. He ruled with moderation, reformed the system of taxation, obtained notable concessions from the Mahrattas, and increased the trade of the port by the admission of "interlopers." But he failed to extend the rebellion beyond Bombay; and, when a letter arrived, under the royal sign manual, ordering him to surrender the fort to Sir John Child, appointed admiral and captain-general of the company's forces, he obeyed.

Meanwhile the company had decided to make Bombay their chief centre in the East Indies, but this was delayed by plague and was accomplished only in 1708. An alliance with the Siddis secured a base of supplies on the mainland (1733), and the Mahratta conquest of Bassein and Salsette (1737-39) removed Portuguese rivalry. French wars in 1744-48 and 1756-63 led to strengthening of fortifications, a city wall having been already built in 1718. Bankot was acquired by alliance with the peshwa (1755) and this ensured supplies, while Watson and Clive (1756) took Vijayadurg and this secured protection from piracy. Dock-building (1750-62) was followed by the beginning of cotton trade with China (1770); the result of a famine in China being that the Chinese Government forced an increase of the area devoted to grain. Administrative reform and town-planning also contributed to the growth of the city, which had 113,000 inhabitants in 1780. A mainland famine in 1803 drove more people to Bombay, and a great fire led to replanning on extended lines.

The British victory over the Mahrattas and the annexation of the Deccan opened a new period of unrestricted development for Bombay. At this time, too (1819) its fortunes were vigorously fostered by Mountstuart Elphinstone, and in 1838 the population had risen to 236,000. But in the next 50 years it more than doubled itself, the figures for 1891 being 821,000. This great leap was due to the influence of railways, of which the first line was completed in 1853, the opening of the Suez canal, and the foundation of cotton factories. In 1866-67 the tide of prosperity was interrupted by a financial crisis, due to the fall in the price of cotton on the termination of the American war. Bombay, however, soon recovered herself, and in 1891 was more prosperous than ever before; but during the ensuing decade plague (*q.v.*) caused a decline in both her population and her trade. The city has recovered once more.

Bombay and environs have undergone considerable development recently owing to the activities of the development directorate appointed in 1920. Large schemes were put in hand destined eventually to house 250,000 of the poorer inhabitants and relieve the existing overcrowding, to open up new areas, and to add 2 sq.m. to the area of the city by reclamation of land in Back bay and East Colaba.

The progress of the development scheme came in for strong criticism and was the subject of an official enquiry in 1926, which centred principally round the reclamation in Back bay. Here it was proposed to take advantage of the curve on the eastern side of the bay and to build a sea wall, 4m. long, from Colaba point to Marine Lines, thus enclosing an area of 1,300ac. which would be reclaimed and added to the city. It gradually became evident, however, that the original estimates both as regards time and cost would be seriously exceeded. As the result of the enquiry it was decided to proceed at present with only the two end sections of the reclamation, that from Colaba point to the Afghan church, and that from the Marine Lines to the Clock Tower. Good progress was made with the section at the Colaba end and a large part was handed over to the military authorities in 1927. The question as to whether the remaining portion of the reclamation shall be proceeded with is left for future decision.

Of the other schemes for the improvement of Bombay, South Salsette island is being developed, and the industrial and residential colonies which have been established along the two railways and the arterial roads from Bombay have become very popular resorts.

The Mahim scheme is complete, comprising two main avenues and cross roads, with a road from Worli. The reclamation scheme between Mazagon and Sewri is also finished, and the cotton, grain and oil depots have been moved from Colaba. Previously raw cotton had been carried on carts from the goods yards to the Cotton Green at Colaba, but now the Bombay Port Trust has provided railway communications between the railway station, the docks, and the depot at Sewri, which has sheds to hold 3,000,000 bales of cotton. X.

BOMBAY DUCK, a small fish (*Saurus ophiodon*), inhabiting the Bombay and Malabar coasts. Dried and salted, it is much esteemed both as food and as a relish.

BOMBAY FURNITURE. "Bombay blackwood furniture" is manufactured in the city of Bombay and in the towns of Surat and Ahmadabad in India. The wood used is Shisham or blackwood (*Dalbergia*), a hard-grained dark-coloured timber which with proper treatment assumes a beautiful natural polish. Some of the articles, such as small tables and ornamental stands, are of exceedingly graceful contour, and good examples are highly prized by collectors. The carving at its best is lace-like in character, and apart from its inherent beauty is attractive on account of the ingenuity shown by the worker in adapting his design in detail to the purpose of the article he is fashioning. "Bombay boxes" are inlaid in geometrical patterns on wood. The inlaying materials consist of wire, sandal wood, sapan wood, ebony, ivory and stags' horns, and the effect produced by the combination of minute pieces of these endlessly varied substances is altogether peculiar and distinctive.

BOMBAY PRESIDENCY, a province or presidency of British India, consisting partly of British districts, and partly of native states under the administration of a governor. This territory extends from 13° 53' to 28° 45' N., and from 66° 40' to 76° 30' E., and is bounded on the north by Baluchistan, the Punjab and Rajputana; on the east by Indore, the Central Provinces and Hyderabad; on the south by Madras and Mysore, and on the west by the Arabian sea. Within these limits lie the Portuguese settlements of Diu, Damaun and Goa, and the native state of Baroda which has direct relations with the government of India; while politically Bombay includes the settlement of Aden. The total area, including Sind and Aden, is 187,074sq.m., of which 123,541 sq.m. are under British rule. The total population (1921) is 26,757,648, of which 19,291,719 are resident in British territory. The province is divided into four commissionerships and 28 districts. The four divisions are the northern or Gujarat, the central or Deccan, the southern or Carnatic, and Sind. The 28 districts are: Bombay City, Bombay Suburban, Ahmedabad, Broach, Kaira, Panch Mahals, Surat, Thana, Ahmednagar, Khandesh (two districts) Nasik, Poona, Satara, Sholapur, Belgaum, Bijapur, Dharwar, Kanara, Kolaba, Ratnagiri, Karachi, Hyderabad, Larkana, Nawabshah, Sukkur, Shikarpur, Thar and Parkar, and Upper Sind Frontier. There are 151 Indian States which are administered either by political agents or by the collectors of the districts in which the smaller states are situated. The chief groups are the Western India States agency (Cutch, Kathiawar and Palampur), Mahi Kantha agency (51 States), Rewa Kantha agency (62 States), and Cambay (Kaira) agency. Others (agencies in brackets) are Bansda, Dharampur and Sachin (Surat), Janjira (Kolaba), Jawhar (Thana), Sawantwari (Belgaum), Akalkot (Sholapur), Bhore (Poona), Aundh and Phaltan (Satara), Surgana (Nasik), Jath (Bijapur), Savanur (Dharwar), Khairpur (Sukkur), Kolhapur with nine feudatories, and the Southern Mahratta country States Daphlapur lapsed to Jath in 1917. The native States under the supervision of the Government of Bombay are divided, historically and geographically, into two main groups. The northern or Gujarat group includes the territories of the Gaekwar of Baroda, with Cutch, Palampur, Rewa Kantha and Mahi Kantha. These territories, with the exception of Cutch, have an historical connection, as being the allies or tributaries of the Gaekwar in 1805, when final engagements were concluded between that prince and the British Government. The southern or Mahratta group includes Kolhapur, Akalkot, Sawantwari, and the Satara and southern Mahratta Jagirs, and has an historical bond of union in the friendship they showed to the British in their final struggle with the power of the peshwa in 1818. The remaining territories may conveniently be divided into a small cluster of independent zamindaris, situated in the wild and hilly tracts at the northern extremity of the Sahyadri range, and certain principalities which, from their history or geographical position, are to some extent isolated from the rest of the presidency.

Physical Aspects.—The Bombay Presidency consists of a long strip of land along the Indian ocean from the south of the Punjab to the north of Mysore. The coast is rock-bound and difficult of access; and though it contains several bays forming fair-weather ports for vessels engaged in the coasting trade, Bombay, Karachi

in Sind, Marmagoa and Karwar alone have harbours sufficiently land-locked to protect shipping during the prevalence of the south-west monsoon. The coast-line is regular and little broken, save by the gulfs of Cambay and Cutch, between which lies the peninsula of Kathiawar.

A range of hills, known as the Western Ghats, runs down the coast, at places rising in splendid bluffs and precipices from the water's edge, at others retreating inland, and leaving a flat fertile strip of 5-50m. between their base and the sea.

Mountains.—In the north of the presidency on the right bank of the Indus, the Hala mountains, a continuation of the great Suleiman range, separate British India from the dominions of the khan of Kalat. Leaving Sind, and passing by the ridges of low sandhills—the leading feature of the desert east of the Indus—and the isolated hills of Cutch and Kathiawar, which form geologically the western extremity of the Aravalli range, the first extensive mountain range is that separating Gujarat from the States of central India. The rugged and mountainous country south of the Tapti forms the northern extremity of the Sahyadri or Western Ghats. This great range of hills, sometimes overhanging the ocean, and generally running parallel to it at a distance nowhere exceeding 50m., with an average elevation of about 1,800ft., contains individual peaks rising to more than double that height. They stretch southwards for upwards of 500m., with a breadth of 10-20 miles. The western declivity is abrupt, the land at the base of the hills being but slightly raised above the level of the sea. As is usually the case with the trap formation, they descend to the plains in terraces with abrupt fronts. The landward slope is in many places very gentle, the crest of the range being sometimes but slightly raised above the level of the plateau of the Deccan. Their best-known elevation is Mahabaleshwar, 4,500ft. high, a fine plateau, 37m. from Poona, covered with rich vegetation, and used by the Bombay Government as its summer retreat. In the neighbourhood of the Sahyadri hills, particularly towards the northern extremity of the range, the country is rugged and broken, containing isolated peaks, masses of rock and spurs, which, running eastward, form watersheds for the great rivers of the Deccan. The Satpura hills separate the valley of the Tapti from the valley of the Nerbudda, and the district of Khandesh from the territories of Indore. The Satmala or Ajanta hills, which are rather the northern slope of the plateau than a distinct range of hills, separate Khandesh from the Nizam's dominions.

Plains.—The more level parts of Bombay consist of five well demarcated tracts—Sind, Gujarat, the Konkan, the Deccan and the Carnatic. Sind, or the lower valley of the Indus, is very flat, with but scanty vegetation, and depending for productiveness on irrigation. Gujarat, except on its northern parts, consists of rich, highly cultivated alluvial plains, watered by the Tapti and Nerbudda, but not much subject to inundation. The Konkan lies between the Western Ghats and the sea. It is a rugged and difficult country, intersected by creeks, and abounding in isolated peaks and detached ranges of hills. The plains of the Deccan and Khandesh are watered by large rivers, but as the rainfall is uncertain, they are generally, during the greater part of the year, bleak and devoid of vegetation. The Carnatic plain, or the country south of the River Kistna, consists of extensive tracts of black or cotton soil in a high state of cultivation.

Rivers.—The chief river of western India is the Indus, which enters the presidency from the north of Sind and flowing south in a tortuous course, falls into the Arabian sea by several mouths. In the dry season the bed varies at different places from 480-1,600 yards. The flood season begins in March and continues till September, the average depth of the river rising from 9-24ft., and the velocity of the current increasing from 3-7m. per hour. Next to the Indus comes the Nerbudda. Rising in the Central Provinces, and traversing the dominions of Holkar, the Nerbudda enters the presidency at the north-western extremity of the Khandesh district, flows eastwards, and after a course of 700m. from its source, falls into the gulf of Cambay, forming near its mouth the alluvial plain of Broach, one of the richest districts of Bombay. The Tapti enters the presidency a few miles south of the town of Burhanpur, flows eastwards through the Khandesh, Rewa Kantha and Surat,

and falls into the gulf of Cambay, a few miles west of the town of Surat. Besides these there are many minor streams. The streams which, rising in the Sahyadri range, or Western Ghats, flow westwards into the Arabian sea are of little importance. During the rains they are formidable torrents, but with the return of the fair weather they dwindle away, and during the hot season, with a few exceptions, they almost dry up. Clear and rapid as they descend the hills, on reaching the lowlands of the Konkan they become muddy and brackish creeks. The Kanarese rivers have a larger body of water and a more regular flow than the streams of the Konkan. One of them, the Sharawati, forcing its way through the western ridge of the Ghats, plunges from the high to the low country by a succession of falls, the principal of which is 890ft. in height. The Sahyadri or Western Ghats also throw off to the eastwards the two principal rivers of the Madras Presidency, the Godavari and the Kistna.

Lakes.—The Manchar lake is situated on the right bank of the Indus. During inundations it attains a length of 20m. and a breadth of 10m., covering a total area estimated at 180sq.m. The remarkable Runn or lake of Cutch is a salt marsh, an inland lake, or an arm of the sea with an area of 8,000sq.m. according to the season of the year, and forms the western boundary of the province of Gujarat. When flooded during the rains it unites the gulfs of Cutch and Cambay, and converts the territory of Cutch into an island.

Geology.—South of Gujarat nearly the whole of Bombay is covered by the horizontal lava flows of the Deccan Trap series, and these flows spread over the greater part of the Kathiawar peninsula and extend into Cutch. In Cutch and Kathiawar they are underlain by Jurassic and Neocomian beds. The Jurassic beds are marine and contain numerous Ammonites, but the beds which are referred to the Neocomian include a series of sandstones and shales with remains of plants. Several of the plants are identical with forms which occur in the upper portion of the Gondwana system. Tertiary limestones, sandstones and shales overlie the Deccan Trap in Cutch, but the greatest development of deposits of this age is to be met with on the western side of the Indus (*see* SIND). The plain of Sind and of eastern Gujarat is covered by alluvium and wind-blown sand.

Climate.—Great varieties of climate are met with in the presidency. In its extreme dryness and heat, combined with a sandy soil, Upper Sind resembles the African deserts. The mean maximum temperature at Hyderabad, in Lower Sind, during the six hottest months of the year is 98° in the shade, and the water of the Indus reaches blood-heat; in Upper Sind it is even hotter, and the thermometer has been known to register 130° in the shade. In Cutch and Gujarat the heat, though less, is still very great. The Konkan is hot and moist, the fall of rain during the monsoon sometimes approaching 300 inches. The tableland of the Deccan above the Ghats, on the contrary, has an agreeable climate except in the hot months, as has also the southern Mahratta country. Bombay island itself, though in general cooled by the sea breeze, is oppressively hot during May and October. The south-west monsoon generally sets in about the first week in June.

Forests.—Bombay Presidency possesses two great classes of forests—those of the hills and those of the alluvial plains. The hill forests are scattered over a wide area, extending from 23° to 14° N. lat., and 12% of the total area is forested. Most of them lie among the Sahyadri hills or Western Ghats. The alluvial forests lie in Sind, on or close to the banks of the Indus. Besides the timber trees (teak, blackwood, etc.) there are others which are valuable for their fruit and nuts. The jungle tribes collect gum from several varieties of trees, and in Sind the Forest Department derives a small revenue from lac. The palms of the presidency consist of cocoa-nut, date, palmyra and areca catechu.

Population.—The census of 1921 gave a total of 26,757,648 out of which the chief religions furnished the following numbers:—

Hindu	21,027,478
Mohammedan	4,615,773
Jain	481,342
Zoroastrian	85,149
Christian	276,765
Animist	189,879

In Sind Islam has been the predominant religion from the earliest Arab conquest in the 8th century. In Gujarat the predominant religion is Hinduism, though petty Mohammedan kingdoms have left their influence in many parts of the province. The Deccan, the home of the Mahrattas, and the Carnatic are largely Hindu. The Konkan is notable for various Christian castes, owing their origin to Portuguese rule; while in the Carnatic, Lingayatism, a Hindu reformation movement of the 12th century, is embraced by many of the population. The Mahrattas are the dominating race next to the Europeans and number (1921), with Kunbis, 2,529,172.

Languages.—Among the many languages of the presidency, the chief are Sindhi in Sind, Cutchi in Cutch, Mahratti in the northern, central and southern division, with Hindi in the northern division and Kanarese in the southern.

Agriculture.—Jwar (great millet) and bajra (spiked millet) are the staple food grains in the Deccan and Khandesh. Rice is the chief product of the Konkan. Wheat, grown mostly in Sind, is exported to Europe in large quantities. Gram is the most important of the pulses, a sesamum, mustard, linseed and ground nut of the oil seeds. Of fibres far the most important is cotton, which has been much improved by the introduction of several better varieties.

Manufactures.—The chief feature of the modern industrial life of Bombay is the great development in the growth and manufacture of cotton. The industry has received further impetus from the provision of electric power. The tendency to replace native crafts by modern industrial establishments continues, and finer yarn is spun and more bleached fabrics are produced. Seventy-eight per cent of the cloth woven in British India comes from the presidency, the industry being confined mostly to Bombay city, Ahmedabad and Sholapur, with nearly two-thirds of the total number of looms in the first named. Silk goods are manufactured in Ahmedabad and Bombay, but the industry is declining. The custom of investing savings in gold and silver ornaments gives employment to many goldsmiths; the metal is usually supplied by the customer, and the goldsmith charges for his labour. Paper is made in Bombay city, Poona and Surat. Ahmedabad and Surat are famous for their carved wood-work and metal-work. Many of the houses in Ahmedabad are covered with elaborate wood-carving, and excellent examples exist elsewhere. The only minerals produced are building stone, salt and a little manganese. Seaborne trade is concentrated on Bombay and Karachi, though efforts have been made to develop Murmagao as a port for the South Mahratta district.

Railways and Irrigation.—All the railways of the presidency, with the exception of the North-Western line, which enters Sind from the Punjab and finds its natural terminus at Karachi, concentrate at Bombay city. The other chief lines are the Great Indian Peninsula, Indian Midland, Bombay, Baroda and Central India, Rajputana-Malwa and Southern Mahratta systems. Schemes are in hand for the electrification of parts of the Great Indian Peninsula line. Only about $\frac{1}{3}$ of the total cultivated area of the presidency proper was irrigated land in 1925, as compared with over $\frac{1}{2}$ in Sind. Large works have been completed on the Godavari and Pravara rivers in recent years, including the huge Bandhaidara dam, and irrigation works fed from the Ghats were in process of construction in 1926.

Army.—Under Lord Kitchener's rearrangement of the Indian army in 1904 the old Bombay command was abolished and its place was taken by the Western Army Corps. As a result of measures taken in 1918 and aiming at decentralization, Bombay now forms part of the southern command, with headquarters at Poona. A brigade is also stationed at Ahmedabad. The Sind brigade, with headquarters at Karachi, is under the western command.

Education.—The University of Bombay, established in 1857, is a body corporate, consisting of a chancellor, vice-chancellor and fellows. The governor of Bombay is *ex officio* chancellor. An elected syndicate with the director of public education as an *ex officio* member is the executive body, and a senate, divided into faculties, the legislative. In 1925 the total number of educational institutions for boys was 11,599, and for girls 1,520. There are 14 colleges, including medical, veterinary, engineering, agricultural,

science, law and commercial colleges. The Education Act of 1923 enabled municipalities to enforce primary education, the control of which has been taken over since 1918 by 34 municipal and 21 district boards. In 1926 only 7% of the male population and 2% of the female were attending schools: 181 men and 30 women in every 1,000 were literate.

Administration.—Bombay is one of the provinces which received the new form of government under the Government of India Act of 1919. The minimum number of elected members is 111. The political administration of the native States is under the superintendence of British agents placed at the principal native courts; their position varies in different states according to the relations in which the principalities stand with the paramount power. Since the acts of 1919 and 1926 municipal self-government in the province has been considerably developed: the elective element is strengthened and the appointment of non-official presidents to district and subdistrict boards increased. There were 29 municipal boroughs in 1926. The administration of justice throughout the presidency is conducted by a high court at Bombay, consisting of a chief justice and seven puisne judges, along with district and assistant judges throughout the districts of the presidency. An act was passed in 1926 for the establishment of a chief court with a judge and three or more puisne judges in Sind, owing to the growing importance of Sind and Karachi, but was not put in force immediately for financial reasons. The administration of the districts is carried on by collectors, assistant collectors and a varying number of supernumerary assistants.

HISTORY

It is believed that about 1000 B.C. an export trade from western India to the Red sea by way of East Africa existed, and that before 750 B.C. a trade had sprung up with Babylon by way of the Persian Gulf. It was by this latter route that the traders brought back to India the Brahmi alphabet, the art of brick-making and the legend of the Flood. Later still the settlement of Brahmans along the west coast had already Aryanized the country in religion, and to some extent in language, before the Persian conquest of the Indus valley at the close of the 6th century B.C. The Persian dominion did not long survive; and the march of Alexander the Great down the Indus paved the way for Chandragupta and the Maurya empire. On the death of Asoka in 231 B.C. the empire of the Mauryas broke up, and their heritage in the west fell to the Andhra dynasty of the Satavahanas of Paithan on the Godavari, a Dravidian family whose dominion by 200 B.C. stretched across the peninsula from the deltas of the Godavari and Kistna to Nasik and the Western Ghats. About A.D. 210, however, their power in the west seems to have died out, and their place was taken by the foreign dynasty of the Kshaharatas, the Saka satraps of Surashtra (Kathiawar), who in 120 had mastered Ujjain and Gujarat and had built up a rival kingdom to the north. Since about A.D. 40 the coast cities had been greatly enriched by trade with the Roman empire, which both the Satavahanas and the satraps did much to encourage; but after the fall of Palmyra (273) and the extinction of the main Kshaharata dynasty (c. 300) this commerce fell into decay. In the next century and a half, short-lived Saka dynasties succeeded one another until, about 388, the country was conquered by the Guptas of Magadha, who kept a precarious tenure of it till about 470, when their empire was destroyed by the White Huns, or Ephthalites (q.v.), who, after breaking the power of Persia and assailing the Kushan kingdom of Kabul, poured into India, conquered Sind, and established their dominions as far south as the Nerbudda.

Under the Hun tyranny, which lasted till the overthrow of the White Huns on the Oxus by the Turks (c. 565), native dynasties had survived, or new ones had established themselves. A new power, too, appeared from the north; the Gurjaras (ancestors, it is supposed, of the Gujar caste), who had probably entered India with the White Huns, established their power over Gujarat and (c. 600) overran north-eastern Kathiawar, made the rajah of Valabhi their tributary, and established a branch at Broach (585-740). During the short-lived empire of Harsha (d. 647 or 648), Malwa, Gujarat and Kathiawar were subject to his sway; but

the southern boundary of his kingdom was the Nerbudda, south of which the Chalukyas in the 7th century, having overcome the Rashtrakutas and other rivals, had absorbed the smaller kingdoms into their empire. In 710-711 (A.H. 92) the Arabs invaded India, and in 712 conquered and established themselves in Sind; they did not, however, attempt any serious attack on the Gurjara and Chalukya empires, confining themselves to more or less serious raids. In 770 they destroyed the city of Valabhi and, as already mentioned, brought its dynasty to an end. Meanwhile the Chalukyas, after successfully struggling with the Pallavas (whose capital was taken by Vikramaditya II., c. 740), had in their turn succumbed to their ancient rivals the Rashtrakutas, who succeeded to the bulk of their dominions, including Gujarat, where they had set up a branch line. For some two centuries (c. 750-950) there was a balance of power between the Gurjaras and Rashtrakutas, neither kingdom being strong enough to encroach on the other to any extent. The Rashtrakutas were, moreover, debarred from large schemes of conquest by dissensions with the branch dynasty which they had set up in Gujarat. Under them the Konkan and the coast farther south were governed by chiefs of the Silahara family, whose rule is mainly notable for the revival of trade with the Persian gulf and, doubtless as a result of this, the arrival in 775 on the west coast of a number of Parsee refugees, who found, in a country where three religions were already equally honoured, the toleration denied to them in Musulman Persia. But in the 10th century the Rashtrakuta power began to break up, in 961 Mularaja Solanki (Chalukya) conquered the kingdom of Anhilvada (Anhilvara) in Gujarat, where his dynasty reigned till 1242; and twelve years later the Chalukyas once more overthrew the Rashtrakutas in the Deccan, establishing their capital at Kalyani, while a branch line was set up in southern Gujarat. Farther south the Silaharas, however, continued to rule the coast, and succeeded in maintaining their independence until after the final fall of the Chalukyas in 1102.

In 1023 Mahmud of Ghazni had already invaded Gujarat with a large army, destroyed the national Hindu idol of Somnath, and carried away an immense booty. Mohammed Ghori also invaded Gujarat, and left a garrison in its capital. But it was not till after the Mussulman power was firmly established in northern India that the Mohammedan sovereigns of Delhi attempted the conquest of the south. In 1204 the emperor Ala-ud-din first invaded the Deccan, and in 1297 he conquered Gujarat. In 1312 the Mohammedan arms were triumphant through the Mahratta country; and seven years later the whole of Malabar fell a prey to the invaders. In the middle of the 14th century the weakness of the Delhi sovereigns tempted the governors of provinces to revolt against their distant master, and to form independent kingdoms. In this way the Bahmani kingdom was established in the Deccan, and embraced a part of the Bombay presidency. Ahmednagar and Gujarat also became the seats of a new kingdom. In 1573 Akbar conquered Gujarat and reannexed it to the empire; in 1599 he effected the reconquest of Khandesh, and in 1600 that of Ahmednagar. During the latter part of the 17th century the Mahrattas rose to power, and almost every part of the country now comprising the presidency of Bombay fell under their sway. In 1498 the Portuguese came first to Calicut, their earliest possession in the presidency being the island of Anjudiv. After their victory at Diu over the Egyptian fleet their mastery of the Indian ocean was undisputed, and they proceeded to establish themselves on the coast. They captured Goa in 1510, Malacca in 1511, and Ormuz in 1515. They next took advantage of the decay of the kingdom of Gujarat to occupy Chaul (1531), Bassein with its dependencies, including Bombay (1534), Diu (1535) and Daman (1559).

The first English settlement in the Bombay presidency was in 1618, when the East India Company established a factory at Surat, protected by a charter obtained from the emperor Jahangir. In 1626 the Dutch and English made an unsuccessful attempt to gain possession of the island of Bombay, and in 1653 proposals were suggested for its purchase from the Portuguese. (See BOMBAY.)

In 1803 the Bombay presidency included only Salsette, the

islands of the harbour (since 1774), Surat and Bankot (since 1756); but between this date and 1827 the framework of the presidency took its present shape. The Gujarat districts were taken over by the Bombay government in 1805 and enlarged in 1818; and the first measures for the settlement of Kathiawar and Mahi Kantha were taken between 1807 and 1820. The dominions of Poona, Ahmednagar, Nasik, Sholapur, Belgaum, Kaladgi and Dharwar, were included in the presidency, the settlement of which was completed by Mountstuart Elphinstone, governor from 1819 to 1827. His policy was to rule as far as possible on native lines, avoiding all changes for which the population was not yet ripe. The period that followed is notable mainly for the enlargement of the presidency through the lapse of certain native states, by the addition of Aden (1839) and Sind (1843), and the lease of the Panch Mahals from Sindhia (1853). Outbreaks among the troops at Karachi, Ahmedabad and Kolhapur were quickly put down, two regiments being disbanded, and the rebellions in Gujarat, among the Bhils, and in the southern Mahratta country were local and isolated. Under Sir Bartle Frere (1862-67) agricultural prosperity reached its highest point, as a result of the American Civil War, and the consequent enormous demand for Indian cotton in Europe. The money thus poured into the country produced an epidemic of speculation known as the "share mania" (1864-65), which ended in a commercial crisis and the failure of the bank of Bombay (1866). Sir Bartle Frere encouraged the completion of the great trunk lines of railways, and with the funds obtained by the demolition of the town walls (1862) he began the magnificent series of public buildings that now adorn Bombay.

During recent times the entire history of Bombay has been sadly affected by plague and famine. The great cities of Bombay, Karachi and Poona suffered most severely. At Bombay, in March 1898, a riot begun by Mohammedan weavers was not suppressed until several Europeans had been fatally injured. In Nasik district, in January 1898, the native chairman of the plague committee was brutally murdered by a mob. Bombay, like the Central Provinces, suffered from famine twice within three years. The failure of the monsoon of 1896 caused widespread distress throughout the Deccan, over an area of 46,000 sq. m. with a population of 7 millions. In 1899 the monsoon again failed in Gujarat, where famine hitherto had been almost unknown; and the winter rains failed in the Deccan, so that distress gradually spread over almost the entire presidency. The worst feature was a virulent outbreak of cholera in Gujarat, especially in the native states. The Bombay government exhausted its balances in 1897, and was subsequently dependent on grants from the government of India. The presidency now consists of 6 administrative divisions: Bombay City, Northern, Central and Southern Bombay, Bombay Suburban and Sind, under which are 27 districts. The financial condition has so far improved that the presidency annually makes grants to the Central Government.

See S. M. Edwardes, *The Rise of Bombay* (1902); James Douglas, *Bombay and Western India* (1893); Sir William Lee-Warner, *The Presidency of Bombay* (Society of Arts, 1904); *The Imperial Gazetteer of India* (1908), V. A. Smith, *The Early History of India* (revd. S. M. Edwardes, 1924), J. Abbott, *Sind* (1924).

BOMBAZINE or **BOMBASINE**, a stuff originally made of silk or silk and wool, and now also made of cotton and wool or of wool alone. Good bombazine is made with a silk warp and a worsted weft. It is twilled or corded and used for dress material. Black bombazine has been used largely for mourning, but the material has gone out of fashion. The word is derived from the obsolete French *bombasin*, applied originally to silk but afterwards to "tree-silk" or cotton. Bombazine is said to have been made in England in Elizabeth's reign, and early in the 19th century it was largely made at Norwich.

BOMBERG, DANIEL (d. 1540), a famous Dutch Christian printer of Hebrew books. His chief activity was in Venice between 1516 and 1549 (the year of his death). Among other great enterprises, he published the *editio princeps* (1516-17) of the rabbinical Bible (Hebrew text with rabbinical commentaries, etc.). He also produced the first complete edition of the Talmud (1520-23).

BOMBPROOF, in military language, a shelter proof against penetration by shells.

BOMBYCILLIDAE: see WAXWING.

BONA, Bône, seaport of Algeria, in 36° 52' N., 7° 48' E., on a bay of the Mediterranean, chief town of an *arrondissement* in the department of Constantine, 220 m. by rail west of Tunis, and 136 m. N.E. of Constantine. The town, with modern ramparts outside the Arab wall, is in the coastal plain of Bona at the foot of the wooded gneissose Edugh. Its general character now is that of a flourishing French city, but some streets are very steep. At the northern end is the quasi-Byzantine cathedral of St. Augustine. The Grand Mosque is built out of ruins of the ancient Hippo. The Kasbah (citadel) stands on a hill north-east of the town. The inner harbour, covering 25 acres, has quays at which vessels drawing 22 ft. can moor. Beyond is a spacious outer harbour, built 1857-1868 and enlarged 1905-1907. Bona communicates with Marseilles direct and ranks after Algiers and Oran in Algeria. The port's shipping in 1925 reached 2,924,115 tons. It imports general merchandise and manufactures, and exports especially phosphates, iron and zinc, but also barley, sheep, wool, cork and esparto. There are manufactories of native garments, tapestry and leather. The draining of marshes at the mouths of the Seybuse and Bujema rivers, which enter the sea to the south of Bona has improved the sanitary condition of the town, which has the advantage of abundant water from the Edugh hills. There are cork woods and marble quarries, and the valley of the Seybuse and neighbouring plains are rich in cotton and other agricultural produce. The population of the town of Bona in 1926 was 51,895.

Bona is identified with the ancient *Aphrodisium*, the seaport of *Hippo Regius* or *Ubbo*, but it derives its name from the latter city, the ruins of which, consisting of large cisterns, now restored, and fragments of walls, are about a mile to the south of the town. In the first three centuries of the Christian era Hippo was one of the richest cities in Roman Africa. St. Augustine lived here as priest and bishop for 35 years. Hippo was captured by the Vandals under Genseric in 431, after a siege of 14 months, during which Augustine died. Only the cathedral, together with Augustine's library and mss., escaped the general destruction. The town was partly restored by Belisarius, but sacked by the Arabs in the 7th century. The place was named Hippo Regius (Royal) by the Romans because it was a favourite residence of the Numidian kings. Bona (Arabic *annaba*, "the city of jujube trees") was built by the Arabs, and the rulers of Tunis built the Kasbah in 1300. From the beginning of the 14th to the middle of the 15th century it was frequented by Italians and Spaniards, and in the 16th it was held for some time by Charles V, who strengthened its citadel. Thereafter it was held in turn by Genoese, Tunisians and Algerines. From the time of Louis XIV. to the Revolution, the French *Compagnie d'Afrique* maintained a very active trade with the port. The town was occupied by the French for a few months in 1830 and reoccupied in 1832. Since then industrial growth has been rapid and has depended on the iron ores of Ouenza and the discovery (1883) of phosphate beds at Tebessa.

BONACCI, LEONARDO: see LEONARDO OF PISA.

BONA DEA, the "good goddess," an old Roman deity of fruitfulness, both in the earth and in women. She was identified with Fauna, and by later syncretism also with Ops and Maia—the latter no doubt because the dedication-day of her temple on the Aventine was on May 1 (Ovid, *Fasti*, v. 140 *et seq.*) This temple was cared for, and the cult attended, by women only, and the same was the case at a second celebration, at the beginning of December, in the house of a magistrate with *imperium*, which became famous owing to the profanation of the mysteries by P. Clodius (q.v.) in 62 B.C., and the political consequences of his act. Wine and myrtle were tabooed in the cult of this deity, and myths grew up to explain these features of the cult. Herbs with healing properties were kept in her temple, and also snakes, the usual symbol of the medicinal art. Her victim was a sow (*porca*), as in the cults of other deities of fertility, and was called *damium*, and we are told that the goddess herself was known as Damia and

her priestess as *damiatrix*. These names are almost certainly Greek; Damia is found worshipped at several places in Greece, and also at Tarentum, where there was a festival called *Dameia*. It is thus highly probable that on the cult of the original Roman goddess was engrafted the Greek one of Damia, perhaps after the conquest of Tarentum (272 B.C.).

See W. W. Fowler, *Roman Festivals* (1899); G. Wissowa, *Religion und Kultus der Römer* (1912).

BONA FIDE (Lat. "in good faith"), in law, a term implying the absence of all fraud. It is usually employed in conjunction with a noun, e.g., "*bona fide* purchaser," connoting the absence of notice of a defect in title; "*bona fide* holder" of a bill of exchange (q.v.); "*bona fide* traveller" under the licensing acts (see LIQUOR LAWS).

BONALD, LOUIS GABRIEL AMBROISE, VICOMTE DE (1754-1840), French philosopher and politician, was born at Le Monna, near Millau in Aveyron. He emigrated in 1791, joined the army of the prince of Condé, and soon afterwards settled at Heidelberg. There he wrote his first important work, the highly conservative *Théorie du pouvoir politique et religieux* (1796; new ed., Paris 1854), which was condemned by the Directory. In 1806 he was associated with Chateaubriand and Fiévée in the conduct of the *Mercur de France*. After the Restoration he was a member of the council of public instruction, and from 1815-22 sat in the chamber as deputy. His speeches were on the extreme conservative side; he even advocated a literary censorship, and was a champion of ultra-montanism. In 1822 he was made minister of State, and presided over the censorship commission. In 1830 he retired to Le Monna, where he died.

Bonald was one of the leading writers of the theocratic or traditionalist school, which included de Maistre, Lamennais, Balanche and d'Eckstein. His writings are mainly on social and political philosophy, and form a defence of political absolutism. They are based ultimately on the principle of the divine origin of language. In his own words, "L'homme pense sa parole avant de parler sa pensée;" the first language contained the essence of all truth. From this he deduces the existence of God, the divine origin and consequent supreme authority of the Holy Scriptures, and the infallibility of the church.

His son, LOUIS JACQUES MAURICE (1787-1870), cardinal (1841), was condemned by the council of State for a pastoral letter attacking Dupin the elder's *Manuel de droit ecclésiastique*.

Besides the *Théorie* above mentioned, the Vicomte de Bonald published *Essai analytique sur les lois naturelles de l'ordre social* (1800); *Législation primitive* (1802); *Du divorce considéré au XIX^e siècle* (1801); *Recherches philosophiques sur les premiers objets de connaissances morales* (1818); *Mélanges littéraires et politiques, démonstration philosophique du principe constitutif de la société* (1819, 1852). The first collected edition appeared in 1817-19, the latest is that of the Abbé Migne (1859).

BIBLIOGRAPHY.—See *Notice sur M. le Vicomte de Bonald* (1841, ed. Avignon, 1853), by his son Victor; Damiron, *Phil. en France au XIX^e siècle*; Windelband, *History of Philosophy* (trans. J. H. Tufts, 1893).

BONANZA, a sudden source of great wealth; term taken from the Spanish, meaning fair weather or prosperity. The first appearance of this word in the English language was in the southwestern United States, where the direct contact with Spanish vernacular gave rise to its application in mining terms, indicating a rich ore body or lode, especially of silver and gold. It is now applied to anything that yields a large income.

BONAPARTE, the name of a family made famous by Napoleon I. (q.v.), emperor of the French. The French form Bonaparte was not commonly used, even by Napoleon, until after the spring of 1796. The original name was Buonaparte, which was borne in the early middle ages by several distinct families in Italy. One of these, which settled at Florence before the year 1100, divided in the 13th century into the two branches of San Miniato and Sarzana. A member of this latter, Francesco Buonaparte, emigrated in the middle of the 16th century to Corsica, where his descendants continued to occupy themselves with the affairs of law and the magistracy.

CARLO BUONAPARTE [Charles Marie de Bonaparte] (1746-1785), the father of Napoleon I., took his degree in law at the University of Pisa, and after the conquest of Corsica by the

French became assessor to the royal court of Ajaccio and the neighbouring districts. In 1764 he married Letizia Ramolino, a beautiful and high-spirited girl, aged 14, descended from an old Corsican family. The first two children, born in 1765 and 1767, died in infancy; Joseph (*see below*), the first son who survived, was born in 1768, and Napoleon in 1769. Simple and frugal in her tastes, and devout in thought and manner of life, Letizia helped to bind her children to the life of Corsica, while her husband, a schemer by nature and a Voltairian by conviction, pointed the way to careers in France.

Though endowed with immense wealth and distinguished by the title of *Madame Mère*, Letizia, after her husband's death in 1785, lived, under the Empire, mainly in retirement, and in the exercise of a strict domestic economy. After the events of 1814 she joined the emperor in the island of Elba and returned with him to Paris during the Hundred Days. After Waterloo, she took up her residence at Rome, under the protection of Pope Pius VII., who treated her with great kindness and consideration. In 1818 she addressed a pathetic letter to the powers assembled at the congress of Aix, petitioning for Napoleon's release, on the ground that his mortal illness had removed any possibility of his ever again becoming a menace to the world's peace. The letter remained unanswered, the powers having reason to believe that its terms had been previously concerted with Napoleon. Henceforth, saddened by the death of Napoleon, of her daughters Pauline and Elisa, and of several grandchildren, she lived a life of mournful seclusion. She died in 1836.

For the Bonaparte family in general, and Carlo and Letizia, *see Storia genealogica della famiglia Bonaparte . . . scritta da un Samminiatese* (D. Morali) (Florence, 1846); F. de Steiani, *Le antichità dei Bonaparte; precede per una introduzione* (L. Beretta) (Venice, 1857); L. Ambrosini and A. Huard, *La Famille impériale. Chuquet, *La Jeunesse de Napoléon* (1897-99); T. Nasic, *Mémoires sur l'enfance et la jeunesse de Napoléon*; Baron H. Larrey, *Madame Mère* (1892); Walter Geer, *Napoleon and His Family* (1927); Emil Ludwig, *Napoleon* (Eng. trans., 1927).

The brothers and sisters of Napoleon I., taken in order of age, are the following —

I. JOSEPH (1768-1844), was born at Corte in Corsica on Jan. 7, 1768. He was educated at the college at Autun in France, returned to Corsica in 1784, and studied law at Pisa. Like his brothers, he embraced the French or democratic side, and on the victory of the Paolist party sought refuge in France. He settled at Marseilles and married Mlle. Julie Clary, daughter of a merchant of that town. Joseph went on a mission to Genoa in 1795 in connection with plans for the recovery of Corsica. In 1796 he accompanied Napoleon in the early part of the Italian campaign, and had some part in the negotiations with Sardinia which led to the armistice of Cherasco (April 28). He took part in the French expedition for the recovery of Corsica, and helped the commissioner of the French Republic, Miot de Melito, in the reorganization of that island. In March 1797 he was appointed by the Directory minister to the court of Parma, and then to Rome. Discords arose between the Vatican and the French Republic, and it is clear that Napoleon and the French Directory ordered Joseph to encourage revolutionary movements in Rome. On Dec. 28, 1797, a disturbance took place opposite the French embassy, which led to the death of the French general Léonard Duphot. Joseph returned to Paris, and became one of the members for Corsica in the Council of Five Hundred.

Before the *coup d'état* of Brumaire he helped Napoleon in making overtures to Siéyès and Moreau, but otherwise did little. He was a member of the council of state and of the *Corps Législatif*. He concluded at Mortfontaine, a convention with the United States (1800). He also presided over the negotiations which led to the Treaty of Lunéville with Austria (Feb. 9, 1801); and he and Maret represented France in the lengthy discussions with the British envoy, Lord Cornwallis, which resulted in the signature of the Treaty of Amiens (March 25, 1802). On the

question of the consolidation of Napoleon's power as First Consul for life (Aug. 1, 1802) with the chief voice in the selection of his successor, the brothers disagreed. As neither Joseph nor Napoleon had a male heir, the eldest brother claimed to be recognized as heir, while Napoleon wished to recognize the son of Louis Bonaparte. On the proclamation of the French empire (May 1804) the friction became acute. Napoleon offered to make Joseph king of Lombardy if he would waive all claim of succession to the French throne, but met with a firm refusal.

Meanwhile Joseph had striven in vain to avert a rupture with England, which came about in May 1803. In 1805 he acted as chief of the French Government while Napoleon was campaigning in Germany. Early in 1806 he was sent to Naples to expel the Bourbon dynasty. By the decree of March 30, 1806, Napoleon proclaimed Joseph king of Naples, but allowed him to keep intact his claims to the throne of France. The memoirs of Count Miot de Melito, whom Joseph appointed minister of war, show how great were the difficulties with which the new monarch had to contend—an almost bankrupt treasury, a fickle and degraded populace, Bourbon intrigues and plots, and frequent attacks by the British from Sicily. During his brief reign at Naples, Joseph abolished the relics of feudalism, reformed the monastic orders, reorganized the judicial, financial and educational systems, and initiated several public works.

But he was suddenly called away by Napoleon to take the crown of Spain (May 1808). There his difficulties were far greater. For the fortunes of King Joseph in Spain and in the eventful years of the Peninsular War, *see SPAIN and PENINSULAR WAR*. His sovereignty was little more than titular. Compelled to leave Madrid hastily in Aug. 1808, owing to the Spanish success at Baylen, he was reinstated by Napoleon at the close of the year; and he was thereafter kept in a subordinate position which led him on four occasions to offer to abdicate. After his flight from Spain in 1813 the emperor wrote to the minister of war (July 11, 1813):—"His [Joseph's] behaviour has never ceased bringing misfortune upon my army; it is time to make an end of it."

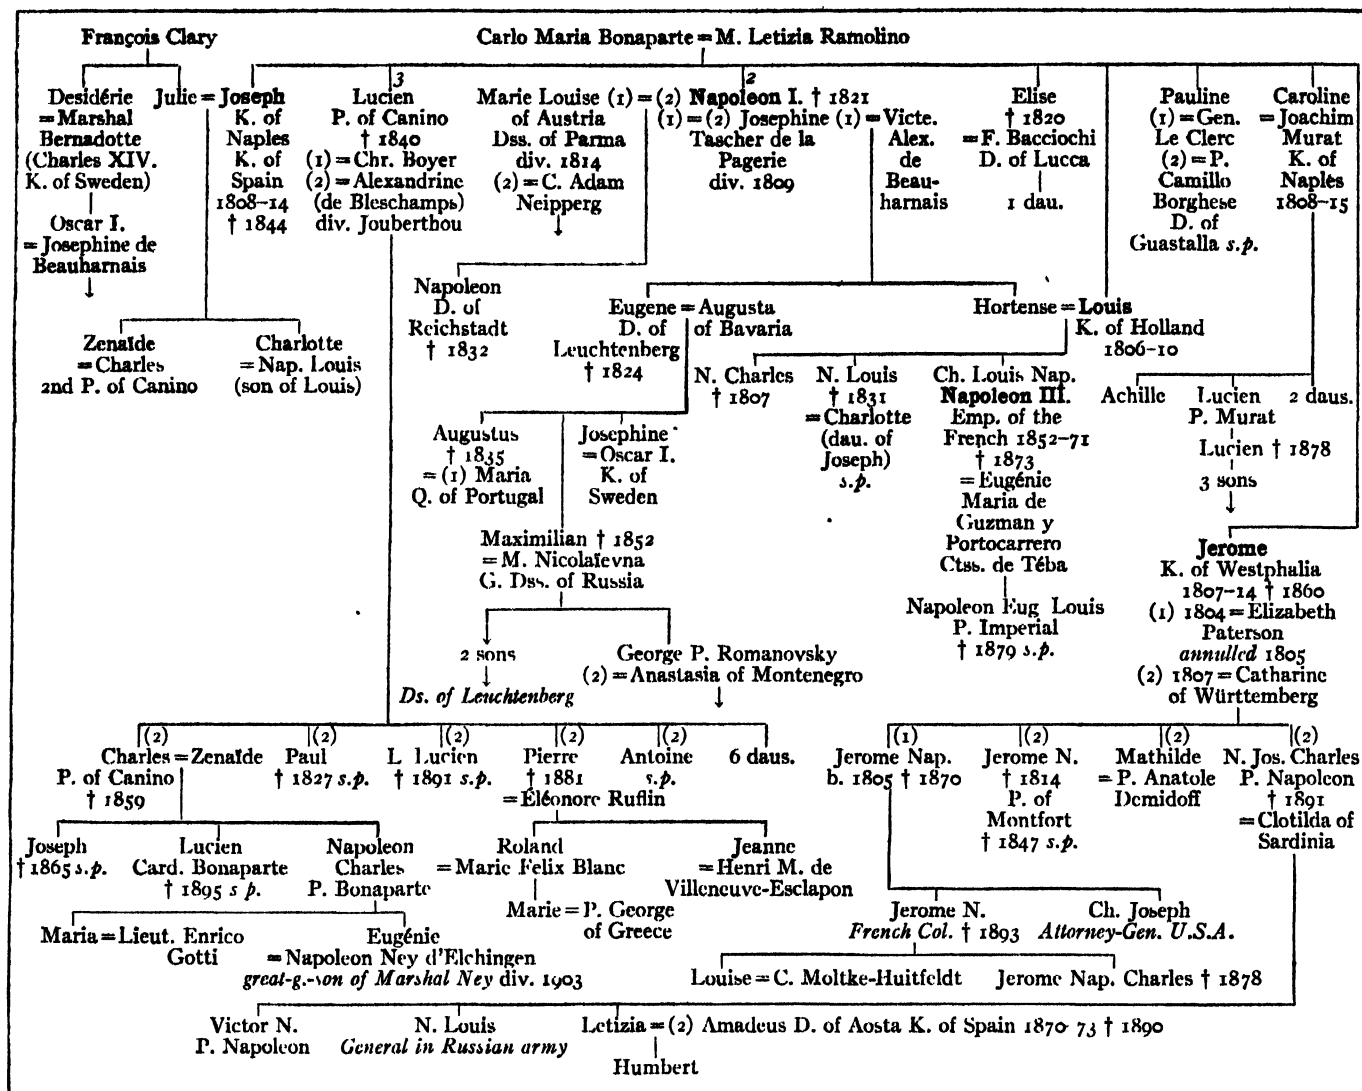

Napoleon was equally dissatisfied with his brother's conduct as lieutenant-general of France, while he himself was conducting the campaign of 1814 in the east of France. On March 30, Joseph empowered Marmont to make a truce with the assailants of Paris if they should be in overpowering strength. On the surrender of the capital Joseph at once retired. The part which he played during the Hundred Days (1815) was also insignificant. After the surrender of his brother to the captain of H.M.S. "Bellerophon" at Rochefort, Joseph went to the United States. In 1830 he pleaded for the recognition of the claims of the duke of Reichstadt (king of Rome) to the French throne. He afterwards visited England, and for a time resided at Genoa and Florence. In the latter city, the cradle of his race, he died on July 28, 1844. In person he somewhat resembled Napoleon, but utterly lacked his strength and energy. He was too mild, supine and luxurious for the tasks thrust upon him by his brother. Yet his correspondence and memoirs prove that he retained for Napoleon warm feelings of affection.

Of the many works dealing with Joseph Bonaparte we may cite Baron A. du Cassé, *Mémoires et correspondance politique et militaire du roi Joseph* (1854), and *Les Rois frères de Napoléon* (1883); J. S. C. Abbott, *History of Joseph Bonaparte* (1869); G. Bertin, *Joseph Bonaparte in America; Joseph Bonaparte jugé par ses contemporains* (anon.); the *Mémoires of Count Miot de Melito* (translated General Fleischmann, 1881); R. M. Johnston, *The Napoleonic Empire in Southern Italy* (with an excellent bibliography, 1904); *Correspondence of Napoleon with Joseph Bonaparte* (1856).

II. LUCIEN (1775-1840), prince of Canino, was born at Ajaccio on May 21, 1775. He followed his elder brothers to the schools of Autun and Brienne, but, being debarred by defective sight from the army, went to the seminary at Aix in Provence (1786). His excitable and volatile disposition agreed ill with the discipline of the place, and on the outbreak of the Revolution in 1789 he returned to Corsica, and became the leading speaker in the Jacobin club at Ajaccio. Lucien urged his brothers to break with Paoli, and headed a Corsican deputation which went to France

BONAPARTE

HOUSE OF BONAPARTE

(Reproduced by permission of the Cambridge University Press from vol. xiii. of the *Cambridge Modern History*.)

to denounce Paoli and to solicit aid for the democrats. In the south of France he worked hard for the Jacobinical cause. In May 1794, he married Catherine Boyer. The *coup d'état* of Thermidor (July 28, 1794) compelled him to accept a small post at St. Chamans. There he was arrested and imprisoned for a time until Napoleon procured his release, and found him a post as commissioner in the French army campaigning in Germany. Lucien disliked the army, and was sent to Corsica. In 1798 he entered the Council of Five Hundred at Paris as deputy for Corsica. He was president of that body on the 19th Brumaire (Nov. 10) 1799, when Napoleon overthrew the national councils of France at the palace of St. Cloud. The refusal of Lucien to put the vote of outlawry, for which the majority of the council clamoured, his opportune closing of the sitting, and his appeal to the soldiers outside to disperse *les représentants du poignard*, turned the scale in favour of his brother.

By a strange irony this event, the chief event of Lucien's life, was fatal to the cause of democracy of which he had been the most eager exponent. In one of his earlier letters to his brother Joseph, Lucien stated that he had detected in Napoleon "an ambition not altogether egotistic but which surpassed his love for the general weal; . . . in case of a counter-revolution he would try to ride on the crest of events." Lucien's suspicion of his brother became a dominant feeling; and the relations between them became strained during the period of the consulate (1799-1804). He accepted office as minister of the interior, but was

soon deprived of it owing to political and personal differences with the First Consul. Napoleon then appointed him ambassador to the court of Madrid (Nov. 1800), where he again fell into disgrace with his brother. He returned to Paris, and again opposed Napoleon's schemes. Lucien's next proceeding completed the breach between the two brothers. His wife had died in 1800; he became enamoured of a Mme. Joubertou and despite the express prohibition of the First Consul, secretly married her at his residence of Plessis on May 25, 1803. At that time Napoleon was pressing Lucien to marry the widow of the king of Etruria, and he now ordered him to leave French territory. Lucien departed for Italy with his wife and infant son, after annoying Napoleon by bestowing on her publicly the name of Bonaparte.

For some years he lived in Italy, chiefly at Rome. In Dec. 1807 the emperor sought to come to an arrangement by which Lucien would take his place as a French prince, provided that he would annul his marriage. This step Lucien refused to take; and after residing for some time at his estate of Canino, from which he took the papal title of prince of Canino, he left for America. Captured by a British ship, he was taken to Malta and thence to England, where he resided under some measure of surveillance up to the peace of 1814. Returning to Rome, he offered Napoleon his help during the Hundred Days (1815), stood by his side at the "Champ de Mai" at Paris, and was the last to defend his prerogatives at the time of his second abdication. He spent the rest of his life in Italy, and died at Rome on June 29, 1840. He

wrote an epic, *Charlemagne, ou l'Église délivrée* (2 vols. 1814), also *La Vérité sur les Cent Jours* and *Memoirs*, not completed.

For sources see T. Jung, *Lucien Bonaparte et ses mémoires* (1882-83); an anonymous work, *Le Prince Lucien Bonaparte et sa famille* (1888).

III. MARIANNE ELISA (1777-1820), born at Ajaccio on Jan. 3, 1777, married (May 5, 1797) Felix Bacciocchi. In 1805, Napoleon bestowed upon her the principality of Piombino and shortly afterwards Lucca; in 1808 her importunities gained for her the grand duchy of Tuscany. Her pride and ability had a great influence on the administration and on Italian affairs in general. Her relations with Napoleon were frequently strained; and in 1813-14 she abetted Murat in his enterprises (see MURAT). After her brother's fall she retired, with the title of countess of Compignano, first to Bologna and afterwards to Santo Andrea near Trieste, where she died on Aug. 6, 1820.

See J. Turquan, *Les Soeurs de Napoléon* (1896); P. Marmothan, *Elisa Bonaparte* (1898); E. Rodocanachi, *Elisa Bonaparte en Italie* (1900).

IV. LOUIS (1778-1846) was born at Ajaccio on Sept. 2, 1778. His elder brother Napoleon supervised his education and in 1795 procured for him admission to the military school at Châlons. Louis went through the Italian campaign of 1796-97 with Napoleon and acted as his aide-de-camp in Egypt in 1798-99. In 1802 the First Consul married him to Hortense Beauharnais, a forced union which led to most deplorable results. In 1804 Louis was raised to the rank of general, and entered the council of state. In the next year he became governor of Paris and undertook various military and administrative duties.

After the victory of Austerlitz (Dec. 2, 1805) Napoleon proclaimed Louis king of Holland (June 6, 1806). From the first the emperor reproached him with being too easy with his subjects. Their relations were embittered by a violent jealousy which Louis conceived against his wife. In 1808 the emperor offered Louis the throne of Spain then vacant; but on Louis refusing to accept it the honour went to Joseph. In 1809 Napoleon virtually resolved to annex Holland, in order to stop the trade which the Dutch secretly carried on with England. At the close of the year Louis went to Paris, partly in order to procure a divorce from Hortense and partly to gain better terms for Holland. He failed in both respects. After the collapse of negotiations with Great Britain in the spring of 1810, the emperor again pressed Louis hard, and finally sent French troops against the Dutch capital. Thereupon Louis fled from his kingdom and finally settled at Töplitz in Bohemia. On July 9, 1810, Napoleon annexed Holland to the French empire. Louis spent the rest of his life chiefly at Rome, concerning himself with literary and philosophic studies and with the fortunes of his sons. Their devotion to the national and democratic cause in Italy in 1830-31 gave him much pleasure, which was overclouded by the death of the elder, Napoleon Louis, in the spring campaign of 1831 in the Romagna. The failure of his other son, Charles Louis Napoleon (afterwards Napoleon III), to wrest the French crown from Louis Philippe by the attempts at Strasbourg and Boulogne also caused him disappointment. He died on July 25, 1846. His sons were Napoleon Charles (1802-07), Napoleon Louis (1804-31), and Charles Louis Napoleon (1808-73), afterwards emperor of the French as NAPOLEON III. (qv).

The chief works on the life and reign of Louis are le comte de Saint-Léu, *Documents historiques et réflexions sur le gouvernement de la Hollande* 2nd ed. (1820); F. Rocquain, *Napoléon I^{er} et le Roi Louis, d'après les documents conservés aux archives nationales* (1875); Baron A. du Casse, *Les Rois frères de Napoléon* (1883); A. Garnier, *La Cour de Hollande sous le règne de Louis Bonaparte, par un auditeur* (Paris and Amsterdam, 1823); T. Jorissen, *Napoléon I^{er} et le roi de Hollande (1806-1813) d'après des documents authentiques et inédits* (Paris and The Hague, 1868); V. Loosjes, *Louis Bonaparte, Koning van Holland* (1888); L. Wichers, *De Regeering van Koning Lodewijk Napoleon* (1806-10) (Utrecht, 1892).

V. MARIE PAULINE (1780-1825), the gayest and most beautiful member of the family, was born at Ajaccio on Oct. 20, 1780. At 17 she married General Leclerc, a staff officer of Napoleon, and accompanied him to St. Domingo, where he died of yellow fever in 1802. Returning to Paris she married Prince Camillo Borghese (Aug. 23, 1803) and went with him to Rome. She soon tired of

him, returned to Paris and gratified her whims in ways that caused some scandal. In 1806 she received the title of duchess of Guastalla. Her off-hand treatment of the new empress, Marie Louise, led to her removal from court in 1810. Nevertheless in 1814 she repaired with "Madame Mère" to Elba, and is said to have expressed a wish to share Napoleon's exile in St. Helena. She died in 1825 of cancer. Canova's statue of her as Venus reclining on a couch is well known.

See J. Turquan, *Les soeurs de Napoléon* (1896).

VI. MARIA ANNUNCIATA CAROLINE (1782-1839) was born at Ajaccio on March 25, 1782. Early in 1800 she married Joachim Murat, whose interests she afterwards advanced with all the power of her ambitious and intriguing nature. He became governor of Paris, marshal of France (1804), grand duke of Berg and of Cleves (1806), lieutenant of the emperor in Spain (1808), and early in the summer of that year king of Naples. The distance of this capital from Paris displeased Caroline; her relations with Napoleon became strained, and she associated herself with the equivocal movements of her husband in 1814-15. Before his tragic end at Pizzo on Oct. 13, 1815, she had retired to Austrian territory. She died on May 18, 1839.

See J. Turquan, *Caroline Murat, reine de Naples* (1899). See also under MURAT, JOACHIM.

VII. JEROME (1784-1860) was born at Ajaccio on Nov. 15, 1784; he shared the fortunes of the family in the early years of the French Revolution, was educated at Juilly and was called to the side of his brother, then First Consul of France, in 1800. While in the Consular Guard he fought a duel with the younger brother of General Davout and was wounded. Soon afterwards he was transferred to the navy and cruised in the West Indies, where he left his ship and travelled through the United States. At Baltimore he married Elizabeth Patterson. When in 1805 Jerome brought his wife to Europe, the emperor ordered her to be excluded from his states. Jerome vainly sought to bend his brother's will in an interview at Alexandria. In May 1805 he received command of a small squadron in the Mediterranean, while his wife proceeded to Camberwell, where she gave birth to a son. In November Jerome returned to service in the navy. Napoleon made him a prince of France, and gave him command of a division of South Germans in the campaign of 1806. After Jena, Jerome received the surrender of several Prussian towns. An imperial decree having annulled the Patterson marriage, the emperor united Jerome to the princess Catherine of Württemberg; and in pursuance of the terms of the Treaty of Tilsit (July 7, 1807) made him king of Westphalia. In the Russian campaign Jerome was entrusted with a movement which might have brought the southern Russian army into grave danger, on his failure (which was probably due to his lack of energy) the emperor promptly subjected him to the control of Marshal Davout, and Jerome returned to Cassel. In 1813, on the fall of the Napoleonic régime in Germany, Jerome retired to France, and in 1814 spent some time in Switzerland and at Trieste. Returning to France in 1815, he commanded a division on the French left wing at Waterloo and attacked Hougoumont with great pertinacity. On Napoleon's second abdication Jerome proceeded to Württemberg, was threatened with arrest unless he gave up his wife and child, and was kept under surveillance at Goppingen; finally he was allowed to proceed to Augsburg, and thereafter resided at Trieste, or in Italy or Switzerland. His consort died in 1835. He returned to France in 1847, and after the rise of Louis Napoleon to power, became successively governor of the Invalides, marshal of France and president of the senate. He died on June 24, 1860. His children were Jerome Napoleon (see XIV.), Mathilde (see XII.) and Napoleon Joseph Charles Paul (born in 1822); the last was afterwards known as Prince Napoleon (see XI. below) and finally became the heir to the fortunes of the Napoleonic dynasty.

The chief works relating to Jerome Bonaparte are: Baron Albert du Casse, *Mémoires et correspondance du roi Jérôme et de la reine Cathérine* (1861-66) and *Les Rois frères de Napoléon* (1883); M. M. Kaisenberg, *König Jerome Napoleon*; W. T. R. Saffell, *The Bonaparte-Patterson Marriage*; August von Schlossberger, *Briefwechsel der Königin Katharina und des Königs Jerome von Westfalen mit König*

Friedrich von Württemberg (Stuttgart, 1886-87), supplemented by du Casse in *Corresp. inédite de la reine Catherine de Westphalie* (1888-93); A. Martinet, *Jérôme Napoléon, roi de Westphalie* (1902); P. W. Sergeant, *The Burlesque Napoleon* (1905).

VIII. CHARLES LUCIEN JULES LAURENT (1803-1857), prince of Canino, son of Lucien Bonaparte, born on May 24, 1803, and died July 29, 1857, was a scientist rather than a politician and a correspondent of many learned societies. He married his cousin, Zénaïde Bonaparte, daughter of Joseph, in 1822. At the age of 22 he began the publication of an *American Ornithology* (4 vols., Philadelphia, 1825-33), which established his scientific reputation. A series of other works in zoology followed. He took part in the political agitation in Italy, and he declared himself at Venice in favour of the independence of Italy and the expulsion of the Austrians. He entered the Junto of Rome in 1848 and was elected deputy by Viterbo to the national assembly. The failure of the revolution forced him to leave Italy in July 1849. He gained Holland, then France, where he turned again to science. His principal works were, *Conspectus systematis ornithologiae, mastozologiae, erpetologiae et amphibologiae, Ichthyologiae* (Leyden, 1850), *Tableau des oiseaux-mouches* (Paris, 1854), *Ornithologie fossile* (Paris, 1858). Eight children survived him: Joseph Lucien Charles Napoleon, prince of Canino (1824-65), who died without heirs; Cardinal Lucien Louis Joseph Napoleon; five daughters; Napoleon Charles Grégoire Jacques Philippe, who married the princess Ruspoli, by whom he had two daughters.

IX. LOUIS LUCIEN (1813-1891), son of Lucien Bonaparte, was born at Thorngrove, Worcestershire, England, on Jan. 4, 1813. He passed his youth in England, not going to France until 1848, when, after the revolution, he was elected deputy for Corsica (Nov. 28, 1848); his election having been invalidated, he was returned as deputy for the Seine in June, 1849. He sat in the right of the Legislative Assembly, but had no direct part in the *coup d'état* of his cousin on Dec. 2, 1851. Napoleon III. named him senator and prince, but he took hardly any part in politics during the Second Empire, and after the proclamation of the Third Republic in 1870 he withdrew to England. There he busied himself with philology, and published notably some works on the Basque language. He died on Nov. 3, 1891, leaving no children.

X. PIERRE NAPOLEON (1815-1881), son of Lucien Bonaparte, was born at Rome on Oct. 11, 1815. He joined the rebels in the Romagna (1830-31); was then in the United States, where he went to join his uncle Joseph, and in Colombia with General Santander (1832). Returning to Rome he was taken prisoner by order of the pope (1835-36). He finally took refuge in England. At the revolution of 1848 he returned to France and was elected deputy for Corsica to the Constituent Assembly. He declared himself an out-and-out republican and voted even with the Socialists. He pronounced himself in favour of the national workshops and against the *loi Falloux*. His attitude contributed greatly to give popular confidence to his cousin Louis Napoleon (Napoleon III.), of whose *coup d'état* on Dec. 2, 1851, he disapproved; but he was reconciled to the emperor and accepted the title of prince. The republicans at once abandoned him. From that time on he led a debauched life, and lost all political importance. In Jan. 1870 a violent incident brought him again into prominence. As the result of a controversy with Paschal Grousset, the latter sent him two journalists to provoke him to a duel. Pierre Bonaparte took them personally to account, and during a violent discussion he drew his revolver and killed one of them, Victor Noir. The High Court acquitted him of murder, and criticism then fell upon the Government. Pierre Bonaparte died in obscurity at Versailles on April 7, 1881. He had married the daughter of a Paris working-man, Justine Eleanore Ruffin, by whom he had, before his marriage, two children: (1) Roland Napoleon (b. 1858) and (2) Jeanne, wife of the marquis de Vence.

XI. NAPOLEON JOSEPH CHARLES PAUL, commonly known as Prince Napoleon, or by the sobriquet of "Plon-Plon,"¹ (1822-1891), was the second son of Jerome Bonaparte, king of West-

¹Derived, it is supposed, from the nickname "Plomb-plomb," or "Craint-plomb" (fear-lead), given him by his soldiers in the Crimea.

phalia, by his wife Catherine, princess of Württemberg, and was born at Trieste on Sept. 9, 1822. After the French Revolution of 1848 he was elected to the National Assembly as a representative of Corsica, and (his elder brother, Jerome Napoleon Charles, dying in 1847) assumed the name of Jerome. Notwithstanding his ostensible opposition to the *coup d'état* of 1851, he was designated, upon the establishment of the Empire, as successor to the throne if Napoleon III. should die childless. Privately he professed himself the representative of the Napoleonic tradition in its democratic aspect, and associated mainly with men of advanced political opinions. At court he represented the Liberal Party against the empress Eugénie. In 1854 he took part in the Crimean campaign as general of division. Returning to France he undertook the chief direction of the National Exhibition of 1855, in which he manifested great capacity. In 1858 he was appointed minister for the colonies and Algeria, but his activity was diverted into a different channel by his sudden marriage in Jan. 1859 with the princess Marie Clotilde of Savoy, daughter of Victor Emmanuel, a prelude to the war for the liberation of Italy. In this war Prince Napoleon commanded the French corps that occupied Tuscany, and it was expected that he would become ruler of the principality. The next few years were chiefly distinguished by remarkable speeches. Unfortunately his indiscretion equalled his eloquence: one speech (1861) sent him to America to avoid a duel with the duke d'Aumale; another (1865), in which he justly but intemperately protested against the Mexican expedition, cost him all his official dignities. The fatal war of 1870 was resolved upon during his absence in Norway, and was strongly condemned by him. After the fall of the Empire he lived in comparative retirement until in 1879 the death of Napoleon III.'s son, the Prince Imperial (see XIII. below) made him direct heir to the Napoleonic succession. His part as imperial pretender was unfortunate and inglorious, and before his death he was virtually deposed in favour of his son Prince Napoleon Victor. He died at Rome on March 17, 1891. In the character of his intellect, as in personal appearance, he bore an extraordinary resemblance to the first Napoleon, possessing similar insight, and the gift of distinguishing the essential from the non-essential. He was a warm friend of literature and art.

His eldest son, Prince Napoleon Victor Jérôme Frédéric (1862-), became at his death the recognized head of the French Bonapartist Party. The second son, Prince Louis Napoleon, an officer in the Russian army, showed a steadier disposition, and was more favoured in some monarchist quarters, in 1900 he was made governor of the Caucasus.

XII. MATHILDE LETITIA WILHELMINE (1820-1904), daughter of Jerome, and sister of Prince Napoleon (XI.), was born at Trieste on May 20, 1820; after being almost betrothed to her cousin Louis Napoleon she was married in 1840 to Prince Anatole Demidov. His conduct, however, led to a separation within five years. After the election of Louis Napoleon to the presidency of the republic she did the honours of the Élysée till his marriage. She continued to live in Paris, having great influence as a friend and patron of men of art and letters, till her death on Jan. 2, 1904.

XIII. NAPOLEON EUGENE LOUIS JEAN JOSEPH (1850-1870). Prince Imperial, only son of the emperor Napoleon III. and the empress Eugénie, was born at Paris on March 16, 1856. He was a delicate boy, but when the war of 1870 broke out his mother sent him to the army. After the first defeats he had to flee from France with the empress, and settled in England at Chislehurst, completing his military education at Woolwich. On his father's death (Jan. 9, 1873) the Imperialists proclaimed him Napoleon IV., and he became the official Pretender. The Bonapartist leaders thought that he should win his crown by military prestige, and he was persuaded to attach himself as a volunteer to the British expedition to Zululand in Feb. 1879. While out on a reconnaissance with a few troopers he was surprised by Zulus, and killed (June 1, 1879). His body was brought back to England, and buried at Chislehurst.

XIV. THE BONAPARTES OF BALTIMORE are a branch of the family settled in America, descended from Jerome Bonaparte by his union with Elizabeth (b. 1785), daughter of William Patter-

son, a Baltimore merchant, probably descended from the Robert Paterson who was the original of Sir Walter Scott's *Old Mortality*. The marriage (see under VII. above) took place at Baltimore on Dec. 24, 1803. It was valid according to American law, and Pope Pius VII. refused to declare it void. Nevertheless Jerome was forced to separate from his wife, and after a stay in England she returned to Baltimore. She died in 1879. Jerome's only child by this marriage was Jerome Napoleon Bonaparte (1805-1870), who was born in England, but resided chiefly in Baltimore. He was on good terms with Jerome, who for some time made him a large allowance, and father and son occasionally met. His elder son, also called Jerome Napoleon Bonaparte (1832-93), entered the French army, with which he served in the Crimea and in Italy.

Charles Joseph Bonaparte (1851-1921), younger son of the first Jerome Napoleon Bonaparte, and a grandson of Jerome, king of Westphalia, attained a distinguished place in American politics. Born at Baltimore on June 9, 1851, and educated at Harvard university, he became a lawyer in 1874 and was elected president of the National Municipal League and occupied other public positions. He was secretary of the Navy in President Roosevelt's cabinet from July 1905 to Dec. 1906, and then attorney-general of the United States until March 1909. He died on June 28, 1921.

See A. H. Atteridge, *Napoleon's Brothers* (1909); J. B. Bishop, *Charles Joseph Bonaparte* (1922).

BONAR, HORATIUS (1808-1889), Scottish Presbyterian divine, was born in Edinburgh on Dec. 19, 1808, and died there on July 31, 1889. He was appointed parish minister of Kelso in 1837, and at the disruption of 1843 became minister of the newly formed Free Church, where he remained till 1860, when he went to the Chalmers memorial church, Edinburgh. In 1883 he was moderator of the general assembly of his church. Bonar's best work was done in hymnology, and he published three series of *Hymns of Faith and Hope* between 1857 and 1866 (new ed., 1886).

See *Horatius Bonar, D.D., a Memorial* (1889).

BONAVENTURA, SAINT (JOHN OF FIDANZA) (1221-1274), Franciscan theologian, was born at Bagnorea, Tuscany. He became a Franciscan about 1243 and studied at Paris under Alexander of Hales and John of Rochelle to whose chair he succeeded in 1253, having been lecturing from 1248. His opposition to the masters of the university who, under the leadership of William of Saint-Amour, sought to exclude the mendicants from teaching, was successful owing to the intervention of Alexander IV, and as a result he received the degree of doctor in 1257, some few months after he had been appointed general of his Order. He sought to reconcile the *Spirituals* and the *Relaxti*, his revised constitutions of the Order being promulgated by the General Chapter of Narbonne (1260). In 1265 he declined the archbishopric of York. In 1273 Gregory X., whose election he had been instrumental in procuring, made him cardinal and bishop of Albano, and insisted on his presence at the great Council of Lyons (1274). At this meeting he died. Bonaventura, deservedly known as "Doctor Seraphicus," was canonized in 1482 by Sixtus IV and ranked as sixth among the doctors of the Church by Sixtus V. in 1587.

Bonaventura combined the character of a man of action with that of a philosopher, theologian and mystic. In philosophy, contrary to his friend St. Thomas, he strongly adhered to the Augustinian school with its Platonic elements, and, mindful of the Paris condemnations, accepted Aristotle only in so far as his teaching was compatible with revelation and tradition. Hence, like his Franciscan predecessors, he attributed to primary matter an imperfect actuality, and held that it was endowed with *rationes seminales* or aptitudes for the forms which it receives during the processes of becoming. Not matter alone, but the union of matter and form is the principle of individuation. Likewise in psychology, his Franciscan training is evident. Man, like all other beings, has a plurality of forms corresponding to the grades of perfection in him, but his unity is preserved by the subordination of the lower forms to the highest form, the rational soul. The most important of the lower forms is the *forma corporeitatis* (like Grosseteste, he regards it as *lux*) which, by giving actuality to the human body as to all bodies, preserves the independence of the soul and ensures its

spirituality and immortality. Bonaventura also supports the hylo-morphic composition of the soul, and regards the faculties as distinguished from its essence in a manner between the real distinction of St. Thomas and the identity theory of Alcher of Clairvaux. The soul's knowledge of the corporeal world is produced by the action of the active and the passive intellect on the material derived from objects by the senses. To acquire certitude this knowledge must be conformed, with the aid of Divine illumination, to the *rationes aeternae*, the ideas in the Divine mind, wherein the fullness of all sense objects is contained. In addition to this knowledge, we can have a knowledge of spiritual beings through innate species which enable the soul to know itself and in so knowing itself to know God, of whom it is the image. The existence of God is also provable by *a posteriori* arguments, by Anselm's ontological argument and by Augustine's argument from the nature of truth.

To complete philosophical speculation, which in its concern for all things leads to God, we need the imperfect but certain knowledge of God given in faith, for the soul's faculties of knowing and loving, though of Divine origin, have been contaminated by its union with the body. Faith, in its turn, is the foundation of the mystical contemplation of God, which Bonaventura regards as the glorious end of man and develops at great length after the inspiration of the pseudo-Dionysius and the Victorines. This contemplation, which requires the restoration of the image of God in the soul and the practice of prayer, meditation and the theological virtues, especially charity, by Divine grace originates in the discernment of the traces of God in the corporeal world and passes through the recognition of His image in the soul to an apprehension of His being and His infinite goodness. The perfect beatific vision is reserved for the next life.

The best known of Bonaventura's works are the commentary on the *Sentences* of the Lombard, *Itinerarium Mentis ad Deum*, *Breviloquium De Reductione Artium ad Theologiam*, *Soliloquium*, *De Triplici Via*, *De Septem Itineribus Aeternitatis*, *Hexameron*, and a life of St. Francis. Of the several editions, the best is that by the Franciscans of Quaracchi, *Opera Omnia*, 10 vols. (1882-1902).

BONCHAMPS, CHARLES MELCHIOR ARTUS, MARQUIS DE (c. 1760-1793), Vendéen leader, was born at Jouveteuil, Anjou, May 10, 1760. He gained his first military experience in the American War of Independence, and on his return to France was made a captain of grenadiers in the French army. In the spring of 1793 he was chosen leader by the insurgents of the Vendée, and to his counsels may be attributed in great measure the success of the peasants' arms.

He was present at the taking of Bressuire, Thouars and Fontenay, and at Fontenay he was wounded; but dissensions among their leaders weakened the insurgents, and at the bloody battle of Cholet (Oct. 16, 1793) the Vendéans sustained a severe defeat, and Bonchamps was mortally wounded. He died the next day. A statue of him by David d'Angers stands in the church of St. Florent.

BOND, SIR EDWARD AUGUSTUS (1815-1898), English librarian, was born at Hanwell, Dec. 31, 1815, the son of a schoolmaster. He was educated at Merchant Taylors' school, and in 1832 obtained a post in the Public Record Office. In 1838 he entered the manuscript department of the British Museum. In 1854 he became assistant keeper of mss., and in 1867 was promoted to the post of keeper. His work in re-organizing the manuscript department was of lasting value, and to him is due the classified catalogue of mss. and the improved efficiency of the department. From 1878-88 he was principal librarian. Under his supervision were erected the new buildings of the "White wing," which provide accommodation for prints, drawings, manuscripts,

and newspapers, and the purchase of the Stowe mss. was concluded while he remained in office. He founded, in conjunction with Sir E. Maunde Thompson, the Palaeographical Society, and first made classical palaeography an exact science. He was created K C B. the day before his death, on Jan. 2, 1898. He edited four volumes of facsimiles of Anglo-Saxon charters from 679 to the Conquest, *The Speeches in the Trial of Warren Hastings* (1859-61), and a number of other interesting historic documents.

BOND, SIR ROBERT (1857-1927), son of John Bond (a Devonshire man and founder of the Newfoundland branch of William Hounsell and Co.), was educated at Queen's college, Taunton, and Edinburgh university, where he studied law. He returned to Newfoundland and entered politics in 1882, when he was elected to the House of Assembly. In 1884 he became Speaker, and in 1889 Colonial Secretary under the Liberal ministry. From 1890 to 1914 he was engaged in negotiations with the French Government on the question of fishing rights, and was also largely responsible for the Hay-Bond Treaty which settled the American fishing claim. In 1900, while still Colonial Secretary, he became Prime Minister, and held these offices until 1909, when the newly formed People's Party came into power. He then used his gift of forceful eloquence as leader of the Opposition until 1914, when he resigned his seat as a protest against the divided aims of a section of the Opposition, the "Coakerites." He died on March 16, 1927, at St. John's, Newfoundland.

BOND, in English law, an obligation by deed. Its design is to secure that the obligor, *i.e.*, the person binding himself by the bond, will either pay a sum of money, or do or refrain from doing some act; and for this purpose the obligor binds himself in a penalty to the obligee, with a condition added that, if the obligor pays the sum secured (which is usually half the penalty) or does or refrains from doing the specified act, the bond shall be void; otherwise it shall remain in full force. This condition is known as the defeasance because it defeats or undoes the bond.

If the condition is not performed, *i.e.*, if the obligor does not pay the money by the day stipulated, or do or refrain from doing the act provided for, the bond becomes forfeit or absolute at law, and charges the obligor and his estate (*see* Conveyancing Act 1881, s. 59). In old days, when a bond was forfeit, the whole penalty was recoverable at law and payment *post diem* could not be pleaded to an action on it, but the court of chancery early interposed to prevent oppression. It held the penalty of a bond to be the form, not the substance of it, a pledge merely to secure repayment of the sum bona fide advanced, and would not permit a man to take more than in conscience he ought, *i.e.*, in case of a common money bond, his principal, interest and expenses. This equitable relief received statutory recognition by an act of 1705 which provided that, in case of a common money bond, payment of the lesser sum with interest and costs shall be taken in full satisfaction of the bond. In cases of special conditions, the court of equity will relieve from a penalty, but if the sum agreed to be paid on default is held to be real damages, it will not interfere. The leading case is *Kemble v. Farren* (1829) 6 Bingham 148.

Bonds were and still are given to secure performance of a variety of matters other than the payment of a sum of money at a fixed date. They may be given and are given, for instance, to guarantee the fidelity of a clerk, of a rent collector, or of a person in an office of public trust, or to secure that an intended husband will settle a sum on his wife in the event of her surviving him, or that a building contract shall be carried out, or that a rival business shall not be carried on by the obligor except within certain limits of time and space. The same object can often be more conveniently attained by a covenant and covenants have largely superseded bonds, but there are cases where security by bond is still preferable to security by covenant.

Bonds given to secure the doing of anything which is contrary to the policy of the law are void. It was not without design that Shakespeare laid the scene of Shylock's suit on Antonio's bond in a Venetian court; the bond would have had short shrift in an English court.

Post Obit Bonds.—A post obit bond is one given by an expectant heir or legatee, payable on or after the death of the

person from whom the obligor has expectations. Such a bond, if the obligee has exacted unconscionable terms, may be set aside.

Bottomry Bonds.—A bottomry bond is a contract of hypothecation by which the owner of a ship, or the master as his agent, borrows money for the use of the ship to meet some emergency, *e.g.*, necessary repairs, and pledges the ship (or keel or bottom of the ship, *partem pro toto*) as security for repayment. If the ship safely accomplishes her voyage, the obligee gets his money back with the agreed interest; if the ship is totally lost, he loses it altogether. A *Respondentia Bond* is one in which the cargo alone is charged.

Lloyd's Bonds.—Lloyd's bonds are instruments under the seal of a railway company, admitting the indebtedness of the company to the obligee to a specified amount for work done or goods supplied, with a covenant to pay him such amount with interest on a future day. They are a device by which railway companies were enabled to increase their indebtedness without technically violating their charter. The name is derived from the counsel who settled the form of the bond.

Debenture Bonds.—Debenture bonds are bonds secured only by the covenant of the company without any floating or fixed charge on the assets. (*See* COMPANY LAW: *Mortgage*.)

Recognizance.—A recognizance differs from a bond in being entered into before a court of record and thereby becoming an obligation of record.

Heritable Bond is a Scots law term, meaning a bond for money, joined with a conveyance of land, and held by a creditor as security for his debt.

For goods "in bond" *see* BONDED WAREHOUSE.

BONDAGER, a word meaning, generally, a servant, but specially used in the south of Scotland and Northumberland as the term for a female outworker whom a married farm-labourer, living in a cottage attached to the farm, undertakes as a condition of his tenancy to supply for field-labour, sometimes also to board and lodge. The origin of the system was a dearth of field-labour.

BONDE, GUSTAF, COUNT (1620-1667), Swedish statesman, advocated a pacific policy at a time when war on the slightest provocation was the watchword of every Swedish politician. In 1659 he succeeded Herman Fleming as lord high treasurer, and was one of the council of regency appointed to govern Sweden during the minority of Charles XI. In 1661 he presented to the senate a plan which aimed at rendering Sweden altogether independent of foreign subsidies, by a policy of peace, economy and trade-development, and by further recovery of alienated estates.

His budget in the following year, framed on the same principles, subsequently served as a guide to Charles XI. Bonde's tenacity of purpose enabled him for some years to fulfil his programme; but the ambition of the oligarchs, and the fear and jealousy of innumerable monopolists who rose in arms against his policy of economy, by the resumption of the alienated Crown lands, proved at last too strong for Bonde, while the costly and useless expedition against Bremen in 1665, undertaken contrary to his advice, completed the ruin of the finances. He practically retired from the Government some time before his death.

See Martin Veibull, *Sveriges Storhetstid* (Stockholm, 1881).

BONDED DEBT, that portion of the indebtedness of a government or subdivision of government, or of a business, firm or corporation which is represented by outstanding bonds. This is often known as the "funded debt." The bonds representing the bonded or funded debt create a fixed financial charge in the form of interest, which, in a business, must be met at each period to prevent foreclosure; hence, care must always be taken to avoid issuing more bonds than can be properly cared for.

BONDED WAREHOUSE. A warehouse in which goods liable to customs or excise duties may be stored without the duty being paid, subject to supervision by revenue officers and to security being given for eventual payment of duty if the goods are not exported. Bonded warehouses constitute an important feature of the revenue machinery in all fiscally-developed countries, their function being to enable merchants to hold stocks of dutiable goods without paying the duty until these goods are to be put

on the home market, and without paying it at all if they are exported. In the latter case merchants avoid the lock-up of capital in the payment of duties, and in the former case the period between payment of duty by the merchant and his recoupment by his customer is minimized, thus reducing the amount of working capital required. Customs duties are of greater antiquity than excise (internal) duties, and the original use of bonded warehouses was for the storage of imported goods, on which customs duties fall. There are, however, examples of the use of bonded warehouses for goods liable to excise duties.

A bonded warehouse is essentially a place for the storage of goods, but operations necessary for their preservation during storage, simple forms of treatment to improve their condition and their preparation for sale or exportation, are permitted. Examples are the "repacking" of goods into packages of different sizes; blending and bottling wines or spirits; fortifying wine with added spirit. As a rule manufacturing processes are not allowed to be carried on in bonded warehouses, but there are exceptions, e.g., the smelting and refining of crude ores in the United States. Goods for the home market pay duty according to the tariff in force at the time of withdrawal from a bonded warehouse. Allowance is made for unpreventable losses in warehouse attributable to such causes as evaporation, leakage, etc., and merchants are only required to pay duty upon the quantity remaining at the time of withdrawal.

Origin and History.—In the United Kingdom, the beginnings of the bonded warehouse system go back to 1700, when provision was made for the "wrought silks" of India and Persia, the use of which at home was prohibited, to be deposited in bonded warehouse for re-exportation. In 1709 pepper and in 1742 rum, were allowed to be deposited in bond, either for subsequent re-exportation or home consumption. Tea, rice and tobacco followed, and in 1803 a general warehousing act brought further extensions. The consolidation of customs acts in 1825 brought the bonded warehouse system to something approaching its modern scope. The main customs law as to bonded warehouses is contained in the Customs Consolidation Act, 1876 (39 and 40 Vict., cap. 36), although alterations of detail have been effected by later acts. The principal statutory provisions relating to excise bonded warehouses are contained in the Spirits act, 1880 (43 and 44 Vict., cap. 24). British spirits are regularly deposited in bonded warehouses for storage and maturing. The Customs and Inland Revenue act, 1881, as amended by the Revenue act, 1898, allowed imported goods, *ie*, goods subject to customs duties, to be deposited in excise warehouses, and goods liable to excise duties in customs warehouses. Since the amalgamation of the customs and excise departments in 1909 the distinction between customs warehouses and excise warehouses has ceased to exist.

Bonded warehouses in the United Kingdom are provided, not by the Government, but by private individuals or companies—frequently port authorities—who charge merchants for the storage of their goods. Every bonded warehouse must be approved by the commissioners of customs and excise, and its construction must conform to rules designed to secure that goods cannot be taken out without the knowledge of the revenue officers. A bonded warehouse may be approved for the storage either of dutiable goods in general or of one or more specified classes of dutiable goods. There are bonded warehouses at all the principal seaports and also at many inland places. The bond required as security for the duty on the goods is entered into by the proprietor of the warehouse.

The doors of bonded warehouses are locked outside working hours with revenue locks, in addition to those affixed by the proprietor; but the proprietor remains solely responsible for the safe custody of the goods and the revenue officers are concerned only to see that none pass into consumption without paying the proper duty. Goods not liable to any duty, and goods, the importation of which into the United Kingdom is prohibited, may not be deposited in bonded warehouses. "Forestalling," or the withdrawal of abnormal quantities of goods on the eve of a budget with a view to escaping an expected increase of duty, may be prevented by the commissioners of customs and excise, who are

empowered by law to restrict the quantities which may be withdrawn at such times. Facilities are given for the inspection of goods and the taking of samples by the owner or prospective purchasers, and goods may be sold "in bond" to await withdrawal by the purchaser when he requires them.

With regard to bonded warehouses in other countries, the general statements in the opening paragraph above sufficiently describe the essential conditions, although there is some diversity in details of practice. To mention one important particular, the provision of bonded warehouses is not invariably left to private enterprise, but may be undertaken by the State or a municipality.

United States.—In the United States the bonded warehousing system was inaugurated in 1846 when it was provided by law that goods might be deposited in public warehouses for a period not exceeding a year. The time was subsequently extended to three years, and varying types of warehouses were authorized.

The secretary of the Treasury in the United States is in charge of the warehousing system with authority to make rules. In general, warehouses may be (1) Government owned or leased, and under the direct control of the collector of customs; (2) private importers' bonded warehouses established as a special provision for a large importer; (3) private bonded warehouses, doing a general storage business or dealing with specific articles such as grain or wines, permission being secured from the secretary of the Treasury and the goods remaining under the control of Government officials; and (4) manufacturing warehouses in which goods intended for export may be manufactured from imported materials without the payment of duty.

Goods remaining in custody for over three years may be sold under regulations prescribed by the secretary of the Treasury. At any time within three years they may be withdrawn upon payment of the duties and discharges, or may be shipped in a manner prescribed by the secretary of the Treasury to another port and held there under the same circumstances as if originally imported at that place.

For the statutory provisions governing bonded warehouses see the *Code of the Laws of the United States of America*, Title 19, Subtitle IV., Part 4.

BONDFIELD, MARGARET GRACE (1873–), British politician, was born March 17 1873, at Chard, Somerset. She early became an assistant in a draper's shop at Brighton, but soon she moved to London, and in 1898 became assistant secretary of the National Union of Shop Assistants. In 1921 she succeeded Mary Macarthur as secretary of the National Federation of Women Workers. She was made chairman of the Trades Union Congress in 1923, and in November of that year was elected M.P. for Northampton. In the Labour Government of 1924 she was parliamentary secretary to the Ministry of Labour, and did notable work as British Government delegate on the Governing Body of the International Labour office and at the Sixth Session (Geneva, 1924) of the International Labour Conference, especially in connection with the development by international agreement of facilities for the utilization of the spare time of the workers, on which subject a general Recommendation, which has proved of great value, was adopted by the Conference. In Nov. 1924 she failed to retain Northampton at the general election, but was subsequently elected for Wallsend, July 1926.

See M. A. Hamilton, *Margaret Bondfield* (1924).

BONDING, in brickwork or masonry, the building of the bricks or blocks in such fashion that the joints of successive courses or layers do not vertically coincide and so weaken the structure. This rule of avoiding adjacent vertical joints is termed "breaking joint." There are various ways of laying bricks to secure good bonding. (See BRICKWORK.)

BONDU, a French protectorate in West Africa, dependent on the colony of Senegal. Bondu lies between the Faleme river and the upper course of the Gambia, between 13° and 15° N., and 12° and 13° W. The country is plateau, dissected in the southern and central parts, which are generally unproductive, and covered with stunted woods. The lower country is more fertile, and grows baobab, tamarind and various fruit-trees. The Bondu streams flow rapidly during the rains but are empty in the dry season. The

inhabitants are mostly Fula, though the trade is largely in the hands of Mandingos. Mohammedanism is fairly generally distributed. Mungo Park, in 1795, was the first European to visit the country. The royal residence was then at Fatteconda, but was moved before 1818 to Bulibani, a small clay walled town. In 1845 the king signed a treaty recognizing French sovereignty over his country. It was at first disregarded by the natives, but in 1858 Bondou came definitely under French control. (See SENEGAL.)

BOND VALUE TABLES, tabulations from which may be ascertained the value of bonds of definite maturity when bought to produce a certain rate of yield. The tables are usually found in book form, generally show bond maturity up to 50 years, with stipulated interest rates from 3% to 7%, and with various fractional yields. There are quite a number of such books published in the United States, varying slightly in terms, rates and yields covered. One has recently been published in which the order is reversed and shows what the yield will be when the bond is bought at some definite price.

BONE, HENRY (1755–1834), English enamel painter, born at Truro. He was employed by London jewellers for small designs in enamel, and in 1800 the beauty of his pieces attracted the notice of the Royal Academy, of which he was admitted an associate; in 1811 he was made an academician. Up to 1831 he executed many beautiful miniature pieces of much larger size than had been attempted before in England; among these are 85 portraits of the time of Queen Elizabeth, of different sizes, from 5 by 4 to 13 by 8 in., now at Kingston Lacey, Wimborne, Dorsetshire. These, and pieces in the Wallace Collection, London, were his greatest works.

BONE, MUIRHEAD (1876–), British painter and etcher, born at Glasgow on March 23, 1876, son of David Drummond Bone, a journalist. He first studied architecture and then art in the evening classes of the Glasgow school of art. Being attracted by the picturesque aspect of buildings he executed drawings of views in his native town. It is as an etcher whose method is that generally of dry-point and as a draughtsman with pencil, charcoal and sepia that Bone has become known. In 1899 he issued a *Portfolio* with etchings of Glasgow. He moved to London in 1901 where the exhibition of his works in 1903 established his fame. In 1904 ten of his dry-points were published by Obach. His work displays a devotion for every form of intricate scaffolding; thus his famous etching "The Great Gantry" (1906) is a study of Charing Cross railway station after the accident to the roof in 1905, with a network of scaffolding set up for reconstruction. This and his "Ayr Prison," "Building," "The Shot Tower," "Liberty's Clock" are among the finest things in dry-point. During the war he was appointed official artist at the western front and with the fleet.

He illustrated several books: Gertrude Bone's *Children's Children* (1907) and James Bone's *The London Perambulator* (1925). See Campbell Dodgson, *Etchings and Drypoints by Muirhead Bone* (1909).

BONE, the hard tissue constituting the framework of the animal skeleton. For anatomy see SKELETON and CONNECTIVE TISSUES.

BONE, INDUSTRIAL USES OF. There is an application for every constituent of bones, the by-product of the meat trade, in various branches of industry. Besides the direct use of bones for such articles as buttons, knife-handles, etc., there is a large range of valuable secondary products. The mineral matter—phosphates, lime—is of value as artificial manure and as a component of porcelain; the fat is worked up by the soap-maker and chandler, and the gelatinous constituents are the source of much of the glue and gelatin of commerce. Further, by dry distillation, not only bone charcoal, a valuable purifying medium, but ammonia and bone-tar are obtained.

Degreasing.—For all purposes the *degreasing* of the bones is the first process to be carried out. The leg and thigh bones, termed "marrows" (containing 18–20% of fat), are the most valuable and are treated separately. The ends are sawn off and worked up with other bones; the marrows are steeped in weak brine for three days to free them from fibrous matter, blood, etc.,

and are then simmered in hot water for six hours. The boiling period is kept to a minimum lest the bones become too soft for working. The fat which rises to the surface is skimmed off. It is pale in colour and is used in pharmacy for the manufacture of pomades, and by the soap-maker. The boiled out bones are cooled, individually scrubbed to clean them, dried and sold to the button and fancy goods trade, finding their chief markets in Germany and France. The shavings and scrapings from the bone-carvers are treated for high-grade gelatin, while the fine meal from the drills, etc., finds a use in poultry- and dog-foods.

The feet of sheep, horses and cattle (the hoofs having been removed) are also treated separately by the simple boiling process. These bones yield oils which are largely consumed in the manufacture of the more delicate grades of leather. *Neat's foot oil* (strictly the oil from the feet of cattle only), when separated from any deposited solid stearine, is used as a lubricant for delicate machinery such as clocks, guns, etc., being valued on account of its low solidifying temperature ("cold test" 25°–28°F.).

The open boiling process only recovers about one-half of the fat contained in the bones, and is unsuitable for old and putrid bones, on account of the inferior yield and because of the offensive odour emitted from the vats. A better yield is obtained by treating the broken bones in autoclaves with open steam under two or three atmospheres pressure. If the steaming is not unduly prolonged only a small amount of the glue-yielding constituents is leached out, and a good quality fat results if fresh bones are employed. Bones contain, on an average, 12% of fat, of which 70% is recoverable by this method.

The grease may be pressed, yielding *fatty bone oil* which resembles neat's foot oil in its properties and is used for the same purposes.

Whale bone oil is extracted by similar treatment, but usually at the blubber-refining stations.

Benzine Process.—Practically the whole of the fat contained in bones can be recovered without any loss of gelatinous material by the *benzine extraction process*. The fat is extracted by digesting the bones with petroleum ether (benzine) or Scotch shale oil (boiling point 212°–270°F.). The grease recovered from the extract by distilling off the solvent is dark in colour, of rank odour, and consequently unsuitable for soap-making, although on the continent a certain amount of extracted bone-fat is used for this purpose. The bulk of the product passes to the candle-maker, who recovers the fatty acids which are satisfactorily bleached by distillation.

The degreased bones are passed on to the glue makers, benzine-extracted bones being very suitable. The gelatinous material is extracted by digestion with steam and hot water in open vessels, or with direct steam under pressure in autoclaves.

The weak glue liquors which are obtained as a by-product from the boiling process of degreasing can be partially concentrated, until on cooling they set to a jelly containing 75% water; this jelly is marketed as *size*. The glue liquors from the degelatinizing treatment are clarified if necessary with alum, and may be bleached with sulphurous acid gas; they are then evaporated (preferably under vacuum) to such a concentration (equivalent to about 33% dry glue) that on cooling in shallow troughs the solution "jellies." The jelly is cut into cakes and dried to give *glue*. Off-colour and twisted cakes are ground to a powder and marketed as *concentrated size*. Besides its use in joinery and furniture-making, there is a large consumption of glue in the paper and book-binding trades; the great textile industries absorb considerable quantities of glue and size for dressing and finishing yarns, sizing woollen threads, stiffening carpets, etc. There are numerous minor applications of glue, including use in preserving ropes, in the preparation of caoutchouc substitutes, etc.

Liquid Glues.—These are glues treated with acids, such as phosphoric, acetic or nitric acid. In the presence of acid the gelatinizing property is lost and the glue solution remains liquid when cold, but the adhesiveness is unimpaired.

Gelatin.—This is prepared from bones pre-treated with hydrochloric acid to remove the phosphate of lime. Carefully picked, spongy-bones are chosen and well cleansed. The decalcified bones

are treated with hot water and steam; the fat being skimmed off, the gelatin is obtained by evaporation of the aqueous liquors. Gelatin is used for photographic emulsions, as a culture medium in bacteriology, for culinary purposes and for the clarifying of wines and beers; it is also employed as a dressing for white fabrics, silks and straw hats.

The residual degreased and degelatinized bones are ground to a meal and used as fertilizer, being valuable on account of the phosphate of lime content. Raw bones are rarely used by the farmer. More often the bone-meals are converted into "superphosphates." To effect this the ground bone-residues are treated with sufficient sulphuric acid to convert the insoluble tri-calcium phosphate $\text{Ca}_3(\text{PO}_4)_2$ of the bones into the more soluble mono-calcium phosphate $\text{CaH}_4(\text{PO}_4)_2$ which is more readily assimilated by the plants.

Dissolved Bones.—This is the term strictly applicable to the superphosphate manufactured from degreased bones only; not being degelatinized, these bones furnish nitrogen to the soil without the necessity for compounding with additional ammoniacal salts. The expression is loosely used for superphosphate fertilizers made chiefly from bones.

Animal Charcoal.—One of the most valuable products from bones is *animal charcoal* (or *boneblack*) which is obtained as a residue from the carbonization of degreased bones (which may be partly degelatinized as well) out of contact with air. The bones are carbonized in retorts (usually horizontal  section) very similar in design to coal-gas retorts. The volatile products comprise a gas suitable for illumination and heating, a tar, and aqueous ammoniacal liquors. The tar is redistilled, giving a volatile product condensing to "bone oil" ("Dippel's oil," "oil of hartshorn"). There is no practical use for this "bone oil," which is a mixture of pyridine and fatty amine derivatives with a most offensive odour, except as a fuel for the factory boilers. There remains in the tar-still a valuable pitch (amounting to 14 lb per ton of bones treated) which is used in the manufacture of black varnishes such as Brunswick black. The ammonia liquors are steam-distilled and the ammonia recovered as sulphate from sulphuric acid collectors; the product is impure but suitable for fertilizer.

The residual charcoal, which is the most valuable product of the carbonization, is removed from the retorts into closed iron coolers, and protected from exposure to air until cold. It is then crushed and graded. Bone charcoal is employed as a decolourizing and refining medium, chiefly in the sugar industry, which consumes enormous quantities; it was used in France to decolourize beet-sugar solutions as early as 1812. The fine dust charcoal is sifted out and used in the preparation of blackings and "ivory black." In sugar-refining the "char" is required from lentil to nut-size; about one ton is needed to decolourize one ton of sugar, but the char can be revived by washing and reburning (out of contact with air) for a life of about two years. When the decolourizing power is exhausted the *spent char* is discarded by the sugar manufacturer, but finds a ready market as a source of superphosphate; or it may be calcined in air to *bone ash*.

Bone Ash.—This, also obtained by burning fresh bones, is composed of calcium phosphate; it is used to make cupels for assaying, and is an important constituent of the paste used for "English bone china" (English spft porcelain). When treated with sulphuric and phosphoric acids, bone ash yields a substitute for cream of tartar in baking powders.

BIBLIOGRAPHY.—See Lewkowitsch, *Oils, Fats and Waxes* (1923) for Bone Fat; Thorpe, *Dictionary of Applied Chemistry* (1923) for Bone Oil; T. Lambert, *Bone Products and Manures* (1925). (E. L., G. H. W.)

BONE BED, a term loosely used by geologists to denote any stratum or deposit which contains bones. It is applied therefore not only to those interstratified layers occurring at definite geological horizons, but also to the brecciated and stalagmitic deposits found on the floors of caves. The stratified deposits are frequently associated with current bedding and probably indicate a sorting out and segregation of the heavier bony material accompanying partial or complete removal of the finer

sediment by the action of currents. A well known bone bed of this nature, the Ludlow Bone Bed, composed of fragments of spines, teeth and scales of ganoid fish, occurs at the base of the Downton Castle Sandstone in Britain.

BONE-LACE, a kind of lace made upon a cushion from linen thread; the pattern is marked out with pins, round which are twisted the different threads, each wound on its own bobbin. The lace was so called from the fact that bobbins were formerly made of bone. (See LACE.)

BONER or BONERIUS, ULRICH (fl. 14th century), Swiss writer of fables, was born in Berne. He was descended from an old Bernese family, and, as far as can be ascertained, became a monk; yet, as he subsequently married, it appears that he received the "tonsure" only and was thus entitled to the benefit of the *clerici uxoriati*, who, on divesting themselves of the clerical garb, could return to secular life. He is mentioned in records between 1324 and 1340, but neither before nor after these dates. He wrote, in Middle High German, a collection of fables entitled *Der Edelstein* (c. 1349), one hundred in number, which were based principally on those of Avianus (4th century) and the *Anonymus* (edited by I. Nevelet, 1010). This work he dedicated to the Bernese patrician and poet, Johann von Rinken-berg, advocatus (*Vogt*) of Brienz (d. c. 1350). It was printed in 1461 at Bamberg—the first book printed in the German language.

Der Edelstein has been edited by G. F. Benecke (1816) and Franz Pfeiffer in vol. iv of *Dichtungen des deutschen Mittelalters* (Leipzig, 1844); a translation into modern German by K. Pannier will be found in Reclam's *Universal-Bibliothek* (Leipzig, 1895). See also C. Waas, *Die Quellen der Beispielen Boners* (Giessen, 1897).

BONES, DISEASES AND INJURIES OF. The more specific diseases affecting the bones of the human body are treated under separate headings (see TUBERCULOSIS, VENEREAL DISEASES, etc.); in this article injuries, inflammations and tumours of bone are dealt with.

There are two kinds of bone, the compact, which is dense and hard and forms the shafts of the long bones of the limbs and fingers, and the cancellous, which is bone of a more open, spongy structure, and forms the ends of the long bones and the whole of such bones as the vertebrae and those of similar shape. Every bone is closely invested by a thin, fibrous sheath—the periosteum—which adheres closely to it and affords attachment for muscle and tendons. It also plays a part in the production of new bone, not only during the period of growth but also in conditions of injury and disease. A typical long bone consists of a shaft composed of compact bone and of two articular ends formed of cancellous bone, the line of union between them being known as the epiphyseal line, which is a narrow zone of actively-growing bone cells. It is here that growth in the length of the bone occurs until adult life is reached, when the epiphysis disappears and no further increase in length is possible. Injury or disease of the epiphyseal line may result in cessation of growth forthwith, or in certain rare cases it may produce excessive growth with the result that the affected limb becomes longer than its fellow. In rickets (*q.v.*) the epiphyseal line becomes widened and very irregular, thus producing the characteristic changes at the wrist and in the ribs. The shaft of a long bone is hollow and is filled with marrow, a fatty tissue possessing numerous blood vessels which branch in all directions and enter the bone through tiny channels for the purpose of supplying it with nourishment.

Injuries of bone vary considerably, the kind and extent depending upon the nature and the force of the violence producing them. At one end of the scale is the simple bruise resulting from a slight injury which tears a few minute blood vessels in the periosteum, and allows the escape of a small quantity of blood into the surrounding tissues, including the space between the periosteum and the bone; the effused blood is soon absorbed, the swelling goes down, and recovery is complete. But not always, for sometimes a little permanent swelling remains as a result of the escape of blood between the bone and the overlying periosteum, which is thereby excited into activity and produces a layer of new bone upon the surface of the old. At the other end of the

scale is the complete shattering of a bone by a fragment of shell or a rifle bullet fired at close range.

Fractures (q.v.) constitute by far the largest proportion of injuries to bone. In the aged the bones become more brittle and break as the result of a degree of violence which in earlier life might almost pass unnoticed. In the very young the opposite condition obtains, for the bones are relatively soft and the fracture may be of the Greenstick variety, in which the bone bends instead of breaking completely through.

There is a rare disease known as *fragilitas ossium*, in which for some unknown reason the bones are unduly fragile, and fractures repeatedly follow trivial injuries.

Fractures are also described as being simple and compound. A simple, or, as it is now usually called, a closed fracture, is one where the overlying skin is not injured, or at least not injured in such a way as to establish communication between the broken bone and the external air. A fracture is described as compound, or open, when the overlying skin is damaged in such a way as to expose the injured bone to the danger of infection by microbes gaining entrance from the outside air through the broken skin.

The detection of a fracture depends upon intelligent appreciation of the symptoms following the injury. These may be very obvious, for the limb may be grossly deformed and shortened by overlapping of the fragments, and on examination a grating feeling may be elicited—*crepitus*—when the broken ends are moved. But in some cases the swelling of the soft parts is so great that it is difficult for the medical attendant to determine whether a fracture is present or not. It is in these cases that X-rays have developed one of their greatest uses in medicine, and it is an almost universal custom to have an X-ray photograph taken in all cases of injury to bone.

Treatment of Fractures.—As soon as the presence of a fracture is detected it is essential to get the broken ends into close apposition with one another by one of the numerous means available. It may be possible to effect this by ordinary manipulation, with or without an anaesthetic, but in many cases this proves impossible and more radical measures have to be adopted. An operation is then undertaken on the following general lines.

The site of the fracture is exposed by an incision through the overlying soft parts and the fractured ends of the bone are brought into close contact with one another; they are then held in position temporarily by means of special bone forceps. It is then necessary to decide what particular method shall be utilized for the purpose of obtaining permanent fixation. A complicated fracture in a large bone like the thigh bone affords plenty of scope for the ingenuity of the surgeon. He may decide to fix the broken ends together with wire of silver, or some similar material of sufficient tensile strength to bear the strain, and sufficiently soft to admit of easy manipulation; but in all probability, with so large and strong a bone to deal with, he will not pin his faith on wire but will adopt the more difficult but more certain method of *plating*.

Plating consists in bridging the fracture with a narrow steel plate from three to six inches in length which is fixed by several screws to the uninjured bone above and below the fracture. This method of fixation of fractures with wire or metal plates has the disadvantage that the foreign body necessarily left in the limb may subsequently give rise to trouble and have to be removed. This difficulty has led to the development of still another method by means of plates fashioned from beef-bone and fixed by beef-bone screws or pegs. These are carefully prepared from the leg bones of the ox, are sterilized by boiling, and have this great advantage, that after their work is done they are slowly absorbed by the tissues and in time completely disappear.

Operations of this character are serious undertakings only embarked upon after careful consideration of all the factors in the case, and after failure to adjust and maintain the bone in position by simpler means. They are not of course confined to the treatment of recent fractures, but are also applicable to old-standing cases of non-union or mal-union which have resulted from ineffective or inefficient treatment. Such non-union or mal-union frequently arises from causes outside the control of the medical

attendant, as for example in cases of compound fracture resulting from gunshot wounds or other causes, where injury to the soft parts precludes successful and immediate treatment of the fracture itself.

Inflammations of bone fall into two categories, the acute and the chronic. The acute forms include the simple and evanescent conditions resulting from slight injuries, but they also include the disease known as acute osteomyelitis, the most violent and the most serious inflammatory condition of bone. Generally speaking, it is a disease of young people and is due to infection of the interior of the bone by *staphylococcus pyogenes aureus*—the same microbe that causes boils and carbuncles; indeed, this disease might in a sense be well described as a carbuncle of bone. Owing to the confined space available, the pus resulting from the inflammation is formed under so much pressure that great pain, high temperature and great constitutional disturbance soon manifest themselves. The pus rapidly makes its way up and down the marrow cavity and also outwards through the bone, and so collects under the periosteum which it strips from the bone, thus depriving it of some of its blood supply. The simultaneous destruction of blood vessels in the marrow by the pressure of pus may be so complete as totally to deprive the affected part of the bone of its essential blood supply and cause its death, or necrosis, the dead portion of bone subsequently becoming separated from the living and forming a sequestrum. Since this disease nearly always affects the bone near a joint it is often mistaken at its onset and treated for acute rheumatism, even by skilled observers. This is a serious matter, for osteomyelitis is so grave a disease and is so apt to be complicated by general blood-poisoning (*septicaemia*) that delay in its detection may cost the limb or even the life of the patient. The appropriate treatment is immediate incision over the affected area, the evacuation of the pus found under the periosteum, and the opening up of the marrow cavity in order to permit of free escape of the poisonous products from the interior of the bone. But no matter how prompt and how successful the treatment may be, recovery is slow and healing long delayed.

Chronic inflammations of bone may be produced by a variety of infective agents, including the organisms of syphilis and typhoid, but by far the most common and most important is the tuberculosis bacillus which especially selects the cancellous ends of the long bones or such cancellous bones as the vertebrae for its attacks, producing the slow destructive effect known as tuberculous caries. The treatment of this disease has fortunately undergone a revolution in recent years, for the drastic and crippling operations formerly in use are now replaced by a régime which includes complete rest of the affected part and, very limited and conservative surgical operations for the purpose of evacuating abscesses, combined with sunlight treatment, real or artificial. When persevered with, such methods almost always effect a cure in every case. Prof. Rollier of Leysin has been a pioneer in the development of this line of attack upon the tuberculosis of bone, and great success has been obtained at his clinic in the Swiss mountains. Similar methods of treatment have been proved to be possible in our English climate, and at the Treloar Home for Cripples at Alton a high degree of success has been obtained.

Tumours, or new growths of bone are comparatively rare diseases. Of the simple or non-malignant new growths of bone the only one of real importance is the cyst, which develops in the long bones of young people and grows so slowly and imperceptibly that its presence may be entirely unsuspected until the bone becomes so weakened that it is fractured by some trivial injury. Treatment consists in opening the cyst and scraping out the lining membrane, the resulting cavity being filled with a graft of healthy bone taken from the patient's shin. In a few recent cases a graft of fatty tissue taken from the abdominal wall has proved successful.

Malignant tumours (see *TUMOURS*) may arise primarily in bones, and are then known as sarcomas. There are two main varieties of sarcoma affecting bones, the endosteal or myeloid, and the periosteal. The former arises almost always within the articular ends of the long bones and forms a tumour of very peculiar character. It slowly expands the bone in which it arises

and destroys its interior, so that in due course a large swelling is produced which consists of the tumour itself, covered by a layer of bone so thin that the mere pressure of the examining finger gives rise to the sensation known as egg-shell crackling, and may, indeed, fracture it.

The malignancy of endosteal growths is rather limited, for although if untreated they go on growing indefinitely, and may destroy life by their local effects, they do not give rise to secondary growths in other parts of the body, and in consequence are often spoken of as semi-malignant. They are healed by complete removal of the part of the bone in which they originate, though this often means the sacrifice of the affected limb.

When dealing with periosteal sarcoma we are faced with an entirely different set of circumstances. As its name implies it grows from the outer surface of the bone, generally a long bone of the lower limb, and it is malignant in the highest possible degree. The most usual treatment is amputation of the affected limb, but even then the disease is apt to return in the stump or else in the form of secondary deposits in the lungs. On the whole periosteal sarcoma is a terribly fatal disease, for no matter how prompt and how radical the treatment may be, the percentage of cases that may be regarded as cured is smaller than in almost every other kind of malignant growth.

Cancer or carcinoma cannot originate in bone, but does occur with some frequency as a secondary phenomenon during the course of such disease as cancer of the breast, prostate, thyroid and kidney. Small fragments of the original growth become detached and are distributed by the blood or lymph to the bones of the arms or thighs or spine. A characteristic of this condition, owing to the replacement of healthy bone by cancer tissue, is the occurrence of so-called spontaneous fractures, *i.e.*, fractures resulting from the muscular strain of ordinary movements. When this stage in the course of a cancer case is reached, the patient is beyond the help of medicine and surgery, and nothing can be done, in our present state of knowledge, beyond measures directed to the relief of pain.

BONESET (*Eupatorium perfoliatum*), a North American plant of the family Compositae. It is also called thoroughwort, ague-weed and Indian sage, common in wet places from Nova Scotia to Manitoba and southward to Florida and Texas. It is a coarse, rough, hairy perennial, 2 ft. to 6 ft. high, with lance-shaped, taper-pointed, toothed, wrinkled, very veiny leaves, 4 in. to 8 in. long, which are joined together at their bases around the stem. In August the plants bear small, tubular, white flowers in numerous heads which are arranged in a flattish much-branched cluster 4 in. to 7 in. wide. Boneset was formerly in high repute for its medicinal properties and is still used in household medicine by many persons. (See EUPATORIUM.)

BONESETTING: see MANIPULATIVE SURGERY

BO'NESS (originally BORROWSTOUNNESS), a municipal and police burgh and seaport of Linlithgowshire, Scotland, on the south shore of the Firth of Forth, 17m. W. by N. of Edinburgh, and 24m. by rail, the terminus of the L & N E railway's branch line from Manuel. Pop. (1921) 10,162. It has an extensive harbour and imports pit-props and exports coal, but Grangemouth, higher up the firth, has limited its trade, in which it ranked next Leith in the 18th century. The chief industry is coal-mining, some

of the pits extending for a long distance beneath the firth. Iron-founding, distilling, stone-quarrying and the manufacture of earthenware and chemical manures are also important. Traces of the wall of Antoninus may be seen especially near Inveravon.

BONFIGLI, BENEDETTO, 15th century Italian painter, was born at Perugia. The most important of his extant works are a series, in fresco, of the life of St. Louis of Toulouse, in the communal palace of Perugia.

BONFIRE, a large fire lit in the open air. The earliest known instance of the derivation of the word occurred as *ban fyre ignis ossium* in the *Catholicon Anglicum* (1483). Other derivations have been sought for the word. Thus some have thought it *Baal-fire*, passing through *Bael*, *Baen* to *Bane*. Others have declared it to be *boon-fire*, a "contribution" fire, every one in the neighbourhood contributing a portion of the material.

Whatever its origin, the word has long had several meanings—(a) a fire of bones; (b) a fire of corpses, a funeral pile; (c) a fire for immolation, such as that in which heretics and proscribed books were burnt; (d) a large fire lit in the open air, on occasions of national rejoicing, or as a signal of alarm, such as the bonfires which warned England of the approach of the Armada. Throughout Europe the peasants from time immemorial have lighted bonfires on certain days of the year, and danced around or leaped over them. The earliest proof of the observance of these bonfire ceremonies in Europe is afforded by the attempts made by Christian synods in the 7th and 8th centuries to suppress them as pagan. Thus the third Council of Constantinople (680), by its 65th canon, orders, "Those fires that are kindled by certain people on new moons before their shops and houses, over which also they use ridiculously and foolishly to leape, by a certaine ancient custome, we command them from henceforth to cease."

Leaping over the fires is mentioned among the superstitious rites used at the Palilia (the feast of Pales, the shepherds' goddess) in Ovid's *Fasti* (q.v.). The lighting of the bonfires in Christian festivals was significant of the compromise made with the heathen by the early church. In Cornwall bonfires are lighted on the eve of St. John the Baptist and St. Peter's Day; sometimes effigies are burned in these fires, and there are grounds for believing that in ancient times human sacrifices were actually made in the bonfires. Spring and midsummer are the usual times at which these bonfires are lighted, but in some countries they are made at Hallowe'en (Oct. 31) and at Christmas.

See J. G. Frazer, *Golden Bough*, vol. III.

BON-GA (sand-pictures). see BON-SEKI

BONGARS, JACQUES (1554–1612), French scholar and diplomatist, was born at Orleans and brought up in the reformed faith. He served Henry IV of France in a long series of diplomatic missions both before and after his accession to the throne. Bongars' works are: an abridgement of Justin's abridgement of the history of Troilus Pompeius (1851), collections of contemporary accounts of the crusades and of Hungarian chronicles, entitled *Gesta Dei per Francos* (Hanover, 1611), and *Rerum Hungaricarum scriptores varii* (Frankfort, 1600); and *Epistolae* (Leyden, 1647, Fr. trans. 1668–70). The largest collection of his ms. papers is at Berne, but others are in Paris libraries.

See H. Hagen, *Jacobus Bongarsius* (Bern, 1874); L. Anquez, *Henri IV. et l'Allemagne* (1887).

BONGHI, RUGGERO (1828–1895), Italian scholar, writer and politician, was born at Naples. He was professor of Greek at Pavia (1859), of Latin literature at Florence (1865), and of ancient history at Rome from 1876 onwards. Elected deputy in 1860 he became celebrated by the biting wit of his speeches, and by the acrimony of his polemical writings. Minister for public instruction in 1873–76, he reformed the Italian educational system, suppressed the privileges of the University of Naples, founded the Vittorio Emanuele library in Rome, and prevented the establishment of a Catholic university in the capital. A bitter critic of King Humbert, both in the *Perseveranza* and in the *Nuova Antologia*, he was, in 1893, excluded from court, only securing readmission shortly before his death. In foreign policy a Francophil, he combated the Triple Alliance.

BONESET, A ROUGH HAIRY HERB COMMON IN WET PLACES OF EASTERN UNITED STATES AND CANADA

BONGO, a tribe of Nilotic negroes, also known as **DOR** or **DERAN**, probably related to the Zande tribes of the Welle district, inhabiting the south-west portion of the Bahr-el-Ghazal province, Sudan. The Bongo lived in countless little independent and peaceful communities. Their huts are well built, and sometimes 24ft. high. The Bongo are a race of medium height, inclined to be thick-set, with a red-brown complexion and black hair. Schweinfurth declares their heads to be very round. The women incline to steatopygia in later life, and this with the tail of bast which they wore, gave them, as they walked, the appearance of "dancing baboons." The Bongo men formerly wore only a loin-cloth, and many dozen iron rings on the arms (arranged to form a sort of armour), while the women had simply a girdle, to which was attached a tuft of grass. Both sexes now largely use cotton cloth as dresses. The tribal ornaments consist of nails or plugs which are passed through the lower lip. The women often wear a disk several inches in diameter in this fashion, together with a ring or a bit of straw in the upper lip, straws in the *alae* of the nostrils, and a ring in the *septum*. The Bongo are not great cattle-breeders, but employ their time in agriculture, cultivating sorghum, tobacco, sesame and durra. The Bongo eat the fruits, tubers and fungi in which the country is rich, and almost every creature—bird, beast, insect and reptile, with the exception of the dog. Earth-eating is common among them. They are skilled in the smelting and working of iron. Iron forms the currency of the country, and is employed for all kinds of useful and ornamental purposes. Bongo spears, knives, rings, and other articles are frequently fashioned with great artistic elaboration. They have a variety of musical instruments—drums, stringed instruments, and horns—and they indulge in a vocal recitative which seems intended to imitate a succession of natural sounds. Marriage is by purchase; and a man is allowed to acquire three wives, but not more. Tattooing is partially practised. As regards burial, the corpse is bound in a crouching position with the knees drawn up to the chin; men are placed in the grave with the face to the north, and women with the face to the south. The form of the grave consists of a niche in a vertical shaft. The tombs are frequently ornamented with rough wooden figures representing the deceased. Of the immortality of the soul they have no defined notion; and their only approach to a knowledge of a beneficent deity consists in a vague idea of luck. They have a most intense belief in a great variety of petty goblins and witches, which are essentially malignant. Arrows, spears and clubs form their weapons, the first two distinguished by a multiplicity of barbs. Euphorbia juice is used as a poison for the arrows. Shields are rare. Their language is musical, and abounds in the vowels *o* and *a*; its vocabulary of concrete terms is very rich, but the same word has often a great variety of meanings. The grammatical structure is simple.

See G. A. Schweinfurth, *The Heart of Africa* (London, 1873); W. Junker, *Travels in Africa* (Eng. edit., London, 1890-1892).

BONGO (*Boöercus eurycerus*), a West African bushbuck, the largest of the group. The male is deep chestnut, marked on the body with narrow white stripes, on the chest with a white crescent, and with two white spots below the eye. Both sexes bear horns.

BONHAM, a city in the north-eastern part of Texas, U.S.A., 14m. S. of the Red river and 62m. N.N.E. of Dallas; the county seat of Fannin county. It is served by the Texas and Pacific and the Denison, Bonham and New Orleans railways. The population in 1920 was 6,008, of whom 916 were negroes. Corn and cotton are the leading crops of the district. The city has a large cotton-mill, cotton gins, flour and cotton-seed oil mills, and a furniture factory. The first settlement was made in 1836. The town was incorporated in 1850, and was named after J. B. Bonham of South Carolina, who was killed in the Alamo.

BONHEUR, ROSA (MARIE ROSALIE) (1822-1899), French animal painter, was born at Bordeaux on March 22 1822, the daughter of an artist, Raymond Bonheur (d. 1849). She was the eldest of four children, all of whom were artists, and studied in Paris. Rosa Bonheur's paintings of animals were remarkable for the firm handling of the subjects, and the extraordinary accuracy of the drawing. She had regularly exhibited in the Salon from 1840

onwards, but her fame dates from the Paris exhibition of 1855. Of her many works the most famous are perhaps: "Ploughing in the Nivernais" (1848), in the Luxembourg gallery; "The Horse Fair" (1853) in the Metropolitan Museum, New York (replica in the National Gallery, London); and "Hay Harvest in Auvergne" (1855). Rosa Bonheur was the first woman to receive (1894) the Grand Cross of the Legion of Honour. She died at By, near Fontainebleau, on May 25 1899.

See Laruelle, *Rosa Bonheur, sa vie, ses oeuvres* (1885); Roger-Miles, *Rosa Bonheur* (1900).

BONHEUR DU JOUR, the name for a lady's writing-desk, so called because, when it was introduced in France about 1760, it speedily became intensely fashionable. The bonheur du jour is always very light and graceful; its special characteristic is a raised back, which may form a little cabinet or a nest of drawers, or may simply be fitted with a mirror. The top, often surrounded with a chased and gilded bronze gallery, serves for placing small ornaments. Beneath the writing surface there is usually a single drawer. The details vary greatly, but the general characteristics are always traceable. The bonheur du jour has never been so delicate, so charming, so coquettish as in the quarter of a century which followed its introduction. The choicer examples of the time are inlaid with marqueterie, edged with exotic woods, set in gilded bronze or enriched with panels of Oriental lacquer.

BONI, GIACOMO (1850-1925), Italian archaeologist and classical scholar, was born in Venice April 25 1859. He entered the Venice Academy of Fine Arts, where he graduated as an architect, after which he studied practical mechanics in England. On returning to Venice he became assistant in the work of restoring the Ducal Palace, and in 1888 inspector of fine arts in Rome. Ten years later he undertook the excavations in the Forum and the Palatine with which his name is chiefly associated. He also erected the Museo Forense in the church of Santa Francisca Romana. In 1914 he undertook excavations on the Palatine. Boni was made Senator in 1923 by Sig. Mussolini. He was the author of a large number of essays, pamphlets and articles on archaeological and kindred subjects and also on botany. He died in Rome July 7 1925.

BONI: see CELEBES.

BONIFACE, SAINT (680-754), the apostle of Germany, whose real name was Wynfrith, was born of a good family at Crediton or Kirtton in Devonshire. While still young he became a monk, and studied first at Exeter, then at Nutcell near Winchester, under the abbot Winberht. He soon distinguished himself both as scholar and preacher, but in 716 he followed the example of other Saxon monks and set out as missionary to Frisia. He was soon obliged to return, however, probably owing to the hostility of Radbod, king of the Frisians, then at war with Charles Martel. At the end of 717 he went to Rome, where in 719 Pope Gregory II. commissioned him to evangelize Germany and to counteract the influence of the Irish monks there. Crossing the Alps, Boniface visited Bavaria and Thuringia; but upon hearing of the death of Radbod he hurried again to Frisia, where, under the direction of his countryman Willibrord (d. 738), the first bishop of Utrecht, he preached successfully for three years. About 722 he visited Hesse and Thuringia, won over some chieftains, and converted and baptized great numbers of the heathen. Having sent special word to Gregory of his success, he was summoned to Rome and consecrated bishop on Nov. 30, 722, after taking an oath of obedience to the pope. Then his mission was enlarged. He returned with letters of recommendation to Charles Martel, charged not only to convert the heathen but to suppress heresy as well.

Charles's protection, as he himself confessed, made possible his great career. Armed with it he passed safely into heathen Germany and began a systematic crusade, baptizing, overturning idols, founding churches and monasteries, and calling from England monks and nuns, some of whom have become famous; St. Lull, his successor in the see at Mainz; St. Burchard, bishop of Würzburg; St. Gregory, abbot at Utrecht; Willibald, his biographer; St. Lioba, St. Walburge, St. Thecla. In 732 Boniface was created archbishop. In 738 for the third time he went to Rome. On his

return he organized the church in Bavaria into the four bishoprics of Regensburg, Freising, Salzburg and Passau. Then his power was extended still further. In 741 Pope Zacharias made him legate, and charged him with the reformation of the whole Frankish church. With the support of Carloman and Pippin, who had just succeeded Charles Martel as mayors of the palace, Boniface set to work. As he had done in Bavaria, he organized the east Frankish church into four bishoprics, Erfurt, Würzburg, Buraburg and Eichstätt, and set over them his own monks. In 742 he presided at what is generally counted as the first German council. At the same period he founded the abbey of Fulda, as a centre for German monastic culture, placing it under the Bavarian Sturm, whose biography gives us many picturesque glimpses of the time, and making its rule stricter than the Benedictine. Then came a theological and disciplinary controversy with Virgil, the Irish bishop of Salzburg, who held, among other heresies, that there were other worlds than ours. Virgil must have been a most remarkable man; in spite of his leanings toward science he held his own against Boniface, and was canonized after his death. Boniface was more successful in France. There a certain Adalbert or Aldebert, a Frankish bishop of Neustria, had caused great disturbance. He had been performing miracles, and claimed to have received his relics, not from Rome, like those of Boniface, but directly from the angels. Planting crosses in the open fields he drew the people to desert the churches, and had won a great following throughout all Neustria. Opinions are divided as to whether he was a Culdee, a representative of a national Frankish movement, or simply the charlatan that Boniface paints him. At the instance of Pippin, Boniface secured Adalbert's condemnation at the synod of Soissons in 744; but he, and Clement, a Scottish missionary and a heretic on predestination, continued to find followers in spite of legate, council and pope, for three or four years more.

Between 746 and 748 Boniface was made bishop of Mainz, and became metropolitan over the Rhine bishoprics and Utrecht, as well as over those he had established in Germany—thus founding the pre-eminence of the see of Mainz. In 747 a synod of the Frankish bishops sent to Rome a formal statement of their submission to the papal authority. The significance of this act can only be realized when one recalls the tendencies toward the formation of national churches, which had been so powerful under the Merovingians. Boniface does not seem to have taken part in the anointing of Pepin as king of the Franks in 752. In 754 he resigned his archbishopric in favour of Lull, and took up again his earliest plan of a mission to Frisia; but on June 5, 754, he and his companions were massacred by the heathen near Dokkum. His remains were afterwards taken to Fulda.

St. Boniface has well been called the proconsul of the papacy. His organizing genius, even more than his missionary zeal, left its mark upon the German church throughout all the middle ages. The missionary movement which until his day had been almost independent of control, largely carried on by schismatic Irish monks, was brought under the direction of Rome. In so welding together the scattered centres and binding them to the papacy, Boniface was actuated by simple zeal for unity of the faith, and not by a conscious political motive.

Though pre-eminently a man of action, Boniface has left several literary remains. We have above all his Letters (*Epistolae*), difficult to date, but extremely important from the standpoint of history, dogma, or literature; see Dümmler's edition in the *Monumenta Germaniae historica* (1892). Besides these there are a grammar (*De octo partibus orationibus*, ed. Mai, in *Classici Auctores*, t. vii.), some sermons of contested authenticity, some poems (*Aenigmata*, ed. Dümmler, *Poetae latini aevi Carolini*, i. 1881), a penitential, and some *Dicta Bonifacii* (ed. Nürnberger in *Theologische Quartalschrift*, Tübingen, vol. 70, 1888), the authenticity of which it is hard to prove or to refute. Migne in his *Patrologia Latina* (vol. 89) has reproduced the edition of Boniface's works by Giles (London, 1884). (J. T. S.)

Boniface has been translated by E. Kylie (London, 1911); J. J. Laur, *Der hl. Bonifatius, Apostel der Deutschen* (Freiburg i. B. 1922); F. Flakamp, *Das Hessische Missionswerk des hl. Bonifatius* (1926).

BONIFACE (*Bonifacius*), the name of nine of the popes.

BONIFACE I., pope from 418 to 422. At the death of Pope Zosimus, the Roman clergy were divided into two factions, one of which elected the deacon Eulalius, and the other the priest Boniface. The imperial government, in the interests of public order, commanded the two competitors to leave the town, reserving the decision of the case to a council. Eulalius having broken his ban, the emperor Honorius decided to recognize Boniface, and the council was countermanded.

BONIFACE II., pope from 530 to 532, was by birth a Goth, and owed his election to the nomination of his predecessor, Felix IV., and to the influence of the Gothic king. The Roman electors had opposed to him a priest of Alexandria called Dioscorus, who died a month after his election, and thus left the position open for him. Boniface endeavoured to nominate his own successor, thus transforming into law, or at least into custom, the proceeding by which he had benefited; but the clergy and the senate of Rome forced him to cancel this arrangement.

BONIFACE III., pope from Feb. 15–Nov. 12, 606. He obtained from the emperor Phocas recognition of the "headship of the church at Rome," which signifies, no doubt, that Phocas compelled the patriarch of Constantinople to abandon (momentarily) his claim to the title of oecumenical patriarch.

BONIFACE IV. (Saint) was pope from 608 to 615. He received permission from the emperor Phocas to convert the Pantheon at Rome into a Christian church.

BONIFACE V., pope from 619 to 625, did much for the christianizing of England. Bede mentions (*Hist. Eccl.*) that he wrote encouraging letters to Mellitus, archbishop of Canterbury, and Justus, bishop of Rochester, and quotes three letters—to Justus, to Eadwin, king of Northumbria, and to his wife Aethelberga. William of Malmesbury gives a letter to Justus of the year 625, in which Canterbury is constituted the metropolitan see of Britain for ever.

BONIFACE VI. was elected pope in April 806, and died 15 days afterwards.

BONIFACE VII. was pope from Aug. 984 to July 985. His family name was Franco. In 974 he was substituted by Crescentius and the Romans for Benedict VI who was assassinated. He was ejected by Count Sicco, the representative of the emperor Otto II., and fled to Constantinople. On the death of Otto (983) he returned, seized Pope John XIV., threw him into prison, and installed himself in his place.

BONIFACE VIII. (Benedetto Gaetano), pope from 1294 to 1303, was born of noble family at Anagni, studied canon and civil law in Italy and possibly at Paris. After being appointed to canonicates in both of these countries, he accompanied Cardinal Ottobuona to England in 1265 for the purpose of reconciling Henry III. and the baronial party. Later he became advocate and notary at the papal court and in 1281 was made cardinal-deacon, and in 1291 cardinal-priest (SS. Sylvestri et Martini). After helping the ineffective Celestine V to abdicate, he was chosen pope at Naples on Dec. 24, 1294, and crowned at Rome in Jan. 1295. By his attempt to exercise his authority in temporal as well as in spiritual affairs, he involved the papacy in many controversies with leading European powers. The policy of supporting the interests of the house of Anjou in Sicily proved a grand failure. The attempt to build up great estates for his family made most of the Colonna his enemies. Until 1303 he refused to recognize Albert of Austria as the rightful German king. Assuming that he was overlord of Hungary, he declared that its crown should fall to the house of Anjou. He humbled Eric VIII. of Denmark, but was unsuccessful in the attempt to try Edward I., the conqueror of Scotland, on the charge of interfering with a papal fief; for parliament declared in 1301 that Scotland had never been a fief of Rome. The most noted conflict of Boniface, was that with Philip IV. of France. In 1296 by the bull *Clericis laicos*, the pope forbade the levying of taxes, however disguised, on the clergy without his consent. Forced to recede from this position by the retaliating ordinances of Philip,

Boniface canonized the king's grandfather Louis IX. (1297). The hostilities were later renewed; in 1302 Boniface himself drafted and published the indubitably genuine bull *Unam sanctam*, one of the strongest official statements of the papal prerogative ever made. The weight of opinion now tends to deny that any part of this much-discussed document save the last sentence bears the marks of an infallible utterance. The French vice-chancellor Guillaume de Nogaret was sent to arrest the pope, against whom grave charges had been brought, and bring him to France to be deposed by an oecumenical council. The accusation of heresy has usually been dismissed as a slander; but recent investigations make it probable, though not quite certain, that Boniface privately held certain Averroistic tenets such as the denial of the immortality of the soul. With Sciarra Colonna, Nogaret surprised Boniface at Anagni, on Sept. 7, 1303, as the latter was about to pronounce the sentence of excommunication against the king. After a nine hours' truce the palace was stormed, and Boniface who had been saved by Nogaret from the vengeful Colonna, imprisoned for three days, until released by the citizens of Anagni. He was conducted to Rome, only to be confined by the Orsini in the Vatican, where he died in Oct. 1303. Dante, who had become embittered against Boniface while on a political mission in Rome, calls him the "Prince of the new Pharisees" (*Inferno*, 27, 85), but laments that "in his Vicar Christ was made a captive," and was "mocked a second time" (*Purgatory*, 20, 87 f.). Boniface patronized the fine arts, interested himself in the Vatican library and founded the University of Rome.

BONIFACE IX. (Piero Tomacelli), pope from 1389 to 1404, was born at Naples of a poor but ancient family. He was able to restore Roman authority in the major part of the papal states, and in 1398 put an end to the republican liberties of the city itself. Boniface won Naples, which had owed spiritual allegiance to the antipopes Clement VII. and Benedict XIII. of Avignon, to the Roman obedience. In 1403 he ventured at last to confirm the deposition of the emperor Wenceslaus by the electors and the choice of Rupert. Negotiations for the healing of the Great Schism were without result. In spite of his inferior education, the contemporaries of Boniface trusted his prudence and moral character; yet when in financial straits he sold offices, and in 1399 transformed the annates into a permanent tax. In 1390 he celebrated the regular jubilee, but a rather informal one held in 1400 proved more profitable. Though probably not personally avaricious, he was justly accused of nepotism.

BONIFACE OF SAVOY (d. 1270), elected archbishop of Canterbury in 1243, through the favour of Henry III., whose queen, Eleanor of Provence, was his niece. Boniface spent much of his time on the Continent attending to family affairs and made little impression on Church or State. In 1250 he provoked the English bishops by claiming the right of visitation in their dioceses. In the barons' war he at first took the side of the national party but later supported the king.

See Matthew Paris, *Chronica Majora*; François Mugnier, *Les Savoyards en Angleterre* (Chambéry, 1890).

BONIFACIO, maritime town, in southern Corsica, arrondissement of Sartène, 87m. S.S.E. of Ajaccio by road. Pop. (1926) 2,278. Bonifacio overlooks the straits of that name separating

Corsica from Sardinia and occupies a remarkable situation on a peninsula of limestone parallel to the coast and enclosing a narrow harbour. Founded about 828 by a Tuscan marquis, as a defence against Saracen pirates, in the 11th century it became subject to Pisa, and in the 12th was taken and colonized by the Genoese, whose influence may be traced in the character of the population. In 1420 it withstood a protracted siege by Alphonso V. of Aragon. In 1554 it fell into the hands of the Franco-Turkish army. St. Dominic, built (13th century) by the Templars, and the cathedral of Santa Maria Maggiore (12th century) are the chief buildings. The fortifications and citadel date from the 16th and 17th centuries. Trade is chiefly with Sardinia in cereals, wine, and cork. Cork-cutting, tobacco-manufacture and coral-fishing are carried on. The olive is largely cultivated and there are oil-works in the town.

BONIFACIUS (d. 432), the Roman governor of the province of Africa who is believed to have invited the Vandals into that province (429), though that action is by Procopius attributed to his rival Aëtius. Whether he really invited the Vandals or not, there is no doubt that he soon turned against them and bravely defended the city of Hippo from their attacks. In 432 he returned to Italy, was received into favour by Placidia, and appointed master of the soldiery. Aëtius, however, resented his promotion, the two rivals met, perhaps in single combat, and Bonifacius, though victorious, received a wound from the effects of which he died three months later.

See Gibbon, *Decline and Fall of the Roman Empire*, vol. iii. pp. 505-506, edited by J. B. Bury (London, 1897), and E. A. Freeman's article in *Eng. Hist. Rev.*, July 1887.

BONIN ISLANDS: see OGASAWARA JIMA.

BONINGTON, RICHARD PARKES (1801-1828), English painter, was born at Arnold, near Nottingham, Oct. 25, 1801. His father, one time governor of Nottingham gaol, was also a drawing-master. In 1817 the family moved to Calais where the father started business in connection with the Nottingham lace trade. Here young Bonington became acquainted with Louis Francia, the friend of Girtin, who grounded him in the principles of English water-colour painting. Moving to Paris, he studied and copied the Dutch and Flemish masters in the Louvre. In 1820 he entered the studio of Baron Gros, which was a meeting-place of revolutionary spirits.

In France at that time the classicist art of David was still predominant, but Géricault and Delacroix were preparing the romantic movement. Bonington met Delacroix at the Louvre and the two formed a close friendship. Both had the same passion for the new conception of historical painting, both studied the costumes and the new histories of the middle ages and the early Renaissance which attracted the writers and actors of the day. Bonington, who from his early youth in Nottingham had loved the theatre, clearly showed the influence of the stage on his designs. Repeated visits to London kept him in touch with English contemporary art when Constable was developing his own original conception of landscape painting. Bonington painted his first landscapes from nature in Normandy and Picardy. In 1822, on a visit to Venice, he produced a series of Venetian pictures. He received the gold medal in the Salon of 1824. On his return to England, his works exhibited at the British Institution in 1826 and at the Royal Academy in 1828, excited admiration and he was befriended by Sir Thomas Lawrence. He died of consumption in London on Sept. 23, 1828. His early death deprived England of one of the fairest promises in the field of art, for although he had studied in France he belonged to both countries. His sparkling and luminous colour was a quality unknown in France at that time and was rivalled among English water-colourists only by Constable and Turner. Thus he brought the knowledge of English art to France, and linked the new vision of English landscapes to the art of the Barbizon school. Moreover, he possessed a dexterity in execution which has since become, among both artists and art-lovers, a tradition in English painting.

Bonington's best known works are "Henry IV. and the Spanish Ambassador" in the Wallace collection, London, and "Francis I. and the Duchesse d'Etampes" in the Louvre, Paris. Nowhere can

BY COURTESY OF SUGIMASA-SHOUTIN

MINIATURE LANDSCAPES MODELLED ON TRAYS OF BRONZE, CONCRETE OR PORCELAIN

- 1 A rolling landscape modelled from earth or a substitute for earth. Sand is used for the water and the scene is embellished with tiny plants representing trees, and with miniature houses and a bridge
- 2 A seascape, the mountains are modelled with a spatula and sand is used for the sea
- 3 A rocky landscape, with a waterfall; tiny figures are climbing the steep cliff
4. A landscape on the edge of the sea; little figures can be seen in the boats

Bonington's art be studied so well as in the Wallace collection which possesses 11 oil and 25 water-colours. The Louvre and the National Gallery, the Victoria and Albert museum, the Tate gallery, the British Museum print room, and most galleries in England possess specimens of his work. He produced a number of lithographs, of which the "Rue de la grosse Horloge à Rouen" is the most famous.

BONITO (*Sarda sarda*), a fish of the mackerel family, abundant in the Mediterranean and in the warmer parts of the Atlantic ocean. It is similar in form to the tunny (*q.v.*), but is a smaller fish, not exceeding 30 in. in length. The colour is steel blue above, silvery below, with numerous narrow dark stripes running obliquely downward and forward from the back. The name is given to *S. chilensis* of the Pacific ocean and to the little tunnies (*Gymnosarda*).

BONITZ, HERMANN (1814–1888), German scholar, was born at Langensalza in Saxony. He held many important teaching posts and took great interest in higher education; he reorganized the schools and universities of Austria and was chiefly responsible for the system of teaching and examination in use in the high schools of Prussia after 1882. But it is as a commentator on Plato and Aristotle that he is best known outside Germany.

His most important works in this connection are: *Disputationes Platonicae Duae* (1837); *Platonische Studien* (3rd ed., 1886); *Observationes Criticae in Aristotelis Libros Metaphysicos* (1842); *Observationes Criticae in Aristotelis quae feruntur Magna Moralia et Ethica Eudemia* (1844); *Alexandri Aphrodisiensis Commentarius in Libros Metaphysicos Aristotelis* (1847); *Aristotelis Metaphysica* (1848–49); *Über die Kategorien des A.* (1853); *Aristotelische Studien* (1862–67); *Index Aristotelicus* (1870). Other works: *Beiträge zur Erklärung des Thukydides* (1854), *des Sophokles* (1856–57); *Über den Ursprung der homerischen Gedichte* (5th ed., 1881). Full bibliography in the obituary notice by T. Gompertz in *Biographisches Jahrbuch für Altertumskunde* (1890).

BONIVARD, FRANÇOIS (1496?–1570), Genevan politician, the hero of Byron's poem, *The Prisoner of Chillon*, was born in Seyssel of an old Savoyard family. Bonivard has been described as "a man of the Renaissance who had strayed into the age of the Reformation." His real character and history are, however, widely different from the legendary account which was popularized by Byron. Son of Louis Bonivard, Lord of Lune, he succeeded his uncle as prior of the Cluniac priory of St. Victor, close to Geneva. He naturally, therefore, opposed the increasing power of the duke of Savoy, aided by his relative, the bishop of the city. He was imprisoned by the duke at Gex from 1519 to 1521, lost his priory, and became more and more anti-Savoyard. In 1528, supported by the city of Geneva, he took up arms against those who had seized his ecclesiastical revenues, but in 1530 he was again seized by the duke and imprisoned for four years underground, in the castle of Chillon, till he was released (March 29, 1536) by the Bernese, who then wrested Vaud from the duke. Becoming a Protestant, Bonivard obtained a pension from Geneva and was four times married. He was entrusted in 1542 with the task of compiling a history of Geneva from the earliest times. In 1551 his ms. of the *Chroniques de Genève* (ending in 1530) was submitted to Calvin for correction; but it was not published till 1831, when it was edited by Dunant. The best edition is that of 1867. He also wrote *De l'Ancienne et Nouvelle Police de Genève* (1555).

BON-KEI ("tray-landscape"), generally acknowledged to be an evolution of *hako-niwa* (*q.v.*), is a popular branch of the Japanese art of making miniature landscapes with earth or its substitutes, representing trees, grass, houses, figures, etc., on bronze, concrete or porcelain trays and used as decorations for windows or rooms. The art is occasionally called *bon-kei* (tray-garden), and the name *bon-kei* is then given to another branch popularly known as *bon-seki* (*q.v.*), but this is not generally accepted. *Bon-kei*, in its present phase, has not been in existence very long, having taken a new life at the dawn of the 20th century, when *keto-tsuchi*, a sort of peat, was introduced by Idzumi

Chisen as a substitute for earth for modelling not only hills, but rocks and stones also. Nowadays actual stones are hardly ever used. As the art gained popularity, all sorts of devices were tried, including old newspapers soaked in water, as substitutes for the earth. Usually, on a round, oval or rectangular tray of from 1 to 3 ft. in extreme dimension, hills, rocks and ground are modelled with *keto-tsuchi*, newspaper preparation, or earth by means of a spatula, and then are painted to give an appearance of snow, a water-fall or distant scenery, the nearer parts being covered with fine moss and planted with vegetation of appropriate size and form. Different coloured earth is strewn to indicate a path, and sand is used to represent water. The views may be embellished with miniature houses, towers, bridges, figures, birds, etc., of baked clay. *Bon-kei* very strongly resembles *hako-niwa*, though the latter is meant to be kept for years, while the former is primarily to meet a temporary need (though with care it may be preserved for months in its original freshness and proportion), and is very quickly made; it is entirely different from *bon-seki*, in which neither earth nor vegetation is used.

BONN, town of Rhenish Prussia, Germany, on the left bank of the Rhine, 15 m. S. by E. from Cologne. Pop. (1885) 35,989; (1905) 81,997; (1925) 90,100. The river is here crossed by a fine bridge (1898), 1,417 ft. in length, flanked by an embankment 2½ m. long, parallel with which is the Coblenzer-strasse, with villas and gardens, which add greatly to the appearance of the town from the river. Bonn (*Bonna* or *Castra Bonnensia*), a Roman military settlement, was the scene, in A.D. 70, of a defeat of the Romans. Greatly reduced by successive barbarian inroads, it was restored about 359 by the emperor Julian. In the centuries that followed the break-up of the Roman empire it again suffered, and was finally devastated in 889 by bands of Norse raiders. Fortified again in the 13th century, from 1265 to 1794 it was the residence of the electors of Cologne. During the various wars of the 16th, 17th and 18th centuries, the town was frequently besieged. Occupied by the French after 1794, it was made over by the Congress of Vienna (1815) to Prussia. The fortifications were dismantled in 1717. The central part of the town, with its narrow streets, contains the Munster (minster), built of grey stone, in Romanesque and Transition styles (12th and 13th centuries). It is surmounted by five towers, of which the central (315 ft.) is a landmark in the Rhine valley. The Minoritenkirche dates from 1278–1318, but the other churches are more recent. The town hall on the market square dates from 1737 and there is a fine block of law-court buildings. The finest building, however, is the famous university (1786–1818), which occupies the larger part of the southern frontage of the town. Originally the electoral palace of the archbishops of Cologne, it was constructed about 1717 out of the materials of the old fortifications, and remodelled after the town came into Prussian possession. There are five faculties—a legal, a medical, and a philosophical, and one of Roman Catholic and one of Protestant theology. The museum contains a valuable collection of Roman relics discovered in the neighbourhood. An academy of agriculture, with a natural history museum and botanic garden, is established in the palace of Clemensruhe at Poppelsdorf, reached by a long avenue of double rows of chestnut trees. A splendid observatory, long under the charge of Friedrich Wilhelm Argelander, stands on the south side of the road. On the Kreuzberg, above the suburb of Poppelsdorf, is a 17th century church and Franciscan monastery, approached by a flight of "holy steps," in imitation of those at Rome. Only one tower, "Der alte Zoll," commanding a magnificent view of the Siebengebirge, remains of the old fortifications. Beethoven was born in Bonn, and a statue was erected to him in the Münsterplatz in 1845. In 1889 a museum of Beethoven relics was opened in the house where he was born. The chief manufactures are stoneware and office furniture. Numbers of foreign residents are attracted by the scenery and by the educational facilities.

BONNAT, LÉON JOSEPH FLORENTIN (1833–1922), French portrait-painter, was born at Bayonne on June 20, 1833, and died on Sept. 8, 1922. He studied under Madrazo at Madrid, and under Cogniet in Paris. His earlier works were genre and historical paintings in which his study of old Spanish art was

evident. The long series of characteristic portraits began in 1875. In these he drew inspiration from Velasquez and the Spanish realists. He painted Thiers, Victor Hugo, Carnot, Taine, Pasteur and other contemporaries, some 200 in all, the finest of these being perhaps the portrait of Léon Cogniet in the Luxembourg. In 1888 he became professor of painting at the École des Beaux-Arts, and in 1905 director.

BONNER, EDMUND (?1500–69), bishop of London, was perhaps the natural son of George Savage, rector of Davenham, Cheshire, by Elizabeth Frodsham, who was afterwards married to Edmund Bonner, a sawyer of Hanley in Worcestershire. This account, which was printed with many circumstantial details by Strype (*Eccles. Mem.*, III. i. 172–173), was disputed by Strype's contemporary, Sir Edmund Lechmere, who asserted on not very satisfactory evidence (*ib. Annals*, I. ii. 300) that Bonner was of legitimate birth. He was educated at Broadgates Hall, now Pembroke college, Oxford, graduating bachelor of civil and canon law in June 1519. He was ordained about the same time, and admitted D.C.L. in 1525. In 1529 he was Wolsey's chaplain, and he was with the cardinal at Cawood at the time of his arrest. Subsequently he was transferred, perhaps through Cromwell's influence, to the service of the king, and in Jan. 1532 he was sent to Rome to obstruct the judicial proceedings against Henry in the papal curia. In Oct. 1533 he was entrusted with the unmannerly task of intimating to Clement VII., while he was the guest of Francis I. at Marseilles, Henry's appeal from the pope to a general council.

Towards the end of that year he was sent to further what he called "the cause of the Gospel" (*Letters and Papers*, 1536, No. 469) in north Germany; and in 1536 he wrote a preface to Gardiner's *De vera Obedientia*, which asserted the royal supremacy. After a brief embassy to the emperor in the spring of 1538, Bonner superseded Gardiner at Paris, and began his mission by sending Cromwell a long list of accusations against his predecessor (*ib.* 1538, ii. 144). He was almost as bitter against Wyatt and Mason, whom he denounced as a "papist," and the violence of his conduct led Francis I. to threaten him with 100 strokes of the halberd. He seems, however, to have pleased his patron, Cromwell, and perhaps Henry, by his energy in seeing the king's "Great" Bible in English through the press in Paris. He was already king's chaplain; his appointment at Paris had been accompanied by promotion to the see of Hereford, and before he returned to take possession he was translated to the bishopric of London (Oct. 1539).

Hitherto Bonner had been known as a somewhat coarse and unscrupulous tool of Cromwell. In the Reformation only the repudiation of papal control appealed to him; and he was one of those numerous Englishmen whose views were faithfully reflected in the Six Articles. He became a staunch conservative, and, apart from his embassy to the emperor in 1524–43, was mainly occupied during the last years of Henry's reign in brandishing the "whip with six strings."

The accession of Edward VI. opened a fresh and more creditable chapter in Bonner's career. Like Gardiner, he could hardly repudiate that royal supremacy, in the establishment of which he had been so active an agent; but he began to doubt that supremacy when he saw to what uses it could be put by a Protestant council, and either he or Gardiner evolved the theory that the royal supremacy was in abeyance during a royal minority. The ground was skilfully chosen, but it was not legally or constitutionally tenable. Both he and Gardiner had, in fact, sought from the young king fresh licences to exercise their ecclesiastical jurisdiction; and, if he was supreme enough to confer jurisdiction, he was supreme enough to issue the injunctions and order the visitation to which Bonner objected. Moreover, if a minority involved an abeyance of the royal supremacy in the ecclesiastical sphere, it must do the same in the temporal sphere, and there could be nothing but anarchy. It was on this question that Bonner came into conflict with Edward's government. He resisted the visitation of Aug. 1547 and was committed to the Fleet, but he withdrew his opposition and was released in time to take an active part against the government in the parliament of Nov.

1547. In the next session, Nov. 1548–March 1549, he was a leading opponent of the first Act of Uniformity and Book of Common Prayer. When these became law he neglected to enforce them, and on Sept. 1 1549, he was required by the council to maintain at St. Paul's Cross that the royal authority was as great as if the king were 40 years of age. He failed to comply, and after a seven days' trial he was deprived of his bishopric, by an ecclesiastical court over which Cranmer presided, and sent to the Marshalsea. The fall of Somerset in the following month raised Bonner's hopes, and he appealed from Cranmer to the council. After a struggle the Protestant faction gained the upper hand, and on Feb. 7 1550, Bonner's deprivation was confirmed by the council sitting in the Star Chamber, and he was further condemned to perpetual imprisonment.

He was released by Mary's accession, and was at once restored to his see. He very vigorously restored Roman Catholicism in his diocese, made no difficulty about submitting to the papal jurisdiction which he had forsworn, and in 1555 began the persecution to which he owes his fame. His apologists explain that his action was merely "official," but Bonner was one of those who brought it to pass that the condemnation of heretics to the fire should be part of his ordinary official duties. The enforcement of the first Book of Common Prayer had also been part of his official duties; and the fact that Bonner made no such protest against the burning of heretics as he had done in the former case shows that he found it the more congenial duty.

Many of his victims were forced upon him by the council, which sometimes thought that he had not been severe enough (see *Acts of the P.C. 1554–1556*, pp. 115, 139; *1556–1558*, pp. 18, 19, 216, 276). So completely had the State dominated the Church that religious persecutions had become State persecutions. Bonner is seen at his worst in his brutal jeers at Cranmer when he was entrusted with the duty of degrading his former chief. It is a more remarkable fact that, in spite of his prominence, neither Henry VIII. nor Mary should ever have admitted him to the privy council. He seems to have been regarded by his own party as a useful instrument, especially in disagreeable work, rather than as a desirable colleague.

On her accession Elizabeth refused to allow him to kiss her hand; but he sat and voted in the parliament and convocation of 1559. In May he refused to take the oath of supremacy, acquiring, like his colleagues, consistency with old age. He was sent to the Marshalsea, and a few years later was indicted on a charge of praemunire on refusing the oath when tendered him by his diocesan, Bishop Horne of Winchester. He challenged the legality of Horne's consecration, and a special act of parliament was passed to meet the point, while the charge against Bonner was withdrawn. He died in the Marshalsea in 1569.

BONNET, CHARLES (1720–1793), Swiss naturalist and philosophical writer, was born at Geneva on March 13 1720, of a French family. He made law his profession, but his favourite pursuit was the study of natural science. In 1740 his paper to the Academy of Sciences containing a series of experiments establishing what is now termed parthenogenesis in aphides or tree-lice, obtained for him the honour of being admitted a corresponding member of the academy. In 1741 he began to study reproduction by fusion and the regeneration of lost parts in the freshwater hydra and other animals; and in the following year he discovered that the respiration of caterpillars and butterflies is performed by pores, to which the name of *stigmata* has since been given. In 1743 he was admitted a fellow of the Royal Society; and in the same year he became a doctor of laws.

In 1745 appeared his *Traité d'insectologie*, and in 1754 his *Recherches sur l'usage des feuilles dans les plantes*; in which he suggests that plants possess powers of sensation and discernment. But Bonnet's eyesight, which threatened to fail altogether,

caused him to turn to philosophy. In 1754 his *Essai de psychologie* was published anonymously in London. This was followed by the *Essai analytique sur les facultés de l'âme* (Copenhagen, 1760), in which he develops his views regarding the physiological conditions of mental activity. He returned to physical science, but to the speculative side of it, in his *Considérations sur les corps organisés* (Amsterdam, 1762), designed to refute the theory of epigenesis, and to defend the doctrine of pre-existent germs. In his *Contemplation de la nature* (Amsterdam, 1764-65) he sets forth the hierarchy of all creatures, and in his *Palingénésie philosophique* (Geneva, 1769-70), treats of the past and future of living beings, and supports the idea of the survival of all animals.

Bonnet's life was uneventful, and he seems never to have left Switzerland. Between 1752 and 1768 he was a member of the council of the republic. He died at Genthod, near Geneva, May 20, 1793. (See *EVOLUTION, history*.)

Bonnet's complete works appeared at Neuchâtel in 1770-83, partly revised by himself. An English translation of certain portions of the *Palingénésie philosophique* was published in 1787, under the title, *Philosophical and Critical Inquiries concerning Christianity*. See also A. Lemoine, *Charles Bonnet* (1850); the duc de Caraman, *Charles Bonnet, philosophe et naturaliste* (1850); Max Offner, *Die Psychologie Charles Bonnet* (Leipzig, 1893); Joh. Speck, in *Arch. j. Gesch. d. Philos.* x., xi. (1897), p. 58 foll., xi. (1898), pp. 1-211; J. Trembley, *Vie privée et littéraire de Charles Bonnet* (Bern, 1794).

BONNET, originally a soft cap or covering for the head, the common term in English till the end of the 17th century; this sense survives in Scotland, especially as applied to the cap known

FROM KELLY, "HISTORIC COSTUME," BY PERMISSION OF B. I. BATESFORD, LTD
FRENCH BONNET, 1782. ENGLISH BONNET, 1774. GERMAN BONNET, 1770

as a "glengarry." The "bonnet" of a ship's sail now means an additional piece laced on to the bottom, but it seems to have formerly meant a piece laced to the top, the term "to vail the bonnet" being found at the beginning of the 16th century to mean "strike sail" (cf. Fr. *avaler*), to let down. "Bonnet" came to be used of a type of head-covering for women fitting closely to the head; hence, the term is also applied to certain protective devices, as in a steam-engine or safety-lamp, or in slang use to a gambler's accomplice, a decoy. A common use is of the covering which protects from the weather the engine of a motor-car.

BONNEVAL, CLAUDE ALEXANDRE, COMTE DE (1675-1747), French soldier of fortune, known as Ahmed Pasha. He entered the Royal Marine Corps at 13, and at 16 transferred to the army. He served until 1704, when he was court-martialled for insolence. He then took service under Prince Eugène, and, with a short interval, served in the Austrian army until 1724, when his ungovernable temper again brought him into disgrace. He then entered the Turkish service and took the name of Ahmed, reorganized the Turkish artillery, and was made a pasha. He served in the sultan's wars against Russia and Persia, and died in Constantinople on March 23, 1747.

The *Memoirs* published under his name are spurious. See Prince de Ligne, *Mémoire sur le comte de Bonneval* (1817); and A. Vandal, *Le Pacha Bonneval* (1885).

BONNEVILLE, BENJAMIN L. E. (c. 1795-1878), American military engineer and explorer, was born in France about 1795. He emigrated to the United States and graduated at the U. S. Military Academy at West Point in 1815. In 1831-36, having obtained leave of absence from the army, he conducted an exploring expedition to the Rocky Mountains. After being cut off from civilization for several years, he returned with a valuable account of his adventures, which was edited by Washington Irving and published under the title *The Rocky Mountains: or Scenes, Incidents, and Adventures in the Far West*; from the *Journal of Captain Benjamin L. E. Bonneville of the Army of the United States* (2 vol., 1837), subsequent editions bearing the title *The Adventures of Captain Bonneville, U.S.A., in the Rocky Mountains and the Far West*. He became a major in 1845, and was breveted lieutenant-colonel for gallantry during the Mexican War. He became a colonel in 1855, commanded the Gila river expedition against the Apaches in 1857, and from 1858 to 1861 commanded the department of New Mexico. He was retired in 1861, but served during the Civil War as recruiting officer and commandant of barracks at St. Louis, Mo., receiving the brevet rank of brigadier-general in 1865. He died at Fort Smith, Ark., on June 12 1878. The extinct glacial lake which once covered what is now north-western Utah has been named in his honour.

BONNEY, THOMAS GEORGE (1833-1923), English geologist, son of the master of Rugeley grammar school, was educated at Uppingham school and St. John's college, Cambridge, and held various academic posts and ecclesiastical preferments. He became secretary and afterwards president of the Geological Society (1884-86), secretary of the British Association (1881-85), president of the Mineralogical Society and of the Alpine Club. In addition to many papers published in the *Quarterly Journal of the Geological Society* and *Geological Magazine*, he wrote several works on geology.

See *Geological Magazine* for Sept. 1901 (with bibliography).

BONNIVET, GUILLAUME GOUFFIER, SEIGNEUR DE (c. 1488-1525), French soldier, was brought up with Francis I. of France, and after the young king's accession he became one of the most powerful of the royal favourites. In 1518, as the head of the French embassy in England, he acted as proxy for the Dauphin in his marriage with Princess Mary. He was the implacable enemy of the constable de Bourbon and contributed to his downfall. In command of the army of Navarre in 1521, he occupied Fuenterrabia and was probably responsible for its non-restoration and for the consequent renewal of hostilities. He succeeded Marshal Lautrec in 1523 in the command of the army of Italy and entered the Milanese, but was defeated and forced to effect a disastrous retreat, in which the chevalier Bayard perished. He was one of the principal commanders of the army which Francis led into Italy at the end of 1524 and died at the battle of Pavia on Feb. 24, 1525. According to Brantôme, Bonnivet was the successful rival of the king for the favours of Madame de Châteaubriand and is said to have been the hero of the fourth story of the *Heptameron*.

BIBLIOGRAPHY.—Bonnivet's correspondence in the Bibliothèque Nationale, Paris; memoirs of the time; complete works of Brantôme, vol. iii, published by Ludovic Lalanne for the Société de l'Histoire de France (1864 seq.). See also Ernest Lavisse, *Histoire de France*, vol. v., by H. Lemonnier (1903-04).

BONOMI, GIUSEPPE (1739-1808), English architect, was born at Rome on Jan. 19, 1739, and died in London on March 9, 1808. He already had a considerable reputation in Italy when he came in 1767 to England and began to practise. Bonomi was largely responsible for the revival of classical architecture in England. His most famous work was the Italian villa at Roseneath, Dumbartonshire, designed for the Duke of Argyll. In 1804 he was appointed honorary architect to St. Peter's at Rome.

His son, GIUSEPPI BONOMI (1796-1878), studied art in London at the Royal Academy, and is best known as an illustrator of the leading Egyptological publications of his day. From 1824 to 1832 he was in Egypt, making drawings of the monuments in the company of Burton, Lane and Wilkinson. In 1833 he visited the mosque of Omar, returning with detailed drawings, and from 1842 to 1844 was again in Egypt, attached to the Prussian gov-

DWARF TREES TRAINED INTO VARIOUS SHAPES BY PRUNING AND FERTILIZATION

1. A tree with two trunks (*ai-oi*) growing out of a single stump, trained to give an appearance of age by the gnarled trunks, the spread of the roots and the distribution of the bare branches
2. A group (*vase-ure*) of similar trees planted close together in a shallow vessel, the whole intended to give the appearance of a forest
3. A tree with its roots growing out of and embracing a rock (*ishi-zuki*) which seems to surmount a precipice over the sea
4. A tree with high exposed roots (*ne-agari*) and overhanging branches suggesting by its drooping its place on a cliff-side

BY, (1) HAYASHI SOKYO (2) SUGIMASA THOUN (3) TAKEI KIMPU, (4) KATSUNO HAKUYE (5) MATSUMURA GENSHOYEN (6) HARADA GENSHOAN (7) TOMITA ICHIGENSAI

JAPANESE TRAY LANDSCAPES AND THE PARAPHERNALIA FOR MAKING THEM

- 1 and 2 Examples of Bon Kei. Earth or a substitute is used for modelling these miniature landscapes, which are then embellished with moss and small plants to represent grass and trees, and with miniature houses, towers, bridges, figures, etc., of baked clay. Bon Kei is different from Bon Seki, examples of which are shown below, in that the former is fashioned from perishable materials and the latter is fashioned from imperishable ones
3. Bon Seki, entirely made of stones and pebbles used in conjunction with sand, in this case to represent the river Fuji, in Japan. Stones are used for the landscape, and sand for the water and the beach
4. Bon Seki, called Moonlight on the Sea. Black stones, indicative of dark shadows, are used for the summer landscape. The markings on

- the sea, made with a heron's plume, are meant to suggest calm, rippling summer waters
5. The flight of geese at Kobado, the land- and sea-scapes are of stone and sand, the geese are portrayed with pebbles
6. Stones with sand between them, the whole designed to represent a waterfall. Black stones are used here, and in fact are most commonly used, because they look well with the white sand
7. Stones of shapes that suggest mountains are used here together with sand flowing through them to represent the river Isuzu, in Japan
- 8 The brushes that sweep the sand together, the plumes that do the modelling and marking of the sand, and all the other paraphernalia that go to make up the equipment of an artist in Bon Seki

BY COURTESY OF JIRO HARADA

AN ARTIST IN BON SEKI AND SOME ARRANGEMENTS OF STONES AND SAND ON TRAYS (KI SEKI)

1. A Japanese artist with his materials about him for the making of bon seki, combinations of stones of beautiful outline and colour with sand on trays to make house ornaments
2. A stone placed on a tray with low growing grass, the latter intended to emphasize the immensity of nature as suggested by the stone
- 3 and 4. Stones of desirable shapes in trays with sand. Natural stones are greatly valued by the Japanese, who have an old custom still prevailing of enjoying stones in themselves, for their form and colour and for their unchanging virtues. These stones are called ki seki

ows; reddish ones for autumn, suggestive of tinted hill-sides; whitish ones for winter, to denote snow. Black stones, however, from the provinces of Kii, Satsuma and Echigo are most commonly used for all scenes, irrespective of seasons, as they go well with the white sand. The desirable size of the principal stone is considered to be about 7 or 8 in. long, and 4 or 5 in. high, though a considerable latitude is allowed in practice. Stones of smaller sizes are also necessary to get variation and perspective. The bottom of the stone is usually sawn flat for stability and is covered with silk so that it may not scratch the surface of the lacquered tray. Besides the principal stones there are *soye-ishi* (auxiliary stones), *sute-ishi* (thrown-away stones), sacrificed to emphasize the more important ones, and *ashirai* (small stones for creating details of the scene). Agate, ruby, serpentine and rock crystals of various shades are also used, though very rarely, for forming islands or as *ashirai*.

Sand is indispensable to *bon-seki*. White sand from the provinces of Bizen and Bingo has been popular, but now-a-days crushed calcareous spar is most generally used. It is generally prepared in ten different grades. Grades from 1 to 5 are used to add details to the scenery, the 6th, 7th and 8th grades for making promontories and seashore, the 9th for streams and waves, and the 10th, the finest, for mists, snow or clouds. Not only calcareous spar, but also agate and corals are granulated and used as sand, though rarely, except the red coral for the rising sun to distinguish it from the moon.

Black lacquered trays are generally preferred, either oval (with extreme length and width of about 16 and 10 in. respectively) or fan-shaped in a smaller size, with low borders, or rectangular, without any border.

Brushes are used very effectively by some masters of this art, but plumes are indispensable. Feathers of hawks, cranes, swans and herons are employed for various purposes. One kind is used to sweep the sand together or remove unnecessary sand from the tray, another, with the aid of a small ruler, to make mists. Still another is required to mark streams and waves of different varieties, for each season has its characteristic waves; for spring they are peacefully long and continuous near the beach and higher off the shore; for summer, ripples cover the calm sea; for autumn, they are rough, intermingled with more peaceful ones; for winter waves, the feather is brushed roughly to right and left, making a choppy sea with roaring surges. The directions of wind peculiar to each season must not be overlooked; the front of the principal stone is always considered as facing south. Other paraphernalia required in *bon-seki* include sieves to sift different grades of sand, a metal spoon and a tube for the sand, a pair of chop-sticks to manage small pebbles, forms for making crescent or full moon, and miniature models in silver or bronze bridges, temples, pagodas, etc.

Bon-seki has had a long history, for it was already in vogue at the time of Ashikaga Yoshimasa (1436-90) and the period that followed, when *cha-no-yu*, commonly known as ceremonial tea, being "a cult founded upon the adoration of the beautiful amidst sordid facts of everyday life," flourished. As in other branches of Japanese art, there arose different styles or "schools," some of the more prominent being Takeya-ryu, Kiyohara-ryu, Tōzan-ryu, Hōshō-ryu, Ikuta-ryu, Uda-ryu, Sekishyu-Tōyama-ryu, Kōno-ryu and Hosokawa-ryu. The last-mentioned school is most active at present, having for its chief master Katsuno Hakuyen, of Nagoya, who revived the school with his rare talent, and established branches all over Japan and her colonies.

There is a special kind of *bon-seki* called *kake-gaku* (hanging picture) or *tome-ye* (fastened painting). The sand is mixed with powdered paste and the completed picture steamed, so that it sticks to the tray. Usually a fine grade of sand is used for this purpose, though recently some masters have contrived to stick even stones by means of gum arabic. There is a similar art known as *bon-ga* (tray-pictures), an evolution of *suma-ye* (sand-painting), which men on the street were accustomed to practise at various times in Japanese history, record showing that the custom existed in the era of An-ei (1772-81). Sands, not only of natural colours, but artificially dyed, are used in depicting almost any

subject: trees and houses, flowers and birds, natural scenes and historical events—a pictorial art in sand. *Bon-ga* is distinct from *bon-seki*, though the latter sometimes appropriates for itself what is practised in the former, and the former does not enjoy either the artistic prestige or the popularity of the latter. Still another branch of art in which sand is used is *sujo-sumaye* (sand-pictures-on-water), or *sui-ga* (water-picture) for short. Using wax-coated sand of different colours, the artist draws pictures on the water contained in a tray. In order to prevent the rippling of the water, which would prevent the sand from floating, pulverized white cowpeas and alum are previously stirred in. This art was in vogue in the era of Bunkwa (1804-18), but is now seldom practised.

Apart from *bon-seki*, there still prevails among the Japanese their ancient custom of enjoying rare stones by themselves. While some of them are too large, others may be used in *bon-seki* as well. They call these stones *ki-seki* (rare or strange stones), or merely *ishi* (stone), and some are among heirlooms of ancient families. Provided with individual wooden stands, they are placed on one's writing desk or in *tokonoma* (alcoves in the guest room), that the gazer may be led into reveries by the fancies their shapes suggest, such as mountains, immense cliffs or some natural phenomena. A stone with a white streak or vein may suggest a waterfall, the sound of which may be heard, or rather felt, in the momentary solitude of one's room, for "heard melodies are sweet, but those unheard are sweeter."

Some stones are placed on a tray with low-growing grass or bamboo in order to emphasize the immensity of nature suggested by the stone. Another way of enjoying them, which has been for centuries and still is popular among the Japanese, is known as *sui-seki* (water-stone). A natural stone of desirable shape is placed in a porcelain or bronze tray or dish with sand and water. Months and years of patient watering and care may, according to the kind of stone used, bring forth a thin coating of moss, enlivening the stone with a verdure like a mountain or an island with forest and meadows (J. HAR.)

BONSTETTEN, CHARLES VICTOR DE (1745-1832), Swiss writer, was born at Berne and educated in his native town, at Yverdon, and (1763-66) at Geneva, where he came under the influence of Rousseau and of Charles Bonnet, and imbibed liberal sentiments. Recalled to Berne by his father, he was soon sent to Leyden, and then visited (1769) England, where he became a friend of the poet Gray. After his father's death (1770) he made a long journey in Italy, and on his return to Berne (1774) entered political life. From 1779 onward he held various administrative posts, but in 1798 had to leave Switzerland on account of his political opinions. He spent the years 1798 to 1801 in Denmark, with his friend Frederika Brun, and then settled down in 1803 in Geneva for the rest of his life. There he enjoyed the society of many distinguished persons, among whom was (1809-17) Madame de Staël. It was during this period that he published his most celebrated work, *L'Homme du midi et l'homme du nord* (1824), a study of the influence of climate on different nations, the north being exalted at the expense of the south. But his best known works are his descriptions of Switzerland, especially the *Lettres pastorales sur une contrée de la Suisse* (1779).

Lives by A. Steinlen (Lausanne, 1860), by C. Morell (Winterthur, 1861), and by R. Willy (Bern, 1898). His correspondence with Frederika Brun was published in 1829 in Frankfurt a.M. See also vol. xiv. of Sainte-Beuve's *Causeries du Lundi*.

BONTOT IGOROT, the name of a powerful, head-hunting tribe of the island of Luzon. The divisions of the tribe are political and exogamic; intensive agriculture is the means whereby subsistence is obtained as, owing to the hilly nature of the Bontot territory, game is scarce. The language is somewhat complicated in structure and has a good vocabulary.

See Seidenadel, *A First Grammar of the Language of the Bontot Igorot* (Chicago, 1909); A. E. Jenks, *The Bontot Igorot* (*Ethnologic Survey Publication*, Manila, 1905), and various publications of the Science Museum, University of the Philippines, Manila.

BONUS, a term used in business or finance to describe an exceptional, occasional, or gratuitous addition to customary payments. It is a jocular and effective application of the Lat. *bonus*,

for *bonum*, "a good thing." When a joint-stock company makes an exceptional profit, and enlarges its dividend temporarily, it pays a "bonus" to its shareholders to distinguish between the extra and the customary payment. When new shares are created out of reserves, and distributed to shareholders, they are termed bonus shares. Similarly, life insurance companies often distribute, out of accumulated surplus (see *LIFE INSURANCE*), bonus additions to the face value of policies. The rise of prices caused by the World War led to the wages of civil servants and others being increased by bonus payments calculated to cover the rise in the cost of living.

BONUS, EMPLOYEE, a phrase used especially in the United States, to designate an award in cash or its equivalent by an employer to an employee, for accomplishment other than that paid for by regular wages, such accomplishment being considered desirable and perhaps implied, though not required, by the contract of employment. It is usually intended as a stimulus but may also express a desire on the part of the employer to share with the employee the fruits of their joint enterprise. Related to bonus, but considered under other headings, are such activities as profit-sharing, stock ownership, prizes, savings plans, extra holidays, vacations with pay, free transportation, luncheons, suggestion systems and "cost of living" bonus; the latter, a device for making the wage scale flexible.

The use of the bonus as a means for stimulating employees to greater efforts received a marked impetus during the period of the World War when labour shortage made it imperative that maximum production per individual be obtained. Early schemes were simple in structure and took into account quantity of production with some provision for penalizing the worker for deficiency in quality of performance. Since then, bonus plans have increased in complexity, and various factors other than quantity and quality are considered. They have also been extended to cover other classes of workers than those employed on direct production. Bonus plans have been developed for practically all classes of employees including supervisory and executive staff.

As illustrative of variety in the application of the bonus idea in the United States the following examples are cited:—

Attendance bonus, usually a stipulated percentage of and paid in addition to regular salary for perfect attendance over a given period of time. Ten per cent of a week's salary for a month of perfect attendance is typical.

Annual or Christmas bonus, a type which has grown in favour rapidly where it has been difficult, if not impossible, to measure individual output, but where the company wished to express its appreciation for extra efforts put forth by all of its employees during a successful business year.

Economy or efficiency bonus, a type based on a predetermined schedule or comparative standard whereby employees are rewarded for increased economy in the use of material, reduction in operating costs, reduction in waste, elimination of errors, etc.

Group bonus, paid on the basis of the activities of the group as a whole and divided among the individuals according to some predetermined arrangement. This type of plan is frequently used to reward the so-called non-productive type of wage earner and often for distributing bonus payments to executives. It is distinguished from the annual bonus type in that it employs some measurable quantity as a basis and is paid more frequently than once a year.

Production or quality bonuses, a stipulated payment for a predetermined volume of production or maintenance of quality standard or both. This is perhaps the earliest known type of plan and the one most readily applied because of its direct relationship to measurable accomplishment.

Length of service bonus, usually given as a mark of appreciation for continuity of service where it is undesirable to further increase the wage scale.

Safety bonus, used to focus attention upon the accident-reduction problem. Usually a group type of bonus.

Sales bonus, used as an additional stimulus beyond that provided by commissions or to reward those connected with sales though not in the commission class.

There has been an increasing interest in the development of bonus plans for executives and those in supervisory positions. This type of bonus is usually paid annually when a lump sum is divided among the executives in accordance with some predetermined plan. This usually takes into account one or more measurable factors having to do with the successful conduct of the business. Experiments are in progress with rating scales as bases for bonus apportionment among executives.

The devising and application of bonus plans presents many problems and difficulties. The bonus must be large enough to be attractive and to give a sense of adequate reward. The requirements for earning the bonus must be such as to be beyond question as to fairness and once established, must not be needlessly altered. This is particularly true with respect to increasing the requirements for earning the bonus. Necessary adjustments must be made with great care and explained to the employees. It has also been found wise to maintain the identity of the bonus as distinguished from regular wages; otherwise it loses its incentive power. Most bonuses are paid separately on this account. It is also necessary that all employees who can reasonably claim to have the right to partake in a bonus plan, be included. See *WAGE SYSTEMS IN INDUSTRY*. (O. G. S.)

BONZE, the European name for the members of the Buddhist religious orders of Japan and China. The word is loosely used of all the Buddhist priests in those and the neighbouring countries. (Port. *bonze* from Chinese *bon-tze*.)

BOOKBINDER, the workman in a printing house or bindery by whom the printed sheets as they come from the press are folded, stitched or sewed together, covered and made up into their final form as books or pamphlets.

Although originally a handicraft, practically all bookbinding operations to-day are performed by machine. The exceptions are blank book work, repairing damaged books and very small editions of *de luxe* works. In such cases the work is performed by craftsmen commonly known in the trade as "hand binders," who are perhaps the most skilled workmen in the whole printing and publishing industry. In the manufacture of a book by hand, the binder receives the sheets folded either by hand or machine. He assembles the sections into complete books and sews them together, using a sewing frame in which the sections are securely held and yet accessible. After being sewn, the books are placed in a vise and given a rounded back with a hammer. Meanwhile, the operation of case making—making the stiff or flexible cover of the book—has been going on. These are built up of board covered with cloth or leather. The ornamentation of the cover with the title of the work, and decoration of gold leaf applied with small heated tools and dies is also part of the binder's work. Having completed the case the binder then "cases in"—makes fast the sewed sections in the cover, either by gluing down the tapes to which the book is sewed, which is customary in heavy or expensive books, or by pasting the end sheets of the first and last sections. Some of the other operations in the finishing of a book are head banding, marbling, edge guiding and edging. The above includes only the barest outlines of the binder's work. There are dozens of styles of binding such as full, half, quarter, check, flexible and hard, each of which has its own peculiar technique. In modern bookbinding, whether pamphlet or edition, all the above operations are performed by machinery and the average "bookbinder" knows little of hand work. He sets and operates folding, gathering, sewing, stitching, case making and covering machines, trimming and gold stamping machines, and is in fact a highly skilled machine operator. Hand work, such as tipping and feeding machines, hand-gathering and padding, is largely unskilled and is performed by low-paid bindery girls. (R. T. W.)

BOOKBINDING, the art of fastening sheets of paper (vellum, cloth, papyrus, etc.), together to make into portable form a written or printed treatise.

HISTORY

Bookbinding began in the Christian era with the change from the continuous roll or volume to the book made up of sepa-

THE GOSPELS OF CHARLEMAGNE

This German binding, of the late 10th or early 11th century, is made of beechwood overlaid with gold. Around the centre figure of Christ enthroned are three borders, each set with precious stones, the outer one being further enriched with rectangles of cloisonné enamels. The specimen is characteristic of the precious bindings put on valuable religious books during the early and middle ages, and is one of the few examples extant.

EXAMPLES OF MODERN BOOKBINDING

- 1, 2, 3 and 4. Modern German bindings
5. Vellum binding with hand gilding
6. Half-vellum binding with hand painted paper

7. Half-vellum binding with blind lettering and vellum paste-down
8. Binding in green Levant morocco, with gold tooling
9. White pigskin binding with blind and gold tooling, a Vale Press book

rate sheets. Early books are composed of single sheets—of vellum at first, of paper later—folded once and collected into gatherings or quires of convenient size. The leaves were held together in the quire by sewing through the central fold; the quires were held together in proper order by sewing them on to flexible bands at right angles to the backs. Later books only differ in that the quire is usually a large single sheet folded several times so that the outer folds require cutting before the book can be read.

Origin of Bookbinding.—To keep the leaves flat and uninjured, early books, which were large, were placed between thin wooden boards. Soon it was found as convenient as it was simple to join book and boards together, by fixing to the boards the ends of the bands holding together the quires. By the time a leather covering had been added to hide and protect the back of the quires, overlapping or completely covering the boards, all the elements of the modern book, half-bound or fully bound, had been evolved. A greater variety of materials is now used, but the principle of construction remains the same.

Early Decoration.—The covers of the bound book lent themselves readily to ornamentation and decoration. Already in the letters of St. Jerome reference is made to jewelled bindings, so that books were being sumptuously ornamented by the 4th century of the Christian era. Costly bindings were often destroyed for their valuable materials; but examples survive, mostly in churches and museums, of books covered or decorated with precious metals, enamels, jewels or carved ivory panels. The earliest is the 7th century Gospels of Theolinda at Monza in Northern Italy. Famous examples are the so-called Gospels of Charlemagne (Plate I.) in the Victoria and Albert Museum, London, and the Lindau Gospels in the J. Pierpont Morgan collection, New York. Others exist in libraries such as the British Museum and the Bibliothèque Nationale.

These precious bindings are, and always were, unusual; they are mostly found on devotional books intended for royal personages or for the service of the church. The ordinary book, covered wholly or partly with leather over boards, was decorated with patterns of lines or stamps, or both. The earliest surviving decorated leather binding on a book, belonging to the same period as the earliest known precious binding, is on St. Cuthbert's Gospel-book (Plate III, fig. 1), taken from his coffin when it was transferred to the new Durham cathedral in 1104, and now preserved at Stonyhurst college. This is ornamented with *repoussé* and painted line-work, and stands quite by itself. The other early decorated bindings are impressed with small stamps in blind (*i.e.*, ungilt) in more or less elaborate patterns, and, apart from isolated examples, date from the century in which St. Cuthbert's Gospel-book was found. Fine examples of these bindings were made during that century at Winchester (Pl. III, fig. 2) and Durham, and later, at Oxford, Cambridge and London. Such bindings with small stamps, supplemented at the very end of the period by roll stamps, were the prevailing fashion in all the European countries (Pl. II.), cut leather bindings also were produced by incising a pattern in the leather, the outline being sometimes emphasized by stippling the background.

With the introduction of printing into Europe about the middle of the 15th century the number of books produced suddenly increased enormously, involving a corresponding increase in the number of people employed in binding. The making and binding of books was transferred from the monasteries to the houses of printers and binders, and soon the names, initials or devices of printers or binders are found stamped on book-covers. Advances were made in the art of binding, styles of decoration developed and as books circulated freely, were copied in other countries.

Famous Styles.—About a quarter of a century after the invention of printing, the greatest advance was made in artistic bookbinding in Europe by the introduction, probably through Venice, of gold-tooling from the East, where it had been practised much earlier. The art quickly developed in Italy, and spread to other countries. The celebrated Venetian printer, Aldus Manutius, was the first to give his name to a style in this new art; but in general, the early styles are called not after their

producers, who are unknown, but after famous collectors, or reputed collectors. "Canevari" bindings, which have in the centre a cameo stamp of Apollo driving a chariot, were so-called after their supposed collector Demetrio Canevari, physician to Pope Urban VIII. Their real collector has recently been shown to have been Pier Luigi Farnese, son of the succeeding Pope, Paul III. Many of the finest Italian and French bindings were made for Jean Grolier, viscount d'Aguisy, treasurer of France in 1545, and bear upon them the legend *Portio mea domine sit in terra viventium* and *Io. Grolierii et Amicorum* (Pl. III., fig. 4). Although not uniform in origin or appearance, these are known as Grolier or Grolieresque bindings. "Maioli" bindings are named after Thomas Maiolus, another famous collector of the period, who used similar inscriptions to Grolier's. Until quite recently he was considered to be an Italian, Tommaso Maioli, but he is now claimed to be a Frenchman, Thomas Mahieu, and identified with the secretary of Catherine de'Medici.

Italian gold-tooled bindings were imitated in other countries. In England, Thomas Berthelet, printer and binder to Henry VIII., was amongst the first to produce gold-tooled bindings "in the Venetian manner," while Thomas Wotton, as a collector, is an English counterpart to Grolier. In Germany, on the other hand, blind stamping, especially with panels on pigskin, continued in general use. In Italy itself fine bindings long continued to be made for great patrons like popes and cardinals, but recent investigations suggest that the supremacy in binding was passing to France earlier than is generally supposed. Grolier and Maioli bindings were produced in France under those patrons of the arts, Francis I. and Henry II. The royal printer and binder for the former, Geoffrey Tory, who also worked for Grolier, designed a decoration for bindings made for his books (Pl. III fig. 5) which includes his device of the *pot cassé*. Fine bindings were made for Henry II., for his queen, Catherine de'Medici, and for his mistress, Diane de Poitiers, and from this time onwards French binders and families of binders have excelled in technical skill and initiative. Later royal binders, Nicholas and Clovis Eve, developed "fanfare" binding (Pl. III., fig. 6) usually associated with their name: "Le Gascon" in the early 17th century developed the *pointille* style, where the dotted line replaces the right line; and the Padeloup and Derome families of the late 17th and the 18th century developed the *dentelle* binding, so called from their lace-work borders.

In England, after Berthelet's time, fine bindings were made for royal and noble patrons, and usually decorated with their arms or badges. Meantime velvet and embroidered bindings, common to most countries, increased in vogue and became especially popular during the Stuart period. In gold-tooled leather bindings a characteristic native style was not evolved until the late 17th century, when Samuel Mearne, royal binder to Charles II., devised the "cottage" design, so-called from its walls and its roof appearance. Along with the richly decorated binding of Mearne and his followers, the characteristic blind-tooled black leather binding, with dark, instead of gilt edges, became fashionable for religious books in England, for some half a century. English binding deteriorated during the 18th century, but it was redeemed towards the end of the century by a brilliant and original artist, Roger Payne, who with his fine small tools and original designs, with their proper appreciation of blank spaces, is the most inspiring of the English book binders. During his time John Edwards of Halifax worked on different lines; he was famous for his transparent vellum bindings covering delicate paintings, and, with John Whitaker, for "Etruscan" bindings, so called from their classical borders and other ornamentations that were carried out in the classical tradition.

Modern Work.—The 19th century witnessed the development of decoration by machinery, whole covers being impressed in blind or gold by means of metal dies, a practice which was greatly extended with the introduction of machine-made cloth bindings. But these developments hardly affected high-class bindings. In France, from the beginning of the century onwards, binding and decoration have been more remarkable than ever for their technical perfection, at the hands of a long line of artists. Bozérian

Thouvenin, Bauzonnet, Trautz, Lortic, Niedrée, Duru, Capé, Chambolle, Cuzin, Michel and others.

In England the most original binder of last century was Charles Lewis (Thomas Grenville's binder), while others followed traditional styles, sometimes rather mechanically, notably Kalthoeber, Staggemeier, Walther, Hering, Bedford and the existing firms of Rivière and Zaehnsdorf. But towards the end of the century an artistic revival took place, inspired by William Morris, who was responsible for the modern revival in printing. The practical founder of the modern school was T. J. Cobden-Sanderson, who established the Doves Press and bindery; a series of his fine bindings is in the British Museum. His most successful pupil is Douglas Cockerell, whose increasing output, revealing originality, combined with a sense of the craft's historic background, confirms his position as the head of the bookbinders of to-day. Mention may also be made of Charles Ricketts, especially for his work on the Vale Press books (Plate IV., fig. 9) and of a recent convert to the decoration of bindings, Glyn W. Philpot, R.A. A number of women bookbinders, Miss Adams (Mrs. Webb), Miss E. M. MacColl, Miss Sarah Prideaux, Miss Sybil Pye, Miss Mary Robinson and others, have helped to increase the prestige of the modern English school, which has influenced the course of artistic binding on the Continent and in the United States. In France and Germany, and to a lesser extent elsewhere, besides work on sounder lines (see Plate IV.), there is an increasing output of bindings which exceeds the true limits of book decoration, partly under the influence of modernist tendencies in other branches of art. (See BOOK; BOOKS, MODERN AMERICAN; BOOKS, MODERN ENGLISH.)

THEORY AND PRACTICE

A book is said to be bound when the sewing cords or tapes are firmly attached to the boards independently of the covering material; books are said to be cased when the cover or case is made apart from the book. In English-speaking countries most books of any importance are issued cased in cloth and a very small percentage of these books are rebound. On the European continent where books are generally issued in paper wrappers binding for private customers is much more usual. While machinery of great complexity has been invented to cope with the casing of the immensely increased output of books resulting from the introduction of paper-making and printing machinery, hand binding is still done by methods and with simple appliances that have changed but little during 400 years.

Classes of Bookbinding.—The letterpress bookbinding trade is now divided into two main branches: publishers' or printers' binders who deal by machinery with the casing of large numbers of identical volumes; miscellaneous binders who deal with the binding of individual books with comparatively little help from machinery. The library binders who rebind books for the public and other libraries occupy a position between the two, while account-book or stationery binders form a trade apart, using rather different and generally sounder methods than those used by the letterpress binders.

The miscellaneous binder is called upon to deal with many classes of books; books of value that require careful repair and strong protective covers; memorial and ceremonial books that may have highly decorated bindings; books for hard use that have to be bound strongly and cheaply; books that merely need to be held together tidily for occasional reference; memorandum and ms. books; diaries; etc.

For fine binding good leather is the best and most usual covering material as it has the quality of being readily moulded to the shape of the book while wet and by its toughness and flexibility it strengthens the back without impeding the opening of the book.

Tools Used.—The chief tools of the hand binder are (1) the sewing frame (see fig. 1) on which the folded sections of a book are sewn to upright cords or tapes, (2) the lying or cutting press (see fig. 2) used for backing and cutting books, (3) the standing

FIG. 1.—SEWING FRAME, SHOWING THE FOLDED SECTIONS OF A BOOK READY TO BE SEWN TO THE VERTICAL CORDS OR TAPES

press used for pressing books during the process of binding. For the lettering and decoration of the covers brass stamps set in wooden handles are used. These are engraved with a letter or decorative device and are pressed on to the prepared leather when hot. Stamps too large to be struck by hand are called

FIG. 2.—LYING OR CUTTING PRESS. IN WHICH THE BACK OF A BOOK IS CUT AND GROOVES ARE MADE ON EACH SIDE OF THE ROUNDED BACK

blocks and are impressed with the aid of a press with a heated platten called a blocking press. When there are several books of one title to be lettered brass type is sometimes set up in a holder and a line impressed by one operation. Long straight lines are made with a wheel called a file; a wider wheel called a roll, with

PROCESSES INVOLVED IN MODERN BOOK-MAKING

1. A workman burnishing gold on the edges of books with a flat burnisher, a process which is still performed by hand
2. A Seybold three-knife drum type continuous trimmer, used for trimming the edges of books
3. A three-knife continuous trimmer which cuts the top, front and foot edges of a pile of books in one operation
4. The round-cornering machine rounding the corners of a number of pamphlets or books
5. A rough-edging machine, in which a rotating studded plate roughens the edges of the sewn book
6. A Seybold book-compressor pressing the leaves of books in preparation for the stitching machine

BY COURTESY OF THE KINGSPORT PRESS

OPERATIONS IN MODERN BOOK-MAKING

1. Laying gold on the book edges, a process requiring considerable skill
2. Spattering colours on book covers, edges and ends with a brush
3. Dipping books into coloured inks by hand to marble the tops and ends
4. Applying glue to the backs of books after the stitching, trimming and smashing are completed
5. A Crowley rounder and backer, which rounds the back of the sewn book
6. The Bentler backliner, the perfect binder type for magazines, used in book plants for attaching muslin backbone linings
7. A Smythe casing-in machine, which fastens the books into covers
8. A board cutter and Stolp-Gore automatic feeder in operation

a pattern engraved on the edge, enables endless bands of ornament to be impressed easily and rapidly.

Leather bindings may be decorated by the impressions of the heated tools directly on the leather, leaving a "blind" impression, or after the leather has been prepared the tools may be struck through gold leaf, leaving the impression in gold. Gold tooling is the commonest and most characteristic method of ornamenting bindings and may be used by itself or in conjunction with blind tooling or with inlays of various-coloured leathers.

Gold-tooled patterns are designed by arranging the impressions of the tools in some orderly manner. The tools may consist of

FIG 4.—ON THE RIGHT, ARE THE ELEMENTARY TOOLS WHICH ARE USED TO FORM THE DESIGN ON THE LEFT

more or less complete designs in themselves (see fig. 3) or may consist of single leaves, flowers, dots, etc. Generally speaking, the more elementary the actual tools, the greater the freedom of the designer. Fig. 4 shows how a design may be formed by the use of elementary tools.

Construction.—The "spine" of a well-bound book should "throw up" when the book is opened, that is to say, the spine convex when the book is closed should become concave when it is open. The leather, if its full qualities are to be utilized, should be attached directly to the back of the sections. This results in a certain creasing of the leather when the book is opened, and this is sometimes objected to as it may injure the gold tooling. This difficulty is got over by lining up the spine so that it cannot alter its shape, but the result is that the book cannot open freely. An alternative is to make what is known as a hollow back, which allows the actual back to throw up independently of the leather. This method throws a great strain on the leather at the joints and in every large library many leather-bound books will be found with the "hollow" breaking away. In cloth-bound books a hollow back is necessary because the cloth cannot be moulded to the shape of the back.

The raised bands on the back of a book are caused by the cords on which the book is sewn. If raised bands are shown on a hollow-backed binding they are false and have nothing to do with the construction.

Materials for Bindings.—Where a whole leather binding is too costly, a saving can be made by binding in half-leather. In a half-binding the back and corners only are covered by the leather and the sides are covered by cloth or paper. Library binders make very strong bindings by sewing books on tapes and securing the ends of these between "split" boards. The spines may be covered with leather that can be left fairly thick if a small interval is left between the boards and the joint so that the bend of the leather is not confined to a single line. Where leather is too expensive, books may be bound in a woven material. The best book cloths are known as buckrams, but any cloth with

a strong woven basis will serve. The cheaper cloths used largely by publishers' binders consist of little but a weak muslin filled in with dressing and these have little strength.

Bookbinding leather is not now always a reliable material. The Royal Society of Arts appointed a committee to investigate the causes of the premature decay of bookbinding leather and a valuable report was issued. The chief cause of decay was found to be the use of sulphuric acid in the dye bath, and certain leather manufacturers now supply leather that they guarantee to be free from injurious acid. Some, but not all, of these guaranteed leathers have proved to be satisfactory for as long as they have been tested. On the whole, sumach tanned goat-skin (known as morocco) has been found to be the most generally satisfactory leather for binding books, although the skins of many other animals if properly prepared may be employed for this purpose. (D. Coc.)

MACHINE BOOKBINDING

Bookbinding by machine methods has been greatly improved in the past decade. Automatic machines have made possible mass production and eliminated much of the hand work heretofore necessary. Machine production is divided into two classes, edition or hard bound products and pamphlet or paper bound publications.

Pamphlet Binding.—In the field of pamphlet production the introduction of web and rotary type printing presses, with folding equipment as part of the press, have eliminated the separate operation of folding such printed sheets. Automatic inserting machines introduce separate leaves or sections and the automatic assembling, wire-stitching and covering machine units complete the operation of pamphlet binding to the point of trimming the edges and packaging for shipment. Several types of machines, combining these operations, are in use and a method known as "perfect binding" is sometimes employed where the side or saddle-stitch type of wiring does not please. Perfect binding is effected in a machine which accepts the complete book in sections, clamps and cuts off the back or folded edge of the sections, glues, affixes crash and in turn glues on a paper cover, completing the book for trimming.

Trimming, or cutting the edges, has been improved by the introduction of rapid three-knife machines which cut the top, front and foot edges of a large pile of books or magazines at one operation. Packaging or wrapping for mailing is accomplished by automatic machines, often in conjunction with addressing equipment synchronized with the wrapping device.

Edition Binding.—Edition binding still included, in 1928, folding printed sheets in machines automatically fed from a pile, one sheet at a time, and delivering one or more sections, or signatures, of 16, 32 or 64 pages each, up to as many as eight 16's or four 32's, at each revolution. Bundling of signatures after folding has been improved by the introduction of compressed air bundlers, in place of the former hand and electrically driven types. The pasting in of illustration leaves and affixing to the first and last sections of each book of the fly-leaves and cover-lining sheets is accomplished by Marresford tipping machines. No machine has yet been developed to paste satisfactorily insert-leaves inside a folded section. End papers may also be affixed to books by attachments built on assembling machines, but as yet few of these equipments have been introduced into binderies. Reinforcing maps, folded sections and the end sections of books is accomplished by Brackett stripping machines, which work equally as well with muslin, twill or paper. Other machines performing similar operations are the Marsh end paper, the Marsh twill school book end paper and the Eldredge end paper machines. Gathering or assembling of the separate signatures into book sequence is almost entirely performed by machines, among which are the Sheridan, Jeungst and Plimpton. These machines consist of ten or more pockets or metal bins in which quantities of each signature are placed in consecutive order, and by the operation of the machine one drawn from the bottom of each pocket, dropped on a travelling conveyor and with one circuit of the machine a gathered book emerges. These machines are often synchronized with perfect binders, stitchers, pamphlet coverers and have end paper affixing

FIG 3.—A GOLD-TOOLED DESIGN, COMPLETE IN ITSELF, USED TO IMPRESS ORNAMENTAL PATTERNS ON BOOKBINDINGS

and smashing units. Smashing and nipping operations have been improved by the introduction of the Sheridan belt conveyor smashers and the Seybold compressor. These machines reduce the books to uniform bulk, eliminate printing impression, and the compressor reduces the swell caused by thread used in sewing.

Sewing machines have been improved in speed and uniformity. It is possible to sew not only on tapes but, by affixing the cotton or twill tapes, to the book proper by stitches passing through the tape. The Smyth curved needle and the National straight needle machines are frequently used in American production. The Staubli Swiss machine, with straight needles, automatic gauging and pasting devices, with straight arm feeding and tape sewing attachments, is a noticeable improvement in machine method. The oversewing machine, for extra strong and library bindings, and the Leonard wire sewing machine, for particular problems, are new developments. A new type of thread binding machine has just been offered which cuts diagonal slots transversely across the back of the gathered book and in the slots automatically places, cuts off and glues in strong threads, tipping the thread ends down on the front and back leaves of the book. This is designed as an improvement over ordinary perfect binding, which has been attempted on edition book work with some success on low cost production. School-books are often side stitched with thread through and through, the book and end papers having twill reinforcements. The Morrison stitcher, which first drills holes half way through the book, and with synchronized stitching attachment forces the needles through the prepared holes, has made possible stitching of books up to one inch in thickness, where five-eighths of an inch was considered the maximum before. Book trimming machines, as in magazine trimming, have been improved in speed, accuracy and capacity. The Smyth continuous trimmer, three-knife type, in which the knives cut against the next book instead of against a base-board, and the Seybold three-knife drum type continuous trimmer have to a large extent superseded the former duplex two-knife and the single knife trimmers for book work.

In edging, the application of gold is still made by the old process of scraping, filling, sizing, laying on leaf in sheets and burnishing. Edge colouring, formerly done by sponge or brush, is now largely accomplished by air gun; sprinkling likewise. Marbling materials have been improved, but the method of spattering colours on a vat and dipping books while held under pressure is still followed. Simulating deckle edges has been improved by the introduction of a steel studded disc, revolving at high speed, against which the front and foot edges of books are held by pressure until the edge is roughened in an even manner. Shaping the back, whereby the concave front and the rounded back edge is obtained, and the joint set, against which the cover will hinge, is accomplished by the Crawley machine. The Pleger gluing-off machine is accepted in many plants as a substitute for hand gluing-off the backs of books before backing. Murray, of London, has developed a new roller type machine backer and an automatic feed for sewing machines, which are not yet introduced in America nor on a large scale abroad. Thumb cut indexing is largely a hand operation, with the improvement in the aperture cutting tools using air pressure to operate instead of hands. In backlining and headbanding, which includes the application of glue, crash, glue and paper to the back and the small ornamental woven headbands, machines are now in vogue which eliminate practically all hand work. These machines include the Blauvelt, Sheridan, Beutler and Brock types; the latter two being exclusively used in plants where they were developed by individuals. The Blauvelt and Brock machines are the only ones which affix headbands as well as linings. Casing-in, or affixing the book in the cover, is entirely accomplished, where the book must be glued tightly into the cover at the back, by hand, and on much of the flexible and limp type of leather and artificial leather bindings. All ordinary productions and many unusual types are affixed in cover by Smyth or Sheridan automatic casing-in machines which, accepting the book placed on a revolving arm by the operator, paste off the end papers well into the joints and affix the cover, fed simultaneously from a magazine, delivering the book on the arm of the

machine to the inspector ready for building into presses between wooden boards having brass, aluminium or other metal edging, which set the cover and form the valley along the back of the book, which gives a hinge to the cover. Screw type compression presses are being replaced with types of compressed air power pressers.

Stock cutting methods have been improved by the Cameron slitting machine, which slits to any desired width and re-rolls paper, cloth, artificial leather or crash in rolls of suitable size for cover making, backlining and wrapping machines. The Smyth cloth cutter slits and cuts off full width rolls of book cloth or artificial leather into single cover size for other types of cover making machines. Board cutting has been simplified by the introduction of the Stolp-Gore automatic feeder for rotary board cutters, which feeds board strips (after the large sheet has been stripped) at triple the hand feeding speed. Machine cover making has been developed by improvements on the Sheridan casemakers which, feeding the cloth from the roll, glue-off the back of the cloth, affix the boards and backlining, cut the cover material to size, shear off the corners and turn in the complete cover at the rate of 1,800 to 2,000 an hour. The Smyth casemaker, formerly hand fed, is now equipped with an automatic feeder, which makes possible a production nearly equal to the Sheridan. New devices on the Smyth machine also make possible the production of leather and artificial leather covers, some types of round corner covers and a large variety of flexible (thin board) and parti type covers. Hand casemaking is more rapid by the use of the Booth, U.S. Shoe Machinery Company and Anthony type machines. The use of gluing machines either with or without belt conveyors to carry the glue materials to operators has superseded hand gluing methods and also for gluing or pasting off labels, inlays and other mountings. Cover stamping or blocking has had more attention than the majority of machine binding operations. Automatic feeders have been developed by Miller and Kluge for feeding book covers from magazines into Chandler and Price and other presses. The use of electrically heated plates as a base for affixing dies in presses has simplified the blinding or blanking out of pattern cloths before inking, thus perfecting register. The introduction of the Peerless, American roll gold and brighten roll leaf attachments for upright two and four rod Sheridan and Standard Machinery Company presses have eliminated to a very large extent the hand laying and slow stamping with gold leaf, metal leaves and ink foils. The two-way attachment by Peerless is the latest development in equipment of this type. Hand laid gold is still employed on many fine quality productions, especially where deep grain goat-skin and cowhide is used for cover material. The use of airbrush methods for sizing covers and particularly in effecting superfinish results, by which variegated colour combinations, grainings, panelings, embossing and several tone treatments are produced, has reached a high point of development. Superfinishing, originated by Utley and developed on book cover work by Molloy, has now become an accepted form of cover decoration in all large binderies. Automatic feeding devices have been installed on Standard machinery upright presses to cope with automatic fed inkers. Book inspection and jacketing continues to be done by hand, but individual wrapping and packaging is now accomplished by machine.

BOOKCASE, a piece of furniture, forming a shelved receptacle for the storage of books.

Books written by hand were kept in small coffers which the great carried about with them on their journeys. As manuscript volumes accumulated in the religious houses or in regal palaces they were stored upon shelves or in cupboards, and it is from these cupboards that the bookcase of to-day directly descends. At a somewhat later date the doors were discarded, and the evolution of the bookcase made one step forward. Even then, however, the volumes were not arranged in the modern fashion. They were either stacked in piles upon their sides or placed upright with their

16TH CENTURY BOOKSTANDS IN THE BIBLIOTECA MEDICEO-LAURENZIANA, FLORENCE

These stands of carved walnut are characteristic of the book receptacles in use before the introduction of bookcases. They allowed for the storage of very few volumes, and the rapid and cheap output of printed books which followed shortly in the 17th century made them impracticable

VIEWS OF THE EAST AND WEST WINGS OF THE BODLEIAN LIBRARY, AT OXFORD, IN 1675

Upper view. The Bodley end of the library, erected 1610-12, containing the earliest examples of shelved galleries extant. The centre door leads into the Duke Humphrey library, founded 1444 and refurnished in 1599 with the oldest known bookcases in England

Lower view. The Selden end or west wing, 1634-40. Books under the galleries were placed with backs to the wall and until 1759 were guarded against theft by iron chains that were long enough to permit the books to be lifted from the shelves and placed on counters

backs to the wall and their edges outwards. The band of leather, vellum or parchment which closed the book was often used for the inscription of the title, which was thus on the fore-edge instead of on the back. It was not until the invention of printing had greatly cheapened books that it became the practice to write the title on the back and place the edges inwards. Early bookcases were usually of oak. (*See Book.*) The oldest bookcases in England are those in the Bodleian library at Oxford, which were placed in position in the last year or two of the 16th century; in that library are the earliest extant examples of shelved galleries over the flat wall-cases. Long ranges of book-shelves are necessarily somewhat severe in appearance, and many attempts have been made by means of carved cornices and pilasters to give them a more graceful appearance—attempts which were never so successful as in the hands of the great English cabinet-makers of the second half of the 18th century.

Both Chippendale and Sheraton made or designed great numbers of bookcases, mostly glazed with little lozenges encased in fret-work frames often of great charm and elegance. The French cabinet-makers of the same period were also highly successful with small ornamental cases. Mahogany, rose-wood, satin-wood and even choicer exotic timbers were used; they were often inlaid with marqueterie and mounted with chased and gilded bronze. Dwarf bookcases were frequently finished with a slab of choice marble at the top. In the great public libraries of the 20th century the bookcases are often of iron, as in the British Museum where the shelves are covered with cowhide, of steel, as in the library of Congress at Washington, or of slate, as in the Fitzwilliam library at Cambridge.

BOOK-COLLECTING, the bringing together of books which in their contents, their form or the history of the individual copy possess some element of permanent interest, and either actually or prospectively are rare, in the sense of being difficult to procure. This qualification of rarity, which figures much too largely in the popular view of book-collecting, is entirely subordinate to that of interest, for the rarity of a book devoid of interest is a matter of no concern. On the other hand so long as a book (or anything else) is and appears likely to continue to be easily procurable at any moment, no one has any reason for collecting it. The anticipation that it will always be easily procurable is often unfounded; but so long as the anticipation exists it restrains collecting, with the result that Horn books are much rarer than First Folio Shakespeares. Of the books which any one generation of readers acquires the great majority are dead before their own owners. But from out of this seemingly dead stock, preserved at haphazard, critics and antiquaries and librarians gradually pick out at auctions or from dealers' stocks books which they find to be still alive and possessing an interest which cannot be reproduced in its entirety by any mere reprint. At first this salvage is rescued at haphazard, but in the modern private collection, as in the modern museum, the first requisite is the steady pursuit of a central idea. Neither the collector nor the curator can be content to keep a mere curiosity shop. It is the collector's business to illustrate his central idea by his choice of examples and by the care with which he examines and describes them. It is mainly by the zeal of private collectors that books which otherwise would have perished from neglect are discovered, preserved and made to yield up their secrets, with the result that almost every great library owes more, on its historical side, to their generosity than to the purchases made from its own resources.

Although adumbrations of it existed under the Roman empire and towards the end of the middle ages, book-collecting, as it is now understood, is essentially of modern growth. Even when the invention of printing had reduced the cost of books by some 80%, book-collectors did not immediately appear. There is a natural temptation to imagine that the early book-owners, whose libraries have enriched modern collectors with some of their best-known treasures, must necessarily have been collectors themselves. This is far from being the case. In England Archbishop Cranmer, Lords Arundel and Lumley, and Henry, prince of Wales (1594-1612); in France Jean Grolier (1479-1565), who bought largely in Italy, and the famous historian Jacques Auguste de

Thou (1553-1617), brought together the best books of their day in all departments of learned literature, put them into handsome leather jackets, and enriched them with their coats of arms, heraldic badges or other marks of possession. But they brought their books together for use and study, to be read by themselves and by the scholars who frequented their houses, and no evidence has been produced that they appreciated what a collector might now call the points of a book other than its fine condition and literary or informational merits. Collecting, as distinct from the formation of working libraries, may perhaps be said to have begun in England at the time of the antiquarian reaction produced by the book massacres when the monasteries were dissolved by Henry VIII., and the university and college libraries and the parish service books were plundered and stripped by the commissioners of Edward VI. To rescue good books from perishing is one of the main objects of book-collecting, and when Archbishop Parker and Sir Robert Cotton set to work to gather what they could of the scattered records of English statecraft and literature, and of the decorative art bestowed so lavishly on the books of public and private devotion, they were book-collectors in a sense and on a scale to which few of their modern imitators can pretend. Men of more slender purses, and armed with none of Archbishop Parker's special powers, worked according to their ability on similar lines. Humphrey Dyson, an Elizabethan notary, who collected contemporary proclamations and books from the early English presses, and George Thomason (d. 1666), the bookseller who bought, stored and catalogued all the pamphlet literature of the Civil War, were mindful of the future historians of the days in which they lived. By the end of the 17th century book-collecting was in full swing all over Europe, and much of its apparatus had come into existence. In 1676 book auctions were introduced into England from Holland, and soon we can trace in priced catalogues the beginning of a taste for Caxtons, and the books prized by collectors slowly fought their way up from amid the heavy volumes of theology by which they were at first overwhelmed.

Early Book-buyers.—Almost all the large book-buyers of the 16th, 17th and 18th centuries bought with a public object, or were rewarded for their zeal by their treasures being thought worthy of a public resting-place. Sir Thomas Smith (d. 1577) bequeathed his books to Queen's college, Cambridge; Archbishop Parker's were left under severe restrictions to Corpus Christi college in the same university; Sir Thomas Bodley refounded during his lifetime the university library at Oxford, to which also Laud gave liberally and Selden bequeathed his books. The library of Archbishop Williams went to St. John's college, Cambridge; that of Archbishop Usher was bought for Trinity college, Dublin. The mathematical and scientific books of Thomas Howard, earl of Norfolk (d. 1646), were given by his grandson to the Royal Society; the heraldic collections of Ralph Sheldon (d. 1684) to Herald's college; the library in which Pepys took so much pleasure to Magdalen college, Cambridge. Bishop Moore's books, including a little volume of Caxton quartos, almost all unique, were bought by George I. and presented to the university library at Cambridge. Archbishop Marsh, who had previously bought Stillington's printed books (his manuscripts went to Oxford), founded a library at Dublin. The immense accumulations of Thomas Rawlinson (d. 1725) provided materials for a series of auctions, and Harley's printed books were sold to Osbourne the bookseller. But the trend was all towards public ownership. While Richard Rawlinson (d. 1755) allowed his brother's books to be sold, the best of his own were bequeathed to Oxford, and the Harleian mss. were offered to the nation at a sum far below their value. A similar offer of the great collections formed by Sir Hans Sloane, including some 50,000 printed books, together with the need for taking better care of what remained of the Cotton manuscripts, vested in trustees for public use in 1702 and partially destroyed by fire in 1731, led to the foundation of the British Museum in 1753, and this on its opening in 1757 was almost immediately enriched by George II.'s gift of the old royal library, formed by the kings and queens of England from Henry VII. to Charles II., and by Henry, prince of Wales, son of James I., who had bought the

books belonging to Archbishop Cranmer and Lords Arundel and Lumley.

When George III. came to the throne he found himself bookless, and the magnificent library of over 80,000 books and pamphlets and 440 manuscripts which he accumulated shows on a large scale the catholic and literary spirit of the book-lovers of his day. As befitted the library of an English king it was rich in English classics as well as in those of Greece and Rome, and the typographical first-fruits of Mainz, Rome and Venice were balanced by numerous works from the first presses of Westminster, London and Oxford. This noble library passed in 1823 to the British Museum, which had already received the much smaller but carefully chosen collection of the Rev. C. M. Cracherode (d. 1799), and in 1846 was further enriched by the wonderful library formed by Thomas Grenville, who died in that year, aged 91. A few less wealthy men had kept up the old public-spirited tradition during George III.'s reign, Garrick bequeathing his fine collection of English plays to the British Museum, and the natural history books of Sir Joseph Banks also passing to it. Capell's Shakespearian treasures enriched Trinity college, Cambridge, and those of Malone went to the Bodleian library at Oxford, the formation of these special collections, in place of the large general library with a sprinkling of rarities, being in itself worth noting. But the noble book-buyers celebrated by the Rev. Thomas Frognall Dibdin in his numerous bibliographical works kept mainly on the old lines, though with aims less patriotic than their predecessors. The duke of Roxburghe's books were sold in 1812, and the excitement produced by the auction, more especially by the competition between Lord Spencer and the duke of Marlborough (at that time marquess of Blandford) for an edition of Boccaccio printed by Valdarfer at Venice in 1471, led to the formation of the Roxburghe club at a commemorative dinner. In 1819 the duke of Marlborough's books were sold, and the Boccaccio for which he had paid £2,260 went to Earl Spencer (d. 1834) for £750, to pass with the rest of his rare books to Mrs. Rylands in 1892, and by her gift to the John Rylands library at Manchester in 1899. The books of Sir M. M. Sykes were sold in 1824, those of J. B. Inglis in 1826 (after which he collected again) and those of George Hibbert in 1829. The 150,000 volumes brought together by Richard Heber at an expense of about £100,000 were disposed of by successive sales during the years 1834-37 and realized not much more than half their cost.

Great Collections.—The wonderful library of William Beckford (d. 1844), especially rich in fine bindings, bequeathed to his daughter, the duchess of Hamilton, was sold in 1882, with the Hamilton manuscripts, for the most part to the German Government. Their dispersal was preceded in 1881 by that of the Sunderland collection, already mentioned. The library of Brian Fairfax (d. 1749), which had passed to the earls of Jersey, was sold in 1885, that of Sir John Thorold (d. 1815) in 1884, his "Gutenberg" Bible fetching £3,900 and his Mainz Psalter £4,950. The great collection of manuscripts formed by Sir Thomas Phillipps (d. 1872) has furnished materials for numerous sales. The printed books of the earl of Ashburnham (d. 1878) kept the auctioneers busy in 1897 and 1898; his manuscripts were sold in sections to the British Government (the Stowe collection shared between the British Museum and Dublin), the German Government (part of the Libri and Barrois collection, all, save one ms. of 13th century German ballads, resold to France), the Italian Government (the rest of the Libri collection), Mr. Yates Thompson (the mss. known as the Appendix) and Mr. J. Pierpont Morgan (the Lindau Gospels). In the present century the Huth library formed by Henry Huth (1815-78) on very broad lines, and augmented by his son Alfred, was dispersed on the latter's death; after 50 books and manuscripts had been selected by the British Museum in accordance with his bequest, and a fine set of Shakespeare quartos sold privately, the collection realized £250,566. Large as was this total it was far surpassed by that fetched by the Britwell library, originally formed by William Henry Miller (1789-1848), of which the main strength lay in the number and rarity of its editions of early English and Scottish literature. After passing, with Britwell Court, to Samuel Christie-Miller (d. 1889)

this great collection was dispersed in the years 1916-27 in 13,707 lots for £612,145. In contrast with these vast collections the modern cabinet theory of book-collecting was first carried out with conspicuous skill by Henry Perkins (d. 1855), whose 865 fine manuscripts and specimens of early printing, when sold in 1870, realized nearly £26,000. Henri Béraldi, in his catalogue of his own collection (printed 1892), has described how in France a little band of book-loving amateurs grew up who in place of the miscellaneous library in which every class of book claimed to be represented, and which needed a special room or gallery to house it, aimed at small collections, more especially of the French illustrated books of the 18th century, which should epitomize the owner's tastes and require nothing bulkier than a neat bookcase or cabinet to hold them. On similar lines Frederick Locker (Locker-Lampson, 1821-95) formed in two small book cases a gathering of first editions of English imaginative literature (catalogue published in 1886) which by its compactness and unity won much admiration, more especially in the United States, where book-collecting was just becoming a popular pastime with wealthy men. The one great private collection of English imaginative writers of the last 300 years still held by an English collector is that of Thomas J. Wise. The catalogue of this in nine volumes was completed in 1928.

(A. W. P.)

UNITED STATES

The United States entered into the field of book-collecting more than two centuries after Sir Robert Bruce Cotton began to gather together his famous library in England, yet it is in America that, during the last 50 years, the most important collections of the world, apart from those already possessed by the great public institutions of England and the Continent, have become established.

Pioneer Collectors.—James Lenox (d. 1880) was a pioneer American book-collector when, in 1847, he brought to America for the first time an example of the Gutenberg Bible, for which he paid the then extravagant price of £500. Prior to 1860, Lenox and John Carter Brown (d. 1874) of Providence, R.I., greatly assisted in their quest by Henry Stevens, an American living in London and engaged in the rare book business, competed against each other in collecting in England volumes relating to the early history of the United States, incidentally picking up other treasures as well. Lenox, for instance, brought home one of the earliest first folios of Shakespeare which came to America; now there are considerably more Shakespearian first folios in America than in England. Of the second edition of *Hamlet* (the first to contain the true text) the three examples extant are to-day respectively in the Huntington library at San Gabriel, Calif., the library of the Elizabethan club of Yale university, New Haven, Conn., and the Henry C. Folger collection in Washington, D.C. Thomas Barton (d. 1866), whose volumes were bequeathed to the Boston public library, was an early collector of Shakespearian items.

The John Carter Brown library, at Providence, R.I., represents the only American bibliographical dynasty. The nucleus of this magnificent collection was begun by Nicholas Brown in the 18th century, added to by his son Nicholas (d. 1841), brought to its great importance in the next generation by John Carter Brown (d. 1874), increased and presented to Brown university in 1904 by his son, John Nicholas Brown (d. 1900), and is still receiving additions through the continuing interest of the present John Nicholas Brown. The Lenox books, including the Gutenberg Bible, are now a part of the New York public library.

Important Collections.—The great impetus to book-collecting in general and to American collecting in particular came when John Pierpont Morgan (d. 1913), the American financier, began to gather together the marvellous library which was later dedicated by his son to the use of the people of the city of New York. Henry E. Huntington (d. 1927), a railroad magnate, acquired, in addition to his Americana, incunabula, and general rarities, Shakespeariana which rival those of the British Museum, and as many English volumes printed prior to 1640 as are in the Bodleian library. At its founder's death, the Huntington col-

lection passed into the hands of the people, and it is now permanently housed in a magnificent library at San Gabriel, Calif. In view of the present competition for bibliographical treasures, and with so large a proportion of the priceless items permanently secured, it is not likely that such collections as those made by Morgan and Huntington can ever again be brought together.

Other noteworthy American collections are those made by Robert Hoe (d. 1909) of New York, which was sold in 1911-12 for nearly \$2,000,000; by Edward E. Ayer (d. 1927) of Chicago, who specialized in books relating to the American Indian, presented before his death to the Newberry library, Chicago; by William A. White (d. 1927), of Brooklyn, whose valuable Shakespearian volumes went to Harvard university at his death, and whose Elizabethans, the envy of book-lovers on both sides of the water, Harvard hopes to acquire by purchase; by Henry C. Folger of New York, specializing in Shakespeariana. Folger's collection is the finest library of Shakespeariana in America, comprising some 20,000 volumes, 42 of which are first folios. In 1928 he arranged for the permanent preservation of his library in a building specially erected for the purpose near the library of Congress in Washington, D.C. General Rush C. Hawkins (d. 1920) collected examples of the earliest presses of the 15th century, now preserved in the Annmary Brown library at Providence, R.I. Harry Elkins Widener (d. 1912), who lost his life in the "Titanic" tragedy, left his collection (including the most complete Stevensoniana in the world) to Harvard university, where it is now housed in the building of the Widener Memorial library.

Improved Outlook.—Only the names of the most noteworthy American collectors have been mentioned. Book-collecting as an art is in its infancy in America. New foundations with ample funds for the purchase of volumes demonstrate the fact that the American people fully realize that libraries are created by books rather than by buildings. Most significant is the army of more modest collectors who undertake the adventure without the financial ability to compete against wealthy enthusiasts, yet succeed in bringing together important libraries. The fact that the great American collections have been made by industrial leaders rather than by scholars is also worthy of attention. The history of book-collecting shows a surprising number of those who have amassed fortunes in industrial pursuits turning with no less zeal to the acquisition of literary treasures; and when these are once acquired, the final wish of their collectors is to place them in the hands of the people. The "despoiling" of the private libraries of England by American financiers, so much decried in England, has resulted in making the "spoils" far more available to the world than if the precious examples had remained in private collections. It is significant that Morgan always declined to bid against the British Museum for any book which obviously should become a part of that great and wonderfully stocked library.

Apart from the famous collections and collectors, American university libraries have reason to feel grateful for the generous additions they have received from private sources. This is especially true as regards those collectors who have devoted their attention to special subjects; e.g., Willard Fiske (d. 1904), who presented his extraordinary collections of Dante, Petrarch and Icelandic literature to the Cornell university library. No university library possesses an adequate endowment, and but for the constantly increasing bequests of individual bibliophiles, American students would be deprived of the opportunity to continue their researches in special fields. A surprising exception to this humanistic attitude of American collectors is their apparent failure to appreciate to the full the importance of the library of Congress. The opportunity thus overlooked of making this of greater national significance to students and scholars is now however, receiving belated attention.

The entry of American financiers into the book-market caused the continuous increase in the prices of books ever since collecting began to progress by leaps and bounds instead of at its earlier quiet though steady pace, so that within the last 40 years prices of first editions of famous English plays, poems and novels have

in many cases increased 40-fold, and some amazing records have been created, for example, that of £15,400, which was paid at Sotheby's in 1928 for the manuscript of "Lewis Carroll's" *Alice in Wonderland*.

Fields of Collecting.—Among American collectors Elizabethan and Pre-Elizabethan authors are always in demand and prices paid are in keeping. Among the 19th Century English authors collected Charles Dickens stands supreme, with Thomas Hardy seemingly on his way to a similar niche. Thackeray, Stevenson and Kipling never lack for admirers. Collectors specializing in American literature can, however, have their share of excitement, with Edgar Allen Poe, Mark Twain; Bret Harte and Walt Whitman standing well out in front. A new game, that of collecting first and limited editions of contemporary authors has acquired startling momentum in the United States. It appeals to the average book-lover who cannot afford the older rarities; and for those who intelligently pursue the hobby there is the added fascination of staking one's own judgment of literature against that of posterity.

Americana (the term includes books, pamphlets and broadsides relating to America) offers a field of special interest for American collectors. It is so large that collectors usually specialize, limiting their field chronologically, geographically or by subject matter. Thus we have collections on certain colonies, on the French and Indian Wars, on the Revolution and Civil Wars, on Indians, on certain states or sections, etc. There are even notable collections on the World War already existing, especially the Hoover collection at Leland Stanford University. A notable increase in the demand for books on the far West has brought this field into prominence in recent years, and the increase in interest in Latin America is also being felt in auction room prices. The Huntington library at San Gabriel, Calif., stands among the great Americana collections. The Bancroft library at San Francisco, the Munk library in Los Angeles, the Coe Collection in New York city are other notable private collections of Western Americana which are now being opened to the public, while the Clements library at Ann Arbor, Mich., and the Burton library at Detroit are already open to scholars.

There are collectors of items of the early American presses, items of Benjamin Franklin usually standing preeminent, and of later presses noted for the typographical excellence of their work. The principal exponent of fine book designing in America at present is Bruce Rogers (see F. Warde, *Bruce Rogers; Designer of Books*, 1926, which contains a check-list) whose books already command a high premium. There are other collectors with more eccentric hobbies which are however no less fascinating. Old books on cooking, navigation, bee-keeping, smoking, hunting, early textbooks, almanacs, guidebooks, time-tables—these and books in a hundred special categories are all in demand by someone and are easily disposed of.

BIBLIOGRAPHY.—The details can be studied in *Bookprices Current*, started by J. H. Slater in 1887, and *Book-Auction Records*, started by Frank Karslake in 1903, both since published annually with decennial indexes, and for the United States in *American Book Prices Current*, started by Luther Livingston in 1913 and also continued annually. The exploits of earlier gatherers are recorded in C and M. Elton, *The Great Book-Collectors* (1893), and W. Y. Fletcher, *English Book-Collectors* (1902), while the *List of Catalogues of English Book-Sales, 1676-1900*, now in the British Museum, printed by order of the trustees in 1915, facilitates research. A notable feature in the museum collection is the auctioneer's copies annotated with prices and purchasers' names from 1744 to the present century. Stories of the later American collections will be found in A. S. W. Rosenbach, *Books and Bidders* (1928), who succeeded G. D. Smith as the chief agent for American collectors at English book auctions. Many guides for would-be collectors have been written, among the best of which are John Hill Burton, *The Book Hunter* (1862); C. J. Davenport, *The History of the Book* (1908); A. E. Newton, *Amenities of Book-Collecting* (1918), and *This Book Collecting Game* (1928); I. A. Williams, *The Elements of Book Collecting* (1927); J. T. Winterich, *Collector's Choice* (1928), and *A Primer of Book Collecting* (1927); C. Davenport, *Byways Among English Books* (1927); C. J. Sawyer and F. J. Darton, *English Books 1475-1900; a Signpost for Collectors* (1927); *The American Collector* (edited by C. F. Heartman, 1925); *A Record of British and American Private Collectors* (pub. by *Bookman's Journal*, 1927); *Private Book Collectors in the United States and Canada* (pub. by Bowker and Co., 1928).

(1918); C. J. Sawyer and F. J. Harvey Darton, *English Books, 1475-1900* (1927) and I. A. Williams, *The Elements of Book-Collecting* (1927). (W. D. O.)

BOOKKEEPING. A systematic record of business transactions, in a form conveniently available for reference, made by individuals or corporations engaged in commercial or financial operations with a view to enabling them with the minimum amount of trouble and of dislocation to the business itself to ascertain at any time (1) the detailed particulars of the transactions undertaken, and (2) their cumulative effect upon the business and its financial relations to others. The ideal of any system of bookkeeping is the maximum of record and of speed in arriving at results, combined with the minimum of labour; but as dishonesty has to be guarded against, no system of bookkeeping can be regarded as adequate which does not enable the record to be readily verified as a true and complete statement of the transactions involved. Such a verification is called an audit, and in the case of public and other large concerns is ordinarily undertaken by professional accountants (*q.v.*). Where the bookkeeping staff is large it is usually organized so that its members, to some extent at least, check each other's work, and to that extent an audit, known as a "staff audit" or "internal check" is frequently performed by the bookkeeping staff itself.

Formerly, when credit was a considerably less important factor in commercial transactions than now, bookkeeping was frequently limited to an account of receipts and payments of money; and in early times, before money was in use, to an account of the receipt and issue of goods of different kinds. Even now what may be called the "cash system" of accounts is almost exclusively used by governments, local authorities, and charitable and other institutions; but in business it is equally necessary to record movements of credit, as a mere statement of receipts and payments of money would show only a part of the total number of transactions undertaken.

History.—The origin of bookkeeping is lost in obscurity, but recent researches would appear to show that some method of keeping accounts has existed from the remotest times. Babylonian records have been found dating back as far as 2000 B.C., written with a stylus on small slabs of clay, and it is of interest to note (*Records of the Past*, xi. 89) that these slabs or tablets "usually contain impressions from cylinder seals, and nail marks, which were considered to be a man's natural seal," thus showing that the modern method of identifying criminals by finger-prints had its counterpart in Babylonia some 4,500 years ago. Ancient Egyptian records were commonly written on papyrus, and contemporary pictures show a scribe keeping account of the quantities of grain brought into and removed from the Government store-houses. It will thus be seen that some form of bookkeeping existed long before bound books were known, and therefore the more general term *accounting* would seem to be preferable—the more so as the most modern developments are in the direction of again abandoning the bound book in favour of loose or easily detached sheets of paper or cards, capable of being rearranged as circumstances or convenience may dictate. At the present time all bookkeeping records are kept in three distinct columns, dealing respectively with the date of the transaction, its nature, and its money value. The earliest extant example of accounts so kept is probably a ledger in the Advocates' Library (now the National Library of Scotland) at Edinburgh, dated 1697, which, it is of interest to note, is ruled by hand. Before that double-entry bookkeeping had been in general use. The exact date of its introduction is unknown; but it was certainly not, as often stated, the invention of Lucas de Bergh, in or about 1494. This, however, is the date of the first issue (at Venice) of a printed book entitled *Everything about Arithmetic, Geometry, and Proportion*, by Luca Pacioli, which contains *inter alia* an explanation of bookkeeping by double-entry as then understood; but in all probability the system had then been in use for something like 200 years. It is perhaps unfortunate that from 1494 until comparatively recent times the literature of accounting has been provided by theorists and students, rather than by practical business men, and it may well be doubted, therefore, whether it accurately describes contemporary pro-

cedure.

General Principles.—The centre of all bookkeeping systems is the *ledger*, and it may be said that all other books are only kept as a matter of practical convenience—hence the name "subsidiary books" that is frequently applied to them. Inasmuch, however, as the transactions are first recorded in these subsidiary books, and afterwards classified therefrom into the ledger, the names *books of entry* or *books of first entry* are often employed. Subsidiary books which do not form the basis of subsequent entries into the ledger, but are merely used for statistical purposes, are known as *statistical* or *auxiliary books*. In the early days of bookkeeping the ledger comprised merely those accounts which it was thought desirable to keep, and was not a complete record of all transactions. Thus in many instances records were only kept of transactions with other business houses, known as *personal accounts*. In the earliest examples transactions tending to reduce indebtedness were recorded in order of date, as they occurred, underneath transactions recording the creation of the indebtedness; and the amount of the reduction was subtracted from the sum of the indebtedness up to that date. This method was found to be inconvenient, and the next step was to keep one account of the transactions recording the creation of indebtedness and another account (called the *contra account*) of those transactions reducing or extinguishing it. For convenience these two accounts were kept on opposite sides of the ledger, and thus was evolved the *Dr.* and *Cr.* account as at present in general use. In this form of account all transactions creating indebtedness due from the person named therein to the business—that is to say, all benefits received by that person from the business—are recorded upon the left-hand or *Dr.* side, and *per contra* all transactions representing benefits imparted by him, giving rise to a liability on the part of the business, are recorded upon the *Cr.* side. The account may run on indefinitely but as a matter of convenience is usually ruled off each time all indebtedness is extinguished.

It is also ruled off at certain periodical intervals, so that the state of the account may then be evident.

Single Entry Accounts.—A mere collection of *personal accounts* is, however, obviously a very incomplete record of the transactions of any business, and does not suffice to enable a statement of its financial position to be prepared. So at an early date other accounts were added to the ledger, recording the acquisition of and disposal of different classes of property, such accounts being generally known as *real accounts*. These accounts are kept upon the same principle as personal accounts, in that all expenditure upon the part of the business is recorded upon the *Dr.* side, and all receipts upon the *Cr.* side; the excess of the debit entries over the credit entries thus showing the value placed upon those assets that still remain the property of the business. With the aid of personal and real accounts properly written up to date, it is possible at any time to prepare a statement of assets and liabilities showing the financial position of a business, and the following is an example of such a statement, which shows also how the profit made by the business may be thus ascertained, assuming that the financial position at the commencement of the current financial period, and the movements of capital into and out of the business during this particular period, are capable of being ascertained.

STATEMENT OF AFFAIRS AS AT DECEMBER 31, 1926

Liabilities.				
Trade creditors	.	.	.	£4,961 10 0
Bills payable	.	.	.	2,620 18 4
Balance, being excess of assets over liabilities (or "Capital") at this date, carried down	.	.	.	14,918 7 2

Balance brought down	£14,918	7	2
Amount drawn out of business during year ended this date	1,500	0	0
	£16,418	7	2

Note. Outside of Great Britain it is customary to place the assets above, instead of under, the liabilities and capital.

The method of accounting hitherto described represents *single entry*, which—albeit manifestly incomplete—is still very often used by small business houses, and particularly by retail traders. Its essential weakness is that it provides no automatic check upon the clerical accuracy of the record, and, should any mistake be made in the keeping of the books, or in the extraction therefrom of the lists of assets and liabilities, the statement of assets and liabilities and the profit or loss of the current financial period will be incorrect to an equal extent. It was to avoid this obvious weakness of single entry that the system of double entry was evolved.

Double Entry.—The essential principle of double entry is that it constitutes a complete record of *every* business transaction it handles, and as these transactions are invariably cross-dealings, involving simultaneously the receipt of a benefit by someone and the imparting of a benefit by someone else, a complete record of transactions from both points of view necessitates an entry of equal amount upon both debit and credit sides of the ledger. Hence it follows that, if the clerical work be correctly performed, the aggregate amount entered up upon the debit side of the ledger must at all times equal the aggregate amount entered up upon the credit side; and thus a complete list of all ledger balances should show an agreement of the total debit balances with the total credit balances. Such a list is called a *trial balance*, an example of which is given below. It should be observed, however, that the test supplied by the *trial balance* is a purely mechanical one, and does not prove the absolute accuracy of the ledger as a record of transactions. Thus, transactions which have actually taken place may have been omitted from the books altogether, or they may have been recorded to the wrong accounts, or the money values attached to them may be incorrect; or, yet again, fictitious records may be entered in the ledger of transactions which have never taken place.

TRIAL BALANCE, DECEMBER 31, 1926

Page	Name of Account	Dr.	Cr.
1	Capital account		£15,010 1 7
5	Drawings	£1,500 0 0

		£72,442 12 4	£72,442 12 4

A *trial balance* is thus no very adequate safeguard against fraud, nor does it bring to light mistakes in the monetary value attaching to the various transactions recorded. This last point is of especial importance, in that the monetary value of transactions may

have been correctly recorded in the first instance, but owing to altered circumstances may have become inaccurate at a later date. This of course means that the altered circumstances constitute an additional "transaction" which has been omitted.

It will be observed that, in order to complete the record of the transactions by double entry, it has become necessary to introduce into the ledger a third class of accounts, known as *impersonal* or *nominal accounts*. These accounts record the transferences of money, or of money's worth, which, so far from representing a mere reshuffling of assets and liabilities, involve an increase in or a reduction of the amount invested in the business, *i.e.*, a profit or a loss. Transactions representing profits are recorded upon the *Cr.* side of nominal accounts, and those representing losses (including expenses) upon the *Dr.* side. This is consistent with the rule already laid down in connection with real and nominal accounts, inasmuch as expenditure which does not result in the acquisition of an asset is a loss, whereas receipts which do not involve the creation of liabilities represent profits. All debit balances therefore that are not assets are losses, and *per contra* all credit balances that are not liabilities are profits. Thus, inasmuch as double entry provides *inter alia* a complete statement under suitable headings of all profits and all losses, it is possible by aggregating these results to deduce therefrom the net profit or loss of carrying on the business—and that by a method entirely distinct from that previously described in connection with single entry, thus constituting a valuable additional check. Taking the trial balance previously shown, the following represent the *trading account*, *profit and loss account*, and *balance sheet* compiled therefrom. The trading account may be variously regarded as the account recording the movements of goods which represent the stock-in-trade, and as a preliminary to (or a subdivision of) the profit and loss account.

Balance Sheet.—The balance sheet is a statement of the assets and liabilities; but (inasmuch as, by transferring the balance of the profit and loss account to the capital account, it is possible to bring the latter account up to date and show the credit balance representing the surplus of assets over liabilities to date) the balance sheet, instead of showing a difference, or a "balance" representing what is *assumed to be* the amount of the capital to date, shows an absolute agreement of assets upon the one hand and of liabilities *plus* capital upon the other. The two sides of the account thus balance—hence the name.

BALANCE SHEET as at December 31, 1926

To A. B., capital account	£14,918 7 2	By fixtures, furniture, etc.	£1,269 4 3
To trade creditors	4,061 10 0	By stock on hand	5,751 3 10
" bills payable	2,620 18 4	" trade debtors	3,842 7 9
		" bills receivable	7,468 14 3
		" cash at bank	4,169 5 5
	£22,500 15 6		£22,500 15 6

Note. Outside of Great Britain it is customary to place the assets on the left hand side of the balance sheet and the liabilities and capital on the right hand side.

In the foregoing example the customary method has been followed of deducting withdrawals of capital from the capital account and of adding profits thereto. Sometimes, however, the balance of the capital account remains constant, and the drawings and net profits are transferred to a separate account called *current account*. This plan is not very often observed in the case of undertakings owned by individuals, or private firms, but is invariably adopted in connection with joint-stock companies, although in such cases the name *appropriation of profits account* is generally employed.

Books of First Entry.—Although it is now usual to employ several books of first entry, in the case of small businesses one such book is sufficient for all purposes, in that it is practicable for one person to record all the transactions that take place as and when they occur. A book of this description is called the *journal*, and for many years represented the only book of first entry employed in bookkeeping. In modern times, however, with

the growth of business it was soon found impracticable to keep one book of first entry for all transactions, and accordingly it became necessary either to treat the journal as an intermediate book, in which the transactions might be brought together and focused as a preliminary to being recorded in the ledger, or to split up the journal into numerous books of first entry, each of which might in that case be employed for the record of a particular class of transaction. The first method has been generally adopted in the Continental countries of Europe, whereas in Great Britain and in North America the latter method more generally obtains.

Sub-division of Ledgers.—With a view still further to split up the work, thus enabling a large staff to be simultaneously engaged, the ledger itself is now generally kept in sections. Thus the cash account and the bank account are frequently bound together in one separate book called the *cash book*, showing in parallel money columns the movements of office cash and of cash

speed with which results are available, and enabling them to be handled more quickly and with greater certainty. *Tabular book-keeping* is a device to achieve one or more of these ends by the substitution of books ruled with numerous columns for the more usual form. The system may be applied either to books of first entry or to ledgers. As applied to books of first entry, it enables the same book to deal conveniently with more than one class of transaction; thus, if the trading of a business is divided into several departments, by providing a separate column for the sales of each department, it is possible readily to arrive at separate totals for the aggregate sales of each, thus simplifying the preparation of *departmental trading accounts*. As applied to ledgers, the application of the system may be best described by the aid of the following example (the headings of the columns only being given), which shows how a very large number of personal accounts may be recorded upon a single opening of a ledger, provided the number of entries to be made against each individual be few.

Reference No.	Name of debtor.	Amount due on Oct. 1, 1926.	Charges for current quarter.	Total debit.	Date received.	Amount received.	Discounts.	Allowances.	Bad debts.	Amount due on Dec. 31, 1926.	Remarks.
		£ s. d.	£ s. d.	£ s. d.		£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.	

at the bank, and by the addition of a third column for discounts the necessity of keeping an additional book of first entry as a *discount journal* may also be avoided. Of late years, however, most businesses pay all moneys received into their banks without deduction, and pay all accounts by cheque; the necessity of an account for office cash thus no longer exists, save in connection with petty payments, which are recorded in a separate book called the *petty cash book*. With regard to the remaining ledger accounts, personal accounts (which are the most numerous) are frequently separated from the real and nominal accounts, and are further subdivided so that customers' accounts are kept separate from the accounts of trade creditors. The customers' accounts are kept in a ledger (or, if need be, in several ledgers) called *sales ledgers*, *sold ledgers* or accounts receivable ledgers (*q.v.*); while the accounts of trade creditors are similarly kept in *purchases ledgers*, *bought ledgers* or accounts payable ledgers (*q.v.*). The nominal and real accounts, if together, are kept in what is called the *general ledger*; but this may be further subdivided into a *nominal ledger* and a *private ledger*. By the employment of *adjustment* or *balancing accounts*, which complete the double entry record in each separate ledger, these various ledgers may readily be made self-balancing, thus enabling clerical errors to be localized and responsibility enforced.

Tabular Bookkeeping.—Of recent years considerable attention has been devoted to further modifications of bookkeeping methods with a view to reducing clerical work, increasing the

Slip System.—Another important application of modern methods consists of what may be described as the *slip system*, which is in many respects a reversion to the method of keeping records upon movable slabs or tablets, as in the Babylonian accounts referred to at the beginning of this article. This system may be applied to books of first entry, or to ledgers, or to both. As applied to books of first entry it aims at so modifying the original record of the transaction (whether it represents an invoice for goods sold or an acknowledgment given for money received) that a facsimile copy may be taken of the original entry by the aid of a carbon sheet, which instead of being immovably bound up in a book is capable of being handled separately and placed in any desired order or position, and thus more readily recorded in the ledger. Additional carbon copies prepared at the same time may serve any other desired purpose, *e.g.*, as delivery notes, stock control sheets, etc. Postings are thus made direct from the original slips, which have been first sorted out into an order convenient for that purpose and afterwards re-sorted so that the total sales of each department may be readily computed; after which they are filed away in a form convenient for reference. Sometimes the process is carried a step farther, and the original slips, filed away with suitable guide-cards indicating the nature of the account, themselves constitute the ledger record—which in such cases is to be found scattered over a number of sheets, one for each transaction, instead of, as in the case of the ordinary book ledger, a considerable number of transactions being recorded

A line drawing of a large, multi-tiered filing cabinet. The cabinet is shown from a three-quarter perspective, with several drawers open. Inside the drawers, numerous index cards are visible, some with text like 'Name', 'Address', and 'City'. The front of the cabinet has a label that reads 'Ad 10'. The cabinet is supported by four legs.

graved at least six plates (some of very important size) between 1503 and 1516 (fig. 2), and to have supplied designs for many others. Several notable plates are ascribed to Lucas Cranach and to Hans Holbein, and to that bevy of so-called Little Masters, the Behams, Virgil Solis, Matthias Zundt, Jost Amman, Saldorfer, Georg Hupschmann and others. The influence of these draughtsmen over the decorative styles of Germany has been felt through subsequent centuries down to the present day, notwithstanding the invasion of successive Italian and French fashions during the 17th and 18th centuries, and the marked effort at originality of

composition observable among modern designers. The heavy, over-elaborated German style never seems to have affected neighbouring countries; but since it was undoubtedly from Germany that was spread the fashion of ornamental book-plates as marks of possession, the history of German *ex-libris* remains on that account one of high interest to all those who are curious in the matter.

It was not before the 17th century that the *movable ex-libris* became tolerably common in France. Up to that time the more

FIG. 2—BOOK-PLATE OF LAZARUS SPENGLER, ENGRAVED IN 1515 BY THE GERMAN PAINTER AND ENGRAVER, ALBRECHT DÜRER

luxurious habit of stamping the cover with a personal device had been in such general favour with book-owners as to render the use of labels superfluous. From the middle of the century, however, the *ex-libris* proper became quite naturalized; examples of that period are very numerous, and, as a rule, are very handsome. It may be here pointed out that the expression *ex-libris*, used as a substantive, which is now the recognized term for book-plate everywhere on the Continent, found its origin in France. The words only occur in the personal tokens of other nationalities long after they had become a recognized inscription on French labels.

English Styles.—In many ways the consideration of the English book-plate, in its numerous styles, from the late Elizabethan to the late Victorian period, is peculiarly interesting. In all its varieties it reflects with great fidelity the prevailing taste in decorative art at different epochs. Until the last quarter of the 17th century the number of authentic English plates is very limited. Their composition is always remarkably simple, and displays nothing of the German elaborateness. They are as a rule very plainly armorial, and the decoration is usually limited to a symmetrical arrangement of mantling, with an occasional display of palms or wreaths. Soon after the Restoration, however, a book-plate seems to have suddenly become an established accessory to most well-ordered libraries. Book-plates of that period offer very distinctive characteristics. In the simplicity of their heraldic arrangements

they recall those of the previous age; but their physiognomy is totally different. In the first place, they invariably display the tincture lines and dots, after the method originally devised in the middle of the century by Petra Sancta, the author of *Tesserae Gentilitiae*, which by this time had become adopted throughout Europe. In the second, the mantling assumes a much more elaborate appearance—one that irresistibly recalls that of the periwig of the period—surrounding the face of the shield. This style was undoubtedly imported from France, but it assumed a character of its own in England. As a matter of fact, thenceforth until the dawn of the French Revolution, English modes of decoration in book-plates, as in most other chattels, follow at some years' distance the ruling French taste. The main characteristics of the style which prevailed during the Queen Anne and early Georgian periods are:—ornamental frames suggestive of carved oak, a frequent use of fish-scales, trellis or diapered patterns, for the decoration of plain surfaces; and, in the armorial display, a marked reduction in the importance of the mantling. The introduction of the scallop-shell as an almost constant element of ornamentation gives already a foretaste of the *Rocaille-Coquille*, the so-called Chippendale fashions of the next reign. As a matter of fact, during the middle third of the century this rococo style (of which the Convers plate [fig. 3] gives a typical sample) affects the book-plate as universally as all other decorative objects. During the early part of George III.'s reign there is a return to greater sobriety of ornamentation, and a style more truly national, which may be called the *urn style*, makes its appearance. Book-plates of this period have invariably a physiognomy which at once recalls the decorative manner made popular by architects and designers such as Chambers, the Adams, Josiah Wedgwood, Hepplewhite and Sheraton. The shield shows a plain spade-like outline, manifestly based upon that of the pseudo-classic urn then so much to the fore. The ornamental accessories are symmetrical palms and sprays, wreaths and ribands. The architectural boss is also an important factor. In many plates, indeed, the shield of arms takes quite a subsidiary position by the side of the predominantly architectural urn. From the beginning of the 19th century, until comparatively recent days, no special style of decoration seems to have established itself. The immense majority of examples

FIG. 3—ENGLISH BOOK-PLATES OF THE 17TH AND 18TH CENTURIES

The plate on the left is that of P. A. Convers, 1762, and is representative of the rococo style that affected decorative art during this period. That on the right, the book-plate model, was made for W. Hewer, Samuel Pepys's secretary, in 1699

display a plain shield of arms with motto on a scroll below, and crest on a fillet above. Of late years, however, a rapid impetus appears to have been given to the designing of *ex-libris*; a new era, in fact, has begun for the book-plate, one of great interest.

The main styles of decoration (and these, other data being absent, must always in the case of old examples remain the criteria of date) have already been noticed. It is, however, necessary to point out that certain styles of composition were also prevalent at certain periods. Many of the older plates (like the majority of the most modern ones) were essentially pictorial. Of this kind the

6 Paul Revere.

ANNA VANDER AA
cb. 15. inc.

BY COURTESY OF (1, 2, 5, 9) THE BRITISH MUSEUM, (3, 7) THE METROPOLITAN MUSEUM OF ART, (4) GLI EX LIBRIS ITALIANI BY BERTARELLI AND PRIOR (6, 8) THE AMERICAN ANTIQUARIAN SOCIETY WORCESTER, MASS.

EXAMPLES OF EARLY BOOK-PLATES

1. Earliest known English book-plate, 1515-30, that of Cardinal Wolsey. Not printed, but drawn and coloured by hand.
2. Heraldic. Fifteenth century woodcut. One of the three earliest German book-plates known to-day. It was found fastened to the cover of an old Latin vocabulary and is thought to antedate the Brandenburg book-plate.
3. German. Earliest portrait book-plate. A copper plate engraving by Albrecht Dürer, 1524, of Bilibald Pirckheimer, a Nuremberg jurist and councillor to the Emperors Maximilian and Charles V.
4. Earliest known Italian dated book-plate, 1622. Anonymous.
5. Eighteenth century English book-plate in Chippendale armorial style. This is not to be confused with the Sir Nicholas Bacon of the 1574 book-plate.
6. Early American book-plate, that of Paul Revere, unsigned but undoubtedly engraved by Revere about 1775.
7. Earliest known American book-plate, bearing the date 1674 and belonging to John Cotton.
8. George Washington's book-plate. Armorial engraving in the Chippendale style, probably between 1765 and 1775.
9. Earliest known Dutch book-plate, that of Anna Vander Aa. It bears the date 1597.

BOOK PLATES BY COURTESY OF (1, 2, 3, 4, 5, 14) AMERICAN ANTIQUARIAN SOCIETY, (6, 7, 8, 10, 11, 12, 16) TRUSTEES OF BRITISH MUSEUM, (9, 13) JULIUS J. LANKES, (15) FOWLER, "BOOK PLATES FOR BEGINNERS"

BOOK PLATES BY MODERN DESIGNERS

1. By J. W. Spenceley
2. By F. Charles Blank
3. By Arthur N. Macdonald
4. By Sidney L. Smith
5. By Dugald S. Walker

6. In colour by Albert Daniel Rutherford
7. By C. F. A. Voysey
8. Armorial book plate by Sherborn

9. By J. J. Lankes
10. By Sidney James Hunt
11. Armorial design by Paul Woodroffe
12. By Sidney James Hunt

13. By J. J. Lankes
14. By E. D. French
15. By Franz von Bayros
16. By George W. Eve

best-defined English genus may be recalled: *the library interior*—a term which explains itself—and *book-piles*, exemplified by the *ex-libris* (fig. 3) of W. Hewer, Samuel Pepys's secretary. We have also many *portrait-plates*, of which, perhaps, the most notable are those of Samuel Pepys himself and of John Gibbs, the architect; *allegories*, such as were engraved by Hogarth, Bartolozzi, John Pine and George Vertue; *landscape-plates*, by wood engravers of the Bewick school (see PLATE), etc. In most of these the armorial element plays but a secondary part.

The value attached to book-plates, otherwise than as an object of purely personal interest, is comparatively modern. The study of and the taste for collecting these private tokens of book-ownership hardly date farther back than the year 1875. The first real impetus was given by the appearance of the *Guide to the Study of Book-Plates*, by Lord de Tabley (then the Hon. Leicester Warren) in 1880. This work, highly interesting from many points of view, established what is now accepted as the general classification of styles: *early armorial* (i.e., previous to Restoration, exemplified by the Nicholas Bacon plate); *Jacobean*, a somewhat misleading term, but distinctly understood to include the heavy decorative manner of the Restoration, Queen Anne and early Georgian days (the Lansanor plate, fig. 3, is typically Jacobean); *Chippendale* (the style above described as *rococo*, represented by the French plate of Convers); *wreath and ribbon*, belonging to the period described as that of the urn, etc. Since then the literature on the subject has grown considerably. Societies of collectors have been founded, first in England, then in Germany and France, and in the United States, most of them issuing a journal or archives: *The Journal of the Ex-libris Society* (London), the *Archives de la société française de collectionneurs d'ex-libris* (Paris), both of these monthlies; the *Ex-libris Zeitschrift* (Berlin), a quarterly.

Until the advent of the new taste the devising of book-plates was almost invariably left to the routine skill of the heraldic stationer. Of late years the composition of personal book-tokens has become recognized as a minor branch of a higher art, and there has come into fashion an entirely new class of designs which, for all their wonderful variety, bear as unmistakable a character as that of the most definite styles of bygone days. Broadly speaking, it may be said that the purely heraldic element tends to become subsidiary and the allegorical or symbolic to assert itself more strongly. Among modern English artists who have more specially paid attention to the devising of book-plates, and have produced admirable designs, may be mentioned C. W. Sherborn, G. W. Eve, Robert Anning Bell, J. D. Batten, Erat Harrison, J. Forbes Nixon, Charles Ricketts, John Vinycomb, John Leighton and Warrington Hogg. The development in various directions of process work, by facilitating and cheapening the reproduction of beautiful and elaborate designs, has no doubt helped much to popularize the book-plate—a thing which in older days was almost invariably restricted to ancestral libraries or to collections otherwise important. Thus the great majority of modern plates are reproduced by process. There are, however, a few artists left who devote to book-plates their skill with the graver. Some of the work they produce challenges comparison with the finest productions of bygone engravers. Of these the best-known are C. W. Sherborn and G. W. Eve in England, and in America, J. W. Spenceley of Boston, Mass., K. W. F. Hopson of New Haven, Conn., and E. D. French of New York city.

BIBLIOGRAPHY—The curious in the matter of book-plate composition will find it treated in the various volumes of the *Ex-libris Series*. See also A. Poulet-Malassis, *Les Ex-libris français* (1875); Hon. J. Leicester Warren (Lord de Tabley), *A Guide to the Study of Book-plates* (1880); Sir. A. W. Franks, *Notes on Book-plates, 1574-1800* (1887); Friedrich Warnecke, *Die deutschen Bücherzeichen* (1890); Henri Bouchot, *Les Ex-libris et les marques de possession du livre* (1891); Egerton Castle, *English Book-plates* (1892); Walter Hamilton, *French Book-plates* (1892), *Dated Book-plates* (1895); H. W. Fincham, *Artists and Engravers of British and American Book-plates* (1897); Count K. E. zu Leiningen-Westerburg, *German Book-plates*, Eng. trans. by G. R. Denis (1901); Clifford N. Carver, *Book-plates of Well-Known Americans* (Princeton, N.J., 1911); George W. Fuller (ed.), *A Bibliography of Bookplate Literature* (Spokane, Wash., 1926). (E. CAS.)

BOOKS. Book is the name for any literary production of some bulk, now applied particularly to a printed composition forming a volume, or, if in more than one volume, a single organic literary work.

The clay tablets of Babylonia and Assyria (*q.v.*) which were literary as well as documentary in their contents and were collected into libraries, are perhaps entitled to be called books, but the direct ancestry of the modern printed book begins rather with a papyrus roll of 18 columns in Egyptian hieratic writing of about the 25th century B.C., in the Musée de Louvre at Paris, preserving the maxims of Ptahhetep. Papyrus continued to be the usual vehicle of writing until the early centuries of the Christian era, and it was from the name by which they called it, *βύβλος* or *βιβλος*, that the Greeks formed *βιβλιον*, their word for a book, the plural of which (mistaken for a feminine singular) has given us our own word Bible. In the 2nd century B.C. Eumenes II., king of Pergamus, finding papyrus hard to procure, introduced improvements into the preparations of the skins of sheep and calves for writing purposes, and was rewarded by the name of his kingdom being preserved in the word *pergamenum*, whence our "parchment," by which the dressed material is known. In the 10th century there was introduced from the East a new writing material made from a pulp of linen rags, and the name of the vanquished papyrus was transferred to this new rival. Paper-mills were set up in Europe in the 12th century and the use of paper gained ground, though not very rapidly, until the invention of printing created an unprecedented demand for it which has since continually increased, and is now largely met by substitutes passing under the same name, mainly composed of wood-pulp, esparto grass and clay (see PAPER).

So long as the use of papyrus was predominant the usual form of a book was that of the *volumen* or roll, wound round a stick, or sticks. The modern form of book, called by the Latins *codex* (a word originally used for the stump of a tree, or block of wood, and thence for the three-leaved tablets into which the block was sawn) was coming into fashion in Martial's time at Rome, and gained ground in proportion as parchment superseded papyrus. The *volumen* as it was unrolled revealed a series of narrow columns of writing, and the influence of this arrangement is seen in the number of columns in the earliest codices. Thus in the Codex Sinaiticus and Codex Vaticanus of the Bible, both of the 4th century, there are respectively four and three columns to a page; in the Codex Alexandrinus (5th century) only two; in the Codex Bezae (6th century) only one, and from this date to the invention of printing, while there were great changes in handwriting, the arrangement of books changed very little, single or double columns being used as was found convenient.

15th Century.—Between a manuscript written in a formal book-hand and an early printed copy of the same work, printed in the same district, the difference in general appearance was very slight. The printer's type (see TYPOGRAPHY) would as a rule be based on a handwriting considered by the scribes appropriate to works of the same class; the chapter headings, headlines, initial-letters, paragraph marks, and in some cases illustrations, would be added by hand in a style which might closely resemble the like decorations in the manuscript from which the text was being printed; there would be no title-page and very probably no statement of any kind that the book was printed, or as to where, when or by whom it was produced. Information as to these points, if given at all, was reserved for a paragraph at the end of the book, called by bibliographers a colophon (*q.v.*), to which the printer often attached a device consisting of his arms, or those of the town in which he worked, or a fanciful design. The earliest title-page is prefixed to a bull of Pope Pius II., printed by Fust and Schoeffer, at Mainz, probably in 1463, and bears the words, "Dis ist die bul zu deutsch die unser allerheiligster vatter der bapst Pius herusgiant hait widder die snoden ungleubigen turcken." In 1470 Arnold ther Hoernen at Cologne printed a nine-line paragraph on an otherwise blank page giving the title of the book, *Sermo ad populum predicabilis in festo presentacionis Beatissime Marie Semper Virginis*, with some words in its praise, the date in Roman numerals, and a reference to

further information on the next page. In 1475 in a Venice edition of Augustine's *De Civitate Dei* the name of the printer, Gabriel Petri, is found in the headline of the first page of text. In 1476 Erhard Ratdolt and his partners at Venice printed their names and the date, together with verses describing the book, on the title-page of a Latin calendar, and surrounded the whole with a border in four pieces. For another 20 years, however; when title-pages were used at all, they usually consisted merely of the short title of the book, with sometimes a woodcut or the printer's (subsequently the publisher's) device beneath it, decoration being more often bestowed on the first page of text. Title-pages completed by the addition of the name and address of printer or publisher, and also by the date, did not become common till about 1520. In other respects the completion of the book, independently of handwork, was fairly rapid. Printed illustrations appear first as rude woodcuts in some small books produced at Bamberg by Albrecht Pfister about 1461. Pagination and headlines were first used by Arnold ther Hoernen at Cologne in 1470 and 1471; printed signatures to guide binders in arranging the quires correctly (*see* BIBLIOGRAPHY) by Johann Koelhoff, also at Cologne in 1472. Illustrations abound in the books printed at Augsburg from the year 1470, and from about 1480 are common in Germany, France and the Low Countries, while in Italy their full development dated from about 1490. Experiments were made in both Italy and France with illustrations engraved on copper, but in the 15th century these met with no success. Bound with wooden boards covered with stamped leather, or with half of the boards left uncovered, many of the earliest printed books are immensely large and heavy, especially the great choir-books, the Bibles and the biblical and legal commentaries, in which a great mass of notes surrounds the text. The paper on which these large books were printed was also extraordinarily thick and strong. For more popular books small folio was at first a favourite size, but towards the end of the century small thin quartos were much in vogue. Psalters, books of hours, and other prayer-books were practically the only very small books in use. As early as 1467 the bishop of Aleria writing to Pope Paul II. speaks of the introduction of printing having reduced prices to one-fifth of what they had previously been, and they steadily diminished.

16th Century.—The popularization of the small octavo by Aldus at Venice in 1501 and the introduction in these handy books of a new type, the italic, had far-reaching consequences. Italics grew steadily in favour during the greater part of the century, and about 1570 had almost become the standard vernacular type of Italy. In France also they were very popular, the attempt to introduce a rival French cursive type (*lettres de civilité*) attaining no success. In England they gained only slight popularity, but roman type, which had not been used at all in the 15th century, made steady progress in its contest with black letter, which by the end of the century was little used save for Bibles and proclamations. The modern practice in the use of i and j, u and v dates from about 1580, though not firmly established till the reign of Charles I. In the second quarter of the 16th century the French printers at Paris and Lyons halved the size of the Aldine octavos in their small sexto-decimos, which found a ready market, though not a lasting one, the printers of Antwerp and Leyden ousting them with still smaller books in 24mo or small twelves. These little books were printed on paper much thinner than had previously been used. The size and weight of books was also reduced by the substitution of pasteboards for wooden sides. Gold tooling came into use on bindings, and in the second half of the century very elaborate decoration was in vogue in France until checked by a sumptuary law. On the other hand a steady decline in the quality of paper, combined with the abandonment of the old simple outline woodcuts for much more ambitious designs, made it increasingly difficult for printers to do justice to the artists' work, and woodcuts, at first in the Low Countries and afterwards in England and elsewhere, were gradually superseded by copper-plates printed separately from the text. At the beginning of this century in England a ballad or Christmas carol sold for a halfpenny and thin quarto chapbooks for 4d (a price which lasted through the century); the Great

Bible of 1541 was priced at 10s. in sheets and 12s. bound, Edward VI.'s prayer-book (1549) at 2s. 2d. unbound, and 3s. 8d. in paste or boards; Sidney's *Arcadia* and other works in 1598 sold for 9s.

17th Century.—Although the miniature editions issued by the Elzevirs at Leyden, especially those published about 1635, have attracted collectors, printing in the 17th century was at its worst, reaching its lowest depths in England in the second quarter. After this there was a steady improvement, partly due to slight modifications of the old printing presses, adopted first in Holland and copied by the English printers. In the first half of the century many English books, although poorly printed, were ornamented with attractive frontispieces, or portraits, engraved on copper. During the same period, English prayer-books and small Bibles and New Testaments were frequently covered with gay embroideries in coloured silks and gold or silver thread. In the second half of the century the decorated leather bindings in vogue were the daintiest England had yet produced. For trade bindings rough calf and sheepskin were most used, and the practice of lettering books on the back, instead of on the sides or fore-edges or not at all, came gradually into favour. Owing to the increase of money, and in some cases to the action of monopolists, in others to the increased payments made to authors, book-prices rather rose than fell. Thus church Bibles, which had been sold at 10s. in 1541, rose successively to 25s., 30s. and (in 1641) to 40s. Single plays in quarto cost 6d. each in Shakespeare's time, 1s. after the Restoration. The Shakespeare folio of 1623 is said to have been published at £1. Izaak Walton's *Compleat Angler* was priced at 1s. 6d. in sheepskin, *Paradise Lost* at 3s., *The Pilgrim's Progress* at 1s. 6d. Dryden's *Virgil*, published by subscription at £5 5s., stands by itself.

18th Century.—During this century there was a notable improvement alike in paper, type and presswork in both France and England, and towards the end of the century in Germany and Italy also. Books became generally neat and sometimes elegant. Book-illustration revived with the French *livres-à-vignettes*, and English books were illustrated by Gravelot and other French artists. In the last quarter of the century the work of Bewick heralded a great revival in woodcut illustrations, or as the use of the graver now entitled them to be called, wood engravings. The best 18th century binders, until the advent of Roger Payne, were inferior to those of the 17th century, but the technique of the average work was better. In trade bindings books were mostly cased in paper boards. Prior and Pope made large sums by subscription editions at high prices. Single poems by Pope, however, were sold at 1s. and 1s. 6d. Novels were mostly in several volumes. The price at the beginning of the century was mostly 1s. 6d. each. It then remained fairly steady for many years, and at the close of the century rose again. Thus Miss Burney's *Evelina* (3 vols., 1778) sold for 7s. 6d., her *Cecilia* (5 vols., 1782) for 12s. 6d. and her *Camilla* (5 vols., 1796) for £1 1s. Johnson's *Dictionary* (2 vols., folio, 1755) cost £4 4s. in sheets, £4 15s. in boards.

19th Century.—A great change in the appearance of books was caused by the use first of glazed calico (about 1820), afterwards (about 1830) of cloth for the cases of books as issued by their publishers. At first the lettering was printed on paper labels, but soon it was stamped in gilt on the cloth, and in the last quarter of the century many very beautiful covers were designed for English and American books. Book illustrations passed through many phases. As subsidiary methods colour-prints, line engravings, lithographs and etchings were all used during the first half of the century, but the main reliance was on wood-engraving, in which very great technical skill was developed. In the '60s and the years which immediately preceded and followed them many of the chief English artists supplied the engravers with drawings. In the last decade of the century wood-engraving was killed for a time by the perfection attained by photographic methods of reproduction (*see* PROCESS), the most popular of these methods entailing the use of paper heavily coated with china clay. During the century trade-printing, both in England and America, steadily improved, and the work done by William Morris at his Kelmscott Press (1891-96), and by other amateur

BY COURTESY OF (1, 4, 5) THE TRUSTEES OF THE BRITISH MUSEUM, (2, 3) FROM STANLEY MORISON, "FOUR CENTURIES OF FINE PRINTING" (BENN)

TYPES OF 17th AND 18th CENTURY PAGE DESIGNS

1. *A Midsummer nights dreame*, by William Shakespeare. The edition was printed by James Roberts and published by Thomas Pavler, who is alleged to have annotated it falsely. The date on the book is 1600 but the real date is supposed to have been 1619
2. *De Imitatione Christi*, by Thomas à Kempis, 1642. The first publication was a folio text of the *Imitatione Christi*, which was printed in Garamand's *Caractères de l'Université*

3. *The Médailles sur les Événements du Règne de Louis Le Grand*, 1702. The book has an engraved frontispiece by the elder Simonneau after Coppel fils. Its borders and fleurons are by Berain; the head of the king on the medals is from the burin of Gerard Edelinck
4. Title page from *Fugitive Pieces in Verse and Prose*, by Horace Walpole, published by the Strawberry-Hill Press in 1758
5. First page of *Fugitive Pieces in Verse and Prose*

printers who imitated him, set a new standard of beauty of type and ornament, and of richness of general effect. On the other hand the demand for cheap reprints of famous works induced by the immense extension of the reading public was supplied by scores of pretty editions at 1s. 6d. and 1s. and even less. About 1894 the number of such medium-priced books was greatly increased in England by the substitution of single-volume novels at 6s. each (subject to discount) for the three-volume editions at 31s. 6d. The preposterous price of 10s. 6d. a volume had been adopted during the first popularity of the *Waverley Novels*, and despite the example of France, where the standard price was 3fr. 50, had continued in force for the greater part of the century.

20th Century.—This opened well with the books printed by Emery Walker and Cobden Sanderson at the Doves Press in a fine roman type, based on that used by Nicolas Jenson at Venice (1470–80), and apart from the badness of paper and shortage of skilled pressmen and binders from 1915 to 1920, there was a steady improvement in printing, due largely to the introduction of monotype machines, which ensured that every new book should be printed with new type. In connection with the monotypes many excellent new founts were introduced, the general tendency being to a lighter style of printing and decoration and a greater use of italics as a text type. The use of attractive paper jackets for new books, especially novels, somewhat lessened the decoration of bindings, but on the whole the standard of book production was higher than ever before, and though for some years after the World War books nearly doubled in price, with better machinery a gradual return to cheapness was found possible. (See PUBLISHING and BOOKSELLING.) (A. W. P.)

ART OF THE BOOK

Though the book throughout its history has tended to become more and more a personal possession, until it is now a necessary adjunct to the ordinary man's life instead of being the semi-magical weapon of the few who could read, it depends, as a thing of beauty, on the fact that it is an inscription, a thought written down. From the Babylonian clay amulet with its charm in writing, as old as civilization, to the modern "book oath" of the law-courts, we find this reverence for "frozen thought" persisting in men's minds. From the impulse of reverence sprang religion, and from religion art, which grew at first in order to make sacred objects more potent. The craftsman of older days took his inspiration directly from the fundamental human emotions of awe and curiosity instead of from the theories of professors, and by directing his reason upon an emotional state of mind was able to explore the technique of his craft, and, quite incidentally, to achieve beauty independent of the whims of aesthetic fashion-mongers. No art is the worse for being criticized with an eye to the purpose and state of mind in which it was produced; but in considering the book we are forced into such an attitude, because we are dealing first and foremost with an instrument of thought, and only secondarily with an object of art. We must keep in mind not only the fact that every rule for the beautiful book arises from some practical need for lucid exposition, but, more important still, we must remember the almost superstitious reverence with which the craftsman regarded man's unique gift of ciphering and deciphering thought. The modern "fine book" is the direct descendant of the sacred book of the past, but any inscription at all has a peculiar relation to the intellect. The gramophone record is not an inscription, because it is deciphered not by the intellect but by merely mechanical devices; hence no embellishment will ever be lavished upon it. But when a message directly enters the mind through the eye, it must be clothed in relation to its importance.

Ancient Books.—The hieratic books of ancient Egypt furnish an early example. The famous surviving ms. of the "Book of the Dead" has called on the utmost resources of calligrapher and illuminator. It is a long roll of papyrus, the early equivalent of paper (*q.v.*). Although this was made of the inner bark of Nile reeds, beaten flat, it seems to have been produced in qualities of extreme fineness and flexibility. Pliny mentions a roll containing the entire Iliad, which could be enclosed in a nut-shell. This may be a myth, but at least it was not considered beyond belief. Parch-

ment was introduced as an expensive substitute in the 2nd century B.C.; but despite its more enduring qualities not a single complete parchment book from the golden age of Roman or Greek literature has survived to our day. Our earliest Latin ms. is possibly of 4th-century origin. The roll form of book, whether of parchment or papyrus, measured often 16 ft. and sometimes far more in length, and was well adapted to the needs of important texts, sacred or profane. In its original form, reading down (or up) from one scroll rod to the other, it keeps nearest to its parent, the inscribed stone tablet, and may have been hung banner-wise in Egyptian temples. An interesting survival of this use of books for exhibition is found in the "Exsultet" rolls of the mediaeval church. The deacon read or sang the tract *Exsultet iam angelica turba* at the Easter vigil, unrolling as he did so a long scroll which hung down from over his lectern. This was painted with illustrative miniatures, upside down from the text he read, so that they were revealed to the congregation as he proceeded.

When, however, the writing was arranged long-wise on the roll it had to be broken up into blocks or sections, the length of the line being governed by ease in reading. These blocks of text then took the familiar rectangular form of our own book page. Merely folding the roll back on itself would convert it into a modern book of leaves as long as the edges were not cut. But the roll was regarded, because of its solemn uses, as a single object rather than as a collection of pages for easy reference; hence it was generally wound, not folded, from one end-rod to another—whence our word volume (from *volvere*, to roll). The end-rods were furnished with bosses and the rolls were enclosed in *scrinia*, cases. Both of these were elaborately worked by craftsmen when the value of the book demanded it, so that Seneca could accuse certain wealthy bibliophiles of paying more attention to their elaborate titlings and cases than to the literary worth of the contents of their libraries. This satire still has point.

As the book grew away from its original function in the temple and became the property of private owners, the needs of convenience altered its appearance. The book of leaves or pages existed as an informal contemporary of the roll, not only in the primitive *diptychs*, or wax-coated folding tablets, which formed the ancient note-book, but by the first century, in genuine published works. Possibly the difficulty of binding papyrus by piercing it through with threads hindered the development of such books. Certainly parchment, better for this purpose, was more costly; but already in the 1st century Martial was unconsciously sounding the knell of the roll in his line (Epigr. I., ii.) "Let the great folk have their *scrinia*; my book can be held in one hand." Martial also mentions (I., lxvi.) "virgin sheet" (*charta*) being soiled by rough chins; which gives us a picture of the difficulty with which a long roll was held open while the reader searched for a particular passage. He also tells of a friend who returned one of his books unrolled to the end rod (*explicitum . . . ad sua cornua librum*) as a proof that it had been read. These *cornua* would seem to have been fashioned of bone or ivory, perhaps for greater flexibility. The roll was held in the left hand and unrolled with the right; many grave-monuments show sculptures of readers holding rolls so that the final page hangs down. "the book is ended." Parchment, which was less brittle at the edges than papyrus, seems to have been specially destined for the *codex* or leaf book, which has three free edges instead of two, and these three multiplied by the number of pages in the book. It also withstood corrections and expunging better than papyrus, and gave a freer surface to the illuminator. Magnificent Greek mss. from mediaeval times were sometimes written in gold upon purple-stained skins. What illumination there was in ancient books would seem to have been more like the modern, straightforward illustration of our own books than like the work of the mediaeval artists, who made decoration spring naturally from the writing of the text. Surviving mss. of Terence, for example, which seem to have been copied from late classic books, show that the pictures were really needed to illustrate the positions of the actors on the stage. Massive initial letters were known, and a rudimentary title-page appears in the inscription of the first leaf of some early Greek manuscripts.

Although the *codex* was dependent on parchment for its development, the latter material was used for writing in Greece from the earliest times. The *codex* originated, it would seem, in Greece or Asia Minor as a form specially suited to books of law (whence our word "code"), in that pages could be excised or added after statutory changes without destroying the continuity of the volume. It may also have perpetuated (for law is conservative) the primitive tables of stone or wood on which decrees were first inscribed. The single pages could, like these tables, be first exhibited and then piled together. But works of literature were soon issued in *codices*, although the fine book as we are considering it was not affected at once by the innovation. As late as the 3rd century of our era the jurist Ulpian defined "books" as rolls to the seeming exclusion of *codices*, although this definition was soon extended to the humbler form.

Though Christianity did not noticeably stay the destruction of ancient books inevitable after the barbarian invasions of Rome, the church of the 3rd to 5th centuries rendered a distinct service to the physical arts of the book by sharply reviving the idea that only sacred writings are worthy of preservation in a beautiful form. A secular author, however great, is at the mercy of the mere literary tastes of subsequent generations; but revealed or pious writings depend on no such whims. Hence a tradition of copied texts was possible. Had there been no church, the fine book might have disappeared entirely in the West; as it was, the *codex*, which gradually superseded the roll, became a far more reasoned and workable thing in daily use in the churches than it could have become on the shelves of rich amateurs in imperial Rome, who—like ourselves—had lost sight of the motives that inspire true craftsmanship. The Gospels were often bound in jewelled cases *because* they were used in public rituals.

The Early Mediaeval Book.—When Charlemagne sent to Rome for a copy of the Gregorian sacramentary, with an idea of establishing a standard of worship as well as of language, the fine book profited by the new script invented for this purpose no less than by the added vigour and realism of decorations inspired by the tastes of the imperial court. Under CALLIGRAPHY there is noted the discrepancy between national styles of writing which made this standardization so necessary; but whereas the hands of early mediaeval France, Italy and Spain were degenerate growths from the writing in capital letters of the classic period, there existed a very important school of fine book-making in Ireland from the 6th century which continued the finest style of Roman 4th-century writing and added to it an original and powerful system of decoration. One of the most pretentious and successful books of all time is the "Book of Kells," a book of the Gospels produced in Ireland in the 7th century. On seeing the curiously sophisticated and intricate embellishments of this ms one realizes that the "spark of civilization," almost extinguished in Western Europe at this time, was well guarded in the Irish monasteries. The Irish sacred book, with its somehow rigid perfection, influenced English work from 664 on, but became more fluid and casual in Saxon hands. Alcuin of York, who was one of the greatest figures of Hiberno-Saxon book work, was called in by Charlemagne to direct the deliberate revival of book production at the end of the 8th century. The so-called *carolingian minuscule* thus evolved allowed a page of great lightness and crispness, due to the simplicity of the letters used; this in turn produced a freer style of illumination. The bold, outstanding initial letter (which, brightly painted, served as a useful "pointer" in finding passages) comes into a closer relation to the text; vines descend from it until they cover the margin, and finally a whole illustrative scene is incorporated within a large initial. From the middle of the 13th century we are able to see what magnificent unity was achieved by the mediaeval book, not through any self-conscious canons of "taste," but because the craftsmen concerned were all imbued with the same set of ideas, indeed the same pictorial traditions. The binding of the kind of book we are considering, *i.e.*, the "fine" book, was often of gold or silver set with the unfaceted precious stones of the day, each one of which had a spiritual and medicinal value to the mediaeval mind. There are crucifixion scenes in *repoussé* metal or ivory. Occasionally an older ivory

diptych would be mounted to serve as a binding; but in general the pages themselves (in such copies as remain unaltered) show the same grouping of figures and stylish treatment as do the covers. Respect for older texts made the miniaturists conservative, and many illustrative scenes can be traced back, by their grouping and costumes, through a chain of earlier mss. to a presumptive original, now lost, such as the copy of the Vulgate written for St. Jerome, which would itself have been an object of reverence.

The Late Mediaeval Book.—The increased sprightliness of decoration, approaching sheer naturalism, was counterbalanced as time went on by the formalizing of script. The final formalization was the angular letter which, at the dawn of the renaissance, was contemptuously nicknamed "gothic" (much as we said "hunnish" in the World War). The "gothic" page is as near as we have come to an abstract form of beauty in writing, because it is rigidly consistent and links each letter into a rich, massive text-page. But "abstract" beauty will not do for the book, however little it be meant for reading and however much for a display of magnificence: and the scholars who revived the Carolingian letter in the 15th century rightly forsook optical consistency for practical legibility, which is a very different thing. Still, whatever its demerits as a readable text, the formal letter attributed to Gutenberg (the supposed perfecter if not the inventor of printing, *c.* 1454) is aesthetically as much a monument to the age that was passing as it was historically a presage of the future. Before dealing with the changes brought about by the printing press it would be well to note how books were affected, during the middle ages, by the purpose for which they were made. Liturgical, legal and other books differed widely and imposed definite rules on the craftsman. Just as portability distinguishes the book itself from the inscription, so the small book became roughly differentiated from the large one. The latter, comprising the volumes regularly used in churches as well as most of the secular romances which delighted the nobility, were kept on shelves and transferred for reading purposes to a lectern; in some libraries books were even chained down to baffle thieves. Of the many liturgical books of this character the most important is the *missale* or mass-book. Such reverence was felt for this rite that craftsmen soon evolved special rules for its written text. The Canon, for example, was in larger letters than the rest of the text, and was placed in the middle of the book, a necessary thing in days when end-leaves were often in danger. The music-books of the liturgy had to be large in order that a choir might read from one page; books oflections could be propped up and read to a community. But with the practice of reciting the hours arose the *breviarium*, a book definitely intended to be carried about. Indeed, in England it was known as a *portiforium*. The book of hours plays a long and important part in the history of the book arts. It was the intimate companion of lay folk as well as of the clergy, and its comparatively small size admitted of its being lavishly decorated by wealthy owners. The *Little Hours of the Virgin*, in particular, offered the scribe a relatively short text and the illuminator a charming series of subjects. Books of hours made for important personages show more and more response to the layman's desire for show and splendour; and it is difficult to think how this desire could be better gratified than by the glowing blue of powdered lapis that shone on the Virgin's cloak in painted miniatures; by the glint of gold-leaf in the marginal vines, raised by sizing, the better to catch the light; by the rubrications of pure vermillion (now become so rare) interspersed among the lines of text, or the binding, often worked in embroidery by pious hands or intricately tooled. A book like this might well be treasured by queens: it was a unique and intensely personal work of art.

The Printed Book.—After contemplating such a masterpiece one is tempted to wonder whether the printed book should strictly be considered as a work of art at all. However beautiful a piece of typography is (and it has unique and subtle beauties of its own), it is in its very nature a replica, a thing produced by a machine. The earliest printed books, by imitating closely every artistic rule of the calligrapher, profited by 14 centuries of previous experiment; type-founders, while they could not equal the nervous fineness of the best writing, certainly attained a new

consistency and clarity of letter design; and yet the lover of written books, fine hand-tooled bindings and original painted illustrations may quite rightly maintain that such original pieces alone deserve the title of works of art, not of reproduction. Collectors and rich patrons, however, could still add a hand-tooled or inlaid binding and make it an individual work of art to that extent; binding, until the introduction of machine stamping and mass production, remained the most personal handicraft connected with typography. Illuminators, too, continued for a while to work on the printed page.

But as soon as printing was generally introduced (after 1456) it became obvious that no mere imitation of ms. style would serve the printed book. The artist's hand, the hand of the creative craftsman, had been transferred from direct writing to the work of designing and engraving the steel punch from which type-matrices were made, and to cutting the wood or metal used for illustrations. The printed page is quite literally, the "proof" of the unseen labours of the punch-cutter and engraver. This gives us, inevitably, a new set of artistic rules. An example is found in the "block books" which were sheets of paper "rubbed off" like proofs from engraved planks of wood inked with liquid, not greasy, ink. Whether these "block books" antedated printing or not, they were closely allied to the single xylographic print which certainly did so; and like the latter, they show how the mechanical problems of the cutter on wood forced him to "buttress" one set of lines with another, executing the lettering with the same rugged freedom as the cut and acquiring perfect homogeneity. When the colourist had added the faint glaze of his pigments, the result was of naive and almost touching beauty—although the *Biblia pauperum* and the rest were the very opposite of "luxurious" books. The Chinese and Japanese block-book could not, on account of the intricacies of the alphabet, be swept away almost at once by type printing, so that we are able to see, in oriental books of this character, what the block book can attain in technical sophistication, when the lettering is done by experts and the colour woodcuts by masters.

The popularization of mechanically produced books was aided, and their appearance greatly affected, by the use of paper. While this substance was being made in France as early as 1189 it was never popular with calligraphers; the slightly acid ink from the scribe's pen was made so as to "bite" into the smooth surface of vellum without any pressure. But printers, with their oil-and-varnish ink, found that the absorbent surface of paper was the perfect medium for receiving pressure, by which ink was actually driven into the substance of the sheet.

Effect of Illustration.—Illustration was seldom used "for art's sake" in the 15th century; but there were many kinds of books that demanded the use of explanatory pictures. The new interest in natural science and the outer world produced herbals, geographies and books of travel like Breydenbach's celebrated *Pilgrimage* (Mainz, 1486). The 16th century added the modern text-book, and with the *Hypnerotomachia* printed by Aldus in 1499 began a long line of "emblem books," collections of symbolic pictures dear to the Renaissance mind, which had an influence upon decorative printing. Each of these kinds of books affected the type-page in some way. The "pocket edition" invented by Aldus for the convenience of scholars, offered little opportunity for lavish decoration; but the book of hours continued, until the 1540's, to call on the resources of the book artist. Music part-books appeared at the beginning of the 16th century, in a distinctive oblong shape.

Engraved illustration was attempted in books as early as 1477 but it was not until the printer-publisher had tired of the many possibilities of wood-cutting that the copper plate came into general use (*post* 1550). By that time types of almost fragile delicacy were being cut; with proper inking and press-work they would have rendered discreet typographic support to the engraved title-pages and frontispieces which added a magnificent and not too alien touch to the book. Christophe Plantin of Antwerp, in the mid-16th century, was one of the last of his period to attempt unity in fine books. But he naturally gave much attention to engravings, and these had the effect of making patrons think of

"fine books" as "fine picture-books" so that the punch-cutter, the ultimate typographic craftsman, lost prestige, save in such exotic efforts as polyglots. The first entirely successful attempt to restore all-round beauty to the book was made at the behest of Louis XIV., when the French national printing office produced its famous folio *Médailles* (see **TYPOGRAPHY**) with the newly-cut "King's types" of Grandjean. By this time the printer had learned how to deal with engraved and etched illustration, and the French 18th century produced the brilliant phenomenon of those octavos and duodecimos illustrated by Gravelot, Cochin and other masters, which were made for the eternal joy of collectors. Wood engravers began to imitate the delicate strokes of the *burin*. There was a general effort toward refinement of the printed page.

But it was John Baskerville of Birmingham who, by experimenting in 1757 not only with type design but with paper, ink and the press, revived the idea of the book as a technical whole, something more important than the sum of fine parts. A Baskerville book in a contemporary English black binding is a thing of the happiest consistency from beginning to end, and shows how little need the intelligent printer has for decoration or plates. Baskerville's followers could hardly improve on this serene style without evolving (as they eventually did) a hard and icy perfection of page, which is not so much tiring to the eye as to the mind. The post-Baskerville style in England was open, serene and friendly; the late 19th century Didot style in France was crisp and magnificently logical; but the books influenced by Bodoni of Italy (d 1812) had an arbitrary perfection which was ill interpreted by his followers. The reaction, when it came in the 19th century, was two-fold. Decoration followed the whimsicalities of the romantic-gothic style with the new technical freedom of lithography and white-line wood engraving; typefounders and printers began to "revive" ancient type faces, so that the more pretentiously designed books took on the self-conscious archaisms of museum replicas. But this piracy of the past had at least an educative value, and prepared the way for the labours of William Morris and the "private presses" at the end of the century. The so-called "crafts" movement was once more to bring instructed reverence to the task of revising the outworn rules for the making of beautiful books. Our own modern typographic achievements are good inasmuch as we realize that all standards of craftsmanship depend on knowing, not only how things should be done, but why they are worth doing.

MODERN ENGLISH AND CONTINENTAL BOOKS

The Private Presses.—William Morris brought back dignity to the printed book in a time of its abject abasement. Indeed, he brought it too much dignity. His books were designed not for the common usage of his day, but, as it were, for the private pomps of mediaeval princes. They were beautiful, but they were not true. Yet they have served a noble purpose, conceived and executed as they were with the passionate faith of a protestant against the ugliness and tawdriness of the industrial 19th century. Morris sought to overthrow the machine. Hand-made paper, hand-cut punches for his types, hand composition, hand press-work: these were the articles of faith in the war against the machine. The result was that there were from 1892 to 1910 a few books printed superbly, almost arrogantly, and a multitude of books monstrous in their ignorance and ugliness. There was nothing between. There was no contact between the two classes.

The second and third decades of the 20th century have seen this contact made. That is their contribution to the art of book printing. The machine has not been tamed—it was never wild; the machine has been *saved*. It has been saved from the corrupt use of its nature. Its nature is to make—to make beautifully. It may make ugly things beautifully, or beautiful things beautifully. But the hand of man cutting letters and printing them painfully on a primitive press upon hand-made paper may make ugliness beautifully just as the machine may. If it is forcing the issue to say that the hand is part of the human machine, it is strictly and relevantly the truth that every type, be it never so hand-designed, hand-cut, hand-cast and hand-set, is a mechanical unit, and that every tool used by Morris in the making of his type, and in his use of it, was essentially a simple form of machine. The whole purpose of printing is to make cheap mechanical reproductions of certain symbols conveying sound and sense. The process of writing and illuminating a ms. in the 12th century is as far removed from the process of hand composition of type as it is from mechanical composition. The wheel, the lever, the wedge, the screw, the pulley—these and these only in less or greater complication make the handpress of Gutenberg and the greatest and latest rotary machine.

The significance of Morris's Kelmscott Press and the other private presses which it inspired (the Doves Press of Cobden-Sanderson and Emery Walker, Hornby's Ashendene Press and Rickett's Vale Press are the most notable) was, therefore, essentially not that they were "hand" presses, but that they were controlled by artists and designers of high competence and honourable enthusiasm. These artists and designers were expert amateurs. Their output was so small and expensive and "precious" as to justify the slightly derogatory sense which the word "amateur" carries; and though it was also conceived lovingly enough to justify the literal sense of the word "precious," it is the fact that the first importance of the private presses lies not in their own productions, but in the effect of their work upon fully mechanical book production. The effect was not first or directly upon the large printing houses. They were very slow to learn. Between them and the lesson were the prejudice of the professional against the amateur, and, even more, many acres and thousands of tons of preposterous type equipment. The first was overcome when it was realized that it was "good business" to be in the typographic movement; the second was disposed of even more completely when type-setting machines replaced the hand compositor in book work—for vast quantities of type became useless, and fetched during the World War a high price as scrap metal.

Modern Methods.—The principal type-setting machines for book work are the monotype and the linotype, of which the former has at present by far the greater variety of good type-faces. The monotype machine produces single types—separate "characters," whereas the linotype machine casts the type in lines, or "slugs." The common virtues of the type-setting machines are that they reduce the cost of composition; that they provide new type for each book; that, as they cast their own letters from matrices, the printer never runs short of a particular type, as he was apt to do in the days of hand composition; and

that type after use is not laboriously "distributed," but put into the melting-pot. The particular merit of the monotype machine is that it possesses at least a score of admirable type faces, as compared with no more than perhaps a dozen really good book types available at great expense to the hand compositor; and that these can be set with a nicety and flexibility of spacing (half the secret of good composition) actually beyond the power of the hand compositor. In short, compared with the old hand processes, the type-setting machine gives a wider range of type-faces with always new types; *can* set these types with greater subtlety; and *does* set them more cheaply. The type-setting machines used with as much skill as hand-set type will give a better result, and, in alliance with fast but very perfect cylinder printing presses, will give this result not to a few but to a multitude. It has taken us from the day of "the book beautiful" and given us the day of the beautiful book. The machine has fulfilled the democratic purpose of printing.

Function of the Typographer.—A new character in the printing industry has appeared to make use of this opportunity. He is the *typographer*. As is the architect to the builder, so is he to the printing house. He may be independent of both publisher and printer, and be called in by one or other as need demands. He may be in the permanent employ of the publisher. He is seldom in the permanent employ of the printer. His is a new profession, a new industrial function. The printer has become the executant. He receives his instructions and obeys them with all his technical skill. He is part of the machine, and his function is that proper to the machine. The machine, let it be repeated, has its own standard of beauty, which we call efficiency. A good printer is an efficient printer. A good typographer is a designer capable of using the mechanical equipment of the printer, the paper-maker and the binder, as tools in the production of a beautiful book. If the printer protests against this delimitation of his power, it must be said that he has in general only himself to blame. The few printers who add typographers to their staff maintain a reputation as something besides executants. The Cambridge University Press, the Curwen Press and the Westminster Press in England are of this class.

Several important English publishing houses—William Heinemann, Jonathan Cape and Chatto and Windus, for example—pay very careful attention to the production of their books. They give to their printer precise instructions as to the size of the page, the "face" or character of type to be used, the closeness or openness of setting, the proportions of type to margin, and their relative positions on the page, the lay-out of the title-page and so on. The results of this initial care and thoroughness are apt of course, to become quickly established as formulae; but they are good formulae, and have assisted materially in the education of public taste in the matter of good book production. It is now a common thing to see the good (or bad) style and printing of a book with no "artistic" pretensions commented on in reviews. This is a distinctly new and encouraging departure for the average commercial book.

The most definite move in the direction of the full and considered use of modern printing equipment has, however, come from certain "semi-private" presses which specialize in the production of "limited editions." The limited edition appeals to three publics: the book collector, who does not read a book so much as fondle it; the speculator, who sees in it an article of commercial profit if the demand much exceeds the supply; and the people who "use books for reading" but still like to have them in a dress appropriate to their subject, and made of pleasant and enduring materials. These three classes in combination make a considerable public. The pre-machine limited edition was very narrowly limited; perhaps 2 or 3 or, rarely, 500 copies might be struck off the hand-press. In 1923 the writer began the publication of fine editions in the making of which the machine was exploited for economy at every point where machine processes were as good as hand processes. The "limit" of the editions was raised to about 1,500 copies, and prices much lower than had before been asked for "fine books" were thus made possible. It was quickly found that a very large public existed in England

UNODC

Now, there are the names of the children of Israel which come into Luke's story. And in the third name, with the rest of the name, I've also had to teach a little bit, and I think this and I think that, and all the souls that are in the house of Jacob were my souls for Jacob was in *Septuaginta* and Joseph died, and all his brethren and all that generation.

[illegible]

And there went a man of the house of Levi, and took to him a slave, but of Levi, and the woman conceived, and bare a son, and when she saw him, that he was a goodly child, she hid him three months. And when she could no longer hide him, she took for him an ark of bulrushes, and daubed it with slime, and with pitch, and put the child therein; and his sister lay on the

A REPRINT OF THE BIBLE ACCORDING TO THE AUTHORISED VERSION OF 1611

1. Binding of the Bible. This volume, comprising the books Genesis to Ruth, is bound in orange decorated with gold
2. Illustrated title page of the same edition of the Bible
3. A page from the Second Book of Moses
4. The final page of the first volume of the Bible. The page design illustrates the Book of Ruth

Jean-François de GALAUP
comte de LA PÉROUSE
1741-1788

est dans les appartements du Roi au château de Versailles. Une pièce sobre. Au mur, des cartes, sur les tables des livres, des manuscrits. Sur une des nippes-mondes, le Roi trace du doigt l'itinéraire d'un long voyage. L'épée au côté, encore jeque dans son uniforme de capitaine de la marine, un homme se tient près de lui et regarde. Le doigt royal va toujours plus loin. Il contourne l'Amérique, remonte vers l'Asie, redescend vers la Chine, erre dans un grand espace bleu. L'Océan. Là sont des terres inconnues. Le doigt s'arrête, comme pour dire: "Vous ne le savez pas." Le capitaine fait signe qu'il a compris.

Le roi, c'est Louis XVI, le capitaine, La Pérouse, Jean-François de Galaup comte de La Pérouse, était né au Gua, près d'Albi, en 1741. Entre à quinze ans dans la marine. La Pérouse conquiert ses grades à la pointe d'épée. La France vient de déclarer la guerre à l'Angleterre. Elle veut soutenir les Américains qui ont proclamé leur indépendance. Avec ses soldais, La Fayette se bat sur le sol même des États-Unis. Pendant ce temps, nos marins sous les ordres d'Orville, d'Estang, de Suffren, de Lamotte-Piquet, affrontent redoublant les flottes anglaises sur toutes les mers. Le jeune La Pérouse prend une part active à ces batailles. A 18 ans, il est blessé et fait prisonnier dans le combat de Belle-Isle. Romain en libère, ses actions d'écrit lui

4

And ek I knowe, of longe tyme agon,
His thewes goode, and that he is nat nyce.
Nauauntour, seith men, certein, he is noon;
To wis is he to doon so gret a vice;
Neals I nyl hym neuere so cherice
That he may make a vaunt by iuste cause;
He shal me neuere bynde in swich a clause.

Now sette a cas, the hardest is, ywis:
Men myghten demen that he loueth me.
What dishonour to myn estat is this?
May ich hym lette of that? Why nay, parde!
I knowe also, and alday here and se,
Men louen wommen al biside hire leue;
And whan hem list no more, lat hem leue!

Ek wot I wel he worthy is to haue
Of wommen in this world the thrifyeste,
As ferforth as she may hire honour saue,
For out and out he is the worthieste,
Saue only Ector, which that is the beste;
And yit his lif lithal now in my cure;
But swich is loue, and ek myn auenture!

Neme to loue, a wonder is it nought;
For wel wot I my self, so god me spede,
Al wolde I that no man wiste of my thought,
I am oon of the faireste out of drede
And goodlieste, who so taketh hede;
And so men seyn in al the town of Troie.
What wonder is, though he of me, haue loye.

and America for books made on this plan, and many other undertakings of somewhat similar style have contributed admirably-made and moderately-priced books to the shelves of the book lover. Traditional style, in this the most significant development of current book production in England, has not been ignored, nor has it been slavishly imitated. There has been a sort of honourable understanding, for instance, that old illustrations and decorations should wherever possible give way to new. Inventiveness in the variations on old typographical themes is recognized and rewarded by a public becoming more and more familiar (chiefly by means of the writings of Stanley Morison and D. B. Updike) with the history of printing and with examples of its most illustrious styles. Thus, things work at present in a virtuous circle. The semi-private presses, which combine the functions of typographer and publisher but not necessarily that of actual printer, have learned from the hand-press a true style which is adaptable to the more fully mechanical processes of an up-to-date printing house, paper mill and bindery. Their support makes economically possible the inventiveness (on the printing side) of the typesetting machine companies, who in their turn are able to offer to the commercial printer excellent characters of types which otherwise he could not possess. Thus contact is made with a great and "untypeconscious" public, which begins to take notice of the physical appearance of its books. From this uninstructed sense of comfort and propriety develops an interest in these books which are made expressly with an eye to beauty, either by well-controlled hand or by well-controlled machine methods.

Modern Typographic Style.—The books of the typographer-publisher presses, most of them reprints, are in general dressed in a format and printed in a type and style created, developed or mitigated for the special requirements of each particular work. If one word can summarize the whole art of the book, it is *suitability*. The modern typographer, unlike the designer of the private press books, has all the equipment of all the printing houses at his disposal in his search after this highly elaborated quality of suitability. Many considerations—the "atmosphere" or the actual date of the text, the nature of the illustrations, with such factors as the desired size of page, or the extent of the contents—will in conjunction suggest the typographer's choice. Of all the lessons which the private or precious presses taught, perhaps the most significant was this: a well-made book is a unity. Subject, paper, type, pictures, binding—all these are to be judged not independently for a self-possessed merit, but each item in relation to the next, and all to the whole. True, Morris and Cobden-Sanderson, in building up a book as a unity, put too much stress upon physical processes. No illustration seemed to them appropriate, for instance, which was not itself printed as a letter-press—a typographical surface of which the raised parts take ink from the roller and impress the paper. But flat surfaces, like the lithographic stone, or intaglio surfaces, such as copper-plates, which require a different printing process, may very well afford entirely suitable results to the eye which is not blinded by pedantry. The great *Daphnis et Chloé* of the Imprimerie Nationale used Garamond's types and lithographic illustrations. And its success or failure is not to be judged by the consideration that in the 16th century lithography had not been invented. There is no limit, except his own inventiveness, to the range of the modern typographer's designs. Such a press as the Doves, on the other hand, maintained a general uniformity of design throughout its publications, because it possessed only its one strongly characteristic type-face, which virtually imposed its own will on the typographer, being capable of but little variety in its disposition on the page.

Book Printing on the Continent.—On the Continent, Germany shows the most interesting recent developments in printing. Just before and after the World War, a number of private presses stimulated the demand for good printing, and provided a training ground for typographic artists. The collapse of the mark spelt ruin to many of these private undertakings; but the typographers, thus released, have turned their attention (with greater benefit to the general reader) to the designing of books for the commercial publishers. The Morris revival in England had a

great though over-appreciated effect upon German typography at the end of the 19th century. The German derivatives of Morris's types and Burne-Jones's illustrations are definitely unpleasant—a kind of mediaeval "art nouveau." The true inspiration of the notable book work done by both private, semi-private and commercial presses in Germany is none the less English. Edward Johnston, the English calligrapher, sent German typographers and type-designers back to the written letter. Upon pen-forms the new German typography is surely founded. Moreover, Rudolph Koch and others experimented with the making of "block books," and learned thereby a pictorial style of letter-making.

The Insel Verlag of Leipzig, one of the many German firms familiar to English collectors of limited editions, has, like other similar firms, turned its attention to the production of unlimited editions at low prices, with marked success. The Propyläen Verlag of Berlin, which has also made many fine limited editions, is issuing a pleasantly printed series of excellent modern editions and reprints at only 2s each. Both of these concerns have maintained the function of typographer with those of printer and publisher.

The printing of novels by some of the leading German firms has been improved out of all recognition. In spite of the fact that the paper used has to be of inferior quality in order that the books can be produced at the prices current in Germany, the efforts made to secure a good impression by means of suitable inking have been so successful that the appearance of the novels published by such firms as Fischer, Ernst Rowholt of Berlin and Kiepenheuer of Potsdam, is highly agreeable. A striking thing about present-day book production in Germany is the use made of patterned papers to give distinction to the covers of cheap books. German typographers also make very excellent use of printers' "flowers" in the decoration of their book covers. Their expert handling of the collotype process of pictorial reproduction means that German books on the fine arts are incomparably better produced than similar books in England. They are also very much cheaper. Germany owes a great deal of her technical expertness in printing, as in other applied arts, to the excellence of her technical schools and institutes, which are supported by the State and served by the best artists and technicians of the day. Switzerland shared in this excellence of instruction, and her standard of book production is also high, following in the main the trend of German development.

In France, the general level of printing is not nearly so high, though certain rather expensive volumes well printed on fine paper have recently appeared, and the standard of the ordinary paper-bound book has risen considerably in the case of the publications of certain houses, among which the *Nouvelle Revue Française* ranks high. The standard of illustration in France is much higher than that of printing; indeed, the value of the expensive French book has hitherto lain almost exclusively in the excellence of its illustrations, with the printing a secondary and unimportant affair. In particular, illustrations coloured by the *pochoir* or stencil process have been brought to a high state of perfection. The pre-War *Gazette du Bon Ton* deserves much credit for this development. The Couluma Press of Argenteuil is responsible for much of the good printing to be found among French books of the day. It is now making a significant addition to its plant of a monotype composing machine. Its handling of monotype material is certain to prove most interesting. What should be a help to the wide dissemination of well-printed books is the custom of certain French publishers of re-publishing their limited editions subsequently in un-numbered editions on cheaper paper. In some instances, there are as many as six editions, ranging downwards according to the paper used and the number of the impression to a final edition costing but a few francs. Unfortunately it often happens that the "imposition," i.e., the setting of the page of type in relation to the margin of the page, goes awry in these reprints, and that the press-work is very poorly done.

Belgian printing is strongly under the influence of France. Belgian books, like French ones, are bound only in paper, and consequently the finest examples of book production in both

France and Belgium are, compared with English books of similar standard, very inexpensive. In Holland there are a number of private presses which have produced good work, but the general level of book production is low. The only strong influence in the direction of improved printing comes from the Enschede foundry, which is not only producing good types, but also printing them very effectively.

Sweden, which formerly followed the lead of Germany in printing matters, has of recent years broken away from this influence, and is developing along her own lines in this as in other branches of applied art. She now favours a much lighter style of printing than that common to Germany, and makes considerable use of "old-face" types rather than of the newer, heavier type faces popular in Germany. But her books maintain a simple sturdiness in their general style as well as in the details of ornamentation, and the "peasant art" motif is clearly discernible.

The contribution of Spain to fine contemporary printing is not large. The monastery of Montserrat is responsible for some strikingly good books. Apart from that, there is a school of competent book printers, whose interest seems to be chiefly in the Didot style in France since the late 18th century.

Italy is not happy in her printers. The average commercial book is very poor, although the Scuola del Libro at Milan is exerting a good influence on the printing trade, and the printing house of Bertieri and Vanzetti has done some good work. But the book as a work of art owes more to, and has more to expect from, the Milan publisher Mondadori, who has recently established his own press at Verona, and has associated with him there Herr Hans Madersteig, whose small editions set in the Bodoni types were unexcelled for their technical skill in all printing history. The State-sponsored editions of d'Annunzio's works have been entrusted to him.

Soviet Russia has contributed some very interesting examples of an aggressive and telling style in printing. The illustrations, in the form of strong and vigorous wood-cuts, are often striking, and the type and style of printing in conjunction with these wood-cuts is provocative and stimulating. The best of these Russian publications have been in the cheaper ranges of book production. No doubt the fact that so many adults in Russia are only now learning to read has had a considerable influence on the very direct and blunt and almost poster-like style of Russian printing.

Czechoslovakia shows a well-informed but definitely conservative taste in printing. Method Kalab of Prague and the national printing office may be mentioned as sources of satisfactory books, employing mainly English monotype faces in their production.

(F. M.)

MODERN AMERICAN

The renaissance of fine book-making, due in England to the unbounded enthusiasm and ability of William Morris and continued in a more restrained style by his disciples, Cobden-Sanderson of the Doves press and others, has had a marked influence on book design and printing in America. The leaders in this revival of the art of the book in the United States were D. B. Updike and Bruce Rogers. But an excellent foundation was laid for them in the closing years of the 19th century and the early part of the 20th by two outstanding printers of a preceding generation: Theodore L. De Vinne and Walter Gilliss.

De Vinne and Gilliss.—The work of De Vinne (1828–1914) fell mostly within the 19th century but continued into the 20th and set a fine example of high standards in the art of printing for the emulation of the younger generation. De Vinne was one of the founders of the Grolier club, the most distinguished among American book clubs, and he planned and printed the majority of its early publications. The De Vinne press not only printed limited editions of fine books for wealthy amateurs, but also established high standards on work which involved, for that period, large scale production; such for instance as the *Century Dictionary*, the *Century Magazine*, and *St. Nicholas*. De Vinne strove constantly to benefit the printing craft, artistically, socially and economically. He was an ardent student of the history of typography and was the author of a number of books on this subject and on the prac-

tice of printing. In book printing his composition was well planned and carefully executed, and the quality of his press-work was unexceptionable. He produced many fine books, the simplest of which are the best, at a time when the printing art in the United States had fallen to deplorable levels. Though not a great artist when compared with some who were to follow him in the next generation, he must be credited with a great accomplishment in the period in which he worked.

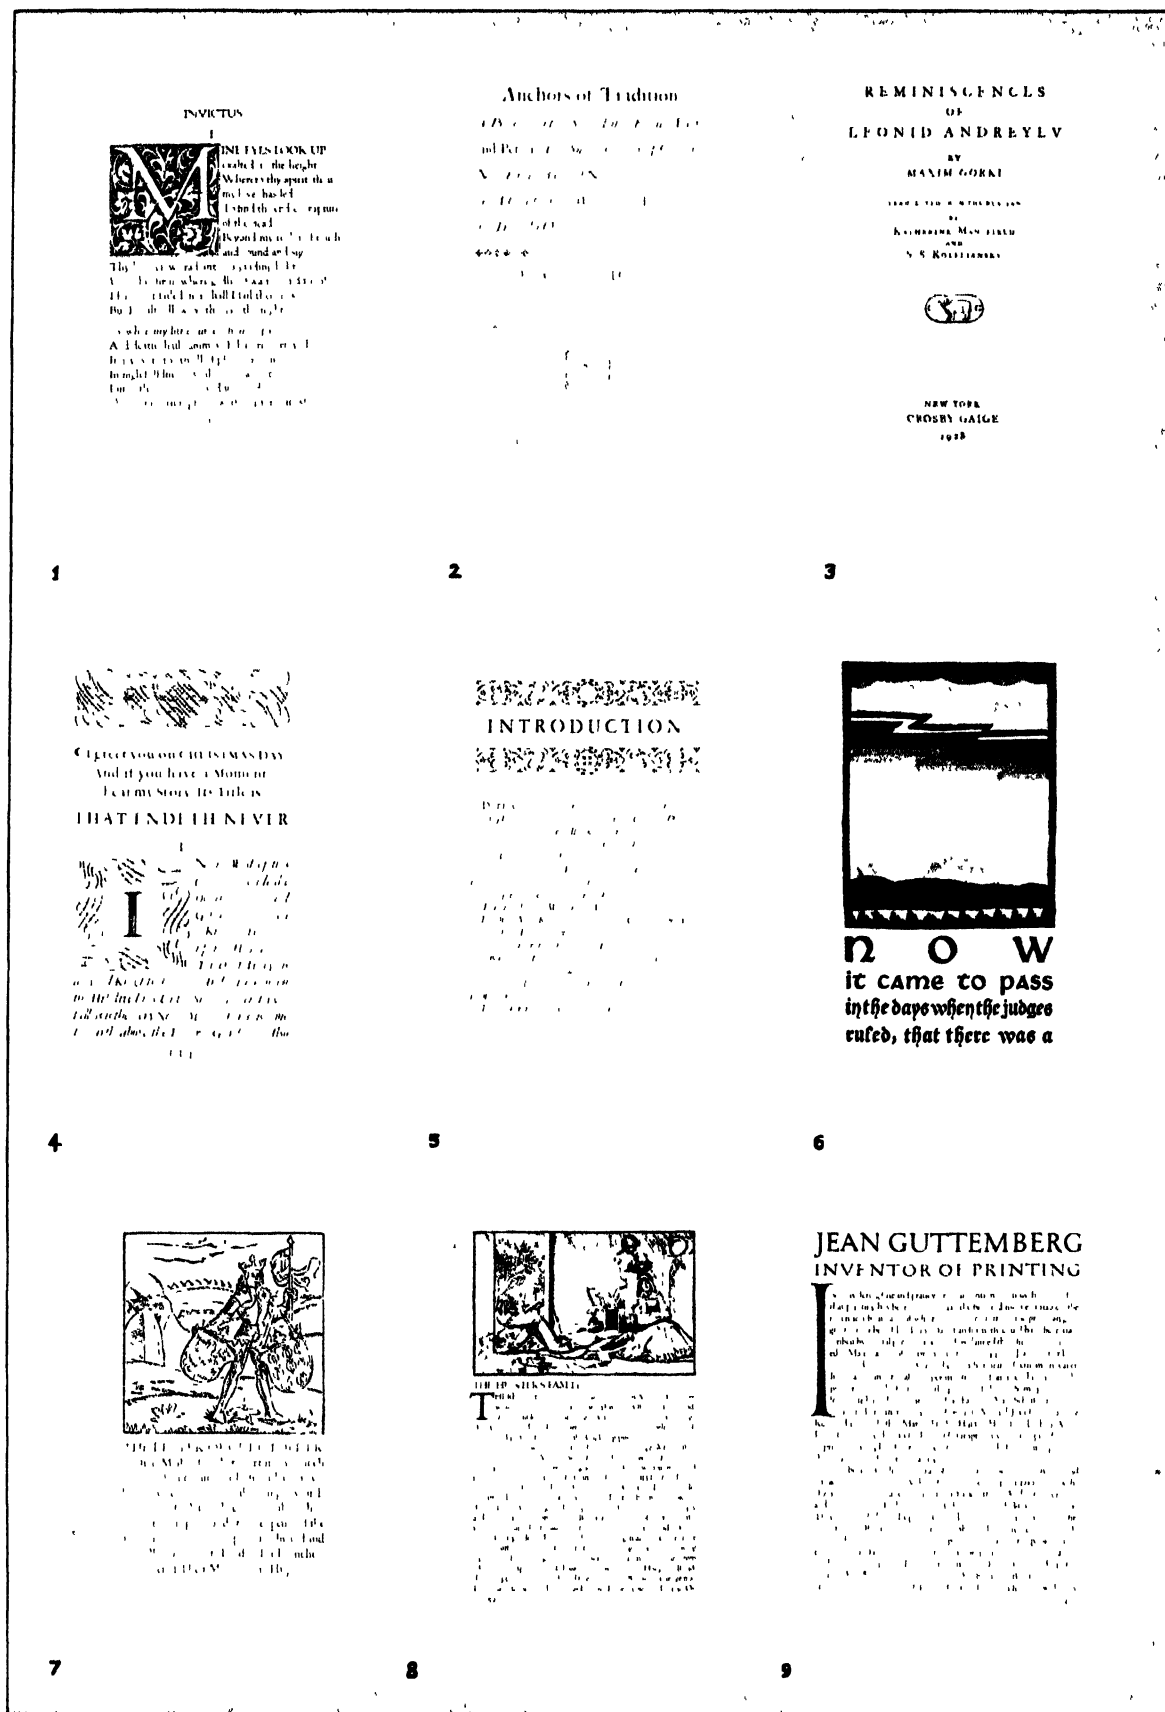

Walter Gilliss (1855–1925) was the other distinguished book printer of De Vinne's generation who did much fine work during the first quarter of the 20th century. During most of this period he did not himself manufacture his printing but he planned it in every detail of typography, paper, printing and binding, and supervised its production with meticulous care. His judgment in visualizing the typography of a book before it was set in type was unerring, a rare faculty among book designers. His original lay-outs, marked with the most minute instructions, were seldom departed from. Most of his work was classical in its simplicity; when he indulged in ornament he appeared to be under 18th century French influence. He was secretary of the Grolier club from its earliest days, and through this and other like connections enjoyed the warm friendship of the leading amateurs of fine books, for many of whom he produced privately printed volumes of great charm—notably the series of dainty volumes for the discriminating bibliophile, William Loring Andrews. He planned much of the printing of the Metropolitan Museum of Art, which has set new standards in institutional printing. His most important book was undoubtedly the *Iconography of Manhattan Island* executed for I. N. Phelps Stokes. At one time in his career, he was concerned also with printing of larger volume, producing *Life* and *Vogue* during the infancy of those periodicals. In the field of type faces, Gilliss was very partial to Elzevir and Caslon and he played a not inconsequential rôle in the revival of the latter face.

The Merrymount Press.—Daniel Berkeley Updike (b. 1860) entered the printing business in 1893 with a very definite ideal; the practice of printing as an art. Yet he aimed to make the enterprise a success financially as well, and has proved that these two ends are not, in every case, mutually exclusive. The first equipment consisted of a composing room only, but later presses were added so that the standards of press-work—too often faulty in well-designed books—might be worthy of the typography. He named his plant the Merrymount press. The first book of importance to be executed was the *Altar Book*, printed in 1896 in the "Merrymount" type, a new face designed for Updike by Bertram Grosvenor Goodhue, the distinguished American architect. The illustrations were by Robert Anning Bell and the borders were designed by Goodhue. A glance at the pages from this book (Plate V. fig. 1) will show to what extent Updike was at this time under the influence of William Morris. The type was black, the borders heavy and the tone of the illustrations in keeping. A pioneer in introducing the Morris style—then a novelty in book-making—in the United States, Updike did not practice it long. Following—and also to a large extent leading—the taste in book design, his printing soon became much lighter in tone. Herbert Horne designed for him a lighter type face, the Montallegro, the punches for which were cut by the celebrated English punch-cutter, Edward P. Prince. It was used first in 1905 in Condi's *Life of Michelangelo Buonarroti* and later in the various volumes of the *Humanists' Library*. Types, in addition to Caslon, which Updike has used most extensively, and with great success, are Montjoye and Oxford, a typefoundry face of earlier years which he has had cast for his own use; also in recent years he has made a limited use of several of the newer types of European origin: Poliphilus, Naudin and Champlévé. Hitherto all his composition has been done in foundry-cast type, set by hand, often by women compositors.

The field of printing in which Updike stands alone is the making of beautiful books by the capable and tasteful use of type alone, without embellishment of any sort, gaining all desired effects of display or emphasis by the use of italic, small capitals, letter spacing, a well-chosen initial here and there, a right relation of sizes, sound spacing between elements on the page and correctly pro-

1. *The Altar Book*, designed by D. B. Updike. 1896. 2. *Isaiah Thomas, Printer, Writer and Collector*, by C. B. Nichols, designed by D. B. Updike. 1912. 3. *Iconography of Manhattan Island* by I. N. P. Stokes, designed by Walter Gillis. 1915. 4. *Catalogue of the John Carter Brown Library*, designed by D. B. Updike. 1919. 5. *The Centaur*, by Maurice de Guerin, designed by Bruce Rogers. 1916. 6. *Geoffroy Tory, Painter and Engraver*, by Auguste Bernard, translated by G. B. Ives and designed by Bruce Rogers. 1909. 7. *The Pierrot of the Minute*, by Ernest Dowson, designed by Bruce Rogers. 1923

PAGE DESIGNS FROM MODERN AMERICAN BOOKS

1. *Songs of the Love Unending*, by Kendall Banning, designed by Frederick and Bertha Goudy. 2. *Anchors of Tradition*, by Caroline Hazard, designed by C. P. Rollins. 3. *Reminiscences of Leonid Andreyev*, by Maxim Gorki, translated by Katharine Mansfield and S. S. Kotliarsky and designed by Frederick Warde. 4. *That Endeth Never*, by Hildegard Flanner, designed by

Porter Garnett. 5. *Plantin's Index Characterum*. 6. *The Book of Ruth*, designed by Edwin and Robert Grabhorn. 7. *The Letter of Christopher Columbus*, designed by Edwin Grabhorn. 8. *The Silverado Squatters*, by R. L. Stevenson, designed by J. H. Nash. 9. *Jean Guttenberg*, translated and designed by D. C. McMurtrie.

portioned margins. All this is done in any one book with the use of one simple face of type in a full range of sizes. The fine artistry he attains by the simplest of means is represented, for example, in a number of college catalogues and reports of institutions, notably in the catalogue of the John Carter Brown library. Updike, however, does not disdain the use of type ornament or other embellishment in proper places, but it is always an incident in the plan of a book rather than the dominating feature of the design. The standards of workmanship at the Merrymount press are exigent, so that well-designed books shall not suffer from blemishes of execution. Updike indulges no fetish regarding handwork where the results he wishes to achieve can be obtained by more effective means. Thus his presswork is done on power-driven cylinder presses of modern type.

In the judgment of many discerning critics, Updike is the best American printer of the current generation. His primacy is due, according to these critics, to the fact that he does not exaggerate in the effort to make beautiful books; he is not restlessly seeking some new device to make a book different from other books for no reason better than a desire for difference. He works on a positive rather than a negative principle, that each book shall be perfectly fit in design to its purpose and subject. If this rule leads him into new fields, he does not hesitate to enter them; should it lead along the paths of tradition he will follow obediently. According to the Merrymount Press's own statement, "an economy of means and a sort of disciplined sobriety mark its product; and this comes about, probably, through aiming at suitability—a quality which involves discarding whatever does not organically belong to the particular work in hand." Updike has rendered a great service to typography in his two-volume work, *Printing Types* (1922), which was awarded the gold medal of the American Institute of Graphic Arts. This book gives a review of the historical development of type design, with a running critique of the aesthetic merits or demerits of the better faces of each period. He is also the author of a series of essays on the work of the printer, *In the Day's Work* (1924), which state many of the principles on which he works. He likewise edited for the Grolier club a reprint of Mores' *A Dissertation Upon English Typographical Founders and Foundries* (1924).

Bruce Rogers.—Bruce Rogers is the most celebrated of the fine printers in America, and his books are now the vogue among collectors, a situation which has led to a sharp appreciation in the market value of the best which he has designed. He has the advantage of being himself an artist of ability and has thus been able to design some of the type faces and almost all the decorations which have gone into the making of his books. Rogers is a traditionalist at heart but he is also endowed with a sprightly inventiveness which has leavened the style of all his work. His first interest in book production was concerned with illustration. He drew for undergraduate publications at Purdue university and after his graduation in 1890 he worked on the art staff of the *Indianapolis News*. Soon after he became acquainted with Joseph M. Bowles who had established an American organ of the "Arts and Crafts" movement called *Modern Art*. Bowles showed Rogers some of the Kelmscott press books which had just begun to appear. They were a revelation to the young artist and, his interest began to widen from illustration alone to embrace the art of the book as an integral whole. In 1895 he designed a few decorations for Thomas B. Mosher, the idealistic publisher of Portland, Me., these being used in an edition of A. E.'s *Homeward Songs by the Way*, in the colophon of which the name Bruce Rogers appears for the first time. In search of financial support Bowles moved *Modern Art* to Boston, and Rogers soon followed to that city—an excellent field for the budding talent of a young book designer. In 1900 Rogers cemented closer a relation already established with the Riverside press of Cambridge, Mass., a special department for the production of fine books in limited editions being set up at that plant under his supervision. From this department issued a succession of charming volumes which promptly won favour with bibliophiles and collectors, many of whom entered subscriptions for all books which might be issued. Time has justified their confidence.

The most attractive feature of the Riverside books was their variety. With the celebrated English presses, to have seen three of their books was to have seen all. With Rogers's work each volume was different, in typography, in decoration (where decoration was used), in format, in binding. And the style of each volume was related, as only a master of book-making could relate it, to the subject of the text it embodied in printed form. Among the more important books produced at Cambridge were the folio *Montaigne* (1902-04), *Franklin and his Press at Passy* (1914), executed for the Grolier club, and a translation of Auguste Bernard's *Geofroy Tory* (1909), for which latter volume Rogers redrew with an exquisite touch the crudely printed but exceedingly beautiful borders engraved on wood by Tory, with the result that they were printed as the great French master would have wished them to appear.

The relation between Bruce Rogers and the Riverside press terminated in 1912 and the designer went abroad for a year. On his return he fell in with Carl Purington Rollins who was operating a small printing office in an old mill, the Dyke mill, at Montague, Mass. Here Rogers printed his perhaps most celebrated book, a slim volume—little more than a leaflet—bound in boards, *The Centaur* by Maurice de Guérin, translated by George B. Ives. This was set in the Centaur type, a very skilful recreation of the great Roman type of Nicolas Jenson, the design and decoration of the book being modelled after the style of Robert Estienne, the French printer of the early 16th century. Only 135 copies were printed, most of these being presented by the designer to his friends. The auction price of this leaflet has gone above \$300.

After a period of work as adviser to the university press in Cambridge, England, Rogers returned to America and became consulting designer of books for William Edwin Rudge who moved to Mt. Vernon, N.Y., a printing plant which had already, in New York City, earned a reputation for printing far above the average. He also became adviser to the Harvard university press. Since his association with Rudge, Rogers' work has shown a new verve. He became enamoured of type ornament—*i.e.*, decorative units cast like single types—and he has used this material in many whimsical and astounding ways. The finest example of its use may be seen in the borders, printed in rose, framing the pages of *Pierrot of the Minute*, by Ernest Dowson, produced in 1923 as one item in the printers' series of the Grolier club. Specimen pages of this book are here shown (Plate V. fig. 7 d). This volume must always be considered among Rogers' finest achievements in creative design. He has also carried the use of type ornament to even more fanciful extremes in several notable pieces of advertisement printing.

Other Eastern Typographers.—Carl Purington Rollins, who operated at Montague, Mass., the press at the Dyke mill already referred to, has been for a number of years typographic adviser to the Yale University Press. In this capacity he has put the impress of beauty upon many trade publications issued at moderate prices. He also operates in his home a private press, performing all the processes of manufacture with his own hands. As a book designer Rollins ranks with the best. His period typography is authentic and ably conceived, and all his work gives evidence of a sure and discriminating taste.

The Village press, whose address has been successively Oak Park, Ill., Hingham, Mass., Forest Hills, L.I., and Marlborough-on-Hudson, N.Y., is a personal enterprise of Frederic W. Goudy and his wife. Village, Kennerley, Forum, Italian old style, and many other fine type faces have been designed by Goudy. The issues of his press, always extremely limited in number, are set in the types he designs, and the decoration used is also a product of Goudy's brush or pen. The pieces are usually small, no large book having issued from the Village press, but they all give evidence of the unquestioned artistry in matters typographic of the master of the press. Being published through no regular channel, their fugitive character makes them the despair of amateurs seeking to acquire a reasonably complete collection.

Elmer Adler is one of the latest entrants into the guild of fine book-making, working in New York under the name of the Pynson Printers. His press is operated as a business enterprise which

makes no concessions to commercialism in the quality of its work. Well grounded in the classic traditions of typography, Adler has been willing to use new types and follow new modes, if they are sound ones, with the result that much of his work is refreshingly original in style without being freakish. As to type faces he has relied principally on Garamond and Bodoni Book, but has also used effectively some of the more modern types, particularly those designed by the German artist, Lucian Bernhard. He has rendered another service to good book-making in having designed, for Alfred A. Knopf, numerous books of general circulation which have exceeded his own manufacturing facilities, and laid out, also for Knopf, the typography of the *American Mercury*.

Frederic Warde, who was doing interesting work as typographic adviser to the Princeton university press, left that institution for extensive travel in Europe, in order to become familiar with Continental book arts and to do work of an experimental character on his own account. While abroad he revived, in collaboration with Stanley Morison, one of the most interesting of the 16th century Italian cursive types, Arrighi, the punches for which were cut by hand. Warde has now returned to America and can be depended upon for some distinguished work in the field of book design.

San Francisco Printers.—From New York and New England it is a long jump to the next centre of fine book printing, San Francisco. The initiative here must be credited to John Henry Nash, a typographer of distinction with personal attributes which have enabled him to make a business success of fine printing, which must often be a hobby, subsidized in one way or another. His way was made the easier by the patronage of a distinguished American collector and he has received other important commissions for the execution of fine books. Nash is an enthusiast for close spacing and his typography is well planned and set. His press-work, which is done outside under his close supervision, is excellent. In style Nash's printing is more flamboyant than that of the other fine printers; he makes generous use of colour, rules and decoration. The possible criticism is that he sometimes strains a little after effect. But he has, on the other hand, the very distinct merit of having established an individual style. He has printed numerous books for the California book club in addition to those commissioned by private collectors, and has also published several handsome volumes on his own account.

Edwin Grabhorn, in association with his brother Robert, has established an enviable reputation within a very few years for doing as fine printing as is done anywhere to-day. He plans his work with exquisite taste in a truly original style. The Grabhorns do all branches of their work in their own small office; hand composition, presswork, illumination and binding. They print their hand-made paper wet, which is becoming a lost art, and attain a uniformity of colour and perfection of impression almost beyond criticism. Both are still young men and much brilliant work may confidently be expected of them.

Taylor and Taylor, also in San Francisco, have done much creditable book printing, and two young men, the Johnson brothers, who work under the name of the Windsor press, show signs of real virtuosity as book typographers.

Recent Contributors.—At the Laboratory press at Pittsburgh, Porter Garnett has not only done some fine printing himself—notably his privately printed volume *That Endeth Never*, a page of which is shown in Plate VI fig 4—but has also made a substantial contribution to the cause of fine printing in America, by training talented students in its principles and artistry. Among the other men who have done or are doing fine work in the book printing field during the 20th century are Spencer Kellogg, Jr., at the Aries press, Eden, N.Y.; Clark Conwell at the Elston press, New Rochelle, N.Y.; William A. Kittredge at the Lakeside press, Chicago; Will Ransom at Chicago; A. B. McCallister at Los Angeles; and Douglas C. McMurtrie at Greenwich, Conn.

Two commercial publishing enterprises deserve consideration in any review of fine book printing in America. The first of these, the Roycroft press at East Aurora, N.Y., founded by Elbert Hubbard, was directly inspired by the work of the Kelmscott press. Its earliest work, done in the spirit of idealism, was good, but as commercial success became the paramount consideration its

standards were lowered. In Portland, Me., Thomas B. Mosher, a publisher with a love for less known items of good literature and excellent taste as to format, produced many lovely volumes which became widely known.

Modern Facilities.—The modern fine printer interested in doing work of the highest quality is fairly well provided with facilities. Modern press equipment, either of the platen or cylinder variety, when properly operated, will deliver impression as perfect as can be obtained on a hand press and with a much greater uniformity in ink distribution. Almost all the finely printed books being produced to-day are printed on power presses. As to type supply, the foundry offerings have improved greatly during the 20th century; the companies making type composing and casting machinery have shown an interest in fine types which they lacked in earlier years, European sources have been tapped for supplies of good types, and a number of the designers have had special faces cut for their own use. As regards paper, a few American mills have been making better and better grades of stock for book printing, though it has been necessary to import the large amounts of hand-made paper which have been required. The quality of ink is reasonably satisfactory though there is still room, in this field, for much improvement. Fine binding is to be had in several centres, the good work being done for the most part by English artisans who have settled in America, but there are also a number of women binders who have taken up this craft in the amateur spirit and have produced highly creditable work.

The cause of fine book-making has received great impetus from the "fifty books" exhibition held annually under the auspices of the American Institute of Graphic Arts. It was difficult to find 50 good books, produced during the current year, worthy of inclusion in the first exhibition in 1923, but with the growth in prestige of this annual show, publishers have displayed a keen rivalry to have their books included among the 50 honoured by the choice of the jury. The exhibition has thus undoubtedly exercised a beneficial influence on the artistry of American book-making, an influence which seems destined to continue. (See TYPOGRAPHY; BOOKBINDING; BOOK-PLATES; PRINTING.)

BOOKS CLOSE, a term indicating the day on which the transfer books of a corporation are closed to permit the making of an accurate list of stockholders to whom to send dividends. Regardless of who may actually own a share of stock, the issuing corporation has no further liability than to send the dividend to the holder whose name is recorded in the transfer books on the day of closing.

BOOKSELLING. The trade in books is of a very ancient date, the oldest reference to it occurring in Egyptian literature. The early poets and orators recited their effusions in public to induce their hearers to possess written copies of their poems or orations. Frequently they were taken down *viva voce*, and transcripts sold to such as were wealthy enough to purchase. A reference in the Talmud seems to show that not only the buying and selling, but also the lending of books was known to the Hebrews in their early history. In the book of Jeremiah the prophet is represented as dictating to Baruch the scribe, who, when questioned, described the mode in which his book was written. These scribes were, in fact, the earliest booksellers, and supplied copies as they were demanded. Aristotle, we are told, possessed a somewhat extensive library; and Plato is recorded to have paid the large sum of 100 minae for three small treatises of Philolaus the Pythagorean. When the Alexandrian library was founded about 300 B.C., various expedients were resorted to for the purpose of procuring books, and this appears to have stimulated the energies of the Athenian booksellers, who were termed *βιβλίων κάπηλοι*. In Rome, towards the end of the republic, it became the fashion to have a library as part of the household furniture; and the booksellers, *librarii* (Cic. *D. Leg.* iii. 20) or *bibliopolae* (Martial iv. 71,

xiii. 3), carried on a flourishing trade. Their shops (*taberna librarii*, Cic. *Phil.* ii. 9) were chiefly in the Argiletum, and in the Vicus Sandalarius. On the door, or on the side posts, was a list of the books on sale; and Martial (i. 118), who mentions this also, says that a copy of his First Book of Epigrams might be purchased for five denarii. In the time of Augustus the great booksellers were the *Sosii*. According to Justinian (ii. 1. 33), a law was passed securing to the scribes the property in the materials used; and in this may, perhaps, be traced the first germ of the modern law of copyright.

The spread of Christianity naturally created a great demand for copies of the Gospels and other sacred books, and later on for missals and other devotional volumes for church and private use. Benedict Biscop, the founder of the abbey at Wearmouth in England, brought home with him from France (671) a whole cargo of books, part of which he had "bought," but from whom is not mentioned. Among the Jews bookselling was well recognized in the middle ages. We read of one bookseller, Aaron, who carried Hebrew mss. into Italy from Toledo, and sold one considerable batch at Perugia. The travelling bookseller was a typical mediaeval figure. Previous to the Reformation, the text writers or stationers (*stacyoneres*), who sold copies of the books then in use—the A B C, the Paternoster, Creed, Ave Maria and other ms. copies of prayers, in the neighbourhood of St. Paul's, London—were, in 1403, formed into a gild. Some of these "stacyoneres" had stalls or stations built against the very walls of the cathedral itself, in the same manner as they are still to be found in some of the older Continental cities. In Henry Anstey's *Munimenta Academica* we catch a glimpse of the "sworn" university bookseller or stationer, John More of Oxford, who apparently first supplied pupils with their books, and then acted the part of a pawnbroker. Besides the sworn stationers there were many booksellers in Oxford who were not sworn; for one of the statutes, passed in the year 1373, expressly recites that, in consequence of their presence, "books of great value are sold and carried away from Oxford, the owners of them are cheated, and the sworn stationers are deprived of their lawful business." It was, therefore, enacted that no bookseller except two sworn stationers or their deputies, should sell any book exceeding half a mark in value, under pain of imprisonment, or, if the offence was repeated, of abjuring his trade within the university.

"The trade in bookselling seems," says Hallam, "to have been established at Paris and Bologna in the 12th century; the lawyers and universities called it into life. It is very improbable that it existed in what we properly call the dark ages. Peter of Blois mentions a book which he had bought of a public dealer, but we do not find many distinct accounts of them till the next age. These dealers were denominated *stationarii*, perhaps from the open stalls at which they carried on their business, though *statio* is a general word for a shop in low Latin. They appear, by the old statutes of the University of Paris, and by those of Bologna, to have sold books upon commission, and are sometimes, though not uniformly, distinguished from the *librarii*, a word which, having originally been confined to the copyists of books, was afterwards applied to those who traded in them.

THE INVENTION OF PRINTING

The modern system of bookselling dates from soon after the introduction of printing. The earliest printers were their own editors and booksellers; but being unable to sell every copy of the works they printed, they had agents at most of the seats of learning. Antony Koburger, who introduced the art of printing into Nuremberg in 1470, although a printer, was more of a bookseller; for, besides his own 16 shops, we are informed by his biographers that he had agents for the sale of his books in every city of Christendom. Wynkyn de Worde, who succeeded to Caxton's press in Westminster, had a shop in Fleet street.

The religious dissensions of the Continent, and the Reformation in England under Henry VIII. and Edward VI., created a great demand for books; but in England neither Tudor nor Stuart could tolerate a free press, and various efforts were made to curb it. The first patent for the office of king's printer was granted to

Thomas Berthelet by Henry VIII. in 1529, but only such books as were first licensed were to be printed. At that time even the purchase or possession of an unlicensed book was a punishable offence. In 1556 the Company of Stationers was incorporated and very extensive powers were granted in order that obnoxious books might be repressed. In the following reigns the Star Chamber exercised a pretty effectual censorship; but, in spite of all precaution, such was the demand for books of a polemical nature, that many were printed abroad and surreptitiously introduced into England. Queen Elizabeth interfered but little with books except when they emanated from Roman Catholics, or touched upon her royal prerogatives; and towards the end of her reign, and during that of her successor, bookselling flourished. Archbishop Laud, who was no friend to booksellers, introduced many arbitrary restrictions, but they were all, or nearly all, removed during the time of the Commonwealth. An order of parliament in 1643 provided that no book should be printed or "put on sale," "unless the same be first approved of and licensed" by the persons appointed by the Government. Booksellers' shops were even liable to be raided in the search for contraband books. It was against this order that Milton wrote his *Areopagitica* (1644). So much had bookselling increased during the Protectorate that, in 1658, was published *A Catalogue of the most Vendible Books in England, digested under the heads of Divinity, History, Physic, etc., with School Books, Hebrew, Greek, and Latin, and an Introduction, for the use of Schools*, by W. London. A bad time immediately followed. The Restoration also restored the office of Licensor of the Press, which continued till 1694.

In the first English Copyright Act (1709), which specially relates to booksellers, it is enacted that, if any person shall think the published price of a book unreasonably high, he may thereupon make complaint to the archbishop of Canterbury, and to certain other persons named, who shall thereupon examine into his complaint, and if well founded reduce the price, and any bookseller charging more than the price so fixed shall be fined £5 for every copy sold. Apparently this enactment remained a dead letter.

In the course of the 16th and 17th centuries the Low Countries for a time became the chief centre of the bookselling world, and many of the finest folios and quartos in our libraries bear the names of Jansen, Blauw or Plantin, with the imprint of Amsterdam, Utrecht, Leiden or Antwerp, while the Elzevirs besides other works produced their charming little pocket classics. The southern towns of Douai and St Omer at the same time furnished polemical works in English.

For later times it is necessary to make a gradual distinction between *booksellers*, whose trade consists in selling books, either by retail or wholesale, and *publishers*, whose business involves the production of the books from the author's mss. and who are the intermediaries between author and bookseller. The article on PUBLISHING (*q.v.*) deals more particularly with this second class, who, though originally booksellers, gradually took a higher rank in the book-trade, and whose influence upon the history of literature has often been very great. The convenience of this distinction is not impaired by the fact either that a publisher is also a wholesale bookseller, or that a still more recent development in publishing (as in the instance of the direct sale in 1902, by the London Times, of the supplementary volumes to the 9th edition of the *Encyclopædia Britannica*, which were also "published" by *The Times*) started a reaction to some extent in the way of amalgamating the two functions. The scheme of *The Times Book Club* (started in 1905) was, again, a combination of a subscription library with the business of bookselling (*see NEWSPAPERS*); and it brought the organization of a newspaper, with all its means of achieving publicity, into the work of pushing the sale of books, in a way which practically introduced a new factor into the bookselling business.

During the 19th century it remains the fact that the distinction between publisher and bookseller—literary promoter and shop-keeper—became fundamental. The booksellers, as such, were engaged either in wholesale bookselling, or in the retail, the old or second-hand, and the periodical trades.

Coming between the publisher and the retail bookseller is the important distributing agency of the *wholesale bookseller*. It is to him that the retailer looks for his miscellaneous supplies, as it is simply impossible for him to stock one-half of the books published. In Paternoster Row, London, which has for over 100 years been the centre of this industry, may be seen the collectors from the shops of the retail booksellers busily engaged in obtaining the books ordered by the book-buying public. It is also through these agencies that the country bookseller obtains his miscellaneous supplies. At the leading house in this department of bookselling almost any book can be found, or information obtained concerning it. At one of these establishments over 1,000,000 books are constantly kept in stock. It is here that the publisher calls first on showing or "subscribing" a new book, a critical process, for by the number thus subscribed the fate of a book is sometimes determined.

What may be termed the third partner in publishing and its ramification is the *retail bookseller*; and to protect his interests there was established in 1890 a London booksellers' society, which had for its object the restriction of discounts to 25%, and also to arrange prices generally and control all details connected with the trade. The society a few years afterwards widened its field of operations, and its designation then became "The Associated Booksellers of Great Britain and Ireland."

The trade in old or (as they are sometimes called) second-hand books is in a sense a more specialized class of business, requiring a knowledge of bibliography, while the transactions are with individual books rather than with numbers of copies. Occasionally dealers in this class of books replenish their stocks by purchasing remainders of books, which, having ceased from one cause or another to sell with the publisher, they offer to the public as bargains. The most recent enactment that affects the second-hand bookseller is that directed against the underhand so-called "knock-out" system, by which at great book-sales, a ring of buyers conspired to bid low and buy in the books at knock-out prices. The periodical trade grew up during the 19th century, and was in its infancy when the *Penny Magazine*, *Chambers' Journal* and similar publications first appeared. The growth of this important part of the business was greatly promoted by the abolition of the newspaper stamp and of the duty upon paper, the introduction of attractive illustrations, and the facilities offered for purchasing books by instalments.

EARLY BOOKS IN MEXICO

The history of bookselling in America has a special interest. The Spanish settlements drew away from the old country much of its enterprise and best talent, and the presses of Mexico and other cities teemed with publications, mostly of a religious character.

The prologue of printing and bookselling in the New World was, in fact, written in Mexico City. Cortez landed at the harbour which he called Vera Cruz on Good Friday, 1519; within eighteen years a book press was in operation in the former capital of the Aztecs. At the instance of the first Viceroy, Don Antonio de Mendoza, and the first bishop, Don Fray Juan de Zumarraga, the famous printer of Seville, Juan Cromberger, sent to Mexico a printing press with all needed supplies, in charge of Juan Pablos, a Lombard from Brescia, originally known as Giovanni Paoli. It is probable that this was in the year 1536, and that in 1537 was printed the first book: *Escala Espiritual* of St. John Climacus, translated from Latin into Spanish by Fray Juan de Estrada. What is known with certainty is that in May 1538 a printing press had been established, and that in April 1540, "it was situated on the southwest corner of Cerrada de Santa Teresa la Antigua and Moneda streets, facing the wall of the Archbishop's palace" (*Bibliografía mexicana del siglo xvi.*, por Joaquín García Icarbalceta). A *Manual de Adultos*, with the imprint of Juan Pablos, was issued in 1540.

Among early books printed in Mexico, one of the most interesting is the *Three Dialogues*, by Francisco Cervantes Salazar, which has the imprint, "Mexici, apud Joannem Paulum Brisensem, 1554." A traveller from old Spain visits the capital city of New Spain, and is entertained by two worthy inhabitants. They

propose to show him the beauties of the town, and set forth together on horseback along Tacuba street, the charms of which are related in their conversation:

"How the view of this street delights the mind and refreshes the eyes! How wide and ample it is, how straight, how level, all paved with stones, lest in winter the feet be mired. Along its centre, for ornament and use, flows water in its channel, open to the sky, that it may give the greater pleasure. All the houses on both sides are splendid and costly, such as befit the richest and most noble citizens; they are so built that they might be called, not houses, but citadels."

The hosts of the visitor explain that these mansions are solidly built because it was impossible in the beginning to gird the city with walls and towers as a protection against the multitude of enemies surrounding it. All the residences along the great street were, we are told, nearly of the same height, so as not to rob each other of the sun and also as a precaution against earthquakes. Further, it was thought that the free course of the winds through the city would ensure the health of its inhabitants. Nor were these dwellings built of wood or other common material, but rather of great stones artistically set, with the insignia of their lords carved above the doors. The roofs were flat. The visitor admires the palace of the Viceroy, greater and loftier than the rest, adorned with many columns and surmounted by a tower: "It is not a palace," he exclaims, "but another city!" On the tower of the palace was a clock with chimies.

They visit the great square, where were held the markets, the merchants of the whole province bringing their wares thither. There, perhaps, were also exhibited the first books printed and sold in the New World. One of the most valuable of these books was the *Spanish-Aztec Dictionary* of Alonso de Molina, printed in 1571. Several copies of this finely printed work are extant.

See Luis Gonzalez Obregon, *Mexico Viejo* (Paris-Mexico, 1900).

THE UNITED STATES

Early History.—The first authentic reference to the trade of bookselling in America appears among the early manuscript records of Harvard college. In 1638, the Rev. Joseph Glover, an English dissenting clergyman, decided that the American Colonies stood in need of aids to the faith such as he might be able to supply. He therefore solicited funds in England and Holland, purchased a printing press, a font of type and other necessary materials, engaged one Stephen Day as printer and three men servants as helpers, and thus equipped, set sail for Boston with his wife and children in the summer of the same year. He died en route; his widow soon after married the Rev. Henry Dunster of Harvard college in whose house the press was set up in the late autumn and commenced operations at once with various pamphlets and books in the service of church and State.

In 1647 appeared "An Almanack. . . By Samuel Danforth, of Harvard College. . . Cambridge. Printed by Matthew Day Are to be sold by Hez. Usher at Boston. 1647." Pioneer Boston was followed by Philadelphia and New York 38 years later with another almanac whose imprint read: "Printed and sold by William Bradford, sold also by the author and H. Murrey in Philadelphia and Philip Richards in New York. 1685." Again Boston led when the first private library, that of "The Late Reverend and Learned Mr. Samuel Lee" is "Exposed . . . to sale by Duncan Campbell" in 1693, and scored once more when "the curious and valuable books belonging to the late Reverend and Learned Ebenezer Pemberton" were catalogued and offered for sale by auction on July 2, 1717. Book catalogues of general interest were few and far between in the 18th century and it was not until 1795 that one appeared in Philadelphia: that of the Moreau de St. Mery & Company's store which listed books in Spanish, Italian, German, Dutch and Latin, with over 900 items in French.

The 19th Century.—Booksellers of English Colonial America appear to have found little favour with the historian; title-pages and colophons note many names that are difficult or impossible to trace elsewhere, and the sale of books at retail was usually an adjunct to printing and publishing. But the year 1801 marks

a striking departure through the organization of The American Company of Booksellers for the purpose of promoting the sale of books by means of fairs similar to those held annually at Leipzig. Matthew Carey of Philadelphia was the first president; a majority of the members were citizens of New York, Boston and Philadelphia. Sales at auction would appear to have fallen into disrepute at this period as one of the rules of the company forbade any member to dispose of books by this method.

In 1802 24 New York booksellers agreed to sponsor the "Literary Fair" to be held in that city in June and invited other booksellers in towns "accessible to water" to attend and to bring samples of such books as they desired to sell or exchange. The long room of the old Coffee House in Beaver street was the site chosen, and a substantial success may be inferred from the fact that at the close of the proceedings the New York members entertained their visitors at a banquet. The Philadelphia members were hosts at the second fair which began on June 20, 1803 during the course of which one Jacob Johnson of Philadelphia was awarded the company's prize of \$50, "or a gold medal of equal value," for having submitted the best specimen of printing ink of American manufacture, one that the members found superior to the London ink which they had hitherto used. The company continued to prosper; membership increased; new by-laws and articles of association were adopted at a meeting in New York in 1804, and another fair was held in Newark the following year, whereupon the company mysteriously dissolved "owing to a general dissatisfaction."

In 1802, ten New York individuals and firms formed The New York Association of Booksellers to publish and sell school and text-books, and began with a Cicero in Latin and English. Philadelphia followed with a small organization of similar purpose during the next year, but both enterprises were short-lived. 1804 saw the publication of "A Catalogue of all the Books printed in the United States . . . Published by the Booksellers in Boston." This was a pamphlet of 79 pages listing 1,338 books divided among the categories of "Law, Physics, Divinity, Bibles, Miscellanies, School-Books and Singing-Books." Book trade cataloguing then languished until 1820 when Orville A. Roorbach began to compile a comprehensive record of American books which remained in the press until 1849 when it was finally concluded and published. Addenda were supplied by the author and other publishers during the following year. *Norton's Literary Adviser*, in the nature of a trade journal, appeared in May 1851 and suffered various changes in style, title and ownership until Jan. 1872 when it appeared as *The Weekly Trade Circular*, and in 1873 became *The Publisher's Weekly*, continuing to-day its valuable career as official trade paper of the booksellers of the United States.

During a large part of the 19th century books, largely for scholars and libraries, were imported from Europe. After the War of 1812 printing-presses multiplied rapidly, and with the spread of newspapers and education there also arose a demand for books, and publishers set to work to secure the advantages offered by the wide field of English literature, the whole of which they had the liberty of reaping free of all cost beyond that of production. The works of Scott, Byron, Moore, Southey, Wordsworth, and indeed of every author of note, were reprinted generally without the smallest payment to author or proprietor. Half the names of the authors in the so-called "American" catalogue of books printed between 1820 and 1852 were British. By this means the works of the best authors were brought to the doors of all classes at low prices and in a great variety of forms. After the Civil War, as a consequence of the high price of labour and the restrictive duties imposed in order to protect native industry, coupled with the frequent intercourse with England, a great change took place, and American publishers and booksellers, even while there was still no international copyright, made liberal offers for early sheets of new publications. During this period Boston, New York and Philadelphia retained their old supremacy as bookselling centres.

Modern Conditions.—Bookselling, as a retail enterprise apart from publishing and printing, developed slowly during the 19th century. A majority of the important publishers maintained departments for the sale at retail of their own publications and

those of their brothers-in-trade; but such departments were usually subsidiary and were adulterated by stationery, playing cards and other foreign matter. Clergymen, pedagogues and members of other professions were allowed discounts ruinous to profit; it was not until the turn of the century that a concerted and determined effort was made to place the trade independently upon a proper basis. In May 1900, there was organized and incorporated in New York city The American Booksellers Association for the principal purpose of enabling its members to establish and maintain the net price system. The retail price for all books intended for general sale was fixed by the publisher, discounts to the trade were arranged upon a sliding scale according to quantity, and bookselling at retail entered upon its first period of comparative stability and security. Under able and energetic management and with the hearty co-operation of the publishers, the association maintains to-day a thriving and exceptionally stimulating trade organization. Its only serious reverse occurred early in its career, when the principle of price maintenance was assailed by a department store in the metropolitan district which filed suit for damages under the Federal law known as the Sherman Act, claiming that the price arrangement between bookseller and publisher constituted "a combination in restraint of trade." After long and costly litigation, the case was decided in favour of the plaintiff who, with other stores of the kind, continues to sell books at less than the price fixed by the publisher.

Current Bookselling.—Consideration of current conditions must begin with *The American Book Trade Directory*, New York, 1928, which lists 5,600 booksellers in the United States, divided among the following categories: circulating library; department store; drug store; educational; college texts; school texts; foreign; general bookstore; gift shop; books at holidays only; juveniles; law; medical; periodicals; old and rare; religious, second-hand; subscription books; wholesale, and fine editions and modern firsts. This is the first authoritative publication of such a list; earlier figures are contradictory and unreliable, but the categories alone indicate the growth in public interest and the increased distribution of the trade.

Periodicals relating directly or indirectly to the bookseller, and newspapers and magazines devoting more or less space to the reviewing of books also showed a striking growth during the same year. Publishers' records of chain stores—circulating libraries, drug and department stores—showed a greater volume of sales and a broadening of the demand for books other than fiction. One of the leading publishing houses at this time had increased the number of its branch bookshops to 26; one company operating as a circulating library, but also selling at retail, reported 53 stores in 14 cities and towns. Another marked increase is recorded in the number of new shops which concentrate on books of a special type or kind, or which emphasize a certain subject: a glance at the New York City *Telephone Directory* reveals firms devoted exclusively to art, philosophy, drama, Irish books, Orientalia and books in many foreign languages. A number of the larger cities support at least one shop which sells children's books only and which is specially decorated and equipped to appeal to the juvenile reader.

The largest and most inclusive stocks for the general book-buyer are still to be found in the older stores, most of which bear the names of well-known publishers; but the smaller shops more recently established are usually staffed by assistants of a new type who read widely, study the leading English and American reviews, and are thoroughly prepared to supply, if requested, exceptionally efficient and intelligent advice and suggestions, in addition to the conventional filling of orders. Co-operative shops appear to thrive best in college and university towns; membership in these is secured by the purchase of one or more shares of stock at a nominal price; dividends are paid at the prevailing rate of interest, and members are entitled to a discount on their purchases.

In recent years, modern first editions have become an important factor and are responsible for a number of newcomers to the trade, especially in the larger cities, early "firsts" of the more esteemed contemporary authors have registered sensational ad-

vances in price: a fine copy of Rudyard Kipling's "Schoolboy Lyrics," published at a few shillings in 1881, sold in 1924 for \$1,500 and in 1928 for \$3,500. The interest in and demand for old and rare books has resulted in an unprecedented rise in values during the last few years and corresponding prosperity to this ancient and honourable branch of the trade. The following comparative table of approximate prices is revealing:—

| | | |
|---|---------------|-------------|
| Boswell's <i>Life of Johnson</i> (boards) | 1903—\$ 37 50 | 1928—\$2500 |
| Defoe's <i>Robinson Crusoe</i> | 1900—\$ 7.50 | 1926—\$3525 |
| Swift's <i>Gulliver's Travels</i> | 1900—\$ 56.00 | 1927—\$4200 |
| Omar-Fitzgerald's <i>Rubasyat</i> | 1901—\$260.00 | 1927—\$3250 |

An interesting phenomenon in present-day bookselling is the rise and growth of the Book Club organized upon a national scale. Two, operating at the present time, 1928, may be taken as fair examples. Their general features are similar: a board of editors, authors and critics who choose one new book per month, or offer a choice of several, for distribution among the members. In the case of the first club, the editorial board reports one month in advance to the members who then make their selection and agree to purchase not less than four books per year at the published price, postage extra; payments monthly within ten days of receipt of bill. The second club allows no appeal from the rulings of its board as to the most desirable book for its members each month, but offers its selection postage prepaid, at a reduction from the retail price to the public. Payment for a year's service may be made in advance, in full or in instalments. The first club, beginning in April 1926, with 4,500 subscribers recorded a membership of 85,000 in Sept. 1928; the second increased from 5,732 in March 1927 to 55,000 in Sept. 1928.

Second-hand booksellers are now widely distributed throughout the country. These dealers buy private libraries and the overstock of publishers and retailers which they dispose of at less than list prices by direct sale and catalogues by mail. Many agencies assist in the marketing of books at retail. The R. R. Bowker Company supplies *The Trade List Annual* which consists of the catalogues of all publishers of importance to the general trade bound in one volume. The H. W. Wilson Company, New York, issues *The United States Catalogue* with frequent supplements, which contains a list of all books, pamphlets and documents published in the United States, arranged in one alphabet under author, title and subject. A similar index of current books appears in each issue of the *Publisher's Weekly*. These three publications are indispensable to the general bookseller. Another aid of great value is the National Association of Book Publishers which supplies the retail trade with various means for the development of new outlets, in addition to the usual medium of advertising in newspapers and magazines. This association publishes and mails gratis the bi-monthly *Year-Round Bookselling News*, a pamphlet of practical advice and suggestion for all branches of the trade. It also provides original and striking posters for display; descriptive circulars of sets, series and single volumes with the booksellers' imprint and return-order blanks; ably written and attractively printed pamphlets concerned with such details as the increasing of mail orders, improvement in shop arrangement, equipment and display; bookkeeping and accounting; and rental libraries.

Women Booksellers.—In conclusion, mention must be made of the extraordinary increase during recent years in the number of women booksellers. Those with college training, and especially those who have specialized in English and in languages, are most acceptable as assistants and usually most competent as managers. Successful bookselling of to-day must combine exceptional taste in literature with shrewd judgment in buying; and it is significant to record that the number of bookshops in the United States owned and operated exclusively by women has grown from the negligible minority of only a few years ago to over 390 in 1928. (T. B. H.)

BOOKS OF ACCOUNT, a complete system of accounting records used by a person, business or organization for the purpose of providing a permanent entry of financial transactions. The financial status of an individual or an organization can be accurately determined only through the operation of an adequate set of

books of account. A small business may require only a journal (*q.v.*) and a ledger (*q.v.*) whereas a larger business might need several types of journals (general, private, purchase, sales, cash, etc.) and several types of ledgers (general, private, accounts receivable, accounts payable, stock, etc.). Except in those organizations which come within the jurisdiction of government bureaux or commissions, business concerns are permitted complete freedom in selecting their books of account (see ACCOUNTING; BOOK-KEEPING).

BOOK-SCORPION or **FALSE SCORPION**, a minute arachnid superficially resembling tailless scorpions and belonging to the order Pseudoscorpiones of the class Arachnida. Occurring in all temperate and tropical countries, book-scorpions live under stones, beneath bark or in vegetable detritus. A few species, however, like the common British forms *Chelifer cancroides* and *Chiridium museorum*, are frequently found in books, old chests, etc.; others like *Ganypus littoralis* under stones between tide-marks; while others, for the most part blind, live in dark caves. Their food consists of minute insects or mites. For safety during hibernation and moulting, book-scorpions spin a small spherical cocoon. The eggs are carried about by the mother, attached to her lower surface, and the young remain with their parent until they acquire their definite form.

BOOK VALUE, the monetary value of an asset as shown in the books of account (*q.v.*). The book value is calculated by deducting from the cost price as shown on the books the depreciation which has been set up against it. Thus the book value of a machine which cost \$1,500 and which has been depreciated \$300 would be \$1,200. An *appraised value* might be higher or lower than the *book value*. The book value of a share of common stock in a company having no preferred issues is determined by dividing the excess of assets over liabilities by the number of shares outstanding. The *market value* of the share as indicated by quotations on a securities exchange might be higher or lower than the *book value* of the share. Generally speaking, there need not be any close coincidence between the book value and the appraised value or the market value. (See VALUE.)

BOOLE, GEORGE (1815–1864), English logician and mathematician, was born in Lincoln on Nov. 2, 1815, the son of a tradesman of limited means. When about 16 years of age, Boole became assistant-master in a private school at Doncaster. Later he established a successful school at Lincoln, and in 1849 was made professor of mathematics in Queen's college, Cork. Boole's earliest published paper, on the "Theory of Analytical Transformations," printed in the *Cambridge Mathematical Journal* for 1839, led to a friendship with D. F. Gregory, the editor. Only two systematic treatises on mathematical subjects were completed by him during his lifetime. The well-known *Treatise on Differential Equations* appeared in 1859 (supplementary posthumous volume, 1865), and was followed, the next year, by a *Treatise on the Calculus of Finite Differences*, designed to serve as a sequel to the former work. In the 16th and 17th chapters of the *Differential Equations* there is a lucid account of the general symbolic method, the bold and skilful employment of which led to Boole's chief discoveries, and of a general method in analysis, originally described in his famous memoir printed in the *Philosophical Transactions* for 1844. Boole was one of the most eminent of those who perceived that the symbols of operation could be separated from those of quantity and treated as distinct objects of calculation.

With the exception of Augustus de Morgan, Boole was probably the first English mathematician since John Wallis who had also written upon logic. Speculations concerning a calculus of reasoning had occupied Boole's thoughts, but it was not till the spring of 1847 that he put his ideas into the pamphlet called *Mathematical Analysis of Logic*. Boole afterwards regarded this as a hasty and imperfect exposition of his logical system, and he desired that his much larger work, *An Investigation of the Laws of Thought, on which are founded the Mathematical Theories of Logic and Probability* (1854), should alone be considered as containing a mature statement of his views. He did not regard logic as a branch of mathematics, as the title of his earlier pamphlet might be taken to imply, but he pointed out such a deep analogy between the symbols

of algebra and those which can be made, in his opinion, to represent logical forms and syllogisms that we can hardly help saying that logic is mathematics restricted to the two quantities, 0 and 1. By unity Boole denoted the universe of thinkable objects; literal symbols, such as x , y , z , v , u , etc., were used with the elective meaning attaching to common adjectives and substantives. Thus, if x =horned and y =sheep, then the successive acts of election represented by x and y , if performed on unity, give the whole of the class *horned sheep*. Boole showed that elective symbols of this kind obey the same primary laws of combination as algebraical symbols, whence it followed that they could be added, subtracted, multiplied and even divided, almost exactly in the same manner as numbers. Thus, $1-x$ would represent the operation of selecting all things in the world except *horned things*, that is, *all not horned things*, and $(1-x)(1-y)$ would give us *all things neither horned nor sheep*. By the use of such symbols propositions could be reduced to the form of equations, and the syllogistic conclusion from two premises was obtained by eliminating the middle term according to ordinary algebraic rules.

Still more original and remarkable, however, was that part of his system, fully stated in his *Laws of Thought*, which formed a general symbolic method of logical inference. Given any propositions involving any number of terms, Boole showed how, by the purely symbolic treatment of the premises, to draw any conclusion logically contained in those premises. The second part of the *Laws of Thought* contained a corresponding attempt to discover a general method in probabilities, which should enable us from the given probabilities of any system of events to determine the consequent probability of any other event logically connected with the given events. Boole died on Dec. 8, 1864.

For Boole's memoirs and detached papers see *Catalogue of Scientific Memoirs*, published by the Royal Society, and the supplementary volume on *Differential Equations*, edited by Isaac Todhunter. In the *Cambridge Mathematical Journal* and its successor, the *Cambridge and Dublin Mathematical Journal*, and in the *Philosophical Magazine* there are other papers. The Royal Society printed six important memoirs in the *Philosophical Transactions*, and a few other memoirs are to be found in the *Transactions of the Royal Society of Edinburgh* and of the *Royal Irish Academy*, in the *Bulletin de l'Académie de St. Pétersbourg* for 1862 (under the name G. Boldt, vol. iv pp. 108-215), and in *Crelle's Journal*. See R. Harley's article in the *British Quarterly Review*, July, 1866, No. 87. (W. S. J.)

BOOM, a pole, bar or barrier (*cf.* Ger *Baum*, tree, Eng. beam); applied as a nautical term to a long spar used to extend a sail at the foot (main-boom, jib-boom, etc.). In the sense of a barrier, a boom is generally formed of timber lashed together, or of chains, built across the mouth of a river or harbour as a means of defence. The "boom" of a cannon, the cry of the bittern, etc., is a different and onomatopoeic word.

In trade, the word boom has two applications. First, it is used colloquially as the equivalent of to push or to advertise energetically; to carry through with a rush and a roar. Hence, no doubt, the derivation from boom, a loud roar or rumble, as in the boom of a gun, boom being a word imitative of the sound it describes. In this sense of booming a thing by sounding its merits, the origin was American. In 1878 Mr. J. B. McCullagh, according to his own statement to *The Century Dictionary* used the term in the Grant presidential campaign through his familiarity with its use by Mississippi pilots to describe the rapid swelling and rising of the river. So he came to speak of the Grant campaign as "booming," and the term passed into general English-speaking use.

In a second sense, the word "boom" is commonly applied to the peak of a trade cycle as opposed to its lowest point which is often called the slump: the two words are now in common use as an expressive pair of antithetical terms.

BOOMERANG, a weapon of the Australian aborigines and other peoples, chiefly used as a missile. The word is taken from the native name used by a single tribe in New South Wales. It is not connected with the *womera* or spear-thrower. Two main types may be distinguished: (a) the return boomerang; (b) the non-return or war boomerang. Both types are found in most parts of Australia; the return form was, according to General Pitt-Rivers, used in ancient Egypt; and a weapon closely resem-

bling the boomerang survives to the present day in north-east Africa, with allied forms made of metal (throwing knives). In south India is found a boomerang-shaped instrument which can be made to return. The Hopis (Moquis) of Arizona use a non-return form. The general form of both weapons is the same. They are sickle-shaped, and made of wood (in India of ivory or steel). The thickness is about $\frac{1}{4}$ th of the breadth, which again is $\frac{1}{2}$ th of the length, the last varying from 6 in. to 3 or 4 ft.

AUSTRALIAN BOOMERANG

Illustration shows the centre of gravity, and the movement of the weapon around this centre, when in flight

The return boomerang, which may have two straight arms at an angle of from 70° to 120° , but in Australia is always curved at an angle of 90° or more, is usually $1\frac{1}{2}$ to 2 ft. in span, and weighs some 8 oz.; the arms have a skew, being twisted 2° or 3° from the plane running through the centre of the weapon, so that B and D (*see fig.*) are above it, A and E below it; the ends AB and DE are also to some extent raised above the plane of the weapon at C; the cross section is asymmetrical, the upper side in the figure being convex, the lower flat or nearly so; this must be thrown with the right hand. The non-return boomerang has a skew in the opposite direction, but is otherwise similar.

The peculiarity of the boomerang's flight depends mainly on its skew. The return boomerang is held vertically, the concave side forward, and thrown in a plane parallel to the surface of the ground, as much rotation as possible being imparted to it. It travels straight for 30 yds or more, with nearly vertical rotation; then it inclines to the left, lying over on the flat side and rising in the air; after describing a circle of 50 or more yards in diameter it returns to the thrower. Some observers state that it returns after striking the object; it is certainly possible to strike the ground without affecting the return. Throws of 100 yds. or more, before the leftward curve begins, can be accomplished by Australian natives, the weapon rising as much as 150 ft. in the air and circling five times before returning. The non-return type may also be made to return in a nearly straight line by throwing it at an angle of 45° ; normally it is thrown like the return type and will then travel an immense distance. No accurate measurements of Australian throws are available, but an English throw of 180 yds. has been recorded, compared with the same thrower's 70 yds. with the cricket ball.

The war boomerang in an expert's hand is a deadly weapon, and the lighter hunting boomerang is also effective. The return boomerang is chiefly used as a plaything or for killing birds, and is often as dangerous to the thrower as to the object at which it is aimed.

BOONE, DANIEL (1734-1820), most famous of American pioneers and backwoodsmen, was born probably on Nov. 2, 1734, near the present city of Reading (Pa.), but moved to the Yadkin valley with his family in his youth. A wagoner and blacksmith in Braddock's disastrous expedition, a wandering hunter and trapper who in 1765 visited Florida and bought a lot intending to settle there, by a strange trick of tradition he has been extolled as the discoverer and founder of Kentucky and has more than any other individual moulded the frontier legend. Many white men had traversed the "dark and bloody ground" before Boone, including John Finley, Boone's guide, Dr. Thomas Walker and Christopher Gist; many land speculators had coveted the fertile forests and plains of Kentucky before Judge Richard Henderson, one of the most enterprising of them, engaged Boone in 1769 to explore the country thoroughly, to assist in negotiating the purchase of the immense tract from the Cherokees, and finally to open up the Wilderness road and escort settlers to the new colony of Transylvania. There is no doubt that Boone displayed immense resource-

fulness, daring and perseverance in his explorations, in the establishment of the border posts, and in the struggles with the Indians. Henderson himself wrote, "It was owing to Boone's confidence in us and the people's in him that a stand was ever attempted in order to wait for our coming." Nevertheless, the inability of Henderson to have his purchase declared valid and Boone's own carelessness about titles and taxes caused him to lose all the choice tracts which he had marked out for himself and in his old age to seek the open prairies in the Spanish territory west of the Mississippi (at La Charette in the present State of Missouri). Even there, after the Louisiana purchase, his title was found to be defective, although Congress, as a result of his pathetic petition and the intervention of the Kentucky legislature, confirmed the grant with praise for the pioneer who had "opened the way to millions of his fellow men." From it he made occasional long trapping expeditions into Kansas and once (1814) to the Yellowstone. He died in the latter part of September (probably Sept. 26) 1820, even then the object of veneration and pilgrimage. In 1845 his and his wife Rebecca's remains were removed to Frankfort (Ky.), where a monument was erected to his memory. Doubtless the germ of the Boone legend was the so-called autobiography, the production of John Filson; but to it have contributed scores of poets, travellers, novelists, and historians including writers as diverse as Lord Byron in *Don Juan* and the obscure Kentucky versifier, Daniel Bryan, in *The Mountain Muse* (1813).

BIBLIOGRAPHY—The best biography is that by R. G. Thwaites (1902). S. E. White's *Daniel Boone, Wilderness Scout* (1922) is designed for juvenile readers. See also W. H. Miner, *Bibliography of Writings Concerning Daniel Boone* (1901); A. B. Hulbert, *Boone's Wilderness Road* (1903), "Historic Highways of America," vol. vi.; Archibald Henderson, *The Conquest of the old Southwest* (1920); Constance L. Skinner, *Pioneers of the Old Southwest* (1919), "The Chronicles of America," vol. xviii.; and the article by C. W. Alvord in the *American Mercury* (July 1926).

BOONE, a city of Iowa, U.S.A., near the Des Moines river, in the centre of the State, at an altitude of 1,100ft.; the county seat of Boone county. It is on the Lincoln Highway, is a division point of the Chicago and North Western, and is served also by the Chicago, Milwaukee, St. Paul and Pacific railway. Pop. (largely native white) was 12,812 in 1925 (State census). The surrounding country is one of the richest sections of the corn belt, and is noted for its cattle and hogs and Belgian horses. It has also large deposits of bituminous coal, clay and gravel. There are three producing coal mines on the edges of the city. The leading manufactures are building and paving brick, reinforced concrete pipe, machinery, brooms and brushes, flour, hosiery, iron implements, coolers and ventilators. In 1925 the output of the 27 factories within the city was valued at \$2,371,060. Near by on the river is the Ledges State park of 644 acres. The National Swedish old people's home and the State home of the Order of the Eastern Star are situated here.

Boone was laid out in 1865; incorporated as a town in 1866; and chartered as a city in 1868. It was named after Col. Nathan Boone, son of the pioneer and backwoodsman Daniel Boone.

BOONE WAY, a thoroughfare extending originally from Crab Orchard, Ky., to Cumberland Gap, where the States of Kentucky, Tennessee and Virginia meet. Named after Daniel Boone, it is also known as the "Boone Route" or "Daniel Boone Trail," and is about 95m. long, all paved. Later it was planned to extend this interesting highway to Lake Superior and the South Atlantic coast.

BOONTON, a town of Morris county, New Jersey, U.S.A., 32m. N.W. of New York city, on the Lackawanna railroad. The population in 1920 was 5,372. It is a trading centre and has paper mills, a large silk factory, and other industries. The New Jersey firemen's home, established 1900, is maintained here by the State firemen's association.

BOONVILLE, a city in the coal-mining and agricultural region of south-western Indiana, U.S.A., on Cypress creek, 17m. north-east of Evansville; the county seat of Warrick county. It is served by the Evansville Suburban and Newburgh and the Southern railways. The population in 1920 was 4,451 (95% native white). Boonville was founded about 1818 and incorporated in 1858.

BOONVILLE, a city in the central part of Missouri, U.S.A., on the right bank of the Missouri river 150m. W. by N. of St. Louis; the county seat of Cooper county. It lies on high

BY COURTESY OF THE UNIVERSAL PICTURES CORPORATION

RECONSTRUCTION OF THE WOOD STOCKADE BUILT IN 1810, THE FIRST STAGE IN THE DEVELOPMENT OF THE CITY OF BOONVILLE

land above the river, and includes a small area in Howard county, across the river, around the northern approach to the fine highway bridge. It is on Federal highway 40, and is served by the Missouri Pacific and the Missouri-Kansas-Texas railways. The population in 1920 was 4,665, and in 1927 a local census showed over 6,000. The natural resources of the region include Loess soil on the bluffs, a variety of clays and shales, stone, coal, and other minerals. Among the industries are a chick hatchery, two creameries, a flour mill, a brick plant, sand works, marble works, and the largest corncob-pipe factory in the world. The State training school for boys (1889) and Kemper Military Academy (1844) are here. There is an Indian mound in Harley Park.

Boonville was settled in 1810, incorporated as a village in 1839, and chartered as a city in 1896. It was named after Daniel Boone. In the pioneer days it was one of the most important trading posts of the region, as traffic to the south-west ascended the Missouri to this point, and then went on by wagon-train over the Santa Fe trail. During the Civil War it was in hotly contested territory, and an engagement took place here June 17, 1861.

BOORDE (or BORDE), **ANDREW** (1490?-1549), English physician and author, was born at Boord's hill, Holms Dale, Sussex. He was educated at Oxford, and was admitted a member of the Carthusian order while under age. In 1521 he was "dispensed from religion" in order that he might act as suffragan bishop of Chichester, though he never actually filled the office, and in 1529 he was freed from his monastic vows, not being able to endure, as he said, the "rugarosite off your relygyon." He visited the universities of Orleans, Poitiers, Toulouse, Montpellier, and Wittenberg, saw the practice of surgery at Rome, and went on pilgrimage with others of his nation to Compostella in Navarre. In 1534 Boorde was again in London at the Charterhouse, and Thomas Cromwell seems to have entrusted him with a mission to find out the state of public feeling abroad with regard to the English king. In 1536 he was studying medicine at Glasgow. About 1538 Boorde travelled extensively, visiting nearly all the countries of Europe except Russia and Turkey, and later making his way to Jerusalem. Of these travels he wrote a full itinerary, lost, unfortunately, by Cromwell, to whom it was sent. He finally settled at Montpellier and before 1542 had completed his *Fyrst Boke of the Introduction of Knowledge*, which ranks as the earliest continental guide book, his *Dietary of Healthe* (printed 1562) and his *Brevyary* (printed 1562). He probably returned to England in 1542. He made his will in the Fleet prison in April 1549.

See Dr. F. J. Furnivall's reprint of the *Introduction* and some other selections for the Early English Text Society (new series, 1870).

BOOS, MARTIN (1762–1825), German pietist, was a Bavarian Catholic priest, who started a movement among Catholics, closely allied to the pietist movement in the Lutheran churches. He pursued his propaganda from about 1799 to 1812 in Austria, but repeated accusations in the consistorial courts compelled him to return to Bavaria, where his enemies followed him. The Prussian Government gave him a professorship at Düsseldorf in 1817, and in 1819 a pastorate at Sayn, near Neuwied. He died on Aug. 29, 1825.

See *Life* by J. Gossner (1831).

BOOT. (1) Profit or advantage (*cf.* Mod Ger *Busse*, "penance, fine," and "better," the comparative of "good"). The word survives in "bootless," *i.e.* useless or unavailing, and in such expressions, chiefly archaic, as "what boots it?" "Bote," an old form, survives in some old compound legal words, such as "house-bote," "fire-bote," "hedge-bote," etc. (*see* ESTOVERS and COMMONS).

(2) A covering for the foot (O. Fr. *bote*, modern *botte*; Med. Lat. *botta* or *bota*). Properly a boot covers the whole lower part of the leg, sometimes reaching to or above the knee, but in common usage it is applied to one which reaches only above the ankle, and is thus distinguished from "shoe" (*see* COSTUME and SHOE).

The "boot" of a coach has the same derivation. It was originally applied to the fixed outside step, the French *botte*, then to the uncovered spaces on or beside the step on which the attendants sat facing sideways. Both senses are now obsolete, the term being applied to the covered receptacles under the seats of the guard and coachman. For boot as an instrument of torture, *see* TORTURE.

BOOT AND SHOE INDUSTRY. In the boot and shoe industry the modern tendency is for large firms to expand, and for it to become increasingly difficult for those with small capitals to build up successful businesses. The limit to the growth of large manufacturing concerns does not appear to have been reached in any country, although the daily output has, in some cases, already attained extraordinarily high figures. In America, where the market created by a large population favours the development of big businesses, an output of 130,000 pairs per day of all classes of boots and shoes has been achieved. This total has not been equalled in Europe by any individual firm, although one of the largest has reached a daily output of between 50,000 and 60,000 pairs.

With the machinery available for the production of boots and shoes, the number of operations which need be performed by hand has become so small as to be almost negligible. There is still a limited demand for footwear made principally by hand, but the section of the industry known as the "bespoke trade" which, in the latter half of the 19th century, was flourishing, has been reduced to small proportions and may eventually cease to exist through lack of skilled handicraftsmen. Few are being trained to take the place of those now earning their living at the bespoke trade, and the apprenticeship system, which was formerly a recognized feature of the industry, has been practically discontinued. In the majority of shoe factories apprentices, when taken, are engaged to learn one or more of the important or "key" operations, but the manufacturer does not undertake to teach them how to make a boot from start to finish. Modern factory methods require the use of a different machine for each operation, and the sub-division of production makes it almost impossible to teach individual workers to handle all the machines, even if this were necessary. To ensure that the younger operatives shall have an opportunity to study all sections of the trade, technical schools have been established in all the larger centres of the trade in Britain, and in other important shoe centres in Europe.

Shoe Styles.—Since 1900 there has been a large increase in the demand for light footwear. Although heavy boots are still produced in considerable quantities for artisan wearers, the tendency among all classes is to select the lightest boots and shoes consistent with reasonable wear. This change is attributed

partly to a demand for smart and comfortable shoes, but it has been encouraged by the development of passenger transport services which have reduced the amount of walking indulged in by the public, particularly in wet weather and over rough surfaces. The increased use of mechanically propelled vehicles has not, however, caused any loss of trade to the shoe industry because the lighter goods are required in larger quantities per head of the population than the stronger footwear formerly worn. Women's shoe styles first showed a tendency to become lighter and more elaborate in design, and in 1911 footwear was being produced of a type which caused the trade to adopt the phrase "shoe millinery" to describe it. But the vogue of the women's light shoe did not develop fully until 1920 and was influenced chiefly by alterations in dress fashions. At first the continued changes in styles caused much inconvenience to the trade generally, retailers in particular suffering financial losses through stock becoming out-of-date before it could be sold. By the end of 1925, however, the fashion trade was working more smoothly as regards both production and distribution, and the industry as a whole benefited considerably by the extra business it brought. Most of the established methods of making shoes proved adaptable for the production of women's light footwear, but at first the turnshoe system, formerly used principally for the manufacture of dancing pumps, slippers and similar indoor shoes, was most favoured. A method of construction, which provided for the attaching of the sole with a strong adhesive, instead of a sewn seam, was also successfully adopted by many manufacturers.

For the production of light footwear chrome tanned upper leathers, including box calf, willow calf and glacé kid, proved most suitable. These leathers can be produced in a wide range of qualities, substances and colours and have a bright finish, besides being soft and pliable. They are used for both men's and women's footwear and have replaced oil-dressed leathers except for the heaviest boots. Patent leather which had long been used for the uppers of shoes became even more popular when the fashion trade increased, and new types of washable leathers in calf and kid were also introduced. These had a bright waterproof finish somewhat similar to patent leather, but the finish, being transparent, allowed the grain and colour of the leather to appear. Many fancy leathers, not formerly considered suitable for footwear, were also used for the higher-grade shoes, but owing to the limited supplies and consequent high cost they could not be employed freely for cheap goods. Leathers with unusual grains and colours were produced from a variety of reptile skins, including Indian and Java lizards, pythons and other snakes with sufficiently large and well-marked skins. Ostrich skins, shark and various fish skins were also dressed for the shoe trade. The leathers with the most attractive grains were closely imitated by printing and embossing calf and other skins, and these imitations were found useful for the manufacture of the cheaper fancy shoes. For boot soles leather similar to that used for this purpose for many centuries is still the most popular, but a few innovations have been made, notably the waterproof sole leathers which are produced by various processes, the chief among which is a special method of chrome tanning. The use of rubber in various forms for soles has increased, and for sports shoes natural (repe) rubber and vulcanized rubber soles are commonly used. A number of compounds made of rubber mixed with fibrous material such as cotton, or a suitable mineral filler, have been produced for use as boot soles and have met with a moderate sale. Most of the compounds are waterproof and wear as well as, if not better than, medium quality leather. They have been used chiefly for the soles of medium to heavy-weight boots and can be sold at prices which enable the producers to compete with tanners of sole leather suitable for this class of footwear.

Production.—The census of production taken in Great Britain in 1924 showed that the output of the British shoe industry in that year was 117,456,000 pairs, valued at £47,427,000. In 1907 when the preceding official census was taken the output was 97,440,000 pairs, valued at £19,874,000. These figures included boots and shoes made wholly or mainly of leather, footwear with canvas uppers, slippers of all kinds and boots and shoes made of

all other materials except rubber. The number of workers engaged in the industry was 147,300 in 1924 and 124,800 in 1907. A large proportion of the output was sold in the home market, the exports to all countries being only 17.7% of the men's footwear and 12.1% of the women's and children's goods made chiefly of leather. In the case of boots and shoes made of materials other than leather (principally slippers of felt and similar fabrics) the exports were less than 4% of the number made.

The shoe industry of the United States has the largest output of any country in the world. Statistics compiled in 1927 from reports supplied by manufacturers to the Government's Department of Commerce showed that the total production of all classes of boots and shoes, except those of rubber, was 343,605,905 pairs. The number of workers engaged to make this quantity was more than 210,000, and they were employed in 1,460 factories. The value of the goods they produced was more than \$930,000,000 and they received as wages \$225,788,000. Of the total produced 8,000,000 pairs were exported. A little over 3,000,000 pairs were imported.

A segregation of the 343,605,905 pairs of shoes produced in the United States in 1927 from January to December inclusive, shows the proportion (in pairs) of various types as follows: Men's 95,328,098; women's 116,258,866; boys' and youths' 24,229,296; girls' and children's 39,649,961; infants' 24,541,551; total of leather shoes, 300,007,772; athletic and sporting, 2,477,519; canvas, satin and fabric, 3,301,433; slippers, 29,158,122; all others, 8,661,060.

The comparatively small export trade transacted by the larger shoe producing countries is due in some degree to the perfection of modern machinery. Where there is a market for shoes, factories are usually to be found which can supply a good proportion of the demand. In the British dominions, including Canada, Australia and South Africa, shoe manufacturing has been introduced and under the protection of import tariffs has been carried on successfully during the period required to get the industry firmly established. The machinery available allows rapid training of unskilled labour to perform many operations, and competent workers can be obtained from other countries to carry out the processes for which trained operatives are essential. Under expert management these factories have been able from their commencement to produce marketable goods in sufficient quantities to obviate the necessity of importing all the boots and shoes required, and the output has improved in quality in proportion to the length of time that the industry has been carried on. (See also **BOOT AND SHOE MACHINERY**)

See E. J. C. Swaisland, *American Methods of Boot and Shoe Manufacture* (Northampton, 1906); F. Plucknett, *Boot and Shoe Manufacture* (1916); T. Wright, *The Romance of the Shoe* (1922).
(F. T. B.)

BOOT AND SHOE MACHINERY. During the last 30 years shoemaking has undergone a complete change, due to the marked progress of mechanical equipment. Keen competition and close co-operation between Britain and America have greatly stimulated development, which to-day must closely follow the dictates of fashion as well as produce bulk with certain and absolute uniformity.

The complex characteristics of shoemaking, the different types of footwear, alternative methods of making, and innumerable completely distinct operations resulting from great subdivision of labour, have made necessary a range of machines differing fundamentally in design and performance and varying greatly in type to an extent equalled in no other industry; very many different machines are used in the making of a single welted shoe; other types of footwear need equally distinctive machines. Machines are grouped into separate departments for distinctive work. Those which deal with the cutting, preparing and assembling of the upper are the clicking and closing departments. The bottom stock department cuts and prepares soles, insoles, etc., and includes the making of heels, stiffeners and welts. The section where the uppers and bottoms are assembled on the last and permanently joined is the making room, and the finishing department produces results that are not only attractive but necessary.

Upper Machinery.—While the greater proportion of upper components is cut by hand in Britain, many standard shapes and a greater number of fittings, i.e., tongue, backstraps, etc., are cut on a clicking press, a machine of the single revolution type, which presses a shallow knife through the leather on to a fibre or wood block. Machines for producing decorative features are numerous. Perforating is done on a machine which makes a distinctive design at one blow, or, alternately, on a machine with one punch holder, for giving a running design as the work is fed through. Involving these same general principles, folding machines are used for turning in and folding back the edges of vamps, caps, etc., after these have received a preliminary skiving and cementing. This produces a very attractively finished edge. Closing machines for sewing the upper components together attain speeds up to 4,000 revolutions per minute and vary in type. There are "flat," "cylinder" and "post" machines, indicating the style of table over which the work is fed. There are chain-stitch and lock-stitch machines to sew one, two or four rows, with adjustments to vary the length of stitch, and some are fitted with under-trimming mechanism, so that the margin from edge to stitching is maintained uniform throughout.

Button-holing is done on a machine capable of cutting and working 22 holes per minute, and a button sewing machine will automatically feed and attach with 16 stitches to each, approximately 60 buttons per minute. Eyeletting and hooking machines are similar in operation. Eyelets, fed from a rotating hopper, gravitate along a chute into holes punched and spaced automatically, and are then clinched. To hold eyeletted uppers in position for lasting, these are temporarily laced by a machine which will tie over from one to four pairs of holes, and at the same time securely knot the thread.

Bottom Stock.—Soles, middlesoles and insoles are pressed out. A most widely used machine is the revolution press, a quick action machine with a heavy beam. The cutting block is of wood or compressed fibre, and shaped knives 4 in. deep are used. The beam descends on to a 4 in. deep knife upon the operator tripping the machine, the knife being moved along after each cut. Soles, etc., are frequently cut to a standard pattern and later trimmed to a particular shape on the rounding machine. A clamp holds sole and wood pattern in position while a knife, with its cutting edge level with the sole, and held to the former by a spring, traverses the complete periphery, giving the desired shape and a square edge. A stamping machine used for recording size, fitting shape, tannage and other information will give 10,000 different markings and maintain a uniform depth of impression irrespective of substance. Channelling machines play an important part in the preparation of soles and also welted insoles. Outsoles are prepared by having an oblique incision or a groove cut parallel to the edge of the sole in which the stitches are buried when the sole is attached, a channelling knife being used to suit the type of seam to be made. In preparing the welt insole an entirely different machine of more intricate design is needed to cut an inside channel and an outside lip at the same time, and with such accuracy that the substance between these two channels is maintained uniform. Subsidiary machines open these channels and perform other minor operations. Sole and insole moulding machines are commonly used with various types of shoes, and particularly women's, where more extreme shapes are met. A preliminary shape is given by this machine, which, using vertical pressure, actuated by toggle motion, moulds the sole to the shape of the last between upper and lower moulds. The machine is alternating, one mould being fed while the other is under pressure.

Heel Building Machines.—Heel lifts and top pieces are generally blanked out on a small press similar to the clicking press. A rand, or bevelled strip of leather, is sometimes attached to the seat lift by a tacking machine, which also employs a slashing knife to facilitate the conformation of the flat strip to the curved outline of the heel. The heel building machine itself carries a mould into which the lifts are fed and held in position while nails are driven at one blow. Heels are compressed on a powerful machine, and acting automatically, as one heel is fed the previous one is ejected. The top piece is generally attached with a slugging

MAKING THE UPPERS AND CUTTING THE BOTTOM STOCK

1. Uppers being cut by hand from metal-edged patterns from finest part of skin. Some standard shapes and most fittings are cut on a clicking press, a machine which presses a shallow knife through leather onto a fibre or wood block
2. Sewing together various pieces which go to make uppers. Several kinds of machines are used, depending upon type of stitch required for part being sewn
3. Middle-soles and insoles being pressed out by machine. A heavy beam presses a shaped knife, through leather, onto cutting block of wood or compressed fibre
4. Uppers being lasted on a "Consol" lasting machine, which uses a single twisting pincer to pleat the surplus upper drawn over the last, and drives tacks from a rotating tack pot

BY COURTESY OF THE SARONE SHOE CO., LTD

MAKING THE BOTTOM AND ASSEMBLING THE SHOE

1. Welt sewn to the upper and insole by a chain stitch machine using a curved needle and producing a tight horizontal seam through welt, upper and insole. Finished welt is shown in Insert
2. Outer sole being stitched to welt with waxed thread by high speed lock-stitch sewing machine with totally enclosed mechanism
3. Heel of various layers of leather which have been blanked out on a small cutting press and built up in a mould into which the lifts are fed and held in position while nails are driven in. The heel is then attached to the sole by nails driven in by a high pressure machine with two distinct blows

machine, which takes its name from the kind of nail used. This is a length of wire cut from a coil and with no head or point. The "breasting" of the front of the heel is done with a gouge of the required curve fixed to a machine with an adjustable table which enables the correct angle of cut to be obtained.

Assembling and Making Machinery.—The operation of pulling over is performed on a machine of ingenious design and great precision. It is to this machine that the insoles and uppers are brought, assembled on the last, with stiffener and toe puff in position. The upper is gripped by three or five pincers, one or two on each side of forepart and one in centre at toe, and tension is applied to draw it tightly over the last after it has been straightened to the satisfaction of the operator by the manipulation of various convenient adjustments. The pull on the pincers is adjustable to suit the lightest fabric or toughest leather, is applied steadily, and is sensitively controlled by an oil buffer. In the second cycle five or seven tacks are driven through upper and insole, retaining the whole in position. The tacks are delivered to the required position by an air blast, which blows them point foremost through conducting tubes, the timing being in perfect unison with the whole sequence of movements. The machine is wonderfully adaptable, admitting all sizes from children's to men's. The lasting machine used in conjunction with the above completes the work as it was formerly performed by hand. The machine uses a single twisting pincer which pleats the surplus upper drawn over the last, and drives tacks delivered from a rotating tack pot. The pounding up machine hammers the tacks home and grinds to a level the bunched upper at the toe. Operations now vary according to the type of shoes and consequently the machines also. Important methods of making shoes include welt, machine sewn, turnshoe, veldt, littleway, etc. Dealing with the two first mentioned, the foregoing operations are all performed mechanically, but only the chief machines are described. After lasting, the surplus upper is removed, staples of fine wire substituted for the lasting tacks, which are withdrawn in order to offer no impediment to the needle of the welt sewing machine. This machine makes a horizontal seam, in which respect it imitates the work of the hand welt sewer. Making a chain stitch of three or four to the inch it uses a curved needle and produces a tight horizontal seam, through welt, upper and the insole lip. A channel guide indicates the point where the needle will pierce through, and helps to steady the work. A hot waxed thread is used and the machine is heated by steam or electricity. Each stitch is pulled tight, regardless of the substance of the material or variation in speed of machine. Surplus material is closely trimmed on a machine specially designed to obviate damage to the seam. The welt is beaten out flat. The machine used for this purpose carries a reciprocating hammer and incorporates a slashing knife for assisting round the toe. The ends of the welt are both skived off simultaneously to any desired angle, and two tacks driven to hold permanently in position on a welt butting and tacking machine. The bottom is filled, shank inserted and sole attached. The shoe, with the last in, is placed under pressure in the sole-laying machine to cause the sole to follow closely the contour of the last. The rounding and channelling machine performs an important work. It roughly trims the edge of the sole, and at the same time cuts a channel parallel to the edge to receive the stitches. An arrangement of adjustable guides mechanically determine the finished shape or contour, which is cut by a chisel-shaped knife. A high speed lockstitch sewing machine, with totally-enclosed mechanism and a needle automatically lubricated, is generally used for fastening the sole to the welt, in which uniformity and tightness of stitches is of paramount importance. The needle and shuttle threads are gummed or waxed and the machine is heated by steam or electricity. After lasting and pounding up as previously mentioned the shank is inserted, and the sole temporarily attached by a wire grip tacking machine, which cuts, points, and drives any desired length of headless tack from a coil of wire. The permanent attachment in this type of shoe is then made direct through sole and insole, taking in the lasted upper at the same time. The shoe with last removed is placed on the horn of the improved Blake sewing machine, and the needle or hook which combines the duties of awl and needle, pierces the sole

so that the barb of the hook projects through the insole, where it takes up the thread passed through the horn. A waxed or gummed thread is used and the machine is generally heated by gas. A chain or crochet stitch is made, each tightened by its successor, the length being variable from three to seven to the inch. Metallic fastenings of various kinds are used for permanent attachment on some classes of shoes. One of these is made by the rapid screwing machine, which, using a coil of steel or brass wire, threaded with a regular pitch, automatically cuts off and clinches at the correct length the screws with which it secures at the rate of 250 per minute at a regular and adjustable spacing. Levelling the bottom is an operation common to most types of footwear. Two distinct types of machines are employed. The roller type uses a rapidly-vibrating roller which sleeks the bottom of the shoe while on the last, pressure being applied successively over the whole surface. The direct pressure type operates with a crank motion, an iron foot on which the shoe is placed swinging under a mould of particular shape. Later developments of this pattern have produced a machine equally effective with work on or off the last which, by a peculiar rocking motion, embodies the advantages of both types. In each case the alternating design admits of one shoe being under pressure while the other is removed and replaced. Machines for attaching heels are stoutly built to withstand the great pressure that is necessary to drive up to 16 nails either from inside or outside the shoe. Automatic nail loaders are attached which replace the required number of nails into the attaching stand ready for the next heel. Any desired pressure can be uniformly applied, the nails being driven by two distinct blows which eliminate the possibility of springing back. Machines have been specially designed for the fitting of Louis and other wood heels. One automatically gauges shoes for correct position from the actual heel.

Finishing Machinery.—High speed ball bearing machines for trimming, scouring and polishing, constitute the major group for this section. When necessary they are provided with means for exhausting dust. The rough heel is trimmed to shape on the heel trimming machine which carries two cutters, moulded to the reverse shape of the heel, in the rotating head, which automatically adjusts itself to variations in height of heel. Edge trimming machines produce the shape of the finished edge of foreparts and waists with specially formed cutters which are readily interchangeable. The latest machines include reciprocating planing knives which blend the juncture of the heel and waist trimming. Marked features of these trimming machines are their solidity, eliminating vibration, and their convenience of operation. Scouring and buffing machines for smoothing the surface of heels and bottoms are similar in general principles, differently shaped rolls of various types, covered with sandpaper, or other abrasive material that can be quickly replaced, being mounted on shafts speeded to give a uniform velocity. Edge setting is a process that requires pressure and friction, and the automatic edge setting machine has been designed to perform this heavy duty entirely mechanically. The shoe is clamped in a travelling jack, the movement of which is controlled through hydraulic action, while a rapidly vibrating heated tool is forced against the edge with uniform pressure which can be varied to suit the lightest or heaviest work. The machine adapts itself to all sizes and represents the furthest step yet made toward automatic shoemaking machinery. Heated machines employing metal or other rolls, burnish heels and bottoms, distributing a film of wax over the surface, and others emboss the sole with trade mark or price, scour and repair the surface of patent leather, and withdraw the last.

With the more universal employment of electric power, many machines have been designed to embody their own individual motors, and this policy is being continued, so that the arrangement of a complete plant may shortly be unaffected by limitations prevalent to-day because of the restricted means for driving. Machines which require heat are also being adapted to the use of electricity, and the extensive use of ball bearings is making a marked reduction in running costs. Close attention is being paid to the incorporation of safety devices and progress will probably lean toward the introduction of more completely automatic machinery.

PRESS AND CLOSING ROOMS

1. The press room, where the soles, middle-soles and insoles are cut out by the revolution press, a quick-action machine

2 Closing room, where the upper parts of the shoes are sewn together. Various types of machines capable of great speed are used here

at this time from the forepart of the shoe, and the surface of the welt and the filling are given a coat of rubber cement and the heavier insole which is cut to the required shape is also coated with rubber cement. The sole is laid or pressed into place in proper position by a machine which has one shoe under pressure while the other is being prepared. The shoe is then rounded, the edges being cut to the required shape and the shoe is given its style. The shape of the sole and its relation to the lasted shoe is of great importance. Incidental to this operation the machine cuts a little channel in the edge of the sole which is afterwards turned back by a machine in order that there may be a clear path for the needle of the stitching machine which unites the outsole to the welt. The thread used is very strong and is coated with hot wax, being maintained in that condition until it is actually set in the leather. The channel is coated with rubber cement and a machine rubs the lip down smoothly to conceal the stitches. The shoe is then levelled by rolls under heavy pressure, rolling out any unevenness which may be in the forepart of the shoe. The heel portion of the outsole is then nailed in place, the nails going through the outsole and clenched against the steel heel piece on the last. Many have rubber top lifts attached to them. The nails in most men's shoes with leather heels are all driven at one time and are clenched against the steel bottom of the last. The rough lifts of the heel are then trimmed to the required shape by means of the rapidly revolving knives of a trimming machine and the breast of the heel is cut to the required shape by a downward thrust of a knife, the movement of which is very accurately gauged. By various scouring operations the breast of the heel is brought to a smooth surface. Then follows a machine which blacks the heel, followed by another machine which coats the surface with hot wax and burnishes it to a lasting finish. The forepart of the shoe is also treated and trimmed very smoothly to the required bevel and shape by rapidly revolving knives on the trimming machine, two cutters being used, one for the forepart and one in the shank where the bevel is changed. These edges are also coated with wax and are burnished by means of hot irons electrically heated, vibrating very rapidly. The bottom of the shoe is then buffed, all the stains gathered in the manufacturing process being removed by rapidly revolving wheels covered with abrasive. The shank of the shoe receives special treatment on a machine on which there are two pads revolving as rapidly as 7,500 times per minute, cooled by a pressure of air from a pump which is a part of the machine. There follow a variety of waxings and finishing operations varying with the type of the shoe. The treeing machine is then employed for ironing out wrinkles and removing any stains on the shoe, and after a final brushing and careful inspection the shoes are ready for packing and shipment. (A. D. AN.)

BOÖTES, a constellation of the northern hemisphere (Gr. *βοώτης*, a ploughman, from *βοῦς*, an ox). The ancient Greeks symbolized it as a man walking, with his right hand grasping a club, and his left extending upwards and holding the leash of two dogs, which are apparently barking at the Great Bear. The brightest star is *ARCTURUS* (*α.υ*). Another interesting star is *εBoötis*, a beautiful double star composed of a yellow star of magnitude 3, and a blue star of magnitude 6½.

BOOTH, BARTON (1681–1733), English actor, who came of a good Lancashire family, was educated at Westminster school, where his success in the Latin play *Andria* gave him an inclination for the stage. He was intended for the church; but in 1698 he ran away from Trinity college, Cambridge, and obtained employment in a theatrical company in Dublin, where he made his first appearance as Oroonoko. After two seasons in Ireland he returned to London, where Betterton gave him all the assistance in his power. At Lincoln's Inn Fields (1700–04) he first appeared as Maximus in *Valentinian*, and his success was immediate. He was at the Haymarket with Betterton from 1705 to 1708, and for the next 20 years at Drury Lane. Booth died on May 10, 1733, and was buried in Westminster Abbey. His greatest parts, after the title-part of Addison's *Cato*, which established his reputation as a tragedian, were probably Hotspur and Brutus. His Lear was deemed worthy of comparison with Garrick's.

See Victor, *Memoirs of the Life of Barton Booth* (1733); Cibber, *Lives and Characters of the most eminent Actors and Actresses* (1753).

BOOTH, CHARLES (1840–1916), English shipowner and sociologist, was born at Liverpool. In 1862 he became a partner in Alfred Booth and Co., a Liverpool firm engaged in the Brazil trade, and subsequently chairman of the Booth Steamship Co. He devoted much time and money to enquiries into the statistical aspects of social questions. The results of these are chiefly embodied in a work entitled *Life and Labour of the People in London* (1891–1903), of which the earlier portion appeared under the title of *Life and Labour* in 1889. The book is designed to show "the numerical relation which poverty, misery and depravity bear to regular earnings and comparative comfort, and to describe the general conditions under which each class lives." It contains a striking series of maps, in which the varying degrees of poverty are represented street by street, by shades of colour.

Booth also paid much attention to the lot of the aged poor. In 1894 he published a volume of statistics on the subject, and, in 1891 and 1899, works on old-age pensions, his scheme for the latter depending on a general provision of pensions of 5s. a week to all aged persons, irrespective of the cost to the State. He was a member of the Royal Commission on the Poor Law, from which he had, however, to retire for reasons of health, but he made important recommendations, which he published separately as *Poor Law Reform* (1910). He was made a privy councillor in 1904. Booth married, in 1871, Mary Macaulay, a granddaughter of Zachary Macaulay. She was the author of *Charles Booth, a Memoir*, published anonymously in 1918.

BOOTH, EDWIN THOMAS (1833–1893), American actor, second son of the Anglo-American actor Junius Brutus Booth, was born Nov. 13, 1833 at Belair, Maryland. His father (born London 1796) removed to America in 1821. There he became a great favourite upon the stage, renewing the successes he had achieved in London, where he was regarded as a serious rival to Edmund Kean.

Edwin Booth's first appearance was made at the Boston Museum on Sept. 10, 1849, as Tresselt to his father's Richard III., in Colley Cibber's version. But it was not until after his parent's death in 1852 that Edwin won renown for himself. His first New York appearance was as Wilford in *The Iron Chest* at the National

AFTER THE STATUE BY QUINN IN GRAMERCY PARK, NEW YORK

EDWIN BOOTH AS HAMLET. ONE OF HIS MOST SUCCESSFUL STAGE RÔLES

Theatre in Chatham Street, Sept. 27, 1850, and a year later, on the illness of his father, Edwin took his place in the character of Richard III. Between 1852 and 1856 he played in California, Australia and the Sandwich Islands, and from this time his dramatic triumphs were warmly acknowledged.

Thus early successful, in 1862 he became manager of the Winter Garden Theatre, New York. There he presented a series of Shakespearean productions of then unexampled magnificence. There the three Booth brothers, Junius Brutus (1821–1883), Edwin and John Wilkes (1839–1865), played together in a memorable performance of Julius Caesar, and later, from Nov. 26,

1864, to March 22, 1865, Edwin played Hamlet consecutively for one hundred times. The splendour of this period in his career was dashed for many months when in 1865 his younger brother, John Wilkes Booth, assassinated President Lincoln. This caused his retirement until January 3, 1866, when he reappeared with success at the Winter Garden as Hamlet.

In 1868 Booth built a theatre of his own, Booth's Theatre, at the corner of 23rd Street and Sixth Avenue, New York, and organized an excellent company of actors. Here he produced practically his own entire repertory, Shakespearean and otherwise. At

this time he used the true text of Shakespeare—whose plays since the Restoration period had been presented in an adapted or revised form, whole scenes being changed beyond all recognition, and others frequently substituted,—and thus antedated by many years a similar reform in England. Almost invariably his ventures were successful, but injudicious direction of the financial affairs connected with the building of the theatre and bad advice acted upon by him following the financial panic of 1873 took away from him the structure he had raised (1874), and with it went his entire personal fortune. By arduous toil, however, he again accumulated wealth, touring the United States, and frequently reappearing in New York.

In later life Booth formed partnerships, which brought artistic distinction to the theatre and success to him and to his associates, with Lawrence Barrett and Helena Modjeska. He played with Madame Ristori in 1885, and during April and May 1886 he and Tommaso Salvini appeared together in *Othello* and *Hamlet*. Booth played Iago to Salvini's Othello, and the latter the Ghost to Booth's Hamlet. In 1861 he had played in London, which he revisited in 1880 and in 1882, playing there and in the English provinces with much success. At the invitation of Henry Irving he alternated Iago and Othello with him at the Lyceum Theatre, London. He also visited Germany in 1882, where his acting was received with the highest enthusiasm. This success he regarded as the summit of his artistic achievement. He was supported by a German troupe. His last appearance was as Hamlet, in 1891 at the old Academy of Music, Brooklyn, N.Y. He died on June 7, 1893. He was elected to the Hall of Fame in 1926. Booth was twice married: in 1860 to Mary Devlin (died 1863), and in 1869 to Mary F. McVicker (died 1881).

The record of Booth's achievements and the testimony of his time bear witness to his undeniable genius as an actor, especially in tragic rôles, for which his personality, voice and appearance were eminently fitted. His place is secure with the greatest in the long line of Shakespearean tradition. Booth, for the most part, confined himself to playing Hamlet, Macbeth, Lear, Othello, Iago, Brutus, Shylock, Wolsey and Richard III., of Shakespeare; and to "Richelieu" by Bulwer Lytton, Bertuccio in Tom Taylor's "The Fool's Revenge," and John Howard Payne's "Brutus," that elder Brutus "that would have brooked the eternal devil to keep his state in Rome as easily as a king."

Despite its professional high-lights the course of Booth's life was sad and tragic, shadowed as it was with exceptional sorrows and reverses. Their effect upon his sensitive nature was to make him more aloof and retiring. He converted his residence at 16 Gramercy Park, New York, into a club—The Players, for the elect of his profession and for such members of other professions as they might choose—and presented to it in perpetuity the house, with all his books and works of art.

BOOTH, WILLIAM (1829–1912), founder and "general" of the Salvation Army, was born at Nottingham on April 10 1829, the son of a speculative builder. He was apprenticed to a pawnbroker. At 15 he underwent the experience of religious conversion, and he became a revivalist preacher. In 1849 he went to London, where he worked in a pawnbroker's shop at Walworth, hating the business, but bound to it by the necessity of sending money home. At this period he met Catherine Mumford, his

future wife and lifelong helpmate. In 1852 he had become a regular preacher of the Methodist New Connection, and in 1855 they were married. After nine years of the ministry Booth broke loose from the Connection and began his career as an independent revivalist. Booth held the simple belief that eternal punishment was the fate of the unconverted. Coupled with this was a profound pity for the outcast, and a hatred of dirt, squalor and suffering. In 1864 Booth went to London and continued his services in tents and in the open air, and founded at Whitechapel the Christian Mission, which became (in 1878) the Salvation Army and which made every convert a daily witness for Christ, both in public and private. Booth modelled its "Orders and Regulations" on those of the British army. Its early "campaigns" excited violent opposition, a "Skeleton army" being organized to break up the meetings, and for many years Booth's followers were subjected to fine and imprisonment as breakers of the peace. After 1889 these disorders were little heard of. The operations of the army were extended in 1880 to the United States, in 1881 to Australia, and spread to the European Continent, to India, Ceylon and elsewhere, General Booth himself being an indefatigable traveller, organizer and speaker. His wife died in 1890. By her preaching at Gateshead, where her husband was circuit minister, in 1860, she began the women's ministry which is so prominent a feature of the army's work.

In 1890 General Booth published *In Darkest England, and the Way Out*, in which he had the assistance of W. T. Stead. He proposed to remedy pauperism and vice by ten expedients: (1) the city colony; (2) the farm colony; (3) the over-sea colony; (4) the household salvage brigade; (5) the rescue homes for fallen women; (6) deliverance for the drunkard; (7) the prison-gate brigade; (8) the poor man's bank; (9) the poor man's lawyer; (10) Whitechapel-by-the-Sea. Money was liberally subscribed and a large part of the scheme was carried out. The opposition and ridicule with which Booth's work was for many years received gave way, towards the end of the 19th century, to very widespread sympathy as his genius and its results were more fully realized. The active encouragement of King Edward VII., at whose instance in 1902 he was invited officially to be present at the coronation ceremony, marked the completeness of the change; and when, in 1905, General Booth went through England, he was received in state by the mayors and corporations of many towns. In the United States also and elsewhere, his work was cordially encouraged by the authorities. The fiery old man had become a great figure in English life. He found it hard to witness his wife's sufferings, and he was saddened by the different views of theology taken by some of his children, and by the loss of his eyesight. His fame lives as the man who believed that the outcast may be restored to society if he can be made to feel that a decent member of that society cares whether he rises or not. The real strength of the man lay in his intense religious conviction and his wide humanity.

BIBLIOGRAPHY.—See T. F. Coates, *The Life Story of General Booth* (2nd ed. 1906); W. Booth, *Life of General Booth* (1912); Harold Begbie, *Life of William Booth* (1920).

BOOTH, WILLIAM BRAMWELL (1856–), general of the Salvation Army, and eldest son of General William Booth, its founder, was born at Halifax, Yorkshire, in 1856. He became an officer in the Salvation Army in 1874, and was from 1880 its chief organizer. He organized the first social relief operations of the army. Mr. Booth was prominent in the campaign against the "white slave" traffic. In 1885, as a result of his part in a social purity agitation, he was indicted with the late W. T. Stead and others on a technical charge, but was subsequently acquitted. The action proved to a sceptical public that young girls could be bought and sold under the most degrading circumstances, and it was largely due to this agitation that the Criminal Law Amendment act, 1885, was passed. He was ably assisted in his work by his wife, Florence, herself a Salvation Army officer, whom he married in 1882. On his father's death in 1912 he became general of the Army.

BOOTH, a temporary dwelling of boughs or other slight materials. The word gained the special meaning of a market-stall

or any non-permanent structure, such as a tent at a fair, where goods were on sale. Later it was applied to the temporary structure where votes were registered, viz., polling-booth. As *bothy* or *bothie*, in Scotland, meaning generally a hut or cottage, the word was specially applied to a barrack-like room on large farms where the unmarried labourers were lodged.

BOOTHIA, a peninsula of northern Canada, belonging to Franklin district, and lying between 69°30' and 72° N. and 92° and 97° W. Area, 13,000sq.m. It forms the western side of the Gulf of Boothia, which separates it from Baffin Land, and takes its name from Sir Felix Booth, who fitted out the expedition of 1829-33, led by Captain (afterwards Sir James) Ross, which discovered the peninsula. Cape Murchison is the most northerly point of the American mainland. The north magnetic pole was first distinctly localized in the peninsula (70°5' N., 96°47' W.), by Ross. (See also ARCTIC REGIONS.)

BOOTLE, municipal, county (1888) and parliamentary (1918) borough, a suburb of Liverpool, Lancashire, England. Pop (1921), 76,487, nearly 12 times the figure of 1861. Area 1,947 ac. It contains a continuation of the main Liverpool (q.v.) docks on the east bank of the Mersey, and has large numbers of transport workers, also ship repairers and engineers, while there are foundries, wire-rope works, tin works and tin-box factories, electrical works, dye works, flour mills and very large timber yards. Bootle also has large storage arrangements for cotton, grain, etc. The corporation consists of a mayor, 10 aldermen and 30 councillors; a proposal to merge it in the city of Liverpool was rejected by parliament in 1903. Since 1918 Bootle has returned one member to parliament.

BOOTLEGGING AND SMUGGLING. National prohibition (q.v.) in the United States has brought about a revival of the lost art of bootlegging and of the once rather popular profession of smuggling. The pioneers of early colonial days found it expedient to outlaw the sale of liquor to the Indians who, unaccustomed to its use, drank to excess and often became dangerous. But unscrupulous citizens, caring more for financial profit than for community welfare, engaged in the forbidden traffic and often concealed in the legs of their boots the liquor they carried for sale. This gave the name "bootlegger" to the illicit liquor trafficker. The name has been revived and applied to the various phases of the intricate outlaw business of supplying liquor to the market in the complex modern world.

Smuggling was a lucrative and more or less accepted occupation in colonial times, there being no centralised Government interested in customs revenues. After the central Government was formed, it established a Federal control of customs revenue and, through the Federal agencies of customs revenue and service and coast guard, it soon made smuggling unprofitable and unpopular, and the practice almost disappeared. The boundary line between the United States and Mexico has been the one exception. This frontier is for each nation the farthest removed from its seat of Government and constitutes for each its least populous region. These conditions are ideal for smuggling, and both nations have suffered financially from its continued practice. In May 1925 the representatives of both nations met in El Paso, Tex., and formulated a treaty that was designed to stop smuggling along the boundary line.

Introduction of Prohibition.—While the early settlers found it expedient to forbid the sale of liquor to a certain class, it was only by slow stages that society in the United States became willing to forbid the sale of liquor to all its members. Laws to this end first appeared in small communities; and here always someone was ready to import liquor for profit in violation of the law. The need was thus always felt for wider and wider control, until ultimately the Constitution of the United States was amended to forbid the manufacture, transportation or sale of intoxicating beverages anywhere within the nation. In its laws making this amendment effective, Congress defined intoxicating beverages as those containing one-half of 1% or more of alcohol by volume.

Individuals who continued to drink created a demand for intoxicating beverages in violation of the law, and, as always, there

were unscrupulous individuals willing to supply this illicit market. There was thus rapidly built up the outlaw business of obtaining supplies of liquor and of distributing them to the market—a business involving the bribery of Government and other agents and the corruption of traffic in alcohol and liquors for legitimate purposes. The Government easily controlled all the known supplies of liquor, and ultimately concentrated them in Government-controlled warehouses from which they were withdrawn for legitimate purposes by Government permit. Those people still determined to drink turned at first to home manufacture. But bootleg liquor soon became available at such prices as made home manufacture unnecessary, as it always had been inconvenient and unsatisfactory.

Revival of Smuggling.—The first bootleg supply was liquor withdrawn from Government warehouses through the use of fraudulent permits, etc. This was soon prevented by the Government and the bootlegger then turned to importation from abroad. Smuggling, on an increasingly large scale, sprang into existence. Ships under the protection of foreign flags, laden with contraband liquor, hovered just without the territorial waters, within easy communication of the shore, and there established an unfailing source of supply to the bootlegger.

The U.S. coast guard, long since relieved of its duty to prevent smuggling, and for generations engaged in the happier duty of bringing relief to those in distress at sea, was ill prepared to break up this traffic. By 1924 as many as 336 rum ships were known to be engaged in bootlegging. All along the coasts, specially equipped high-power motor-boats, often armed and armoured, and innumerable fishing and other coastwise craft, were engaged in running liquor from these ships to countless inlets and landing places. Congress increased the personnel and equipment of the coast guard to meet this situation; and the Government made treaties with foreign powers which, for this purpose, extended the U.S. territorial waters from 3 m to 12 miles. By June 1, 1925, the coast guard was sufficiently augmented to make a serious effort to eliminate this smuggling business off the Atlantic coast between Boston and Atlantic City. The method employed was to picket each rum ship with small patrol boats which rendered contact with the shore impracticable. This resulted in reducing the rum fleet along this front to negligible proportions and in keeping at much greater distances the few ships which did appear.

Home Manufacture.—As bootlegging found increasing difficulty in importing its supplies from abroad, it turned to home manufacture and rapidly acquired facility in imitating every foreign and domestic brand that the market demanded. Labels and containers were imitated with sufficient perfection to defy detection on the part of the purchaser. The alcohol for this manufacture was obtained by the diversion of alcohol, and particularly of denatured alcohol, from its legitimate avenues in industry. This rapidly became the chief, practically the only, source of supply. The percentage of unadulterated genuine whisky found among the total of the whisky confiscated runs between 1 and 2%.

Alcohol (q.v.) is one of the articles essential to industry. Its uses are so numerous in manufacture, and the quantities used legitimately by industry are so large, that its control introduces the most serious problems for the Government in the enforcement of the prohibition laws. This involved issuing annually over 40,000 permits and supervising the operations of the permittees.

The bootleg industry in turn invaded practically every field of business and secured permits for the use of alcohol, transacting just enough legitimate business to secure the permits, while diverting to the liquor traffic the rest of the alcohol secured. To do this successfully they sold to legitimate customers at greatly reduced prices in order to get enough business to justify their existence. They thus menaced the stability of many legitimate business enterprises and almost forced them to participate in the illegitimate profits derived from the bootleg industry. The Government undertook to control this situation in its earlier developments by denaturing alcohol for industrial use, to make it unfit for beverage use. But the bootlegger, indifferent to considerations of public health, soon established the practice of "boiling," or

redistilling—but indifferently well. A later expedient was the introduction of chemicals to counteract the denaturant, liquors containing a double dose of chemicals thus reaching the market.

Narcotics.—While the conspicuous revival of smuggling involves liquors primarily, it is only natural that the practice, once established, should have come to include other articles. Smuggling was in 1928 practically the only source of supply for the illicit trade in narcotics. Because this trade offers tremendous profits, and because narcotics are moved in such small packages, the Government finds it difficult to control this smuggling. All manner of expedients are resorted to by the smugglers, and their detection requires constant vigilance on the part of highly trained agents. Real progress was, however, being made.

In this connection, Government has taken a most interesting step. The United States, recognizing that the success of Governmental efforts to control the illicit narcotic trade was dependent upon quick, decisive action on the part of police, initiated an effort which has resulted in an international agreement, including already eleven nations, by which the Secret Service agencies of these nations deal directly with each other in the detection and apprehension of criminals engaged in this nefarious traffic. This is a unique agreement, perhaps the first time in history that any nation has undertaken to have its Governmental agencies give information to those of another nation which might lead to the arrest and punishment of one of its own criminal citizens. Heretofore, such information has had to be exchanged through the Foreign Offices of the European nations and our own State Department. Diplomatic channels generally resulted in such delay as to make the arrival of the information too late to be effective. This manifestation of modern, practical, international cooperation is a matter of great interest and should prove most beneficial toward the elimination of this serious criminal traffic. (L. C. A.)

BOOTY, plunder or gain (cognate with Ger. *Beute* and Fr. *butin*). The phrase "to play booty," dating from the 16th Century, means to play into a confederate's hands, or to play badly at first in order to deceive an opponent.

BOPP, FRANZ (1791–1867), German philologist, born at Mainz on Sept. 14, 1791, educated at Aschaffenburg, in Bavaria. In 1812 he went to Paris to study Sanskrit. In 1816 he published, at Frankfurt-on-Main, *Über das Conjugationssystem der Sanskritsprache in Vergleichung mit jenem der griechischen, lateinischen, persischen und germanischen Sprache*. The object of Bopp's researches was to trace the common origin of the grammatical forms or inflections of Sanskrit, Persian, Greek, Latin and German, a task which had never before been attempted. By an historical analysis of those forms, as applied to the verb, he furnished the first trustworthy materials for a history of the languages compared.

Bopp visited London and brought out, in the *Annals of Oriental Literature* (London, 1820), an essay entitled, "Analytical Comparison of the Sanskrit, Greek, Latin and Teutonic Languages," in which he extended to all parts of the grammar what he had done in his first book for the verb alone. He had previously published a critical edition, with a Latin translation and notes, of the story of *Nala and Damayanti* (London, 1819), the most beautiful episode of the Mahābhārata. Other episodes of the Mahābhārata—*Indralokāgamanam*, and three others (Berlin, 1824); *Diluvium*, and three others (Berlin, 1829); and a new edition of *Nala* (Berlin, 1832)—followed in due course.

In 1821 Bopp was appointed to the chair of Sanskrit and comparative grammar at Berlin, and was elected member of the Royal Prussian academy in the following year. He brought out, in 1827, his *Ausführliches Lehrgebäude der Sanskrita-Sprache*, on which he had been engaged since 1821. A new edition, in Latin, was commenced in the following year, and completed in 1832; and a shorter grammar appeared in 1834. At the same time he compiled a Sanskrit and Latin glossary (1830) in which, more especially in the second and third editions (1847 and 1867), account was also taken of the cognate languages. His chief activity, however, centred on the elaboration of his *Comparative Grammar*, which appeared in six parts (1833–52) as *Vergleichende Grammatik des Sanskrit, Zend, Griechischen, Lateinischen, Litthauischen,*

Altslavischen, Gothischen, und Deutschen. (Eng. trans. by E. B. Eastwick, 1845.) Two other essays (on the "Numerals," 1835) followed the publication of the first part of the *Comparative Grammar*. The Old Slavonian began to take its stand among the languages compared from the second part onwards. A second German edition, thoroughly revised (1856–61), comprised also the Old Armenian. Bopp tried in his grammar to give a description of the original grammatical structure of the languages as deduced from their intercomparison, to trace their phonetic laws, and especially to investigate the origin of their grammatical forms. He also wrote monographs on the vowel system in the Teutonic languages (1836), on the Celtic languages (1839), on the Old-Prussian (1853), and Albanian languages (1854), on the accent in Sanskrit and Greek (1854), on the relationship of the Malayo-Polynesian with the Indo-European languages (1840), and on the Caucasian languages (1846).

See M. Bréal's translation of Bopp's *Vergl. Gramm.* (1866), introduction; Th. Benfey, *Gesch. der Sprachwissenschaft* (1869); A. Kuhn in *Unsere Zeit*, Neue Folge, iv. 1 (1868); Leimann, *Frans Bopp* (1891–97).

BOPPARD, a town in Rhenish Prussia, Germany, on the left bank of the Rhine. Pop. (1925), 6,540. An old town, still partly surrounded by mediaeval walls, its most noteworthy buildings are the parish church (12th and 13th centuries); the Carmelite church (1318); the castle, now used for administrative offices, and the former Benedictine monastery on Marienberg, founded 1123. Boppard is a favourite tourist centre of the picturesque gorge of the Rhine, and has become a residential town. Trade is in wine and fruit. The *Baudobriga* of the Romans became a royal residence under the Merovingian dynasty and in the middle ages Boppard was raised to the rank of a free imperial city with considerable trade and shipping. From 1312 to 1794, when France absorbed the town, it was in the possession of the electors of Trier. In 1815 it was assigned, by the congress of Vienna, to Prussia.

BORA (Boreas—North Wind), an Italian name for a violent cold northerly and north-easterly wind, common in the Adriatic, especially on the Istrian and Dalmatian coasts. The wind generally produces boisterous squalls sometimes with whirling snow. There is always a northern tendency in the winds on the North Mediterranean shores in winter owing to the cold air of the mountains sliding down to the sea where the pressure is less. When, therefore, cyclones are found over the Mediterranean, the currents in their north-western area draw the air from the cold northern regions, and during the passage of a cyclone the bora often prevails, but the actual violence is largely on account of the weight of the cold air on the plateau. It forms a torrent which may be independent of Buys Ballot's law (*q.v.*) It is suggested that such local winds should be called "katabatic." A similar wind is experienced at Novorossiysk on the Black sea.

BORACITE, a mineral of special interest on account of its optical anomalies. Small crystals bounded on all sides by sharply defined faces are found in considerable numbers embedded in gypsum and anhydrite in the salt deposits at Lüneburg, in Hanover, where it was first observed in 1787. In external form these crystals are cubic with inclined hemihedrism, the symmetry being the same as in blende and tetrahedrite. Their habit varies according to whether the tetrahedron, the cube or the rhombic dodecahedron predominates. The crystals vary from translucent to transparent, with a vitreous lustre, and are colourless or white, though often tinged with grey, yellow or green. The hardness is as high as 7 on Mohs's scale; specific gravity 3.0.

The characters so far enumerated are strictly in accordance with cubic symmetry, but when a crystal is examined in polarized light, it will be seen to be doubly refracting, as was first observed by Sir David Brewster in 1821. Thin sections show twin-lamellae, and a division into definite areas which are optically biaxial. By cutting sections in suitable directions, it may be proved that a rhombic-dodecahedral crystal is really built up of twelve orthorhombic pyramids, the apices of which meet in the centre and the bases coincide with the dodecahedral faces of the compound (pseudo-cubic) crystal. When the crystals are

heated these optical characters change, and at a temperature of 265°C. the crystals suddenly become optically isotropic; on cooling, however, the complexity of internal structure reappears.

Chemically, Boracite is a magnesium borate and chloride with the formula $Mg_2Cl_2B_{10}O_{20}$. A small amount of iron is sometimes present, and an iron-boracite with half the magnesium replaced by ferrous iron has been called huyssenite. The mineral is insoluble in water, but soluble in hydrochloric acid.

In addition to embedded crystals, a massive variety, known as stassfurtite, occurs as nodules in the salt deposits at Stassfurt in Prussia: that from the carnallite layer is compact, resembling fine-grained marble, and white or greenish in colour, whilst that from the kainite layer is soft and earthy, and yellowish or reddish in colour. (L. J. S.)

BORAGE (bŭ'rrij), a herb (*Borago officinalis*) with bright blue flowers and hairy leaves and stem, considered to have some virtue as a cordial and a febrifuge; used as an ingredient in salads or in making claret-cup, etc.

BORAGINACEAE, a family of plants belonging to the sympetalous section of dicotyledons, and a member of the series Tubiflorae. They are rough-haired annual or perennial herbs, more rarely shrubby or arborescent in tropical and sub-tropical forms. The leaves, generally alternate, are usually entire and narrow. The radical leaves in some genera, as *Pulmonaria* (lungwort) *Cynoglossum*, differ from the stem-leaves, being broader and sometimes heart-shaped. A characteristic feature is the one-sided (*dorsiventral*) inflorescence, illustrated in forget-me-not (*Myosotis*); the cyme is at first closely coiled, becoming uncoiled as the flowers open. Often the flowers are red in bud, becoming blue as they expand, as in *Myosotis*. The flowers are generally regular;

is a one-seeded nutlet; there are generally four, but one or more may not develop.

The family is widely spread in temperate and tropical regions, and contains 100 genera with about 1,000 species. Its chief centre is the Mediterranean region, whence it extends over central Europe and Asia, becoming less frequent northwards. A smaller

centre occurs on the Pacific side of North America. The family is less developed in the south temperate zone. It is of little economic value. Several genera, such as borage, were formerly used in medicine, and the roots yield purple or brown dyes. Heliotrope or cherry-pie (*Heliotropium peruvianum*) is a well-known garden plant.

In Great Britain the family is represented by some 12 genera and upwards of 25 species; among these are the borage (*Borago officinalis*), the gromwell (*Lithospermum officinale*), the hound's-tongue (*Cynoglossum officinale*), the viper's-bugloss (*Echium vulgare*) and several species of forget-me-not or scorpion-grass (*Myosotis*). In North America there are about 30 genera and upwards of 250 species, most numerous in the western United States. In the northeastern States and adjacent Canada about 50

species are found, one-third of which are naturalized, in the Rocky Mountain region upwards of 150 species occur; in the Great Basin (Utah and Nevada) there are more than 100 species, and in California, more than 90. Exclusively North American genera are *Allocarya*, *Amanckia*, *Cryptantha*, *Oreocarya* and *Plagiobothrys*.

BORAH, WILLIAM EDGAR (1865–), American politician, was born at Fairfield, Ill., on June 29, 1865. He studied at the Enfield academy, Ill., and entered the University of Kansas with the class of 1889, but did not finish his course. He was admitted to the bar in 1889, practised at Lyons, Kan., 1890–01, and later at Boise, Idaho. He was elected to the U.S. Senate in 1906 and re-elected in 1912, 1918 and 1924. At the time of the split in the Republican Party in 1912 he opposed the nomination of President Taft, but refused to follow Roosevelt, although in sympathy with his policy. He favoured woman suffrage and independence of the Philippines, but was opposed to the League to Enforce Peace on the ground that it tended toward internationalism. He strongly opposed many of the measures of President Wilson's Administration, and in particular the League of Nations, of which he was always an active opponent.

Always a strenuous advocate of disarmament, Borah proposed a resolution in the Senate in favour of opening negotiations with Great Britain and Japan for a mutual reduction in the naval programmes of the three Powers. Though rejected at first, it was ultimately adopted by Congress in 1921. He suggested also

THE FORGET-ME-NOT (*MYOSOTIS PALUSTRIS*) A MEMBER OF THE BORAGINACEAE FAMILY LONG REGARDED AS AN EMBLEM OF FRIENDSHIP

the form of the corolla is rotate in borage, tubular in comfrey, funnel-shaped in hounds-tongue. The throat is often closed by scale-like outgrowths from the corolla, forming the corona.

The five stamens alternate with the lobes of the corolla. The ovary, of two carpels, is seated on a ring-like disc which secretes honey. Each carpel becomes divided by a median constriction each containing one ovule; the style springs from the centre. The colour of the flowers and the presence of honey serve to attract insects. The scales around the throat of the corolla protect it from wet or undesirable visitors, and by difference in colour from the corolla-lobes, as in the yellow eye of forget-me-not, may serve to indicate the position of the honey. In most genera the fruit

A biennial plant common to corn-fields, it owes its name to stem spots which resemble the marks on a viper

a world economic conference to consider disarmament, and it was in part owing to his efforts in this direction that the Washington Conference on the limitation of armaments (Nov. 1921) was held. He endeavoured unsuccessfully to persuade the Senate to recognize the Soviet Government of Russia. At the time of the coal strike of 1922 he favoured the operation of the mines by the Federal Government. He was opposed to the World Court, on the ground that it was an adjunct of the League of Nations. Opposed as he was to the United States joining the League of Nations, he prepared an alternative plan to "outlaw" war, which he placed before the Senate in 1923.

At the Republican national convention held at Cleveland, O., in 1924, he was nominated for the office of vice president, but refused to permit his name to go before the convention. Both on the platform and in the Senate he continued to take an active independent interest in foreign affairs as they affected the United States, freely criticizing the policy of the Government. He constantly urged that pressure be brought to bear upon the Allied nations in connection with the repayment of the loans made to them by the United States. On the death of Senator Henry Cabot Lodge in 1924 he became chairman of the committee on foreign relations.

One of the most influential men in American public life, Borah has distinguished himself as an independent thinker of keen logic and clear convictions. His critical powers have dominated his actions especially since 1915. He effectively seconded Mr. Kellogg, secretary of State, in promoting the Pact of Paris in September, 1928; at the same time he engaged most actively in the presidential campaign.

BORÅS, a town of Sweden, in the district (*län*) of Älfsborg, 45 m. E. of Gothenburg by rail, on the river Viske. Pop. (1928) 34,564. It ranks among the first 12 towns in Sweden both in population and in the value of its manufacturing industries, principally textile. There are numerous cotton and woollen spinning and weaving mills, together with a weaving school. The town was founded in 1632 by King Gustavus Adolphus.

BORAX, a colourless crystalline salt found native in quantity in California, Chile, Tibet, Peru and Canada. It has an alkaline taste, and is moderately soluble in water, for which it often serves as a softening agent. When heated, borax fuses, loses the water which makes up part of its molecule, and melts finally to a clear glass-like substance.

The borax which occurs along the shores and bottoms of saline lakes, as in California especially, is usually very pure. Borax was formerly obtained by melting boric acid (*q.v.*) and soda ash together and extracting the fused mass with water from which the borax was crystallized. Since extensive deposits of Colemanite (*q.v.*), which is principally calcium borate, have been discovered, borax is now largely prepared from this material and from Rasovite found in California. Finely powdered native calcium borate is mixed and melted together with sodium carbonate. This causes sodium borate and calcium carbonate to be formed, and from this mixture the sodium borate may be extracted with water, leaving the less soluble calcium carbonate behind. By concentrating and cooling the solution of sodium borate, borax is obtained. If crystallization takes place above 60° C the pentahydrate is deposited, while below that temperature the decahydrate forms. This phenomenon takes place whenever sodium borate solutions are allowed to crystallize, regardless of which compound was used in making up the solution.

Borax hydrolyses (*see* HYDROLYSIS), giving an alkaline solution. Fused borax dissolves many metallic oxides to form characteristically coloured boron glasses. This property is made use of in metallurgy and in chemical analysis (*see* CHEMISTRY: Analytical). Borax finds use in soaps, in glass making, as a household and commercial water softener, as a mild antiseptic, and in glazing pottery and related substances. As a flux in welding, it dissolves the metallic oxides present on the metal surfaces, leaving clean faces to be welded. Perborates are formed when borax is electrolysed in solution or treated with hydrogen peroxide. The perborates find application in the arts as bleaching or oxidizing agents.

The United States produced, in 1925, 49,967 tons of borax, valued at \$4,083,209. Next to the United States, Chile is the largest producer of borax, one source of supply there being the residual or "mother" liquors of the nitrate vats.

Borax after fusion has the formula $\text{Na}_2\text{B}_4\text{O}_7$, being sodium tetraborate, and theoretically derived from the neutralization of four molecules of sodium hydroxide with two molecules of boric or boracic acid (*q.v.*), with elimination of two extra molecules of water, then

it thus is a diborate or pyroborate. In its ordinary form, as "common" or prismatic borax it has ten molecules of water of crystallization, $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$; another form, known as "jewellers'" or octohedral borax, has the composition $\text{Na}_2\text{B}_4\text{O}_7 \cdot 5\text{H}_2\text{O}$. There is also another crystalline form found in nature, Rasovite, which is $\text{Na}_2\text{B}_4\text{O}_7 \cdot 4\text{H}_2\text{O}$.

BORDA, JEAN CHARLES (1733–1799), French mathematician and nautical astronomer, was born at Dax. Entering the army at an early age he transferred later to the navy, and in 1782 was taken prisoner at sea by the English, but was immediately released on parole. He contributed a long series of valuable memoirs to the Academy of Sciences. His researches in hydrodynamics were highly useful for marine engineering, while the reflecting and repeating circles, as improved by him, were of great service in nautical astronomy. He was associated with J. B. J. Delambre and P. F. A. Méchain in the attempt to determine an arc of the meridian, and the greater number of the instruments employed in the task were invented by him.

See J. B. Biot, "Notice sur Borda" in the *Mém. de l'Acad. des Sciences*, iv.

BORDAGE. (1) A nautical term for the planking on a ship's side. (2) A feudal term for the tenure by which a certain class of unfree peasants held their cottages. A "bordar" was a peasant of this type who held a cottage and a few acres of arable land in return for customary labour services. (*See* VILLENAGE.)

BORD AND PILLAR. The bord and pillar method of working coal is perhaps the first systematized method practised.

PLAN OF THE BORD AND PILLAR METHOD OF SYSTEMATIZED COAL WORKING

At top, diagram showing bord, pillar and walls. Below, plan of panel, or district, in bord and pillar working. The arrows denote direction of ventilating current; stone stopping is indicated by lines = =; and the shaded area represents removed or worked-off pillars. R. Regulator; S. Scale; D. Separation door.

In this method narrow roads are driven in the coal seam so as to form pillars, which are subsequently removed. The term bord and pillar is of north of England origin, the system of working

being known in other districts as "stoop and room" (Scotland), "pillar and stall" (Midlands), and sometimes merely as "narrow work."

"Bord" is an old Saxon word for road.

In most coal seams the coal is possessed of a very definite cleavage (cleat), smooth facings or partings which run through the seam in two directions at right angles to each other, one set of cleavages, termed the "bordways cleat," being more pronounced than the other. The roads (bords) driven at right angles to it are made wider than the other roads or "walls," as the coal got thereby is larger in size. The driving of the bords and walls to form the pillars is termed "working in the whole" or the "first working," the succeeding process, the removal of the pillars, being known as "working in the broken" or "broken working." At the beginning of the last century, according to John Buddle ("Mining Records 1838"), the pillars were being made 6yd by 22yd., and only 45½% of the seam was got. In 1809 Buddle introduced an improvement in the working of bord and pillar by leaving barriers of solid coal round each district, and the name of "panel work" was given to the improved method.

At first the pillars were not removed, then later they were partially worked off; but for 100 years or more it has been the practice to work off the pillars entirely, for which purpose they are made much larger.

"Wide work," a system of working practised in the getting of the "thick coal" or "ten yard" seam of south Staffordshire, is a modification of bord and pillar, but is much more complicated. Under this method there may be four, five or even six separate workings.

See COAL MINING.

BORDEAUX, city and seaport of south-west France, capital of the department of Gironde, 350m. S S W of Paris by the Orléans railway and 150m N.W of Toulouse on the Southern railway. Pop. (1926) 244,009. Bordeaux, the fourth largest town in France, lies on the left or west bank of the Garonne 15m above its junction with the Dordogne and 60m from the sea, in a plain east of the wine-growing district of Médoc. The Garonne (550-750 yd. wide) sweeping northwards in a broad curve, separates the city proper from the suburb of La Bastide on the right bank. The river is crossed by the Pont de Bordeaux (early 19th century), 1,534ft. in length, by a railway bridge and by a recently constructed *transbordeur*. From the Pont de Bordeaux, the view westward embraces a crescent of wide quays 5m. long with a background of tall warehouses, factories and mansions. Near the centre of the quays is the Place des Quinconces, the nodal point. The streets and squares of the central portion are symmetrically planned in the 18th century manner. Outside this quarter, which contains most of the important buildings, the streets are narrow and quiet and bordered by the low white houses characteristic of Bordeaux. The whole city is surrounded by a semicircle of boulevards, beyond which lie the suburbs of Le Bouscat, Caudéran, Mérignac, Talence and Bégles. The dry soil of Médoc attracted settlement already in the Bronze age and, at least since Roman times, Bordeaux has been a flourishing town and port, with connections particularly with Spain and Britain. As *Burdigala* it was the chief town of the Bituriges Vivisci. Under the Roman empire it became a commercial city, and in the 4th century it was made the capital of Aquitania Secunda. Ausonius, a contemporary native writer, describes it as a square walled-city, and celebrates it as one of the greatest educational centres of Gaul. It suffered severely after the disintegration of the empire, and did not recover till the 10th century. Along with Guienne it belonged to the English from 1154 to 1453, and was for a time the seat of the court of Edward the Black Prince, whose son Richard was born in the city. Commerce developed between Bordeaux merchants and their fellow-subjects in London, Hull, Exeter, Dartmouth, Bristol and Chester. Various privileges were granted by the English as trade increased. The influence of Bordeaux was still further augmented when several neighbouring towns, e.g., St. Emilion and Libourne, united in a federation under its leadership. The defeat of the English at the battle of Castillon in 1453 ended their domination in the province. The privileges of the city were

at once curtailed, and only partially restored under Louis XI., who organized the *parlement* of Guienne and the university. In 1548 the inhabitants rebelled against the imposition of the salt-tax.

The reformed religion found numerous adherents at Bordeaux, and after the massacre of St. Bartholomew nearly three hundred of its inhabitants lost their lives. The 17th century was a period of disturbance. The Fronde insurrection found great support among the Bordelais. In the 18th century, a period of commercial and architectural activity for Bordeaux, the marquis de Tourny, *intendant* of Guienne, spent large sums in widening the streets and laying out public squares. It was the headquarters of the Girondists at the Revolution, and during the Reign of Terror suffered severely. Its commerce was greatly reduced under Napoleon I. In 1814 it declared for the house of Bourbon; and Louis XVIII. afterwards gave the title of Duc de Bordeaux to his grand-nephew. In 1870 the French government was transferred to Bordeaux from Tours on the approach of the Germans to the latter city. The city again became the seat of the French Government when Paris was threatened by the Germans in Aug. 1914.

Chief Buildings.—Near the centre of the city are the allées de Tourny and the Place des Quinconces. The latter, planted with plane trees, contains two huge statues of Montaigne and Montesquieu and terminates upon the quays with two rostral columns which serve as lighthouses. On its west side is a monument to the Girondin deputies proscribed under the convention in 1793. At its south-west corner the Place des Quinconces opens into the Place de la Comédie, the heart of the city, which contains the Grand Théâtre (18th century), and is traversed by a street which, under various names, runs from the quai de la Douane on the east to the outer boulevards on the west. The rue Sainte Cathérine runs at right angles to this and enters the Place de la Comédie on the south. The Pont de Bordeaux is continued by the Cour Victor Hugo, a curved street leading to a spacious square in which stands the cathedral of St. André. It consists of a large nave without aisles, a transept at the extremities of which are the main entrances, and a choir, flanked by double aisles and chapels and containing many works of art. The broad nave begun in the 12th century contrasts with the lofty 14th century Gothic choir. Both the north and south façades are richly decorated. Near the choir stands the Clocher Pey-Berland, named after the archbishop of Bordeaux who erected it in the 15th century. Of the numerous other churches of Bordeaux the most notable are St. Seurin (11th to 15th centuries), with a finely sculptured south door; Ste Croix (12th and 13th centuries), remarkable for its Romanesque façade; and St. Michel (14th and 16th centuries). The bell tower of St. Michel (15th century) has the highest spire (354ft.) in southern France, and, like that of the cathedral, stands apart from its church. The palace of the Faculties of Science and of Letters (1881-1886) contains the tomb of Montaigne. The prefecture, the hôtel de ville, the bourse and the custom-house belong to the 15th century. The law-courts and the hospital of St. André (founded 1390) date from the early 19th century. The Palais Gallien, situated near the public garden, consists of remains of a Roman amphitheatre. The city lost its fortifications in the 18th century, but several old gateways remain.

Bordeaux is the seat of an archbishop, the headquarters of the XVIII. army corps, the centre of an *académie* (educational division) and the seat of a court of appeal. A court of assizes is held there, and there are tribunals of first instance and of commerce, a council of trade-arbitrators, and a chamber of commerce. The University (1441) includes faculties of law, of science, of letters and of medicine and pharmacy, and a faculty of Catholic theology. There are several museums, including one with a large collection of pictures and sculptures, a library with over 200,000 volumes, and numerous learned societies. The trade of Bordeaux, the fourth port in France for tonnage of goods, is chiefly carried on by sea. Its port, 5½m. long and on the average 550yds. wide, is formed by the basin of the Garonne and is divided into two portions by the Pont de Bordeaux. The city trades chiefly with Great Britain, Spain, Argentina, Portugal and the United States, and has the South American service of the

Messageries Maritimes. The city is the centre of the trade in "Bordeaux" wines, and the wine-cellars of the quays are one of its principal sights. Other principal exports are brandy, resin-extract, talc, ochre, walnuts, wood-hoops, turpentine, pitwood, fruit, potatoes and other vegetables. The chief imports are pyrites, timber, grain, hardware, agricultural and other machinery and chemicals. A large fleet is annually despatched to the cod-fisheries of Newfoundland and Iceland. The most important industry is ship building and refitting. Ironclads and torpedo-boats as well as merchant vessels are constructed. Railway carriages are also built. The industries subsidiary to the wine-trade, such as wine-mixing, cooperage and the making of bottles, corks, capsules, straw envelopes and wooden cases, occupy many hands. There are also flour-mills, sugar-refineries, breweries, distilleries, oil-works, cod-drying works, manufactories of canned and preserved fruits, vegetables and meat, and of chocolate. Chemicals, leather, iron-ware, machinery and pottery are manufactured, and a tobacco factory employs 1,500 hands.

See Camille Jullian, *Hist. de Bordeaux, depuis les origines jusqu'en 1895* (Bordeaux, 1895); Charles Saunier, *Bordeaux* (2nd ed. 1925); Edw. Delage, "Le port de Bordeaux," *Rev. Maritime* I, pp. 745-759 (1928).

BORDEAUX WINES. More and better wines have been shipped from Bordeaux to all parts of the world than from any other port. But the wine that passed through Bordeaux was not always Bordeaux wine. For the past 700 years, during the three centuries of English rule in Gascony until the early part of the 20th century, the merchants of Bordeaux spent a great deal of trouble and money—and the lawyers of Bordeaux have displayed great ingenuity—to decide which wines were and which were not entitled to the name of Bordeaux.

Since Feb. 18, 1911, the French law has laid down which wines have alone the right to be sold as Bordeaux wines; they are the wines made from grapes gathered within the Gironde Département, a département named after the River Gironde, which is the name given to the River Garonne from the Bec d'Ambès, below Bordeaux, where it receives the waters of the Dordogne, until it reaches the Bay of Biscay.

The Gironde Département produces approximately 84 million gallons of Bordeaux wine in an average year, of which some 64 million are red and 20 million white wines. This immense quantity of wine is far from uniform in quality. The best red and white wines of Bordeaux are those of four distinct districts within the Gironde Département, i.e., the *Médoc*, *Graves*, *Sauternes* and *St. Emilion* districts. But there are many other vineyards in the undulating country between the rivers Dordogne and Garonne, a district known as the *Entre-deux-mers*, from which much white wine and very much more red wine is made which is of very fair quality when climatic conditions are favourable. There are also many vineyards planted in rich alluvial soil close to river banks and upon the islands of the River Gironde, which produce much wine, mostly red, of a commoner type, yet entitled to the name of Bordeaux.

A wine sold merely as "*Bordeaux*" is, or should be, a wine, or a blend of wines, made from grapes grown within the Gironde Département.

A Bordeaux wine made from the vineyards of one of the better districts of the Gironde, such as *Médoc*, *Graves*, *St. Emilion*, or *Sauternes*, is sold under the name of its native district, whether it be the produce of a single vineyard or a blend of wines from a number of different vineyards within the same district.

The Finest Bordeaux.—The best Bordeaux wines are made from the vineyards of a particularly good estate and they are always sold under the name of their native estate—a *Château*, a *Clos*, a *Cru* or a *Domaine*.

The finest of all Bordeaux wines are the following:

Red Wines.—Château Lafite—(Médoc); Château Margaux—(Médoc); Château Latour—(Médoc); Château Haut Brion—(Graves); Château Ausone—(St. Emilion); Château Yquem—(Sauternes).

The better class wines of Bordeaux are kept in cask for about three years, before they are bottled, and they should be kept some years in bottle—the better the wine the longer should it be kept.

Bordeaux wines are bottled either "at the château," i.e., in the cellars of the estate where the wine is made, or "at Bordeaux," by the Bordeaux merchants, or in any part of the world by the merchants who import their wine in casks and bottle it themselves.

A château bottled or Bordeaux bottled wine is not necessarily better than the same wine shipped in cask and bottled by the importing merchant, but it is often preferred on account of the guarantee of origin which château bottling carries. (See CLARET, GRAVES, MÉDOC, SAUTERNES.)

BORDEN, SIR FREDERICK WILLIAM (1847–1917), Canadian statesman, was born in Cornwallis, Nova Scotia, on May 14, 1847, and died at Toronto on Jan. 6, 1917. He was educated at King's college, Windsor, and at Harvard University, and for some years practised medicine at Canning, Nova Scotia. In 1874 he was elected to the Canadian parliament as Liberal member for King's county. In 1896 he became minister of militia and defence in the Liberal ministry.

BORDEN, SIR ROBERT LAIRD (1874–), Canadian statesman, born at Grand Pré, Nova Scotia, on June 26, 1854. Called to the bar in 1878, he rapidly became a leading figure in the courts of his native province and in 1896 was elected Conservative member for Halifax in the Canadian House of Commons. On the resignation of Sir Charles Tupper, in Feb. 1901, he became leader of the Conservative opposition, Sir Wilfrid Laurier being at that time in office. His policy was one of ardent imperialism and antagonism to Canadian reciprocity with the United States.

At the general election of 1908 Borden was again returned for his old constituency of Halifax, after an interval during which he had represented Carlton, and in 1911 he undertook a notable campaign throughout the west in opposition to the Laurier policies. As a direct consequence Laurier's Liberal majority of 50 was turned, at the general election in the autumn, into a coalition majority of 49, and Borden was called to form a government.

He took office on Jan. 1, 1912, and soon became involved in vigorous controversy with President Taft, who had offered Canada a commercial alliance. Borden held that a reciprocity treaty on those lines would make Canada "an appanage of the United States." In regard to the navy, he declined to proceed with the Laurier programme for a Canadian navy to be built in six years, and in June, 1912, went to London to discuss with the home government the whole problem of imperial defence. As a result he proposed, at the end of the year, in the Canadian House of Commons a contribution of 35 million dollars to the imperial exchequer, earmarked for naval construction, the home government agreeing on their side to welcome a Canadian minister in London and to make him a permanent member of the Committee of Imperial Defence. The vote went through the Commons in Feb. 1913 but, after a campaign of heated criticism, was thrown out in the senate by 51 to 27. In place of the imperial contribution, an acceleration of the Laurier building programme was then arranged.

Borden was created G.C.M.G. in 1914, and remained at the head of the Canadian Government throughout the World War, in which he rendered notable service to the cause of the Allies. In Oct. 1917 he formed a National, or Coalition, Government of Liberals and Conservatives, which was confirmed in office at elections two months later. At the Peace Conference he was largely responsible for securing the separate representation of Canada. In 1919 he retired from the premiership, and in 1922 published *Canadian Constitutional Studies*. In 1927 he was Rhodes Memorial lecturer at Oxford university. (See CANADA.)

BORDENTOWN, a city of Burlington county, New Jersey, U.S.A., on the Delaware river and the Pennsylvania railroad, 5m. south-east of Trenton. The population in 1920 was 4,371. It lies on a broad plain, 65ft. above the river, and has beautifully shaded wide streets. Most of the wage-earning residents work in Phila-

delphia, Trenton, New York, or on the railway. The public schools in 1927 had 1,000 pupils. There is a private military academy, and an industrial training school for coloured youth, supported and controlled by the State.

The first settlers were several Quaker families, in the 18th century. The town was laid out by Joseph Borden, and was incorporated as a borough in 1825. It was chartered as a city in 1867, and in 1913 adopted a commission form of government. It was the home for many years of Francis Hopkinson (1737-91); of Rear-Admiral Charles Stewart (1778-1869); of Prince Napoleon Lucien Charles Murat; of Joseph Bonaparte, ex-king of Spain, who lived on a magnificent estate known as "Bonaparte's Park"; and of F. Marion Crawford, Richard Watson Gilder, Thomas Paine and Clara Barton. In 1832 the famous engine "Johnny Bull," built in England for the Camden and Amboy railway, had its first trial here, and the site was marked by a monument.

BORDER ROADS, a highway extending from Osoyoos, British Columbia, to Trail in the same province, is about 100m. in length and improved throughout. Passing over the picturesque Cascade mountains it forms part of the Trans-Canada highway and is one of the most important routes in North America.

MAP OF THE OSOYOOS TRAIL IN BRITISH COLUMBIA NEAR THE U.S. BORDER

BORDER, THE, the territory on both sides of the boundary line between England and Scotland, but especially the Scottish side. The vicissitudes of its life illustrate the relations between the two kingdoms for centuries before the union. The line begins on the coast of Berwickshire at a spot 3m. N. by W. of Berwick, and, after running a short distance west and south reaches the Tweed near the village of Paxton, whence it keeps to the river to a point just beyond Carham. There it strikes off south-south-east to the Cheviot hills, the watershed of which for 35m. constitutes the boundary, which is thereafter formed by a series of streams—Bells Burn, the Kershope, Liddel and Esk. After following the last named for 1m. it cuts across the country due west to the Sark, which it follows to the river's mouth at the head of the Solway firth. The length of this boundary is 108m., but a direct line from Solway to the North sea is only 70 miles. At the extreme eastern end a small district of 8sq. m., consisting of the tract north of the Tweed not included in Scotland, forms the "bounds" or "liberties" of Berwick, or the country of the borough and town of Berwick-on-Tweed. On the extreme west between the Sark and the Esk, as far up the latter as its junction with the Liddel, was "No man's land" (locally debatable or thriep land), for generations the haunt of outlaws and brigands, the possession of which was a constant source of contention between England and Scotland until its boundaries were finally adjusted in 1552. The English border counties are Northumberland and Cumberland, the Scottish Berwick, Roxburgh and Dumfries; though historically, and still by usage, the Scottish shires of Selkirk and Peebles have always been classed as border shires.

On the south side are lofty, bleak moorlands, affording subsistence for sheep and cattle, and rugged glens and ravines, while on the north there are many stretches of fertile soil, especially in the beautiful valleys and dales. The Roman road known in mediaeval times as Dere street crossed the Cheviots at Brownhartlaw (1,664ft.), close to the camp of *Ad Fines* by means of which the warlike Brigantes on the south and the Gadeni and Otadeni on the north were held in check, while another Roman road, the "Wheel Causeway," passed into Scotland near the headwaters of north Tyne and Liddel.

The main ways across the border in modern times include roads from the Scottish side converging on Berwick and continued southward along the coast or via Wooler, roads from Wooler on the English side crossing at Coldstream, with a secondary route via the valley of Bowmont Water reaching the Tweed at Kelso, the road from Hexham via the Reed valley to Carter Bar and Jedburgh crossing the Cheviots at over 1,250ft. above sea, the north Tyne way to Liddel Water followed by a secondary road

related to the Wheel Causeway of the Romans, and the roads from Carlisle and Brampton on the English side via Longtown and via Gretna Green. (For early history see *LOTHIAN*; *NORTHUMBRIA*; *STRATHCLYDE*.)

In the 12th century were founded the abbeys of Hexham and Alnwick, the priory church of Lindisfarne and the cathedral of Carlisle on the English side, and on the Scottish side the abbeys of Jedburgh, Kelso, Melrose and Dryburgh. The deaths of the Scottish king, Alexander III (1286) and Margaret the Maid of Norway (1290) were followed by the wars of the succession and independence between the kingdoms. Berwick and Carlisle were repeatedly assailed, and battles took place at Halidon Hill (1333), Otterburn (1388), Nisbet (1402), Homildon (1402), Piperden (1435), Hedgeley Moor (1464), Flodden (1513), Solway Moss (1542), and Ancrum Moor (1544). There were also innumerable fights arising out of family feuds and raids among the Douglasses, the Percies, Scotts of Buccleuch, Kers, Humes, Haigs of Bemersyde, Armstrongs, Eliots, Grahams, Johnstones, Maxwells and other families, of which the most serious were the encounters at Arkenholme (Langholm) in 1455, the Raid of Reidswire (1575), and the bloody combat at Dryfe Sands (1593). The English expeditions of 1544 and 1545 involved the destruction of the four Scottish border abbeys, the sack of towns, and the obliteration of Roxburgh. The only other important conflict belongs to the Covenanters' time, when the marquess of Montrose was defeated at Philiphaugh in 1645. Partly for the defence of the kingdom and partly to overawe the border freebooters and moss troopers, who menaced the peace until they were suppressed in the 17th century, castles were erected at various points on both sides of the border.

The line of the border was usually divided into the East, Middle and West Marches, each under the control of an English and a Scots warden, who had to keep the peace, enforce punishment for breach of the law, and take care that neither country encroached on the boundary of the other. The wardens usually conferred once a year, as a rule in a friendly spirit, though in 1575 a display of temper led to the affair of the Raid of Reidswire. The appointment was important and lucrative, part of the fines and forfeits falling to the warden, who was also entitled to ration and forage for his retinue. On his first public progress to London, James VI of Scotland and James I of England attended service in Berwick church (March 27, 1603) "to return thanks for his peaceful entry into his new dominions." Anxious to blot out the bitter past, he forbade the use of the word "Borders," replacing it by "Middle Shires," which, however, soon ceased to be used. Frontier fortresses were to be dismantled and their garrisons reduced to nominal strength. This policy had the desired effect, though the expression "Borders" proved too convenient geographically to be dropped. Some English strongholds, such as Alnwick, Chillingham, Ford and Naworth, have been modernized; others, like Norham, Wark and Warkworth, are picturesque ruins; but most of the Scottish fortresses have been demolished and their sites built over, or they are now grass-grown mounds. A chain of peel towers crosses the country from coast to coast. Many were homes of marauding chiefs, and nearly all were used as beacon-stations. Early in the 18th century the Scottish gypsies found a congenial home on the Roxburghshire side of the Cheviots; and later the Scottish border became notorious for 100 years as offering hospitality to runaway couples who were clandestinely married at Gretna Green, Coldstream or Lamberton.

Border ballads occupy a distinctive place in English literature. Many were rescued from oblivion by Sir Walter Scott in *Minstrelsy of the Scottish Border* and he preserved a great deal in *Border Antiquities of England and Scotland*. Border traditions and folk-lore appealed strongly to James Hogg ("the Ettrick Shepherd"), John Wilson ("Christopher North"), and John Mackay Wilson (1804-35), whose *Tales of the Borders*, published in 1835, long enjoyed popular favour.

BORDET, JULES (1870-), Belgian physiologist, was born at Soignies, June 13, 1870. In 1892 he graduated as doctor of medicine at the University of Brussels. From 1894 to 1901 he worked at the Pasteur Institute at Paris whence he was

recalled to Brussels to found a "Pasteur Institute" for the province of Brabant of which he was made director. He was also appointed professor at the University of Brussels and in 1919 received the Nobel Prize for medicine and physiology.

His early studies showed that antimicrobial sera include two active substances, one existing there before immunization, and known as alexine; the other a specific antibody created by vaccination. He introduced the method of diagnosing microbes by sera; and his discovery of the fixation of alexine (in the first instance for cholera) inaugurated a general method of diagnosis for infectious fevers, now universally employed for the identification of typhoid fever, plague, tuberculosis, etc. He discovered haemolytic sera in 1898, and showed that they act on foreign blood by a mechanism strictly comparable with that by which an anti-microbial serum acts on microbes and, further, that the reactions of all these sera are colloidal in nature.

More recently he discovered the microbe of whooping cough, determining its action and the method of immunizing convalescents from that disease. He has thrown light on the process of the formation of coagulin, showing that it includes two elements; the first, albuminoidal and peculiar to the liquid blood, and the other, lipoidal in nature, originating in the cells of the blood or tissues. He further studied the formation of anaphylactic poisons, and, in the sphere of microbial biology, the autolysis of microbial transmissibility. Bordet's *Traité de l'Immunité dans les maladies infectieuses* was published in 1920.

BORDIGHERA, Liguria, Italy, province of Imperia, 91m. S.W. of Genoa by rail, and 3m. E.N.E. of Ventimiglia. Pop (1921) 5,462. This famed winter resort has beautiful coast scenery and fine gardens; flowers are largely exported; palms supply palm branches for St. Peter's at Rome and other churches on Palm Sunday. The Bicknell museum contains a unique collection of the flora of the Riviera.

BORDONE, PARIS (1500-1571), Venetian painter, was born at Treviso, and entered the *bottega* of Titian at an early age. In 1538 he was invited to France by Francis I, at whose court he painted many portraits, though no trace of them is to be found in French collections, the two portraits at the Louvre being later acquisitions. He also is said to have visited Augsburg and worked for the Fuggers, probably in 1548. A true child of the Renaissance, he painted a number of religious pictures, numerous mythological scenes, allegories, nymphs, cupids and subjects from Ovid's fables, but he excelled as a portraitist. His principal historical painting, signed and dated 1540, is the "Fisherman and Doge" at the Venice academy. The National Gallery, London, has a "Daphnis and Chloe" and a portrait of a lady. Other important works are the "Madonna" in the Tadini collection at Lovere, the "Adoration of the Shepherds" in the Duomo of Treviso, two mythological pictures at the Villa Borghese and the Doria palace in Rome, the "Chess Players" in Berlin, "Christ among the doctors" in the Gardner collection at Boston and a "Baptism of Christ" in Philadelphia. Besides these, there are examples of his art in Bergamo, Milan, Genoa, Padua, Siena, Venice, Florence, Munich, Dresden, Vienna and in private collections in England. Bordone died in Venice on Jan. 19, 1571.

Beyond some references in general works on Italian paintings, very little has been written on Paris Bordone since the days of Vasari, who knew him and visited him in 1566. In 1900 the committee of the fourth centenary of Paris Bordone, Treviso, published L. Bailo and G. Biscaro's *Della Vita e delle Opere di Paris Bordone*; and the *Nuova Antologia* (Nov. 16, 1900) contains a 16-page paper on Paris Bordone by P. G. Molmenti.

BORE, a high tidal wave rushing up a narrow estuary or tidal river. A tide often rising 18ft. in 90mins. produces the Severn bore by crowding water into the narrowing funnel of the estuary. The phenomenon is also particularly well illustrated in the Bay of Fundy. The name is usually derived from a Scandinavian word (*bára*) a wave, billow. The other name by which the phenomenon is known, "cagre," is also of unknown origin. There is, of course, no connection with "bore," to make a hole by piercing or drilling, which is a common Teutonic word, cf. Ger. *böhren*, the Indo-European root being seen in Lat. *fordere* to pierce, Gr. *φάρος*, plough. For the making of deep holes for

shafts, wells, etc. (see BORING). The substantival use of this word is generally confined to the circular cavity of objects of tubular shape, particularly of a gun, hence the internal diameter of a gun, its "calibre" (see GUN). A "bore" is also a tiresome, wearying person, particularly one who persistently harps on one subject. This has generally been taken to be merely a metaphorical use of "bore," to pierce. For an early use in English in this sense see Earl Carlisle's letters 1768, printed in Jesse's *Life of George Selwyn*. The *New English Dictionary* suggests derivation from Fr. *bouvrer*, to stuff, satiate.

BOREAS, in Greek mythology, a personification of the north wind. He was said to have carried off the beautiful Oreithyia, a daughter of Erechtheus, king of Athens, when he found her leading the dance at a festival or gathering flowers on the banks of the Ilissus. He had before wooed her in vain and now carried her off to his home in Thrace, where they lived as king and queen of the winds and had two sons, Calais and Zetes (q.v.).

To show his friendliness for the Athenians, Boreas wrecked the fleet of Xerxes off the promontory of Sepias in Thessaly (Herodotus, vii. 189), in return for which they built him a sanctuary or altar near the Ilissus and held a festival (*Boreasmos*) in his honour. In works of art Boreas was represented as bearded, powerful, draped against cold, and winged. On the Tower of the Winds at Athens he is figured holding a shell, such as is blown by Tritons. Boreas carrying off Oreithyia is the subject of a beautiful bronze relief in the British Museum, also of many painted Greek vases.

BORECOLE: see CABBAGE.

BOREL, PETRUS, full name PIERRE JOSEPH BOREL D'HAUTERIVE (1809-1859), French writer, was born at Lyons. His father had been ruined by taking part in the resistance offered by the Lyons royalists against the Convention, and Petrus Borel was educated in Paris to be an architect. He soon abandoned his profession to become one of the most violent partisans of the Romantic movement. His extravagant sentiments were illustrated in various volumes: *Rhapsodies* (1832), poems; *Champfrevort, contes immoraux* (1833); *Madame Putiphar* (1839), etc. His works did not rescue him from poverty, but through the kindness of Théophile Gautier and Mme. de Girardin he obtained a small place in the civil service. He died at Mostaganem in Algeria.

See Jules Claretie, *Petrus Borel, le Lycanthrope* (1865); and Ch. Asselineau, *Bibliographie romantique* (1872).

BORELLI, GIOVANNI ALFONSO (1608-1679), Italian physiologist and physicist, was born at Naples. He was appointed professor of mathematics at Messina in 1649 and at Pisa in 1656. In 1667 he returned to Messina, but in 1674 was obliged to retire to Rome, where he lived under the protection of Christina, queen of Sweden, and died on Dec. 31, 1679. His best-known work is *De motu animalium* (1680-81), in which he sought to explain the movements of the animal body on mechanical principles; he thus ranks as the founder of the iatrophysical school. In a letter, *Del movimento della cometa apparsa il mese di dicembre 1664*, published in 1665 under the pseudonym Pier Maria Mutoli, he was the first to suggest the idea of a parabolic path; and among his many astronomical works was *Theorica medicorum planetarum ex causis physicis deducta* (Florence, 1666), in which he considered the influence of attraction on the satellites of Jupiter.

BORENIUS, TANCRED (1885-), Finnish art historian, was born July 14 1885, at Wiborg, Finland, son of Carl Borenius. He began his studies at the University of Helsingfors and went therefrom to Italy, where he laid the foundations of his profound knowledge of Italian painting. In 1914 he was appointed lecturer on the history of art, and in 1922 professor at University college, London. When Finland became independent, he acted as secretary to the Diplomatic Mission (1918), notifying the event to Great Britain, France, Belgium, etc., and the next year he was the temporary diplomatic representative of Finland in London. His works include *The Painters of Vicenza* (1909); a new edition of Crowe and Cavalcaselle, *History of Painting in North Italy* (1912); *Catalogue of the Collections of Sir Frederick Cook*, vol. i, "Italian Schools" (1913); *Catalogue of Viscount Lee of Fareham's Collection* (1923); *Four Early Italian Engravers* (1923); *English Primitives* (1924).

BORER, a name for the hag fish (*q.v.*). The word is also used for many different animals that bore into solid substances, such as the boring sponge (*Cliona*), which bores into the shells of molluscs, the piddock (*q.v.*) of chalk cliffs and the ship-worm (*see* TEREDO).

BORGÄ: *see* PORVOO.

BORGHESE, a noble Italian family of Siennese origin, first mentioned in 1238, a member of which, Marcantonio Borghese, settled in Rome and was the father of Camillo Borghese (1550–1620), elected pope under the title of Paul V. (1605). The family took its place among the higher Roman nobility by the marriage of the prince's son Paolo with Olimpia, heiress of the Aldobrandini family, in 1614. In 1803 CAMILLO FILIPPO LUDOVICO, PRINCE BORGHESE (b. July 19, 1775), married Pauline, sister of the emperor Napoleon, and widow of General Leclerc. In 1806 he was made duke of Guastalla, and for some years acted as governor of the Piedmontese and Genoese provinces. After the fall of Napoleon he fixed his residence at Florence, where he died on May 9, 1832. He sold the Borghese Art Collection to Napoleon, part of his payment being the Piedmontese domains. On the restoration of these to Sardinia in 1815 he received part of the collection. The Borghese palace at Rome is one of the most magnificent buildings in the city, and contained a splendid gallery of pictures; most have been transferred to the Villa Borghese outside the Porto del Popolo, now Villa Umberto I, the property of the Italian Government.

See A. von Reumont, *Geschichte der Stadt Rom*, iii. 605, 609, 617, etc.; *Almanach de Gotha* (Gotha, 1902); J. H. Douglas, *The Principal Noble Families of Rome* (Rome, 1905).

BORGHESI, BARTOLOMEO (1781–1860), Italian antiquarian, was born at Savignano, near Rimini, July 11, 1781, and died at San Marino, April 16 1860. He studied at Bologna and Rome. His monumental work, *Nuovi Frammenti dei Fasti Consolari Capitolini* (1818–20), attracted the attention of the learned world as furnishing positive bases for the chronology of Roman history, while his contributions to Italian archaeological journals established his reputation as a numismatist and antiquarian. Napoleon III. ordered the publication of a complete edition of his works. This appeared in 10 vols (1862–97).

BORGIA, CESARE (1476–1507), duke of Valentinois and Romagna, was the son of Pope Alexander VI. by Vanozza dei Cattanei. He was born at Rome while his father was cardinal, and on his father's elevation to the papacy (1492) he was created archbishop of Valencia, and a year later cardinal. Cesare was Alexander's favourite son. In the early years of his father's pontificate he led a profligate life at the Vatican. When Charles VIII. left Rome for the conquest of Naples (Jan. 25, 1495), Cesare accompanied him as a hostage for the pope's good behaviour, but he escaped at Velletri and returned to Rome. His violence was notorious; when in 1497 his brother Giovanni, duke of Gandia, was murdered, the deed was attributed, perhaps with reason, to Cesare.

In July 1497 Cesare went to Naples as papal legate and crowned Frederick of Aragon king. Now that the duke of Gandia was dead, the pope needed Cesare to carry out his political schemes, and in Aug. 1498, Cesare was released from ecclesiastical obligations. On Oct. 1 he set forth for France with a magnificent retinue as papal legate to Louis XII., to bring him the pope's bull annulling his marriage with Jeanne of France (Louis wished to marry Anne of Brittany). In exchange he received the duchy of Valentinois, as well as military assistance for his own enterprises. He married Charlotte d'Albret, sister of the king of Navarre (May 1499). Alexander now contemplated sending Cesare to Romagna to subdue the turbulent local despots, and with the help of the French king to carve a principality for himself out of those territories, owing nominal allegiance to the pope. Cesare made Sesena his headquarters, and with an army consisting of 300 French lances, 4,000 Gascons and Swiss, besides Italian troops, he attacked Imola, which surrendered at once, and then besieged Forlì, held by Caterina Sforza, who was the widow of Girolamo Riario. She held out gallantly, but was at last forced to surrender on Jan. 22, 1500; Cesare treated her with consideration, and she

ended her days in a convent. The Sforzas having expelled the French from Milan, Cesare returned to Rome in February, his schemes checked for the moment. His father rewarded him for his successes by making him gonfalonier of the church and conferring many honours on him, and he remained in Rome and took part in bull fights and other carnival festivities. In July occurred the murder of the duke of Bisceglie, Lucrezia Borgia's third husband. Again Cesare was suspected as the instigator of the deed, and in fact he almost admitted it himself. Bisceglie was related to the Neapolitan dynasty, with whose enemies the pope was allied, and he had had a quarrel with Cesare. When it appeared that he was recovering from his wounds, Cesare had him murdered, but not apparently without provocation, for, according to the Venetian ambassador Cappello, the duke had tried to murder Cesare first.

In Oct. 1500 Cesare again set out for the Romagna, on the strength of Venetian friendship, with an army of 10,000 men. Pandolfo Malatesta of Rimini and Giovanni Sforza of Pesaro fled, and those cities opened their gates to Cesare. Faenza held out, for the people were devoted to their lord, Astorre Manfredi, a handsome and virtuous youth of 18. Manfredi surrendered in April 1501, on the promise that his life should be spared; but Cesare broke his word, and sent him a prisoner to Rome, where he was afterwards foully outraged and put to death. After taking Castel Bolognese, he returned to Rome in June, to take part in the Franco-Spanish intrigues for the partition of Naples. He was now lord of an extensive territory, and the pope created him duke of Romagna. His cruelty, his utter want of scruple, and his good fortune made him a terror to all Italy. His avidity was insatiable, and he could brook no opposition; but, unlike his father, he was morose, silent and unsympathetic. His next conquests were Camerino and Urbino, but his power was now greatly shaken by the conspiracy of La Magione (a castle near Perugia where the plotters met). Several of the princes deposed by him, the Orsini and some of his own captains, such as Vitellozzo Vitelli (*q.v.*), Oliverotto da Fermo, and G. P. Baglioni, who had been given estates but feared to lose them, joined forces to conspire against the Borgia. Risings broke out at Urbino and in Romagna, and the papal troops were defeated, Cesare could find no allies, and it seemed as though all Italy was about to turn against the hated family, when the French king promised help, and this was enough to frighten the confederates into coming to terms. Most of them had shown very little political or military skill, and several were ready to betray each other. But Cesare, while trusting no one, proved a match for them all. During his operations in northern Romagna, Vitelli, Oliverotto, Paolo Orsini and the duke of Gravina, to show their repentance, seized Senigallia, which still held for the duke of Urbino, in his name. Cesare arrived at that town, decoyed the unsuspecting *condottieri* into his house, had them all arrested, and two of them, Vitelli and Oliverotto, strangled (Dec. 31, 1502).

He was back in Rome early in 1503, and took part in reducing the last rebel Orsini. He was gathering troops for a new expedition in central Italy in the summer, when both he and his father were simultaneously seized with fever. The pope died Aug. 18, while Cesare was still incapacitated, and this unfortunate coincidence proved his ruin; it was the one contingency for which he had not provided. On all sides his enemies rose against him, in Romagna the deposed princes prepared to regain their own, and the Orsini raised their heads once more in Rome. When Cesare tried to browbeat the cardinals by means of Don Michelotto and his bravos, they refused to be intimidated, he had to leave Rome in September, trusting that the Spanish cardinals would elect a candidate friendly to his house. At the Conclave, Francesco Todeschini-Piccolomini was elected as Pius III., and he showed every disposition to be peaceful and respectable.

Cesare's dominion at once began to fall to pieces, Guidobaldo, duke of Urbino, returned to his duchy with Venetian help; and the lords of Piombino, Rimini and Pesaro soon regained their own; Cesena, defended by a governor faithful to Cesare, alone held out. Pius III. died Oct. 18, 1503, and a new Conclave was held. Cesare, who could still count on the Spanish cardinals, wished to prevent the election of Giuliano della Rovere, the

enemy of his house, but on Nov. 1 he was elected, and assumed the name of Julius II. Venice hoped to intervene in Romagna and establish her protectorate over the principalities, but Julius was determined to prevent this intervention, and after trying in vain to use Cesare as a means of keeping out the Venetians, he had him arrested. Borgia was obliged to surrender all his castles, and departed for Naples, where the Spaniards were in possession. The Spanish governor, Gonzalo de Cordova, had given him a safe-conduct, and he was meditating fresh plans, when Gonzalo arrested him by the order of Ferdinand of Spain as a disturber of the peace of Italy (May 1504). In August he was sent to Spain, where he remained a prisoner for two years; in Nov. 1506 he made his escape, and fled to the court of his brother-in-law, the king of Navarre, under whom he took service. While besieging the castle of Viana, held by the rebellious count of Lerin, he was killed (March 12, 1507).

Cesare Borgia was a type of the adventurers with which the Italy of the Renaissance swarmed, but he was cleverer and more unscrupulous than his rivals. His methods of conquest were ferocious and treacherous; but once the conquest was made, he governed his subjects with firmness and justice, so that his rule was preferred to the anarchy of factions and local despots. But he was certainly not a man of genius, as has long been imagined, and his success was chiefly the result of the support of the papacy; once his father was dead Cesare's career was at an end, and he could no longer play a prominent part in Italian affairs.

BIBLIOGRAPHY.—The chief authorities for the life of Cesare Borgia are the same as those of Alexander VI., especially M. Creighton's *History of the Papacy*, vol. v. (1807); F. Gregorovius's *Geschichte der Stadt Rom*, vol. vii. (Stuttgart, 1881); and P. Villari's *Machiavelli* (1892); also C. Vriarte, *César Borgia* (1889), an admirable piece of writing; Schubert-Soldern, *Die Borgia und ihre Zeit* (Dresden, 1902), which contains the latest discoveries on the subject; E. Alvisi, *Cesare Borgia, Duca di Romagna* (Imola, 1878); Rafael Sabatini, *The Life of Cesare Borgia*; and G. Portigliotti, *The Borgias*, trans. Bernard Miall (1928). (L. V.)

BORGIA, FRANCIS (1510–1572), Roman Catholic saint, duke of Gandia, and general of the order of Jesuits, was born at Gandia (Valencia) on Oct. 10, 1510, and from boyhood was remarkable for his piety. Educated from his 12th year at Saragossa under the charge of his uncle the archbishop, he had begun to show a strong inclination towards the monastic life, when his father sent him in 1528 to the court of Charles V. Here he married Eleanor de Castro, a Portuguese lady of high rank, was created marquis of Lombay, and was appointed master of the horse to the empress. He accompanied Charles on his African expedition in 1535, and also into Provence in 1536; and, on the death of the empress in 1539, he was deputed to convey the body to the burial-place in Granada. This sad duty confirmed his determination to leave the court, and also, should he survive his consort, to embrace the monastic life. On his return to Toledo he was made viceroy of Catalonia and commander of the order of St. James. At Barcelona, the seat of his government, he lived a life of great austerity until 1543, when, having succeeded his father in the dukedom, he resigned his viceroyalty. He now powerfully encouraged the recently founded Society of Jesus. At Gandia he built a Jesuit college; and on the death of Eleanor in 1546, he resolved to become himself a member of the society. A papal dispensation allowed him, in the interests of his young children, to retain his dignities and worldly possession for four years after taking the vows. In 1550 he visited Rome, where he was received with every mark of distinction, and where he furnished the means for building the Collegium Romanum. Returning to Spain in 1551, he assumed the Jesuit habit, was ordained priest, and entered upon a life of penance and prayer. He refused a cardinal's hat, and at the command of Ignatius Loyola, he devoted himself to the work of itinerant preaching. In 1554 he was appointed commissary-general of the order in Spain, Portugal and the Indies. On the death of Lainez in 1565, Francis Borgia was chosen to succeed him as third general of the Jesuits. So great was the progress of the society under his government that he has sometimes been called "its second founder." Borgia's ideal was a simple monasticism rather than a life of manifold and influential contact with the world. He died at Rome on Sept. 30 1572. He was beatified by Urban

VIII. in 1624, and canonized by Clement X. in 1671, his festival being afterwards (1683) fixed by Innocent XI. for Oct. 10.

Several works by St. Francis Borgia have been published, the principal of these being a series of *Exercises* similar to the *Exercitia Spiritualia* of Loyola, and a treatise *Rhetorica Concionandi*. The *Opera Omnia* were published at Brussels in 1675. His life was written (1592) by his confessor, Pedro de Ribadeneira. See A. M. Clarke, *The Life of St. Francis Borgia* (1894); P. Suan, *St. François de Borgia* (1905), *Histoire de St. François de Borgia* (1910); C. C. Martindale, *In God's Army*, vol. ii. (1917).

BORGIA, LUCREZIA (1480–1519), duchess of Ferrara, daughter of Cardinal Rodrigo Borgia, afterwards Pope Alexander VI. (q.v.), by his mistress Vanozza dei Cattanei, was born at Rome. Her father contemplated a Spanish marriage for her, and at the age of 11 she was betrothed to Don Cherubin de Centelles, a Spanish nobleman. But the engagement was broken off almost immediately, and Lucrezia was married by proxy to another Spaniard, Don Gasparo de Procida, son of the count of Aversa. On the death of Innocent VIII. (1492), Cardinal Borgia was elected pope as Alexander VI., and annulled the union with Procida; in June 1493 Lucrezia was married to Giovanni Sforza, lord of Pesaro. When the pope became friendly to the king of Naples, the enemy of the house of Sforza, he planned the subjugation of the vassal lords of Romagna, and Giovanni, feeling his position insecure, left Rome for Pesaro, with his wife. By Christmas 1495 they were back in Rome. The pope decided that he had done with Sforza, and annulled the marriage on the ground of the husband's impotence (March 1497). In order to cement his alliance with Naples, he married Lucrezia to Alphonso of Aragon, duke of Bisceglie, a handsome youth of 18, related to the Neapolitan king. But when Alexander backed up Louis XII. of France in the latter's schemes for the conquest of Naples, Bisceglie fled from Rome, fearing for his life, and the pope sent Lucrezia to receive homage of the city of Spoleto as governor. On her return to Rome in 1499, her husband, who really loved her, joined her once more. A year later he was murdered by the order of her brother Cesare.

After the death of Bisceglie, Lucrezia retired to Nepi, and then returned to Rome, where she acted for a time as regent during Alexander's absence. The latter now arranged a marriage between his daughter and Alphonso, son and heir to Ercole d'Este, duke of Ferrara, and in Sept. 1501 the marriage was celebrated by proxy with great magnificence in Rome. On Lucrezia's arrival at Ferrara she won over her reluctant husband by her youthful charm (she was 22), and from that time led a peaceful life. On the death of Ercole in 1505, her husband became duke, and she gathered many learned men, poets and artists at her court, among whom were Ariosto, Cardinal Bembo, Aldus Manutius the printer and the painters Titian and Dosso Dossi. She devoted herself to the education of her children and to charitable works; the only tragedy connected with this period of her life is the murder of Ercole Strozzi, who is said to have admired her and fallen a victim to Alphonso's jealousy. She died on June 24, 1519, leaving three sons and a daughter by the duke of Ferrara, besides one son (Rodrigo) by the duke of Bisceglie.

See the bibliographies for ALEXANDER VI. and BORGIA, CESARE; and especially F. Gregorovius's *Lucrezia Borgia* (Stuttgart, 1874), the standard work on the subject; and G. Campori's "Una Vittima della Storia, Lucrezia Borgia," in the *Nuova Antologia* (Aug. 31, 1866), which aims at the rehabilitation of Lucrezia.

BORGLUM, GUTZON (1867–), American sculptor, was born in Idaho on March 25, 1867. He was educated at St. Mary's college (Kan.), studied art at the school of the San Francisco Art Association, and during 1890–93 attended the Académie Julien and the École des Beaux-Arts in Paris. He then returned to America, but in 1896 went to London, and exhibited sculpture and painting there and in Paris. In 1902 he moved his studio to New York. He was a disciple of Rodin. The huge scale of many of his conceptions can be compared only with that of antique oriental monuments. For example, he proposed a Confederate memorial on Stone Mountain near Atlanta (Ga.), to be cut in relief along the face of that granite mountain as a frieze representing an army on the march, conspicuous from a great distance. The Stone Mountain Confederate Monumental Association was formed in order to carry out the suggestion and Borglum prepared

a design. The work, however, was interrupted owing to difficulties arising between him and the association. A new design by Augustus Lukeman was adopted on Aug. 27, 1925, in place of that of Borglum. In 1919 he exhibited a head of Lincoln cut from a block weighing six tons. The same year he was chosen to design a monument for Warsaw, commemorating the rebirth of Poland. Among his colossal figures are the Twelve Apostles for the cathedral of St. John the Divine, in New York, and another head of Lincoln in the rotunda of the Capitol at Washington. Other works include the Sheridan monument in Washington; "Mares of Diomedes" and "Ruskin" in the Metropolitan Museum of Art, New York; a statue of Lincoln, Newark (N.J.); and a statue of Henry Ward Beecher at Brooklyn. In 1926 he accepted a commission to carve the statue of Alexander Stephens for the Georgia section of the National Hall of Fame. In 1927 he was engaged in carving in the stone of Mt. Rushmore, Black Hills of South Dakota, gigantic figures as a memorial to Presidents Washington, Jefferson, Lincoln and Roosevelt; this memorial was dedicated by President Coolidge Aug. 10, 1927.

BORGLUM, SOLON HANNIBAL (1868-1922), American sculptor, was born in Ogden, Utah, on Dec. 22, 1868, the son of a Danish wood-carver and the brother of Gutzon Borglum (*q.v.*). He studied under Louis F. Rebisso in the Cincinnati art school in 1895-97, and under Frémiet in Paris. He took as his early subjects incidents of western life, cow-boys and Indians, with which he was familiar from his years on the ranch, notable works being his "Last Round-up" and "Burial on the Plains." In 1911 he completed his bronze "God's Command to Retreat," representing Napoleon on horseback in a snowdrift. His "The Little Lady of the Dew" and "Inspiration" and "Aspiration," two statues of Indians, in stone, were unveiled in 1920 in the churchyard of St. Mark's-in-the-Bouwerie, in New York city. He was Y.M.C.A. secretary with the French army in 1918, won the Croix de Guerre and later was engaged in work with the A.E.F. in France. He died on Jan. 31, 1922.

BORGOGNONE, AMBROGIO (*f.* 1473-1524), Italian painter of the Milanese school, whose real name was Ambrogio Stefani da Fossano, was approximately contemporary with Leonardo da Vinci, but represented, at least during a great part of his career, the tendencies of Lombard art anterior to the arrival of that master—tendencies from his predecessors Foppa and Zenale, which he had adopted and perfected. His fame is principally associated with that of one great building, the Certosa, at Pavia, for which he worked much and in many different ways. He seems to have lived there from 1486 to 1494, when he returned to Milan. Only one known picture, an altar-piece at the church of San Eustorgio, can with probability be assigned to a period of his career earlier than 1486. For two years after his return to Milan he worked at the church of San Satiro in that city. From 1497 he was engaged for some time in decorating with paintings the church of the Incoronata in the neighbouring town of Lodi. Thenceforth references in regard to him are few and far between. In 1508 he painted for a church in Bergamo; in 1512 his signature appears in a public document of Milan; in 1524—and this is the last authentic record—he painted a series of frescoes in the portico of San Simpliciano at Milan illustrating the life of St. Sisinius. The National Gallery, London, has two fair examples of his work—the separate fragments of a silk banner painted for the Certosa, and containing the heads of two kneeling groups of men and women, and a large altar-piece of the marriage of the two SS. Catherine, painted for the chapel of Rebecchino, near Pavia.

BORG SAN DONNINO: see FIDENTIA.

BORGU or **BARBA**, an inland country of West Africa. The western part is included in the French colony of Dahomey; the eastern in the Ilorin province of the British protectorate of Nigeria. Borgu is bounded N.E. and E. by the Niger, S. by the Yoruba country, N.W. by Gurma. It consists of an elevated plain traversed by rivers draining north or east to the Niger. Borgu is inhabited by a number of pagan negro tribes, several of whom were dependent on the chief of Nikki, a town in the centre of the country, the chief being spoken of as sultan of Borgu. The chief or king of Bussa (*q.v.*) was another more or

less powerful potentate. In 1894 Borgu became the object of rivalry between France and Great Britain. The Royal Niger Company, which had already concluded a treaty of protection with the king of Bussa, sent out Capt. F. D. Lugard (afterwards Lord Lugard) to negotiate treaties with the king of Nikki and other chiefs, and Lugard succeeded in doing so a few days before the arrival of French expeditions from the west. Disregarding the British treaties, French officers concluded others with various chiefs, invaded Bussa, and established themselves at various points on the Niger. To defend British interests Joseph Chamberlain, then secretary of State for the Colonies, early in 1898 sent Lugard back to Borgu. A period of great tension ensued. It was at this time that Lugard raised the West African frontier force. In the result an Anglo-French conflict was averted, and by the convention of June 1898 the western part of Borgu, including the town of Nikki, was declared French and the eastern British, the French withdrawing from all places on the lower Niger.

Since 1898 the country has been opened, and from being the most lawless and truculent of people the Bariba have become singularly amenable and law-abiding. Elephants are still to be found in the 50m. strip of forest land which stretches between the Niger and the interior of the country, in which are extensive areas of land suitable for cotton.

BORIC ACID or **BORACIC ACID** is familiar as a fine white powder or as small crystals which are "soapy" to the touch, a property which accounts for its use in preparing floors for dancing. This acid was first prepared by Wilhelm Homberg (1652-1715) from borax (*q.v.*), by the action of mineral acids, and was given the name *sal sedativum Hombergi*. The presence of boric acid or its salts has been noted in almost all fruits (A. H. Allen). The free acid is found native in certain volcanic districts such as Tuscany, the Lipari islands and Nevada, issuing mixed with steam from fissures in the ground; it is also found as a constituent of many minerals (borax, boracite, boronatrocalcite and colemanite). Its formula is H_3BO_3 .

The chief source of boric acid for commercial purposes is the Maremma of Tuscany, an extensive and desolate tract of country over which jets of vapour and heated gases (*soffioni*) and springs of boiling water spurt out from chasms and fissures. In some places the fissures open directly into the air, but in other parts of the district they are covered by small muddy lakes (*lagoni*). The soffioni contain a small quantity of boric acid (usually less than 0.1%), together with a certain amount of ammoniacal vapours. In order to obtain the acid, a series of basins constructed over the vents is so arranged as to permit of the passage of water through them by gravitation. Water is led into the highest basin and by the action of the heated gases is soon brought into a state of ebullition; after remaining in this basin for about a day, it is run off into the second one and is treated there in a similar manner. The operation is carried on through the entire series, until the liquor in the last basin contains about 2% of boric acid. It is then run into settling tanks from which it then passes into the evaporating pans, which are shallow lead-lined pans heated by the gases of the soffioni. These pans are worked on a continuous system, the liquor in the first being concentrated and run off into a second, and so on, until it is sufficiently concentrated to crystallize. The crystals are purified by recrystallization from water. Boric acid is also obtained from boronatrocalcite by treatment with sulphuric acid, followed by the evaporation of the solution so obtained. The residue is then heated in a current of superheated steam, in which the boric acid volatilizes and distils over. It may also be obtained by the decomposition of boracite with hot hydrochloric acid. In small quantities, it may be prepared by the addition of concentrated sulphuric acid to a cold saturated solution of borax:

Boric acid crystallizes from water in white nacreous laminae belonging to the triclinic system; it is difficultly soluble in cold water (2.6% at 40° C.), but dissolves readily in hot water (37% at 107°). It is one of the "weak" acids, its dissociation constant being only 1.69×10^{-10} , and consequently its salts are appreciably hydrolysed in aqueous solution. Boric acid is volatile in steam to

the extent of 2-8%. The free acid turns blue litmus to a claret colour. Its action upon turmeric is characteristic; a turmeric paper moistened with a solution of boric acid turns brown, the colour becoming much darker as the paper dries; while the addition of sodium or potassium hydroxide turns it almost black. Boric acid is easily soluble in alcohol, and the vapour of the solution burns with a characteristic vivid green colour. The acid on being heated above 107° C. loses water and is converted into *metaboric acid*, HBO_2 ; at 140° C. *pyroboric acid*, $\text{H}_2\text{B}_4\text{O}_7$, is produced; at still higher temperatures boron trioxide is formed. The salts of the normal or orthoboric acid in all probability do not exist; metaboric acid, however, forms several well-defined salts which are readily converted by acids, even by carbon dioxide, into salts of pyroboric acid. That orthoboric acid is a tribasic acid is shown by esterification to ethyl orthoborate, the vapour density of which corresponds to the molecular formula $\text{B}(\text{OC}_2\text{H}_5)_3$; the molecular formula of the acid must consequently be $\text{B}(\text{OH})_3$ or H_3BO_3 . With glycerol, boric acid forms a strong monobasic acid (*see BORON*). The metallic borates are generally obtained in the hydrated condition, and with the exception of those of the alkali metals are insoluble in water. The most important of the borates is sodium pyroborate or borax (*q.v.*).

Borax and boric acid are feeble antiseptics, hence they have been used to preserve food-substances, such as milk and butter, but this use was forbidden in Great Britain by law in 1927. In medicine boric acid is used in solution to relieve itching, but its chief use is as a mild antiseptic to impregnate lint or cotton-wool. Recent work has shown it is too feeble to be relied upon alone, but where really efficient antiseptics, such as mercuric chloride and iodide, and carbolic acid, have been already employed, boracic acid (which, unlike these, is non-poisonous and non-irritant) may legitimately be used to maintain the aseptic or non-bacterial condition which they have obtained. Borax taken internally is of some value in irritability of the bladder, but as a urinary antiseptic it is now surpassed by several more recent drugs, such as urotropine (hexamine).

BORING is employed for: (1) prospecting or searching for mineral deposits; (2) sinking petroleum, natural gas, artesian or salt wells; (3) determining the depth below the surface to bed-rock or other firm substratum, together with the character of the overlying soil, preparatory to mining or civil engineering operations; and (4) geological or other scientific explorations.

Prospecting by boring is most successful in the case of mineral deposits of large area, nearly horizontal, or at least not highly inclined; *e.g.*, deposits of coal, iron, lead and salt. Beds of such minerals may be pierced at any desired number of points, and the depth at which each hole enters the deposit and the thickness of the bed itself are readily ascertained, so that a map can be constructed with some degree of accuracy. Samples of the mineral are secured also, furnishing data as to the value of the deposit. While boring is sometimes adopted for prospecting irregular and steeply inclined deposits of small area, the results are obviously less trustworthy than under the conditions named above, and may be actually misleading unless a large number of holes are bored. Incidentally, boreholes supply information as to the character and depth of the valueless depositions of earth or rock overlying the useful mineral. Such data assist in deciding upon the appropriate method for, and estimating the cost of, sinking shafts or driving tunnels to develop and exploit the deposit.

Several of the methods of boring in soft ground are employed in connection with civil engineering operations; as for ascertaining the depth below the surface to solid rock, preparatory to excavating deeply, and for estimating the cost of large-scale excavations.

In sinking petroleum wells, boring serves both for discovering the oil-bearing strata and for extracting the oil. Since about 1918 a number of the deepest borings in the world have been made for oil or natural gas; for example, two in West Virginia of 7,386 and 7,579ft., two in south-west Pennsylvania of 6,300 and 7,248ft., two in Texas of 5,400 and 5,908ft., four in California of 6,240, 7,187, 7,212 and 7,319ft. and one in Spain of 5,285 feet. Rock salt deposits are sometimes worked through boreholes by introducing water and pumping out the brine for further treatment.

Boring is useful in mines for exploring the deposit ahead of the workings, searching for neighbouring veins and sounding the ground on approaching dangerous inundated workings. In the coal regions boreholes are sometimes used to carry steam pipes and hoisting ropes underground at points remote from a shaft.

Lastly, deep holes have been bored for geological exploration or for observing the increase of temperature in depth in the earth's crust; for example, at Czuchow, Silesia, 7,348ft. deep; at Leipzig, Germany, 6,265ft.; near Pittsburgh, Pa., 5,532ft.; and at Wheeling, W. Va., nearly 5,000 feet. The two last mentioned were bored to obtain as complete knowledge as possible of the bituminous coal and oil-bearing formations.

Boring Methods.—Of the six boring methods—by (1) earth augers, (2) drive pipes, (3) jointed rods and drop drill, (4) the rope system, in which the rod is replaced by rope, (5) diamond drill and (6) rotary drill—the first two are adapted to soft soils only; the others are for rock.

(1) *Earth augers* comprise spiral and pod augers. The spiral resembles the wood auger used by carpenters. It is attached to a rod by a socket joint, successive lengths of rod being added as the hole is deepened. The auger is rotated by horizontal levers clamped to the rod—by hand for holes of small diameter (2 to 6in.), by horse power for the larger sizes (8 to 16in.). Cohesive soils containing few stones are readily bored; stony ground, with difficulty. The operation is intermittent; after a few revolutions the auger is raised and cleared of the soil clinging between the spirals. Depths to 50 or 60ft. are usually bored by hand; deeper holes by horse power. For non-cohesive soil, the auger may be encircled by a close-fitting sheet-iron cylinder to retain the soil.

Pod augers are generally 8 to 20in. in diameter. A common form (fig. 1) consists of two curved plates, one attached to the rod rigidly, the other by hinge and key. A few revolutions fill the pod. Figure 2 shows a type for sandy soils. For holes of large diameter the auger is handled with the aid of a light derrick.

(2) *Drive pipes* are widely used for testing the depth and character of soft material overlying solid rock and as a necessary preliminary to rock boring when some thickness of surface soil must first be passed through. In its simplest form the drive pipe consists of one or more lengths of wrought iron pipe, open at both ends and $\frac{1}{2}$ in. to 6in. in diameter.

When of small size the pipe is driven by a heavy hammer; for deep and large holes, a light pile-driver is necessary. The lower end of the pipe has an annular steel shoe; the upper end, a drive-head for receiving the blows of the hammer. Successive lengths are screwed on as required. For shallow holes the pipe may be cleaned out by a "bailer"—a cylinder 4 to 6ft. long, with a valve in the lower end. It is lowered at intervals, filled by being dashed up and down, and then raised and emptied. If, after reaching some depth, the external frictional resistance prevents the pipe from sinking farther, another pipe of smaller diameter is inserted and driving continued. Drive pipes are often sunk by applying weights at the surface and slowly rotating by levers. Two pipes are then used, one inside the other. Water is pumped down the inner pipe, to loosen the soil and raise the debris; this is sometimes called "wash-boring." In a variation of this, for tough soil or hard-pan, a drill bit on a hollow rod is raised and dropped inside the pipe. The water, passing down the

FIGS. 1 AND 2.—TWO TYPES OF POD AUGER, SHOWING RIGID AND HINGE CONSTRUCTION

FIGS. 3 AND 4.—DRILL BIT, CUTTING TOOL AND ROD FOR DROP DRILL WORK

rod and through holes in the bit, raises the debris. The well-known "empire drill" is an example. The "driven well" for water supply is an adaptation of the drive pipe.

(3) *Drop drill and rod* has long been used in Europe and elsewhere for deep boring. It is now rarely employed for depths greater than 200 to 300 feet. The usual cutting tool or bit is shown in fig. 3. The rod is from 1 to 2 in. square in long lengths with screw joints (fig. 4). Wooden rods are occasionally used. For shallow holes (50 to 75 ft.) the work is done by hand, one or two cross-bars being clamped to the rod. The men alternately raise and drop the drill, while walking round and round to rotate the bit and so keep the hole true. The cuttings are cleaned out by a bailer, as for drive pipes.

In boring by hand the practical limit of depth is soon reached, due to the increasing weight of the rod. For going deeper (100 to 300 ft.) a "spring-pole" may be used—a tapering pole perhaps 30 ft. long and 5 or 6 in. in diameter at the small end. It rests in an inclined position on a fulcrum set about 10 ft. from the butt, the latter being firmly fixed. The rod is suspended from the end of the pole, which extends at a height of several feet over the mouth of the hole. With the aid of the spring of the pole the strokes are produced by a slight effort of the driller. Speeds of 6 to 10 ft. per 10 hours are easily made, to depths of 200 to 250 feet.

For deep boring the rod system (nearly obsolete) requires a more elaborate plant. The rod is suspended from a walking-beam actuated by a steam engine. By a screw-feed, the rod is fed down as the hole is deepened. A derrick carries the sheaves and ropes by which the rod and tools are manipulated. The drill bit cannot be attached rigidly to the rod as in shallow boring, because the momentum of the heavy parts would cause excessive breakage. A pair of sliding links between the rods and bit is therefore necessary. On striking, the bit comes to rest, while the rod descends to the end of the stroke, the links closing up. On the up-stroke the lower link, with the bit, is raised for another blow. For large holes the striking weight may be 800 to 1,000 lb; length of stroke, 2½ to 5 ft.; and speed, from 20 to 30 strokes per minute. By using the sliding links the cross-section and weight of the rod may be greatly reduced. To deliver an effective blow, however, the rod and bit must drop with a quick stroke, which brings a heavy strain upon the operating machinery. To overcome this difficulty, "free-falling tools" have been devised to cause the bit to fall by gravity; the rod follows on its measured down-stroke and picks up the bit. Free-falling tools comprise: (1) those by which the bit is released automatically; (2) those operated by a sudden twist imparted to the rod by the drillman. They are not now of sufficient importance to be detailed here. Tools are sometimes used for cutting an annular groove around the bottom of the hole and raising the core so formed for observing the character of the rock.

(4) *Rope and drop tools*, also known as the "churn" or "oil-well" drill, are widely used for prospecting and for oil, artesian and natural gas wells. The chief difference from rod-boring is in using rope instead of jointed rods. For deep boring this saves the large amount of time consumed in raising and lowering the rod, when the hole is to be cleaned out or a dull bit replaced, since the tools are rapidly run up or down by means of the rope with which they are operated while drilling. The speed of rope-boring is therefore but little affected by increase of depth, while with rod-boring it falls off rapidly. In its simplest form the "string of tools," suspended from the rope, consists of the bit, jars and rope-socket. The jars are a pair of sliding links, similar to those for rod-boring, but serving a different purpose, viz., to produce a sharp shock on the up-stroke, as the jars come together, for loosening the bit if it tends to stick fast. A heavy bar (auger

stem) is generally inserted between the jars and bit to increase the force of the blow. The weight of another bar (sinker-bar) above the jars keeps the rope taut. The length of stroke and the feed are regulated by a "temper-screw" (fig. 5). Clamped to it is the drill rope, which is let out at intervals as the hole is deepened. The bits are usually 3 to 8 in. in diameter; speed of boring, generally between 20 to 40 ft. per 24 hours, according to the kind of

FIG. 6.—STANDARD DESIGN DIAMOND DRILL WITH DIFFERENTIAL FEED

FIG. 7.—SMALL DRILL FOR UNDERGROUND WORKING OF MINES, SHOWING DIFFERENTIAL FEED

rock. A great variety of "fishing tools" is used in case of breakage of parts in the hole or other accident. For convenience in moving from place to place, especially in prospecting, the entire drilling machinery may be mounted on a truck.

(5) *Diamond drill*.—By methods (1) to (4) holes can be bored vertically downward only. By the diamond drill, holes may be bored at any angle, from vertically downward to vertically upward. It makes an annular hole, the core of which furnishes a practically complete cross-section of the strata penetrated; the thickness and character of each stratum are revealed, with its depth below the surface. Thus, the diamond drill is well adapted to prospecting deposits from which samples are desired.

The apparatus consists of a line of hollow rods, coupled by screw joints, an annular steel bit, set with diamonds, being attached to the lower end; by a small engine on the surface the rod is rapidly rotated and fed down automatically as the hole is deepened. The speed of rotation is from 300 to 800 revolutions per minute, depending on the kind of rock and diameter of the bit. While the boring is in progress water is forced down the hollow rod by a pump, returning to the surface through the annular space between the rod and the walls of the hole. The cuttings are thus carried to the surface, leaving the bottom of the hole clean and unobstructed. To recover the core and inspect the bit and diamonds, the rod is raised at every

FIG. 8.—SINGLE-CYLINDER HYDRAULIC FEED FOR DIAMOND DRILL

3 to 8 ft. of depth by a small drum and rope operated by the driving engine.

Diamond drills of standard designs (fig. 6) bore holes from 1½ to 2½ in. in diameter, yielding cores of 1 to 1½ in. diameter and are capable of reaching depths of a few hundred to 4,000 ft. or more. In the South African gold-fields several holes from 4,500 to 5,200 ft. deep have been bored. Diamond drills require 8 to 30 boiler h.p. Large machines will bore shallower holes of 6, 9

FIG. 5.—TEMPER-SCREW REGULATION FOR STROKE AND SPEED USED IN ROPE WORK

since the tools are rapidly run up or down by means of the rope with which they are operated while drilling. The speed of rope-boring is therefore but little affected by increase of depth, while with rod-boring it falls off rapidly. In its simplest form the "string of tools," suspended from the rope, consists of the bit, jars and rope-socket. The jars are a pair of sliding links, similar to those for rod-boring, but serving a different purpose, viz., to produce a sharp shock on the up-stroke, as the jars come together, for loosening the bit if it tends to stick fast. A heavy bar (auger

or even 12 in. diameter. For operating in underground workings of mines, small machines are sometimes mounted on columns (fig. 7). They bore $1\frac{1}{2}$ to $1\frac{3}{4}$ in. holes to depths of 300 to 400 ft., cores being $\frac{1}{2}$ to 1 in. in diameter. Hand-power and truck-mounted drills are also built. Rates of advance for core-drilling to moderate depths range usually from 2 to 3 ft. per hour, including ordinary delays, though in favourable rock higher speeds are attainable. In deep holes the speeds diminish, due to time consumed in raising and lowering the rod. If no core is desired a "solid bit" is used. The drilling then proceeds faster, as it is necessary to raise the rod only occasionally for examining the condition of the bit.

FIG. 9.—SOFT STEEL BIT SET WITH DIAMONDS

The driving engine has two cylinders, coupled to a crank-shaft, by which, through gearing, the drill-rod is rotated. The rod is of wrought iron or steel tubes, usually in 5 to 10 ft. lengths. There are two feed devices, the differential screw and hydraulic cylinder. For the *differential feed* (fig. 6, 7) the engine has a hollow left-hand-threaded screw-shaft to which the rod is coupled. This shaft is driven by a spline and bevel gearing and is supported by a threaded feed-nut in the lower bearing. Geared to the screw-shaft is a light counter-shaft. The number of teeth in the gear-wheels is such that the feed-nut revolves a little faster than the screw-shaft, so that the drill-rod is fed downward a fraction of an inch for each revolution. To vary the rate of feed for different rocks, there are three pairs of gears with different ratios of teeth. The screw-shaft and gearing are carried by a swivel-head, which can be rotated in a vertical plane, for boring holes at any angle.

FIG. 10.—CORE LIFTER USED IN DIAMOND DRILL WORK

With the *hydraulic feed* (fig. 8) the rate of feed is independent of the rotative speed of the rod and can be adjusted with precision. There are either one or two feed cylinders, C, supplied with water from the pump. The rod, R, while rotating freely, is supported by the feed cylinder piston, P, and caused to move slowly downward by allowing the water to pass from the lower to the upper part of the cylinder. S is a ball-bearing and K a bevel gear, driven by a companion gear, L, on the engine shaft. Valves regulate the passage of the water and hence the rate of feed.

The bit, in fig. 9, is of soft steel, set with 6 to 8 or more diamonds, according to its diameter. The diamonds, usually from $1\frac{1}{2}$ to $2\frac{1}{2}$ carats in size, are carefully set in the bit, projecting but slightly from its surface. Two kinds of diamonds are used, "carbons" and "borts." The carbons are opaque, dark in colour, and being tougher than the brilliant, with no cleavage planes, are suitable for hard rock. Borts are imperfect brilliants, and are best used for softer rocks. As the bit wears, the stones must be reset from time to time. The wear of carbons in a well-set bit is small though extremely variable. Above the bit are the core-lifter and core-barrel. The core-lifter, A (fig. 10), grips and breaks off the core, and raises it to the surface. The barrel, 3 to 10 ft. long, fits closely in the hole and may be spirally grooved for the passage of water and debris. It serves partly as a guide, tending to keep the hole straight, partly for holding and protecting the core.

FIG. 11.—DRIVING MECHANISM FOR ROTARY DRILLING

Diamond drills do not work satisfactorily in broken, fissured rock, as the carbons are liable to be injured or torn from their settings. In these circumstances and for soft rocks, the diamond bit may be replaced by a steel-toothed bit. Another core-drill is the Davis Calyx drill. For hard rock it has an annular bit, accompanied by a quantity of chilled-steel shot ("shot-boring"); for soft rock a toothed bit is used.

Diamond-drill holes are rarely straight, usually deviating considerably from the direction in which they are started. Very deep holes may vary as much as 45° or even 60° from their true direction. This is because the rod does not fit closely in the hole and therefore bends. Deviation is likely to occur also in drilling through inclined strata, especially when the layers are of different degrees of hardness. By using a long and closely fitting core-barrel deviation is reduced but cannot be wholly prevented. Nearly horizontal holes always deflect upward, because the sag of the rod tilts up the bit. Diamond-drill holes should therefore always be surveyed. This is done by lowering into the hole instruments for observing at a number of successive points the direction and degree of deviation. If accurately surveyed a crooked hole may be quite as useful as a straight one. For details see Peele's *Mining Engineers' Handbook*, sec. 9, 2nd edition.

Casing.—Generally, boreholes made by any method must be lined with casing pipe to prevent caving of the walls; for details, too extensive and technical to be given here, see Peele's *Mining Engineers' Handbook*, sec. 9, 2nd edition. For the details of oil-well boring, see DRILLING.

BORING MACHINES: see DRILL AND BORING.

BORIS I. (?-903), Bulgarian tsar, succeeded his father Presian in 853. The early years of his rule were occupied by wars in Central Europe. His alliance with Ludwig the German caused the Byzantine emperor, Michael III., to make overtures to Boris with a view to an alliance, to be sealed by Boris' conversion to the Orthodox faith. A treaty was concluded in 864, and Boris was baptized in the following year. In 866, however, he approached the pope, Nicholas I., in the hope of securing from the Western Church the promise of an independent national patriarchy for Bulgaria. The pope sent Latin clergy to Bulgaria and promised to appoint an independent head of the national church; but on his failing to fulfil his promise, Boris finally decided for the Byzantine Church at the Council of Constantinople (870). The Bulgarian nation accepted the Orthodox faith and numerous monasteries sprang up throughout Bulgaria. Into one of these Boris retired to spend his last years (889), after abdicating in favour of his eldest son Vladimir; but learning from his retreat of his son's incompetent and vicious reign, he emerged, captured and blinded Vladimir, and proclaimed his youngest son Simeon (q.v.) tsar (893). He then returned to his monastery, where he died in the odour of sanctity on May 2, 903. He is reckoned a saint by the Orthodox Church.

Although his campaigns against Serbia (854) and Croatia (855) were unsuccessful, Boris was a strong and influential sovereign, but he is chiefly famous for his conversion to Christianity and his furtherance of the spiritual life of Bulgaria.

BORIS III. (1894-), king of the Bulgarians, was born at Sofia on Jan. 30 1894, the eldest son of Tsar Ferdinand I. and Princess Marie Louise of Bourbon-Parma. He received at birth the title of prince of Tirnovo. In 1896 his religion was changed,

for political reasons, from Roman Catholic to Orthodox. He was educated at the military academy of Sofia, and served as a major in the first Balkan War (1912). During the World War he was attached to his father's staff. After his accession in 1918 he rarely left Bulgaria. He is a strictly constitutional monarch, and his personal popularity is considerable. He has a younger brother Cyril, prince of Parma (born 1895), and two sisters, Eudoxia (born 1898) and Nadejda (born 1899), who married (1925) Albert Eugène, duke of Württemberg.

BORISOGLYEBSK, a town in the south of the Tambov province of the Russian Socialist Federal Soviet Republic. Pop. (1926) 39,062. It was founded in 1646 as a frontier defence of Muscovy against the Crimean Tatars and in 1696 was surrounded by wooden fortifications. It has annual fairs and trades in grain (and has an elevator), wool, cattle and leather, and has iron casting, leather, tallow and brick-making industries.

BORKEN, chief town of a western sub-division of the district of Münster, in the Prussian province of Westphalia. Pop. (1925) 6,517. The industries include the preparation of chicory and linen and cotton weaving.

BORKU or **BORGU**, a region of Central Africa between 17° and 19° N. and 18° and 21° E., an extension of the Chad depression (160 metres, altitude) forming part of the transitional zone between the Sahara and the fertile central Sudan. Bounded east by the Ennedi and north by the Tibesti mountains, it is in great measure occupied by lesser hills belonging to the same system, merging south and east into the plains of Wadai and Darfur. South-west, in the direction of Lake Chad, is the Bodele basin. The country drains to the lake, but the numerous *khors* mostly contain water for brief periods only. A considerable part of the soil is light sand drifted about by the wind. Oases produce dates and barley. The northern valleys are inhabited by a settled population of Tibbu stock, known as the Daza, and by colonies of negroes; the others are mainly visited by nomad Berbers, the dominant Arab Ouled Sliman, and the Senussi, also Arabs. The inhabitants own large numbers of goats and asses.

Borku is also called Borgu, but must not be confounded with the Borgu (*q.v.*) west of the Niger. It was lately opened up; and was described by Gustav Nachtigal in *Sahara und Sudan* (Berlin, 1879-89). An Anglo-French agreement (1899) gave Borku to France; it was under the Senussi but the French entered in 1907, retiring again afterwards. Borku now forms part of the French territory of Chad.

BORKUM, a low island of Germany, in the North sea, belonging to the Prussian province of Hanover, the westernmost of the East Frisian chain, lying between the east and west arms of the estuary of the Ems. Pop. 3,300. The island, 5m. long and 2½m. broad, is a favourite summer resort. There is a daily summer steamboat service with Emden (57km.), Leer and Hamburg.

BORLASE, WILLIAM (1695-1772), English antiquary and naturalist, was born at Pendeen, Cornwall. As rector of Ludgvan, he made in his parish a collection of mineral and metallic fossils, and thus was led to study somewhat minutely the natural history of the county. In 1750 he was admitted a fellow of the Royal Society. His published works are: *Antiquities of Cornwall* (Oxford, 1754; 2nd ed., London, 1769); *Observations on the Ancient and Present State of the Islands of Scilly, and their Importance to the Trade of Great Britain* (Oxford, 1756); *Natural History of Cornwall* (1758). He presented a variety of fossils and antiquities to the Ashmolean museum, Oxford.

Borlase's letters to Pope, St. Aubyn and others, with answers, fill several volumes of manuscript. There are also ms. notes on Cornwall, and a ms. treatise *Concerning the Creation and Deluge*. Borlase's memoirs appeared in Nichol's *Literary Anecdotes*, vol. v.

BORMIO, a town, Italy, province of Sondrio, 41½m. N.E. of Sondrio. Pop. (1921), 1,952. It is in the Valtellina (the valley of the Adda), 4,020ft. above sea-level, at the foot of the Stelvio pass, and was of military importance in the middle ages. It contains interesting churches and picturesque houses and towers.

The baths of Bormio (Aquae Bormiae), 2m. farther up the valley, are mentioned by Cassiodorus, secretary of Theodoric, and are much frequented.

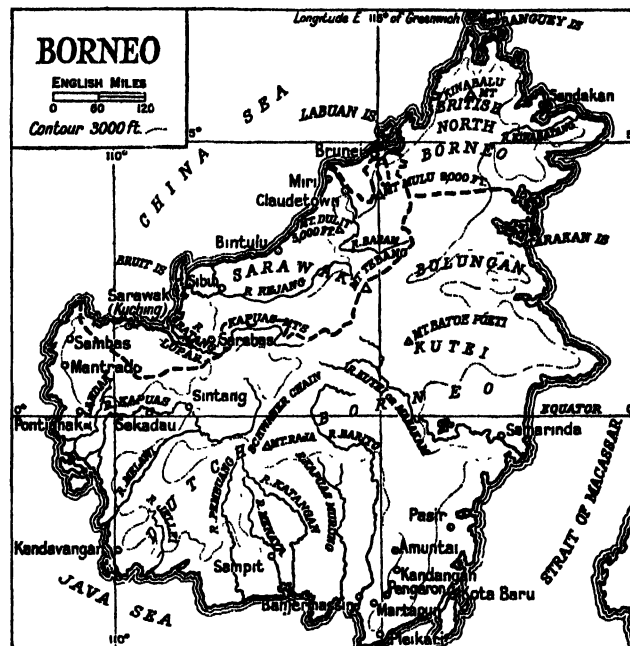

BORN, IGNAZ, EDLER VON (1742-1791), Austrian mineralogist and metallurgist, was born of a noble family at Karlsburg, in Transylvania, on Dec. 26 1742, and died at Vienna, July 24 1791. In 1776 he was appointed by Maria Theresa to arrange the imperial museum at Vienna, where he was nominated to the council of mines and the mint, and continued to reside until his death. He introduced a method of extracting metals by amalgamation (*Über das Anquicken der Erze*, 1786), and other improvements in mining and technical processes. His publications also include *Lithophylacium Bornianum* (1772-75) and *Bergbaukunde* (1789).

BORNA, a town in the west of the Free State of Saxony, 17m. S. by E. of Leipzig. Pop. (1925) 10,978. It manufactures musical instruments.

BORNEO (see also BORNEO, BRITISH NORTH), a great island of the Malay Archipelago between 7° N. and 4° 20' S, 108° 53' and 119° 22' E.; 830m. long N.E. to S.W., 600m. max. breadth; area (calculations of Topographical Bureau, Batavia, 1894), 293,496 square miles. Meyer, who is generally accurate, gives area 289,860 square miles. It is roughly five times as large as England and Wales. Politically Borneo is divided into four portions: (1) British North Borneo (*q.v.*) under the Chartered British North Borneo Company; (2) Brunei (*q.v.*), a Malayan sultanate under British protection with a British Resident; (3) Sarawak (*q.v.*), the large territory ruled by Rajah Brooke, and with its foreign relations under British protection; and (4) Dutch Borneo, by far the largest and most valuable portion.

GEOGRAPHY AND GEOLOGY

Physical Features.—The general character of the country is mountainous, though no range attains to any great elevation, and Kinabalu, the highest peak, near the north-western extremity, is only 13,698ft. above sea-level. There is no proper nucleus of

MAP OF THE ISLAND OF BORNEO, SHOWING POLITICAL DIVISIONS
British North Borneo, Sarawak and Brunei are British protectorates. The remainder, and much larger part of the island, belongs to the Dutch. Borneo, roughly five times the area of England and Wales, is rich in minerals but awaits development

mountains whence chains ramify in different directions. The central and west central parts of the island, however, are occupied by three mountain chains and a plateau. These chains are. (1) the folded chain of the upper Kapuas, which divides the western division of Dutch Borneo from Sarawak, extends west to east, and attains near the sources of the Kapuas river a height of 5,000 to 6,000ft.; (2) the Schwaner chain, south of the Kapuas, 3,000 to 7,500ft., the latter being the height of Bukit Raja, a plateau which divides the waters of the Kapuas from the rivers of southern Borneo; and (3) the Müller chain, between the eastern parts

of the Madi plateau and the Kapuas chain, a volcanic region presenting heights such as Bukit Terata (4,700ft.), long extinct. The Madi plateau lies between the Kapuas and the Schwaner chains. Its height is from 3,000 to 4,000ft., and it is clothed with tropical tree ferns. From the eastern end of the Kapuas mountains there are further to be observed: (1) a chain running north-north-east, forming the boundary between Sarawak and Dutch Borneo, the highest peak of which, Gunong Tebang, approaches 10,000ft. This chain can hardly be said to extend continuously to the extreme north, but it carries on the line of elevation towards the mountains of Sarawak to the west, and those of British North Borneo to the north, of which latter Kinabalu is the most remarkable. (2) A chain which runs eastward from the central mountains and terminates in the great promontory of the east coast, known variously as Cape Kanior or Kaniungan. (3) A well-marked chain running in a south-easterly direction among the congeries of hills that extend south-eastward from the central mountains, and attaining, near the southern part of the east coast, heights up to and exceeding 6,000ft.

Coasts.—Resting on a submarine plateau of no great depth, the coasts of Borneo are for the most part rimmed round by low alluvial lands, of a marshy, sandy, and sometimes swampy character. In places the sands are fringed by long lines of Casuarina trees; in others, and more especially in the neighbourhood of some of the river mouths, there are deep banks of black mud covered with mangroves and Nipa palms; in others there are bold headlands, cliffs, mostly of a reddish hue, clad with greenery, or rolling hills sometimes covered by a growth of rank grass. The depth of the sea around the shore rarely exceeds a maximum depth of 1 to 3 fathoms, and there are few accessible ports. The towns and seaports are, as a rule, at or near the mouths of those rivers which are not barricaded too efficiently by bars. The long coast-line of Dutch Borneo has only seven ports of call, which are habitually made use of by the ships of the Dutch Packet Company. They are Pontianak, Banjarmasin, Kota Baru, Pasir, Samarinda, Beru and Bulungan. The islands off the coast are not numerous. Excluding some of alluvial formation at river-mouths, and others along the shore which owe their existence to volcanic upheaval, the principal islands are the Natuna group on the west, the Tawi-tawi group to the east, Banguay and Balambangan on the north, Labuan (*q.v.*), a British colony off Brunei, Tarakan on the east, Pulo Laut on the south-east, and the Karimata islands.

Rivers.—The rivers play a very important part both as highways and as lines along which run the main arteries of population. Hydrographically the island has five principal versants. The shortest embraces the north-western slope, north of the Kapuas range, and discharges its waters into the China sea. The most important rivers of the north-west coast are the Sarawak, on which Kuching, the capital of Sarawak, is situated, the Batang-Lupar, the Saribas, the Rejang (navigable for more than 100m.), the Baram, the Limbang or Brunei river, and the Padas. The rivers of British North Borneo to the north of the Padas are, except the Kinabatangan, of no importance and of scant practical utility, owing to the proximity of the mountain range to the coast with which it runs parallel. In the south-western versant, the largest river is the Kapuas, which, rising near the centre of the island, falls into the sea between Mampawa and Sukadana at Pontianak, the chief town of the south-western division, after a long and winding course. This river, of volume varying with tide and rainfall, is normally navigable by small steamers and native prahus, of a draught of 4 to 5ft., for 300 to 400m., that is to say, from Pontianak up to Sintang, and thence as far as Benut. The middle part of this river, wider and more shallow than the lower reaches, gives rise to a region of inundation and lakes which extend as far as the northern mountain chain. The southern Melawi, with its affluent the Penuh, is a considerable tributary. It reaches the sea through several channels in a wide marshy delta. The Sambas, north of the Kapuas, is navigable in its lower course for vessels drawing 25ft. Rivers, south of the Kapuas, but less important, are the Simpang, Pawan and Kandawangan, near whose mouths or upon the adjacent coast, the principal native villages are situated in each case. The Barito, which is the principal river

of the southern versant, takes its rise in the Kuti Lama lake, and falls into the Java sea in $114^{\circ} 30' E$. Its upper reaches are greatly impeded by rocks, rapids and waterfalls, but the lower part of its course is wide, and traverses a rich, alluvial district, much of which is marshy. Cross branches unite it with two rivers of considerable size towards the west, the Kapuas Murung or Little Dayak, and the Kahayan or Great Dayak. The Katingan or Mendawai, the Sampit, Pembuang or Surian, and the Kota Waringin fall into the sea farther to the west. The rivers of the southern versant are waters of capacious drainage, the basin of the Kahayan having, for instance, an area of 16,000sq.m., and the Barito one of 38,000 square miles. These rivers, and the Barito's affluents, are navigable for two-thirds of their course by steamers of a fair size, but in many cases the bars at their mouths present considerable difficulties to ships drawing anything over 8 or 9ft. The south-eastern, like the north-western corner of the island, is watered by several short mountain streams. The one great river of the eastern versant is the Kutei or Mahakam, which, rising in the central mountains, flows east with a sinuous course and falls by numerous mouths into the Straits of Macassar. At a great distance from its mouth it has still a depth of three fathoms, and, in all its physical features, it is comparable with the Kapuas and Barito. The Kayan or Bulungan river is the only other in the eastern versant that calls for mention. Most rivers of the northern versant are comparatively small, as the island narrows into a kind of promontory.

Lakes are neither numerous nor very large. In most cases they are more fittingly described as swamps. In the flood area of the upper Kapuas, already mentioned, there occurs Lake Luar, and there are several lake expanses of a similar character in the basins of the Barito and Kutei and all other large rivers. A really fine natural harbour is that of Sandakan, the principal settlement of the North Borneo Company on the north coast.

Geology.—The geology of Borneo is very imperfectly known. The mountain backbone between Sarawak and the Dutch possessions consists chiefly of crystalline schists, together with slates, sandstones and limestones, all much disturbed and folded. The sedimentary deposits were formerly believed to be Palaeozoic, but Jurassic fossils have since been found in them, and it is probable that several different formations are represented. Some-what similar rocks appear to form the axis of the range in south-east Borneo, and possibly of the Tampatung mountains. But the Müller range, the Madi plateau, and the Schwaner mountains of West Borneo, consist chiefly of almost undisturbed sedimentary and volcanic rocks of Tertiary age. The low-lying country between the mountain ranges is covered generally by Tertiary and Quaternary deposits, but there are Cretaceous beds at several localities. *Vertebraria* and *Phyllothea*, plants characteristic of the Indian Gondwana series, have been recorded in Sarawak; and marine forms, similar to those of the lower part of the Australian Carboniferous system, are stated to occur in the limestone of Northern Borneo. *Pseudomonotis salinaria*, a Triassic form, has been noted from the schists of the west of Borneo. In the Kapuas district radiolarian cherts of supposed Jurassic age are to be found. Undoubted Jurassic fossils, of several horizons, have been described from West Borneo and Sarawak. The Cretaceous beds, long known in West Borneo, are comparatively little disturbed. They consist for the most part of marls with *Orbitolina concava*, and are referred to the Cenomanian. Cretaceous beds of somewhat later date are found in the Marpapura district in south-east Borneo. The Tertiary system includes conglomerates, sandstones, limestones and marls, which appear to be of Eocene, Oligocene and Miocene age. They contain numerous seams of coal. The Tertiary beds generally lie nearly horizontal and form the lower hills, but in the Madi plateau and the Schwaner range they rise to a height of several thousand feet. Volcanic rocks of Tertiary and late Cretaceous age are extremely developed, especially in the Müller mountains of Dutch Borneo. The whole of this consists of tuffs and lavas, andesites prevailing in the west and rhyolites and dacites in the east. A great deal of survey has still to be done, especially in several parts of the mountainous interior.

Climate and Health.—The climate is hot and damp. In the hills and in the interior, regions are found which may almost be described as temperate, but on the coast the atmosphere is dense, humid and oppressive. Throughout, the average temperature is from 78° to 86°, but the thermometer rarely falls below 70°, except in the hills, and occasionally on exceptional days mounts as high as 96° in the shade. The rainy westerly winds (south-west and north-west), prevail at all the meteorological stations, not the comparatively dry south-east wind. The average rainfall over the whole island is approximately 150 in. a year. The atmosphere is uniformly moist, and though days of continuous downpour are rare, comparatively few days pass without a shower. Most rain falls between November and May, and at this season the torrents are tremendous while they last, and squalls of wind are frequent and violent, almost invariably preceding a downpour. Over such an extensive area there is, of course, great variety in the climatic character of different districts, especially when viewed in relation to health. Among the native races the prevailing diseases, apart from those of a malarial origin, are chiefly such as arise from bad and insufficient food. Skin diseases are common among the natives throughout the country, and especially in the interior; elephantiasis is frequently met with on the coast. Smallpox, dysentery and fevers, frequently of a bilious character, are endemic, and occasionally epidemic. Cholera, brought in by ships, breaks out from time to time and works great havoc. Ophthalmia is common, and sometimes will attack whole tribes. About one-sixth of the native population of the interior, and a smaller proportion on the coast, suffer from *kurap*, a kind of ringworm, which is almost universal among the Sakai and Semang, the aboriginal hill tribes of the Malayan Peninsula. The disease is believed to be aggravated by chronic anaemia. Consumption is not common. Beri-beri was a scourge, where people lived on imported milled rice (see *BERI-BERI*).

Fauna.—The fauna of Borneo comprises a large variety of species, many of which are numerically of great importance. Among the large mammals the most remarkable is the orang-utan (Malay, *orang utan*, i.e., jungle man), as the huge ape, called *Maia* by the natives, is named by Europeans. Numerous species of monkey are found in Borneo, including the gibbon, a creature more human in appearance and habits than the orang-utan, and several *Semnopithec*i, such as the long-nosed monkey (*Nasalis larvatus*), Hose's grey monkey (*S. hosei*), and a red variety with a black cross down the back and arms (*S. cruciger*). There are also three species of macaque monkeys. The large-eyed *Tarsius spectrum* and *Nycticebus tardigradus* also deserve mention. The larger beasts of prey are not met with, and there is little check on the graminivores. A small clouded tiger-cat (so-called)—*Felis nebulosa*—is the largest animal of the cat kind. The little honey-bear is common. The rhinoceros is widely distributed, but the elephant occurs only in the north; both are somewhat rare. The distribution of quadrupeds as between Borneo, Sumatra and the Malayan Peninsula is peculiar and seemingly capricious. Many quadrupeds, such as the honey-bear and the rhinoceros, are common to all, but while the tiger is common both in the Malayan Peninsula and in Sumatra, it does not occur in Borneo; and the orang-utan, so plentiful in parts of Borneo and Sumatra, has never been discovered in the Malay Peninsula. It has been suggested, but with very scant measure of probability, that the existence of elephants in Borneo, whose confinement to a single area is remarkable and unexplained, is due to importation; and the fact is on record that when Magellan's ships visited Brunei in 1522 tame elephants were in use at the court of the sultan of Brunei. Wild oxen (*Bos sondaicus*) are found all over the island, and the whole country swarms with wild swine. Four species of deer are common, including the mouse-deer, or *plandok*, of remarkable grace and beauty, about the size of a hare but considerably less heavy. There are also to be found civet-cats, bear-cats, flying-foxes, otters, porcupines, squirrels, flying-squirrels, tree shrews (*Tupaia*), rats, bats and the curious little badger (*Mydaus*). Crocodiles are found in all the rivers, but the gavia is met with less frequently. Lizards are in great variety, some of the genus *Draco* being able to fly; snakes of various kinds, from

the python downward, are abundant, while the forests swarm with tree-leeches, and the marshes with horse-leeches and frogs. A remarkable flying-frog was discovered by Prof. A. R. Wallace. The most important birds are eagles, kites, falcons, owls, horn-bills, pheasants—notably the argus, fire-back, and the peacock-pheasant (*Polypectron*), partridges, crows, parrots, pigeons, wood-peckers, doves, snipe, quail and swifts. The swift (*Collocalia*) builds the edible nest from which the famous bird-nest soup is made by the Chinese. Its nests are built mostly in limestone caves, and the Borneo variety is esteemed the best in the archipelago. Mosquitoes and sand-flies are the chief insect pests, and in some districts are very troublesome. Several kinds of parasitic jungle ticks cause much annoyance to men and beasts. There are also two kinds of fire-ants which are peculiarly painful. Hornets, bees and wasps of many varieties abound. The honey and the wax of the wild bee are collected by the natives. Butterflies, moths and beetles are remarkable for their number, size, variety and beauty. The swamps and rivers, as well as the surrounding seas, swarm with many kinds of edible fish. The *trobok* is a species of fish found in the sea and valued for its roe, which is salted. The natives are expert and ingenious fishermen. Turtles, sea-cucumbers and pearl-shell are also of some commercial importance.

The dog, cat, pig, and fowl are domesticated. The buffalo, a smaller breed than that met with in the Malayan Peninsula, and in some districts bullocks of the Brahmin breed, zebu, and small horses and goats are the principal domestic animals. The character of the country and the nomadic habits of many of the natives of the interior, who rarely occupy their villages for more than a few years in succession, have not proved favourable to pastoral modes of life. The buffaloes are used not only in agriculture, but also as beasts of burden, and as draught-animals. Horses, introduced by Europeans and owned only by the wealthier classes, are found in Banjarmasin and in Sarawak. In British North Borneo, and especially in the district of Tempasuk on the north-west coast, Borneo ponies bred originally, it is supposed, from stock indigenous to the Sulu archipelago, are fairly common.

Flora.—The flora is very rich, the far greater portion of the surface of the island being clothed in luxuriant vegetation. The king of the forest is the *Tapang* (*Arburia*), rising to a great height without fork or branch to a splendid dome of foliage, beneath which may often be seen 50 to 70 nests of the wild bees on the larger branches. The official seats of some of the chiefs are constructed from the wood of this tree. Ironwood, remarkable for its durability, is abundant; it is used by the natives for the pillars of their homes and forms an article of export, chiefly to Hong-kong. It is rivalled in hardness by the *tembesu*. In all, about 60 kinds of timber of marketable quality are furnished, but the difficulty of extraction, even in the regions near the large waterways, renders it improbable that the timber trade of Borneo will attain to any very great dimensions until other and easier sources of supply have become exhausted. Palm-trees are abundant in great variety, including the *nipah* (the leaves of which are much used for roofing); others are the cabbage, fan, sugar, coconut and sago palms. The last two furnish large supplies of food to the natives. Some copra is exported, and sago factories, mostly in the hands of the Chinese, prepare sago for the Dutch, British, and other markets. Rubber, gutta-percha, camphor, cinnamon, gambier, ilippi (*shorea*) nuts, are all produced in the island; most of the tropical fruits flourish, including the much-admired, but, to the uninitiated, most evil-smelling, durian, a large fruit with an exceedingly strong outer covering of stout pyramidal spikes, like a huge horse chestnut. It grows upon the branches of a tall tree. Yams, several kinds of sweet potatoes, melons, pumpkins, cucumbers, pineapples, oranges, pomelos, bananas, mangoes and mangosteens are cultivated, as are a large number of other fruits. Rice is grown in irrigated lands near the rivers and in the swamps, and also in rude clearings of considerable size in the interior on the hillsides, where the whole of the forest is cut down and burnt off before planting the seed padi; sugar-cane of superior quality is grown all over the country; cotton, sometimes exported in small quantities, is found on the banks of the Negara, a tributary of

the Barito, and many other rivers; tobacco, used very largely now in the production of cigars, comes from various parts of Northern Borneo; and tobacco for native consumption, of small commercial importance, is cultivated in most parts. Indigo, coffee, and pepper have been cultivated since 1855 in the western division of Dutch Borneo and also extensively in Sarawak. Among the more beautiful of the flowering plants are chlorodendrons, orchids and pitcher-plants, the latter reaching extraordinary development, especially in the northern districts about Kinabalu, Mulu, and many other mountains of the interior. Epiphytous plants are common, many that are usually independent assuming here the parasitic character; the orchid *Vanda lowii*, for example, grows on the lower branches of trees, and its strange pendant flower-stalks often hang down almost to the ground. *Rafflesia*, the largest flower in the world, grows at Lundu, in Sarawak. Ferns and allied plants are abundant everywhere, particularly on the limestone mountains.

See H. Keppel, *The Expedition to Borneo of H.M.S. "Dido" for the Suppression of Piracy, etc.* (1847); Posewitz, *Borneo* (trans. 1892); Hose and MacDougall, *Pagan Tribes of Borneo* (1912); H. N. Ivor Evans, *Among Primitive Peoples in Borneo* (1922). (C. H.; E. S.)

Population.—The population of Borneo is estimated (1927) to be about 3,000,000. The Europeans number some 5,000 and the Chinese 250,000. According to the latest official estimates, the population of the four divisions of the island is: Dutch Borneo, 1,626,001 (census of 1920); British North Borneo, 257,804 (census of 1921); Sarawak, 600,000 (estimated); Brunei, 25,451 (census of 1921).

ETHNOLOGY

Races.—The peoples of Borneo belong to a variety of races, of different origin and degrees of civilization (see GENERAL ETHNOLOGY section). The Chinese seem to have been among the first civilized people who had dealings with Borneo, if the colonization of a part of the island by Hindus be excepted. Chinese annals speak of tribute paid to the empire by Pha-la on the north-east coast of the island as early as the 7th century, and later documents mention a Chinese colonization in the 15th century. Traditions of Malays and others seem to confirm the statements, and many of the leading families of Brunei in north-west Borneo claim to have Chinese blood in their veins, while the annals of Sulu record an extensive Chinese immigration about 1575. The flourishing condition of Borneo in the 16th and 17th centuries was largely due to the energy of Chinese settlers and to trade with China. In the 18th century there was a considerable Chinese population settled in Brunei, engaged for the most part in planting and exporting pepper, but consistent oppression by native rajahs destroyed their industry and led eventually to the practical extirpation of the Chinese. The Malay chiefs of other districts encouraged immigration from China with a view to developing the mineral resources of their territories, and before long Chinese settlers were to be found in considerable numbers in Upper Sarawak, at Bau and Bidi, Sambas, Montrado, Pontianak and elsewhere. They were at first forbidden to engage in commerce or agriculture, to carry fire-arms, to possess or manufacture gunpowder. About 1779 the Dutch acquired immediate authority over all strangers, and thus assumed responsibility for the control of the Chinese, who presently proved themselves somewhat troublesome. Their numbers constantly increased and were re-enforced by new immigrants, and, pushing inland in search of fresh mineral-bearing areas, they contracted frequent intermarriages with the Dayaks and other non-Mohammedan natives. They brought with them from China their aptitude for the organization of secret societies which, almost from the first, assumed the guise of political associations. These secret societies facilitated collective action, and under astute leaders they offered a formidable opposition to the Dutch Government. Later, when driven into the interior, and eventually out of Dutch territory, they cost the first rajah of Sarawak, about the year 1857, some severe contests before they were at last reduced to obedience. Serious disturbances among the Chinese are now, in Borneo, matters of ancient history, and to-day the Chinaman forms, perhaps, the most valuable ele-

ment in the civilization and development of the island, just as does his fellow in the mining states of the Malay Peninsula. They are industrious, frugal and intelligent; the richer among them are excellent men of business, and are peculiarly equitable in their dealings; the majority of all classes can read and write their own script, and the second generation acquires an education of an European type with great facility. The bulk of the shop-keeping, trading and mining industries, so long as the mining is of an alluvial character, is in Chinese hands. The greater part of the Chinese on the west coast were originally drawn from the boundaries of Kwang-tung and Kwang-si. They are called Kehs, and are of the same tribes as those which furnish the bulk of the workers to the tin mines of the Malay Peninsula. They are a rough and hardy people, and are apt at times to be turbulent. The shop-keeping class comes mostly from Fuh-kien and the coast districts of Amoy. The Hylams make excellent domestic servants.

The classification of the peoples of Borneo is beset with difficulties, because clear lines of demarcation between types are, for various reasons, almost impossible to determine.

Causes of Admixture.—In the first place, of all the pagan tribes, the Kayans and perhaps the Punans have alone remained, in the real sense of the word, true to type. In all other cases the perpetual fusion of tribe with tribe and people with people has caused countless intermediate subtypes. Most of the tribes are

migratory by nature, and whether from the mainland to Borneo, or from one part of the island to another, have advanced by fighting; as they advanced, they took captives, who, in order to strengthen and increase the tribe, were gradually absorbed by marriage.

Another cause of intermixture is economic. Certain tribes especially skilful in the obtaining of valuable forest products, have been, during all periods, in great request; and isolated members, or small parties, have constantly left their home-districts for some

BY COURTESY OF THE ROYAL PACKET NAVY CO
BORNEO WOMAN ENGAGED IN SPINNING, A CHIEF NATIVE OCCUPATION

centre where they have been able to find a ready market and good prices. In later days the demand in Europe for forest products has brought down to the coast or else to convenient up-country depots, people who otherwise would have lived remote.

The rivers are always the highways of the country, and have been responsible for a number of landslides of population on a considerable scale; e.g., the movement of the Peng tribe on the Upper Mahakam of Dutch Borneo down river in 1885 (following an attack by the Ibans of Batang Lupar), and, again, from Dutch Borneo into the up-country portions of the Baram district of Sarawak in 1898-99.

Negritos.—It is probable that at one time the island was inhabited by people of the Negrito (pygmy) race. Remnants of a Negrito population are to be found in almost all the islands adjacent to the coast of Borneo, and on the island of Palawan there exists to-day a dwarfish Negrito people known as Aïta, undoubtedly an indigenous element, and, still in many places, the recognized owners of the soil.

In Borneo itself it is doubtful if any communities of this race remain, although individuals may occasionally be met with whose hair and facial characteristics strongly suggest an infusion of Negrito blood. Such cases are perhaps sufficiently accounted for by the fact that from time to time slaves and captives have been imported from outside.

Malays.—To-day the inhabitants of the island may be classified generally as *Laut* and *Dayak*.

The first word means "Sea people," and is applied by the pagan inhabitants of the island to Malays, who are Mohammedans and mostly live on the coast; the second is a Bornean word varying in exact significance according to locality, and meaning either up-country people, or more generally, all people who are not coast people or Mohammedans. The Malays first settled in Borneo,

especially on the north coast, some 700 years ago, and later penetrated inland, naturally following the course of the many rivers. They seem to have belonged, in the main, to the class known as *Orang-Benua* (men of the soil), such as are found elsewhere (e.g., in Celebes, Jilolo and Madagascar) and are distinct from the cultured Malay peoples, many of whom were probably Hindus before conversion. Many of the *Orang Malayu* in the island today are either recent converts to Islam, or the descendants of such converts.

"Pagan" Tribes.—Regarding the origin of the older and pagan peoples, at some very remote period, a considerable migration took place, of Caucasian¹ tribes and peoples, described as a Proto-Caucasic race, and in a south-easterly direction, even reaching, at its extreme easterly limit, as far as the islands of the western Pacific. To these peoples when settled in their Asiatic home, was given the name Indonesians, meaning thereby all the earlier inhabitants of the islands and sea-coast countries from Burma to New Guinea. These Indonesians were dolichocephalic. On their way south and east they encountered, with varying results, other migratory tribes known as Southern Mongols and Oceanic Mongols, who seem to have originated in northern China and would appear to have parted company on their way south. An admixture in various degrees between them and the Caucasic peoples then formed two distinct great groups of peoples travelling south, either down the valleys of the Brahmaputra and the Irrawaddy, or through southern China and Cambodia by way of the Mekong and Sikiang and in some cases passing to their present habitat by way of the Philippines. From an admixture of these two elements are descended the pagan tribes of Borneo.

The Cambridge university anthropological expedition in 1898 confirmed Hose's suggested classification of these six groups; viz., Punans, Klemantans, Kenyahs, Kayans, Muruts and Ibans (commonly known as Sea-Dayaks); the first three representing the oldest stock in the island, Kayans, Ibans and Muruts being later arrivals. Of these tribes it is more than likely that the Kayans and Kenyahs took the westerly route, the Punans, Klemantans, Ibans and Muruts, the easterly. The Kayans and Kenyahs are, therefore, presumably akin to such peoples as the Nagas, Karens, Arakanese, and what Keane calls Tibeto-Burmese; while the Punans, Klemantans, Ibans, and Muruts (the latter of whom show considerable affinity with certain Philippine tribes) have as their kinsmen Formosans, Bugis, Javanese, Sundanese, and Malays. The Punans, Klemantans and Kenyahs have a predominant percentage of Caucasian features, the long head, wavy rather than curly hair and fair complexion. The Mongolian ingredients are shown by the Mongol "fold" of the eyelid, which is found in a very large number of cases. They arrived in Borneo as pagans and remain pagans to this day, having a number of gods of an indefinite character and personality, mostly deities derived from natural phenomena (as the sea, the forest, and so forth), but believing vaguely in one Supreme Being. They make figures of their gods and build altars, but have not reached the stage of temple-building.

The three other tribes, the Kayans, the Muruts and the Ibans, all arrived in Borneo late enough for them to be called invaders. The Kayans, though later arrivals than the Punan-Klemantan-Kenyah group, are undoubtedly the most occidental of all the peoples. They seem to have migrated very slowly, halting for long periods at the various stages, but never remaining permanently at any point until they reached Borneo. They brought with them their own culture, and hardly mingled at all with the various Mongol peoples whom they encountered. With them are to be grouped, according to Dr. A. W. Nieuwenhuis (*Quer durch Borneo*, Leyden, 1904-07), the great Bahau people found in the eastern part of Dutch Borneo.

The Muruts are rather more Caucasian than the Kayans, but they brought with them less from the west, very possibly because they took a longer time over their journey, and were more af-

fectured in habits, although not in race, by the peoples whom they met.

The third group, the Ibans, who perhaps are nearer to the Muruts than any other group and may be the latest of the invaders, stand somewhat apart, for they differ more from the other tribes than the latter do from each other. They, like Punans, Klemantans and Muruts, have been called Proto-Malayans, and are often referred to as Malays. This nomenclature, however, requires correction. The Malays are not a racial or ethnological, but a religious group; converts to Islam dating from the 12th century, who after their conversion so changed their habits of life that, acquiring great influence over all parts of Indonesia, they appeared to be a homogeneous race, though in fact made up of all sorts of tribes and peoples. These energetic sea-rovers and conquerors appear to have spread either from the peninsula or from the Sumatran district of Menangkabau, about eight or nine hundred years ago, founding permanent settlements around the Bornean sea-board and the adjacent islands of the Archipelago, and spreading eastwards almost to Papua and north to Cambodia and Annam. Among others with whom they came into close contact were the Ibans of Sarawak, who, if they were not actually converted, at least acted with them in various enterprises, chiefly piracy and the capture of slaves.

There is a tradition, which cannot be satisfactorily checked, that a few centuries ago the Ibans were brought from Sumatra into Borneo by Malay nobles of Sarawak. This is possibly correct, but it is quite probable that many settlements of Ibans had already been formed in other parts of Borneo before any Malay occupation of the coastal districts.

Ibans have undeniably associated with Malays and actually, by conversion to Islam, become Malays and intermarried with them, and the Malay language undoubtedly contains many Iban words; but they are only one of the many widely differing and widely scattered peoples out of whom the present day Malays have been built up.

SOCIAL AND POLITICAL ORGANIZATIONS

Dutch Borneo.—Dutch Borneo is divided for administrative purposes into three divisions, the western and the south and eastern respectively. Of the three, the first is under the more complete and effective control. In these divisions there is an average density of eight people to the square mile. The sparseness of the population throughout the Dutch territory is due to a variety of causes—to the physical character of the country restricting population to the near neighbourhood of the rivers, to the low standard of civilization many natives have attained; to wars, piracy and head-hunting, the last of which has not even yet been wholly checked in the interior; and to aggression and oppressions in earlier times of Malayan, Arab, Bugis and other settlers. Among the natives of the north, more especially of the interior, an innate restlessness which leads to a life of poverty, insufficient nourishment, an incredible improvidence which induces them to convert into intoxicating liquor a large portion of their annual crops, feasts of a semi-religious character which are invariably accompanied by prolonged drunken orgies, and certain superstitions which necessitate frequent procurement of abortion, have contributed to check growth of population. In Sambas, Montrado, and some parts of Pontianak, the greater density of the population is due to immigration from Java and Sumatra, the greater fertility of the soil, the opening of mines, the navigation and trade plied on the larger rivers, and the concentration of the population at the junction of the rivers, the mouths of rivers and the seats of government. In Amuntai and Martapura, early Hindu colonization, of which the traces and the influence still are manifest, the fertile soil, trade and industry aided by navigable rivers, have led to large growth of population. Only a very small proportion of the Europeans in Dutch Borneo, Sarawak, or British North Borneo, live by agriculture or business industry, the great majority of them being officials. The Arabs and Chinese, Malays and interior tribes, are engaged in trading, mining, fishing, rubber-planting and agriculture. Of the natives, fully 90% live by the collection of forest produce or by agriculture, which, however,

¹The words "Caucasian," "Caucasic" are here used as convenient terms without any geographical significance. "We are no more called upon to believe that the Caucasic peoples originated in the Caucasus than that the Semites are all descendants of Shem." (Keane *op. cit.*)

until recent years has been for the most part of a somewhat primitive description. The industries of the natives are confined to such crafts as spinning, weaving and dyeing, the manufacture of iron weapons and implements, boat and ship-building, and the collection of jungle products. More particularly in the south-eastern division, and especially in the districts of Negara, Banjarmasin, Amuntai and Martapura, in Dutch Borneo, and amongst most of the peoples of Sarawak, ship-building, iron-forging, gold and silver smith's work, and the polishing of diamonds, are industries of high development in the larger centres of population.

The actual power and influence of a chief depend naturally on local and tribal custom and personality. Among Kayans, Kenyahs, and most Klemantans, the influence of the village chief is considerable; among Muruts and Ibans it is less marked, while among the Punans the functions of the chief are informal and are chiefly concerned with social welfare. Among the Kayans, and still more so among the Kenyahs, his position is one of greater authority and he receives much voluntary assistance, consideration, and respect.

Social Classes.—A peculiar feature especially noticeable among Kayans and Kenyahs, but one which with the diffusion of European influence is gradually disappearing, is the existence in a village of three different classes of inhabitant. Such a class distinction doubtless owes its origin to the taking of captives by conquering tribes, and is for that reason more to be observed among the Kayans than with others; in some cases also the creation of a lower class has been due to disciplinary action. Among Kayans and Kenyahs there are to-day three strata of society, more or less distinguishable and recognized by the people themselves. The upper class consists of the family of the village chief and his near relatives; they bear their part in the work of the community, such as the cultivation of crops, but their work is less prolonged and less intensive than that of the lower classes.

The lowest of the three classes is that containing descendants of captives taken in the former civil wars. The modern governments of Borneo have given such opportunities for captives to regain their independent status, that this third class is gradually dying out. Among the Ibans, who are geographically the nearest to the important centres of the Government of Sarawak on all the large rivers of the country, it can be said no longer to exist. Among the tribes where the system still remains, the position of these captured people is in no sense that of slaves except that they are attached to the house, and need certain formalities to procure their emancipation, a step rarely taken and often retraced. These dependents are either what is called "servants of the house" or "servants outside the room." Those inside the house are the families of captives, absorbed into it by marriage; their work and position are servile only in so far as they are bound to the house; in practice they are part of the tribe. The servants outside the room are hangers-on, whose connection with the house is accidental; and whose absence or presence is immaterial. They are not inclined to leave, and when they do so, are easily persuaded to return.

Between these is a middle class, who commonly comprise the majority of the people in a house. *De facto* they belong to the upper class although their voices in public affairs carry less weight. They are, as might be expected, the result of fusion or of decadence, *parvenus* who are in the process of working upwards, or members of a higher class who have fallen. As the influence of the central government spreads, these distinctions tend toward obliteration, the lowest class ceasing to be created, and the middle class being gradually absorbed into the higher.

The unit of political life is the village, which may consist of one or more long houses. Each house has its own chief, but one is recognized as the head chief of the village. Each village is independent although, as a matter of caution, before any important affair, such as a change of location or the undertaking of a war expedition, the advice and often the co-operation of neighbouring villages belonging to the same tribe is sought. Inter-marriages between villages, which, especially in the case of chiefs, are common, more usually result in alliance than fusion.

Long Houses.—The Long House, which is found in all parts of the island, is derived perhaps from the pile-built houses of lake

dwellers, such as are found to-day, together with raft-dwellings, along the tidal rivers and especially at Brunel, a pile-built town. These long houses, the best of which are built by Kayans, are erected on the banks of tidal rivers, out of reach of the freshets, and are usually of one type, the average length being six or seven hundred feet. They are divided longitudinally into two parts, the front forming a long gallery serving as a communal room, a sort of combination of public hall and village street. The back is divided into a number of rooms, each housing one family. The whole is built on massive piles of ironwood and raised 15 to 20 ft. from the ground, the gallery being reached by ladders. A Kayan village usually consists of three to five such houses. The same is frequently the case with Kenyah and some Klemantan villages, but an Iban settlement invariably consists of a single house at no great distance from others.

The House Chief.—The powers of the house chief are concerned with house matters, such as marriage and divorce, compensation for personal injury or loss, and disputes arising from the ownership of property, especially farming and fruit lands. The village chief, who sits in council with subordinate chiefs, deals with matters which affect the village as a whole, and trials for serious personal injuries. He is also responsible for the proper observation of omens, and the regulation of *taboos* and restrictions (other than those of individuals), and various religious rites. He takes the leading part in social ceremonies and is regarded by other chiefs as largely responsible for the behaviour of his people. Above all, in war he is responsible for both strategy and tactics.

The Penghulu.—At the head of a tribe, or of a group of villages more or less scattered, is a kind of justice of the peace or native magistrate, called the *Penghulu*. The title is largely an honorary one, the *Penghulu* being a Government officer, elected by the people and approved by the Government and a member of the general council; whether in Dutch Borneo, Sarawak or British North Borneo, he is an essential part of the administration.

RELIGION AND BELIEFS

In the matter of beliefs the Bornean, possessing a mechanical mind, is under no illusion as to "devils" resident in machinery. At the same time, the belief in various spirits is an essential ingredient in his nature. In Borneo, as elsewhere, the progressive stages of belief range from Animism through Polymorphism to Monotheism. These forms of belief are found not only spread throughout the islands, but commonly combined in one tribe and in one individual. The belief in spiritual powers is universal, such powers being either (a) Anthropomorphic gods, or (b) vague impalpable nature spirits, for which the generic name in Kayan is *Toh*, possibly a corruption of the Malay word *Hantu*, ghost.

The Greater Gods.—Of these the first are spirits, thought of as possessing man's shape and, by certain fortunate individuals in the past, actually so seen. They are regarded with awe and gratitude, and are addressed in prayers and thanksgivings. Such gods are *Balingo*, the Kenyah god of thunder, *Laki Pesong*, the Kayan god of fire, and three Kayan gods of life; some, such as the gods of fire and of the harvest, are friendly, others, as the gods of madness and fear, malevolent. In origin these gods are undoubtedly animistic. Images representing them are found outside most houses, but the images are not regarded either as being gods themselves or having any divine power; rather they are symbolic reminders, serving a double purpose, to the worshipper recalling the existence of the spirits, and to the gods the needs of their suppliants.

Beside and above all these is one principal god who is perhaps regarded as a sort of house or village chief among gods, and whose name, rather than his functions, varies in different tribes. Among the Kayans he is known as *Laki Tenangan*, and has a wife *Doh Tenangan*, who is especially addressed by women; among many Klemantans he is *Pa Silong*, among Kenyahs, *Penyalong*. *Penyalong*, with the Punans, is the title given to a crocodile god, who is almost the only personal god in whom they believe.

Toh.—The second class of spirits, the *Toh*, are vaguely conceived and may include the souls of animals and men past and present. They are regarded as malevolent and the object of fear,

surrounding the long house and infesting the rivers, the mountains, the forest, and, by coastal tribes, the sea. Death, sickness, the failure of crops and other major disasters are ascribed to the influence of these spirits which may be avoided by disguise, or propitiated by offerings. *Toh* are naturally most formidable in the least accessible places, such as mountain-tops, and, to some extent, caves and waterfalls. In the regulating of conduct they play an important part, being connected with various taboos; it is on fear of them rather than any feeling towards the major gods, that morality is based. The most important *Toh* are those connected with the dried heads of enemies, which are found in many Bornean long houses.

Iban Petara.—The Ibans do not seem to have any concept corresponding to the Supreme Spirit of the other tribes. The *Petara* of these people is a conception of one god having many manifestations and functions, each manifestation being anthropomorphic. Such are the mythical warrior, *Klieng*, and the god of war, *Singalang Burong*, who has a material animal form (that of the white-headed hawk, *Bali Flaki* of the Kenyahs); a yearly festival (*Begawai*) is held in his honour at which songs and prayers are continued for ten or twelve hours without cease.

The Unknown Helper.—Ibans, and some other tribes, have another, but a very rare belief in the *Ngarong* (*Tua* of the Malays), an invisible helper, usually the spirit of an ancestor or dead relative, who becomes the special protector of some individual, being first manifested in a dream. After such a dream the Iban wanders through the forest seeking a sign, either an animal or an inanimate object, which thereafter becomes to him the abode of his guardian spirit. The animal is most commonly a snake, a bear, a tiger-cat, a wild boar, or a gibbon. In such a case all individuals of that species become objects of special regard to the protégé of the *Ngarong*; he will not kill or eat any such animal, and as far as he can, restrains others from so doing. Every Iban who has no such guardian hopes to obtain some bird or beast as his helper at the *Begawai*, the festival of the *Petara*.

Life after Death.—The attitude of Borneans towards death and the life after death is peculiar, since a man's soul is regarded as remaining in the neighbourhood of the body so long as it remains in the house. The Kayans appear to distinguish two souls, the one (*Blua*) the true vital principle, the other a ghost-soul, which in a live man may wander far, in dreams, in sickness and in abstractions; and accordingly the word *wrip*, meaning to be alive, is used as a term of respect to a person recently dead, but still, so to speak, in the neighbourhood. After death the soul is supposed to wander on foot until from a high point it views a great river, *Long Malan* (*Long Bali Matai* of the Kenyahs), in the basin of which are found the dwelling places of souls, the destination of each varying according to the manner of death. The largest of these districts is *Apo Leggan* (Kayan), where life is continued much as on earth. Other districts are *Tan Tekkan*, where suicides pass a miserable existence, and *Long Julan*, the weir leading to the lake of blood, where warriors who have met a violent end live in comfort, having for wives the ghosts of women who died in childbirth. The river of death, which all must cross, is bridged by a single log suspended from bank to bank, and constantly shaken by a guardian, *Maligang* (Klemantan). At the far end of this rocking bridge, according to the Punans, sits a giant helmeted hornbill, which frightens timid souls and causes them to fall into the river and be swallowed by a great fish.

In general the life after death is considered as not in any way much different from this life. Social distinctions, especially such as are achieved by the taking of heads in war, are perpetuated; hence the importance attached to tattooing. Death is neither greatly feared nor desired, and often old people, apparently cheerful and vigorous, will express their entire indifference to the whole matter.

Omens.—The observation of omens, whether by the cries of birds and beasts, or by the livers of sacrificial pigs, plays a most important part in the life of every tribe.

In the first place, auspices from birds are always taken by the aristocracy of a tribe, and consist in the observation of the flight of hawks made from a *tabernaculum* or booth with a rectangular

frame, embracing a definite portion of the sky (*templum*). The flight of birds to the left is considered, in each case, a good omen. While the omens are being taken all sounds which might be unpromising are drowned by the beating of gongs and drums, a band of young men being provided for the purpose. These omens, when obtained, must be corroborated by the inspection of a sacrificial animal, a pig or a fowl. In Borneo, the liver is the seat of omens, and is, for the purposes of haruspicy, divided into certain regions, which are chiefly geographical or territorial. The omens thus obtained are held to be the answer of the god to the prayers carried to him by the spirit of the pig.

The rice-harvest (*danggi*) is one of the greatest importance, and the continuity of life, in the seed-grain, with which is associated the fertility of the women of the tribe, is ensured by the ceremonial mixture of old and new rice, grains taken from a special store of rice kept in the house for this semi-religious purpose, being added each year to the grain intended for planting. The old store is on each occasion replenished by a similar quantity of new seed.

HEAD TAKING

The taking of the heads of enemies killed in battle has certain characteristic features which deserve special notice. In this matter it is necessary to distinguish clearly between the practice of the Ibans in this matter, and that of the other tribes. (See HEAD-HUNTING.)

Among Ibans.—Ibans alone appear to take heads for the sake of glory, and to attack other tribes with this aim. It is highly probable that they were not the originators of the habit, but having come across it in existence among other tribes, they found it to their liking and made a hobby of it. In this doubtless they were encouraged by the Mohammedan pirates with whom they co-operated between the 15th and 19th centuries and who allowed them to take the heads of such enemies as were not captured alive. To-day the spread of European influence and the fact that Ibans are mostly to be found near government stations, has done much to stamp out head-taking; but, in any case there has been, both in fiction and in sober histories, a deal of exaggeration as to the custom. Undoubtedly Ibans have been known to attack friendly villages and even rob tombs in order to obtain heads; and it is equally true that they have been encouraged by their women-folk. But to suggest, as has been done frequently, that marriage is conditional upon head-taking, or that head-hunting is a habitual exercise, is completely misleading.

Other Tribes.—Among other tribes head-taking is almost exclusively connected with retaliation on enemies, the prosperity of the rice-crop, or the funeral rites of a dead chief. In earlier days an essential part of the burial of a person of importance was the sacrifice of a slave who was to accompany and serve the departed in the next world. This appears clear from the presence, at the head and foot of coffins, of wooden effigies, to which a live fowl is attached. For slaves, economy, in the course of time, no doubt, suggested the substitution, first of an outsider, later of an enemy taken in battle; and then, for convenience, of an enemy's head. Such a head is always thickly covered with palm-leaves tied round it, as if to disguise the fact that it is a head.

Among the Kayans, whose practice is typical and largely influences that of other tribes, the period of mourning for a dead chief is only terminated by the taking of a head; but, since that termination may be indefinitely delayed, the village waits (often for years) for a *casus belli* with another tribe, when a successful raid may achieve a double purpose. Nowadays, indeed, a dried head is often borrowed from a friendly village, both for this purpose and for the harvest festival and fertility of the crops and also for the ceremony of initiation of young boys into the art of war, in which a head is struck at by tiny children in mimic warfare, while at certain stations the Government keeps a few old heads which can be borrowed. Kayans do not care to have in the house more than some 20 or 30 heads at most, and on certain occasions, e.g., the removal to a new house, such as are superfluous are furtively left behind in a newly built hut where a fire kept burning for several days deceives the ghost souls of the heads.

The Rite of the Heads.—When the heads of enemies are taken they are not immediately placed in the gallery of the long house, but are lodged in a temporary hut built for the purpose. Here, outside the hut, the initiation of the boys is held. On the next day, a tall bamboo post is erected at a distance from the house near the image of the war god; this post is covered with strips of palm-leaves and from its top a single head is suspended. Before this altar-piece are placed smaller posts bearing small portions of human flesh, a thank-offering to the gods and to the omen-birds. The mourning period is terminated by a head or portion of one being carried down stream and placed on the dead chief's tomb; the ceremony is completed by the sacrifice of pigs and chickens. Later, other heads taken are brought into the house, where they are hung up amid general rejoicing, in the main verandah, opposite the principal room.

Heads and Toh.—The heads are believed to be haunted by a ghost soul or *Toh* of exceptional power and value. They are treated with respect and awe. Old men only may touch them since their hold on life is short. Fire is kept constantly burning below, a circle of small hooks is attached to them, and occasionally they are offered pork and rice-spirit.

The origin of *Toh* is probably due to the belief that the ghost-souls are resident in the human head, which, as long as it is not neglected, produces fertility in the soil, and promotes the growth of crops as well as the prosperity of the community in general and in particular that of the person who, alone, or with others, took the head. If neglected, the head is said to grind or champ its teeth, and on occasions, to cast itself on the floor, breaking the rattan by which it is suspended. The wooden hooks and bamboo cups attached to the heads of enemies mean that provision is made for additional heads and sustenance for the ghost-souls. Similar beliefs are current among the people of Assam, and this similarity is of importance in indicating the origin, migrations, and the persistence of beliefs amongst tribes which must have separated before the dawn of recorded history.

AGRICULTURE AND INDUSTRIES

The Bornean tribes seem in earlier days to have done little or nothing in the way of raising crops, being content, as are the Punans, with the products of the forest; and rice would seem to have been unknown in the island until some three hundred years ago. To-day it is the staple food of the island, having, in all likelihood, been introduced from Java by Malays or from the Philippines by the Muruts and their kindred. Muruts are credited with having introduced rice-cultivation in terraces and irrigation, and they are the best farmers in the interior of Borneo inasmuch as they raise two crops a year. Apart from rice, they cultivate a certain amount of maize, millet, tobacco and vegetables, especially gourds, cucumbers and chillies; and they are thus able to be self-supporting throughout the year. The only other tribes that produce enough to keep themselves are the Kayans and the Ibans. The Kayan is here, as in other matters, painstaking and methodical. His only crop is rice, but he takes great care in selecting various kinds so as to suit different localities. The Iban shows his versatility in the variety of produce, and he is careful not to exhaust his land. He is a hard worker and grows various vegetables in small areas cultivated by individual families.

Of the other tribes Klemantans are skilful up to a point, but they have only comparatively recently become farmers, and as their chief aim is to economize labour, they depend largely on imported food-stuffs. The Kenyah is prevented from being a good agriculturist only by his natural improvidence and his hospitality. He rarely raises enough rice to last him for more than nine months; for the rest of the year if he cannot exchange jungle produce for what he needs, he is, like the Punans, satisfied with wild sago.

The collection of various commercial products for sale or export is the source of various profitable industries. The chief commodities thus obtained are rattans, vegetable tallow from the seed of the Shorea tree (Punans and Ibans), rubber, both wild and (latterly) Para, beeswax, *bêche-de-mer* or *trepan* (coastal tribes); camphor (Punans), gutta-percha (Kayans, Klemantans

and Ibans) and edible birds' nests (Kayans and Klemantans). The most important arts are boat and house building, ironwork (Kayans and Kenyahs), basket and mat work (Klemantans and Punans), weaving (Ibans), carving (Kayans, Klemantans and Kenyahs), and the manufacture of the blow-pipe (Kayans, Kenyahs and Punans). Tattooing is common all over the island, especially among Kayan women, with whom it has a ceremonial and religious significance.

Minerals.—The mineral wealth of Borneo is great and varied. It includes diamonds, the majority of which, however, are of a somewhat yellow colour, gold, cinnabar, copper, iron, stibnite, mineral oils, sulphur, rock-salt, marble and coal. The exploitation of the mines suffers from difficulties of transport, high duties payable in Dutch Borneo to native princes, competition among rival companies, and often the limited quantities of the minerals found. The districts of Sambas and Landak in the west, the Kahayan river, the mountain valleys of the extreme south-east, and parts of Sarawak, have furnished the largest quantities of gold, mostly from alluvial washings. Diamonds are also found widely distributed. The Kapuas valley near Landak has so far yielded the largest quantity.

Considerable progress has been made in the development of oil-fields in Dutch Borneo, and the *Nederlandsch Indische Industrie en Handel Maatschappij*, the Dutch business of the Shell Transport and Trading Company, increased its output from 123,592 tons in 1901 to about 675,000 tons in 1926. At Miri, in Sarawak, great discoveries have been made (see SARAWAK), but in North Borneo up to the end of 1925 no oil in paying quantities had been found, although there are numerous indications in Kalias and other parts of the State. Coal mines have, in many instances, been opened and abandoned. Coal of good quality has been found in Pengaron and elsewhere in the Banjarmasin district, but most Borneo coal is considerably below this average. It has also been found in fair quantities at various places in the Kutei valley, and in Sarawak. The coal-mines of Labuan (*q.v.*) have been worked spasmodically, but success has never attended the venture. Sadong yields something under 130 tons a day, and there is the Kilinkang range of hills in Sarawak, at Selantik, an enormous coal-field, well surveyed by the Government. In 1825, John Crawfurd, the orientalist, learned that a quantity of antimony had been brought to Singapore by a native trader as ballast. The principal mine is at Bidi, in Sarawak, but the supply has been diminishing for several years.

HISTORY

There is no reason to believe that Borneo has ever formed a political unity; and few if any of its indigenous inhabitants have any conception of it as an island. By some *Klemantan* has been declared to be its native name, but for this there is scant warranty, natives of the archipelago speaking invariably of a particular part of the island, never of the island as a whole. The name *Borneo* is derived from Brunei (*q.v.*), the Malayan sultanate of that name on the west coast, which is to-day under British protection. The only archaeological remains are a few Hindu temples, and it is probable that the early settlement of the south-eastern portion of the island dates from about the sixth century A.D. In Borneo the primitive Hinduism, which still lingers on in Lombok and Bali, has long ago died out. There exist no data from which the early history of Borneo can be reconstructed. It began to be known to Europeans after the fall of Malacca in 1511, when d'Albuquerque despatched Antonio d'Abreu with three ships to search for the Molucca, or Spice, islands, with instructions to establish friendly relations with all native potentates whom he might meet. D'Abreu, sailing in a south-easterly direction from the Straits of Malacca, skirted the southern coast of Borneo and laid up his ships at Amboyna (*q.v.*). He returned to Malacca in 1514, leaving one of his captains, Francisco Serrano, a kinsman of Magellan, at Ternate, where the latter's followers found him still living in 1521. After Magellan's death, his comrade sailing south-south-by-west, entered the Brunei river and landed at Brunei town. During the remainder of the 16th century Borneo, being on the highway between Malacca and the Spice islands, was fre-

quently visited by the Portuguese, who established a trade with Brunei. Of this the Spaniards in 1573 tried unsuccessfully to win a share, but this object was not attained till 1580, when they supported a claimant to the throne of Brunei who had appealed to them for aid. Thereafter the commercial intercourse between Brunei and the Spaniards was intermittent and hostilities frequent. In 1645 the latter sent an expedition on a larger scale to punish repeated acts of piracy, but the Spaniards and the Portuguese were both seeking trade, not territory. Proselytizing was only once essayed and Antonio Ventimiglia, a Theatine monk, its originator, was speedily killed. The monopoly of the Iberian nations in the trade of the archipelago was now assailed by the Dutch and British East India companies, and the former established trading-depots on the west coast of Borneo in 1604, and in 1608 Samuel Bloommaert was appointed Dutch head factor at Landak and Sukedana. The British reached Borneo in 1609 and by 1698 they had an important factory at Banjarmasin, whence they were expelled about 1733 through Dutch influence, the latter having obtained from the Sultan of Bantam a trading-monopoly throughout his Bornean territory. In the north of the island, over which the Sultan of Sulu claimed sovereign rights, the British succeeded in establishing their influence to some extent, Alexander Dalrymple obtaining possession of the island of Balambangan and the whole of the northern promontory (Sabah). The local *Datu'* (chiefs), who resented this cession of their territories, destroyed a British fort in 1775, and this incident prevented the latter from profiting by a treaty with Brunei concluded in 1774. By the end of the 18th century British influence in Borneo was extinct; and the Dutch also, after a troublous experience, abandoned all their Bornean posts in 1809, by order of Marshal Daendels. Freed from intruders, the natives of the Bornean coast aided and stimulated by immigrants from the archipelago, devoted themselves to piracy on a large scale, putting to sea in great fleets manned by 2,000 or 3,000 men for three years' cruises, and interfering materially with the trade of more civilized nations. During the British occupation of Java an embassy was sent to Sir Stamford Raffles by the Sultan of Banjarmasin asking for assistance; and in 1811 Alexander Hare was sent there as Commissioner and Resident. He obtained an advantageous treaty and for himself the grant of a district. In 1816, Java having been restored to the Dutch, the latter obtained concessions from the sultan of about half his kingdom. Meanwhile George Müller, while exploring the east coast, obtained from the Sultan of Kutei an acknowledgment of Dutch authority, but was shortly afterward killed. Trouble in Java caused Borneo to be neglected by the Dutch during a prolonged period, and piracy became rampant. On the rise of Singapore a direct trade sprang up with Sarawak and Brunei, and to this the piratical adventures of the Bajaus and Ilanuns of north-west Borneo constituted a serious and constant menace. James Brooke, a retired officer of the Indian Army, who had fitted out his yacht *Royalist* for exploration in the Malay archipelago, determined to deal with the nuisance. On August 15th, 1830, he anchored off Kuching, the capital of Sarawak, and in 1841 the Sultan of Brunei ceded to him the huge district of Sarawak as a reward for his services in suppressing a civil war in that part of the country and checking piracy. By a treaty concluded with the British Government in 1888 the second Rajah Brooke surrendered the control of his foreign relations to the British Government. Piracy was finally extirpated by the British Navy by the battle of Marudu Bay in 1845. The island of Labuan (*laboh-an*, "anchorage") was ceded by the Sultan of Brunei to the British Crown in 1847. The conclusion of this treaty with the Sultan of Brunei finally excluded the Dutch from the northern part of Borneo, but it stimulated them to increased activity in the south. The boundaries of British and Dutch Borneo were finally defined by a treaty concluded on June 20, 1891. The rise of British North Borneo under its Chartered Company is dealt with in a separate article. Labuan was at first only a naval outpost, but in 1848 it became a separate Crown colony, ruled by its own governor. Later, for a period, it was governed by the governor of the Chartered Company's territory. In 1907 it was annexed to the Straits Settlements and declared to be part of the settlement of

Singapore. In 1912 it was constituted a separate settlement. The Government of the Straits is represented there by a Resident, who is also the district judge. The Governor of the Straits Settlements is British Agent for Sarawak and British North Borneo.

BORNEO, BRITISH NORTH (or **SABAH**; the native name of the northern promontory of Borneo), now applied to the whole of the Chartered Company's territory.

GEOGRAPHY

The state of North Borneo is defined by the treaty concluded with the Dutch in June 1891.

The total area of the company's territory is estimated at about 31,000sq.m., with a coast-line of over 900 miles. The greater portion is exceedingly hilly and in parts mountainous, and the interior consists almost entirely of highlands with here and there open valleys and plateaux 50 to 60sq.m. in extent. On the west coast the mountain range runs parallel with the seashore at a distance from it of about 15 miles. Of this range the central feature is the mountain of Kinabalu (13,498ft.). Mt. Madalon, some 15 or 20m. to the north, is 5,000ft. in height, and inland across the valley of the Pagalan river, which runs through the Tambunan country and falls into the Padas, rises the peak of Trus Madi, estimated by some to be 11,000ft. and by others not more than 8,000ft. above sea-level. The valley or the Pagalan is itself for the most part from 1,000 to 2,000ft. above the sea, forming a string of small plateaux marking the sites of former lakes. From the base of Trus Madi to the eastern coast the country consists of huddled hills broken here and there by regions of a more mountainous character. The principal plateaux are in the Tambunan and Keningau valleys, in the basin of the Pagalan, and the Ranau plain to the eastward of the base of Kinabalu. Similar plateaux of minor importance are to be found dotted about the interior. In British North Borneo the proximity of the mountain range to the sea-shore causes the rivers of the north-west coast, with the single exception of the Padas, to be rapid, boulder-obstructed, shallow streams of little value as means of communication for a distance of more than 6m. from their mouths. The Padas is navigable for light-draught steam-launches and native boats for a distance of nearly 50m. from its mouth, and smaller craft can be punted up as far as Rayoh, some 15m. farther, but at this point its bed is obstructed by impassable falls and rapids, which are of such a character that nothing can even be brought down them. Even below Rayoh navigation is rendered difficult and occasionally dangerous by similar obstructions. None of the other rivers of the north-west coast of British North Borneo is of great importance as a means of communication. The Tampasuk is noted for the Kalupis waterfall (1,500ft.), one of the highest in the world, though the volume of water is not great. Here also are the principal Bajau settlements. Throughout the Malayan archipelago the words *Bajau* and *pérômpak* (pirate) are still used as synonymous terms. At the northern extremity of the island Marudu bay receives the waters of the Marudu, which rises on the western side of Mt. Madalon. On the east coast the principal rivers are the Sugut, which rises in the hills to the east of Kinabalu and forms its delta near Torongohok or Pura-Pura island; the Labuk, which has its sources 70m. inland and debouches into Labuk bay; and the Kinabatangan, the largest and most important river in the territory, which is believed

to have its rise eastward of the range of which Trus Madi is the principal feature, and is navigable by steamer for a considerable distance and by native boats for a distance of over 100 m. from its mouth. Some valuable tobacco land, which, however, is somewhat liable to flood, and some remarkable burial-caves are found in the valley of the Kinabatangan. The remaining rivers of the east coast are the Segamah, which rises west of Darvel bay, the Kumpong, and the Kalabakang, which debouches into Cowie harbour. The company's territory is much less generously watered than other parts. Many rivers, especially of the west coast, are obstructed by bars at their mouths. Several natural harbours of North Borneo, on the other hand, are accessible, safe and commodious. Sandakan harbour, on the north-east coast ($50^{\circ} 40' \text{ N.}, 118^{\circ} 10' \text{ E.}$), runs inland for some 17 m. with a very irregular outline broken by the mouths of numerous creeks and streams. The mouth, only 2 m. across, is split into two channels by the little, high, bluff-like island of Valhalla. This beautiful name given to the sacred rock has apparently been corrupted into Barhala. The depth in the main entrance varies from 10 to 17 fathoms, and vessels drawing 20 ft. can advance half-way up the bay. The principal town in the territory, and the seat of government (though an attempt has been unsuccessfully made to transfer this to Jesselton on the west coast), is Sandakan, situated just inside the mouth of the Sarwaka inlet. At Silam, on Darvel bay, there is good anchorage; and Kudat in Marudu bay, first surveyed by Com. Johnstone of H.M.S. "Egeria" in 1881, is a small but useful harbour.

Climate and Population.—The climate is tropical, hot, damp and enervating. The rainfall is steady and not usually excessive. The shade temperature at Sandakan ordinarily ranges from 72° to 94° . The population of the company's territory given in the census of 1921 was 257,804, three-fourths living on the west coast. The seashore and the country bordering closely on the west coast are inhabited chiefly by Dusuns, Kadayans, Bajaus, Ilanuns, and Brunei Malays. The east coast is very sparsely populated, mostly by Bajaus and settlers from the neighbouring Sulu archipelago. The interior is dotted with infrequent villages of Dusuns or Muruts (see BORNEO: *Ethnology*).

Settlements and Communication.—The company possesses a number of small stations along the coast, of which Sandakan, with a population of about 10,000, is the most important. The remainder which call for separate mention are Lahat Datu on Darvel bay on the east coast; Kudat on Marudu bay, and Jesselton on Gaya bay on the west coast. A railway of indifferent construction runs along the west coast from Jesselton to Weston on Brunei bay, with a branch along the banks of the Padas to Tenom above the rapids. This was eventually to be extended across the territory to Cowie harbour (Sabuko bay) on the east coast, but the extraordinary engineering difficulties, the sparse population of the territory, and the failure of the existing line to justify expectations make this highly improbable. After 1918 an extension scheme for opening up North Borneo by means of roads was introduced, but the need for economy resulted in a revision of this policy. Sandakan is connected by telegraph with Mempakul on the west coast whence a cable runs to Labuan and so gives telegraphic communication with Singapore, and wireless has been installed in various parts of the country.

Products and Trade.—Coal has been found in the neighbourhood of Cowie harbour and elsewhere, but though its quality is believed to be as good as that exported from Dutch Borneo, it is not yet known to exist in payable quantities. Gold has been found in alluvial deposits of east coast rivers. Traces of mineral oil, iron ores, copper, zinc and antimony have been found, but the wealth of North Borneo lies mainly in its jungle produce. Like the rest of the island it possesses a great profusion of excellent timber. In 1920 a modern saw-mill was established in Sandakan, but owing to the chaos in China the timber industry has not realized expectations. Gutta, rattans, mangrove-bark, edible nuts, guano, edible birds' nests, etc., are all valuable articles of export. The principal cultivated produce is rubber, tobacco, sago, coconuts, coffee, pepper, gambier and sugar-canes. Between 1886 and 1900 the value of the tobacco crop increased from £471 to £200,000, but the industry has in recent years experienced reverses

and only the financial assistance of the company enabled the three tobacco companies still operating in 1925 to survive. As is common throughout Malayan lands, the trade of North Borneo is largely in the hands of Chinese shopkeepers.

Administration.—For administrative purposes the territory is divided into nine provinces: Alcock and Dewhurst in the north; Keppel on the west; Martin in the centre; Myburgh, Mayne and Elphinstone on the east coast; and Dent and Cunliffe in the south. The boundaries of these provinces, however, are purely arbitrary and not accurately defined. The form of government is modelled roughly upon the system adopted in the Malay States of the peninsula during the early days of their administration by British residents. The government is vested primarily in the court of directors appointed under the company's charter. The supreme authority on the spot is represented by the governor, under whom are the residents of Kudat, Darvel bay and Keppel, officers who occupy much the same position as that usually known by the title of magistrate and collector. The less important districts are administered by district magistrates, who also collect the taxes. The principal departments, whose chiefs reside at the capital, are the treasury, land and survey, public works, constabulary, medical and judicial. The secretariat is under the charge of a government secretary who ranks next in precedence to the governor. Legislation is by the proclamation of the governor, but there is a council, meeting at irregular intervals, upon which the principal heads of departments and one unofficial member have seats. The public service is recruited by nomination by the court of directors. The governor is the chief judge of the court of appeal, but a judge who is subordinate to him takes all ordinary supreme court cases. The laws are the Indian Penal and Civil Procedure Codes and Evidence Acts, supplemented by a few local laws promulgated by proclamation. There is an Imam's court for the trial of cases affecting Mohammedan law of marriage, succession, etc. The native chiefs are responsible for the preservation of law and order and have restricted judicial powers. The constabulary numbers some 600 men and consists of a mixed force of Sikhs, Pathans, Punjabi Mohammedans, Dayaks and Malays, officered by a few Europeans. There is a Protestant mission which supports a church—the only stone building in the territory—and a school at Sandakan, with branches at Kudat, Kaningau and Tambunan. The Roman Catholic mission maintains an orphanage, a church and school at Sandakan, and has missions among the Dusuns at several points on the west coast and in the Tambunan country. Its headquarters are at Kuching in Sarawak. The Chinese have their joss-houses and the Mohammedans a few small mosques, but the vast majority are pagans without religious buildings.

Finance and Money.—The principal sources of revenue are the licences granted for the importation and retailing of opium, wine and spirits, which are in the hands of Chinese; a customs duty of 5% on imports; an export tax of 5% on jungle produce; a poll-tax sanctioned by ancient native custom; and a stamp duty. A land revenue is derived from the sale of government lands, from quit rents and fees of transfer, etc. Judicial fees bring in a small amount, and the issue and sale of postage and revenue stamps have proved a fruitful source of income. The people of the country are by no means heavily taxed, a large number of the natives of the interior escaping all payment of dues to the company, the revenue being for the most part contributed by the more civilized members of the community residing in the neighbourhood of the company's stations. Revenue in 1921 was £372,000, in 1923, £357,400, and in 1925, £399,550, expenditure in the same years being £440,000, £344,779, and £270,000. Imports in 1924 were £827,660 and in 1925, £845,399, exports being respectively £1,301,715 and £2,083,800—the last figure reflecting the increased value of rubber. There are bank agencies in Sandakan, and the company does banking business when required. The State is in the postal union, and money orders on North Borneo are issued in Great Britain and in most British dominions and vice versa. There is a State bank. Notes issued by the principal banks in Singapore were made current in North Borneo in 1900. There are also government notes for both dollars and cents issued by the company for use within the territory only. The currency is the

Mexican and British dollar, the company issuing its own copper coin, viz., cents and half cents. The principal medium of exchange among the natives in the interior is the large earthenware jars, imported originally, it is believed, from China, which form the chief wealth both of tribes and individuals. (See BORNEO.)

(C. H.)

History.—The British connection with northern and north-western Borneo, broken off in 1775, was not resumed till 1839. Labuan (q.v.) was occupied by the British as a Crown Colony in 1848, and in 1872 the Labuan Trading Company was established in Sandakan, the fine harbour on the northern coast which later became the capital of the British North Borneo Company's territory. In 1878, through the instrumentality of Mr. (afterwards Sir) Alfred Dent, the Sultan of Sulu was induced to transfer to a syndicate, formed by Baron Overbeck and Mr. Dent, all his rights in North Borneo, of which he had been from time immemorial the overlord. The chief promoters of this syndicate were Sir Rutherford Alcock, Admiral of the Fleet the Hon. Sir Harry Keppel, and Richard B. Martin. Early in 1881 the British North Borneo Provisional Association, Limited, was formed to take over the concessions which had been obtained from the Sultan of Sulu, and in November of that year a petition was addressed to Queen Victoria praying for a royal charter. This was granted, and subsequently the British North Borneo Company, which was formed in May 1882, took over, in spite of diplomatic protests from the Dutch and Spanish Governments, all the sovereign and territorial rights ceded by the original grants, and proceeded to organize the administration of the territory. The company subsequently acquired further rights from the Sultan of Brunei and his chiefs in addition to those already obtained at the time of the formation of the company. The Putatan river was ceded in May 1884, the Padas district, including the Padas and Kalias rivers, in November of the same year, the Kawang river in February 1885 and the Mantanani islands in April 1885. In 1888, by an agreement with the "State of North Borneo," the territory of the company was made a British protectorate, but its administration remained entirely in the hands of the company, the Crown reserving only control of its foreign relations, and the right to approve the appointment of its governors. In 1890 the British Government placed the Colony of Labuan under the administration of the company, the governor of the State of North Borneo thereafter holding a royal commission as governor of Labuan in addition to his commission from the company. This arrangement held until 1905, when Labuan was removed from the jurisdiction of the company and attached to the colony of the Straits Settlements. In March 1898 the Sultan of Brunei ceded to the company all his sovereign and territorial rights to the districts situated to the north of the Padas river. The company's acquisition of territory was viewed with considerable dissatisfaction by many of the natives, and this found expression in frequent acts of violence. The most noted and the most successful of the native leaders was a Bajau named Mat Saleh (Muhammad Saleh) who for many years defied the company. In 1898 a composition was made with him, the terms of which were unfortunately not defined with sufficient clearness, and he retired into the Tambunan country, to the east of the range which runs parallel with the west coast, where for a period he lorded it unchecked over the Dusun tribes of the valley. In 1899 it was found necessary to expel him, since his acts of aggression and defiance were no longer endurable. A short, and this time a successful campaign followed, resulting, on the 31st of January 1900, in the death of Mat Saleh, and the destruction of his defences. Some of his followers who escaped raided the town of Kudat on Marudu bay in April 1900, but caused more panic than damage, and little by little during the next few years the last smouldering embers of rebellion were extinguished. The introduction of rubber-planting under European control and management has done much to stimulate progress, and of late years there has been considerable immigration of Chinese, but the territory still suffers from an inadequate population. (See BORNEO.)

BORNEOL (also known as Borneo camphor): see CAMPHORS.

BORNHOLM, an island in the Baltic Sea, 22 m. S.E. of the Swedish coast, belonging to Denmark, lying in 15° E., and between 55° and 55° 18' N., and measuring 24 m. from south-east to north-west and 19 from east to west. Pop. (1921) 44,426. The surface is generally hilly, and the granite hill of Helligdomsklipper dominates the island. The variety of rocks in Bornholm is remarkable when the uniformity of the other Danish Islands is considered. Besides freestone, exported for building, limestone, blue marble and porcelain-clay are worked and some coal is used locally. Oats, flax and hemp are cultivated. Fishing, the manufacture of earthenware, weaving and clock-making are also carried on. The capital is Rønne (115 m. from Copenhagen); other small towns are—Svanike, Neksø (the birthplace of Madvig, 1804-1886), Hasle, Allinge and Sandvig. A railway connects Rønne with Neksø (22 m. E. by S.). The island attracts many visitors. On the north-west coast is the ruined castle of Hammershus, built in 1158, which long served as a state prison. In early times the island was the independent seat of marauding vikings. It has several round churches. In the 12th century it became a fief of the archbishop of Lund. Captured by the Hanseatic League (1510) it came under Danish sway in 1522 and in 1526 was made subject to the city of Lubeck. Though captured by Sweden (1645) the sympathies of the people were with Denmark, and the Swedish forces were expelled, the island falling finally to Denmark in 1660.

BORNIER, HENRI, VICOMTE DE (1825-1901), French poet and dramatist, was born in Lunel (Hérault) on Dec. 25, 1825, and died in Paris on Jan. 28, 1901. He served for half a century in the Arsenal library, when he rose to be director in 1889. His first volume of lyrics, *Premières Feuilles*, appeared in 1845, and his *Poésies Complètes* appeared in 1894. His best known work, however, was done for the theatre, in historical plays. The most famous were *Le Mariage de Luther* (1845), *La Fille de Roland* (1875), *Les Noces d'Attila* (1880), *Mahomet* (1888). In *La Fille de Roland*, written in verse, he went back to the national legend of Charlemagne for his subject, and the grandiose treatment of the conflict between love and honour inevitably provoked comparison with Corneille.

See Abbé Lecigne, *Henri de Bornier* (1900).

BORNITE, a copper-iron sulphide, Cu₂FeS₄, of importance as an ore of copper. It crystallizes in the cubic system, the usual form being that of interpenetrating cubes twinned on an octahedral plane. The faces are usually curved and rough, and the crystals confusedly aggregated together. The colour on a freshly fractured surface is coppery, but in moist air this rapidly tarnishes with iridescent blue and red colours; hence the names purple copper ore, variegated copper ore (Ger. *Buntkupfererz*), horse-flesh ore and erubescite (from the Lat. *erubescere*, "to grow red"). The lustre is metallic, and the streak greyish-black; hardness 3; sp. gr. 5.0. Owing to the frequent presence of mechanically admixed chalcopryite and chalcocite the published analyses of bornite show wide variations, the copper, for example, varying from 50 to 70%. Bornite occurs in copper-bearing veins as one of the most impor-

tant minerals of the zone of secondary enrichment and has been mined as an ore of copper at Redruth in Cornwall, Montecatini in Tuscany, Bristol in Connecticut, Acton in Canada, etc.

(L. J. S.)

BORNU, a country in the Central Sudan, lying west and south of Lake Chad, bounded west by Sokoto, south by Muri and Adamawa, and north by the Sahara. Formerly an independent Mohammedan sultanate, it was divided between Great Britain, Germany and France. To France has fallen a portion of northern Bornu and also Zinder (*q.v.*), a tributary state to the north-west, while the south-west part was incorporated in the former German colony of Cameroon. Three-fourths of Bornu proper, some 50,000 square m., forms part of the British protectorate of Nigeria

Bornu slopes gradually to Lake Chad, which was formerly much larger. The Komadugu (*i.e.*, river) Waube—generally known as the Yo—and its tributaries rise south-east of Kano, and flow north and east to Lake Chad, the Yo in its last few miles marking the frontier between French and British possessions. A part of south-west Bornu drains to the Benue. The rivers are intermittent, and water in southern Bornu is obtained only from deep wells. The vast plain of Bornu is stoneless, except for rare outcrops of ironstone, and consists of the porous fissured black earth called "cotton soil" in India, alternating with, or more probably overlaid by, sand. Throughout the flat country water is apparently found everywhere at a depth of 54 ft., corresponding to the level of Chad, and the riverine areas of Chad and Chari are sometimes flooded when the lake rises. Acacia forest extends from Gongola to Gujba. The general vegetation is sub-desert with acacia bush, tamarinds and palms. South of Maifoni are baobabs, also some *Ficus*. The baobab has been taken north to Kuka, north of which grow *Hyphaene* palms, tamarinds and figs. Wild cotton and indigo give rise to the blue-striped cotton industry of the country, and the cotton near Lake Chad is fine. Rice and wheat are raised, but in small quantities, the staple food being *gussub* millet. Ground-nuts, yams, sweet potatoes, several sorts of beans and grains, peppers, onions, water-melons, tomatoes, limes and figs are grown. Lions, giraffes, elephants, hyenas, crocodiles, hippopotami, antelopes, gazelles and ostriches find food and cover in wood and marsh. Horse, camel and ox are used as beasts of burden. The country abounds with bees, and honey is a great delicacy.

From March to the end of June it is oppressively hot, day temperatures are often 105° to 107°, and night ones not much below 100°. In June the wet season begins, with thunder and lightning, and rivers and lakes are in flood till September, but the rainfall is only 350 millimetres at Kuka and 730 millimetres at Fort Lany. Fevers are prevalent in the rainy season but in September cooler winds blow from west and northwest and the climate becomes healthy and agreeable.

The dominant Bornuese, Berberi or Kanuri negroes, with an infusion of Berber blood, have black skins, large mouths, thick lips and broad noses, but good teeth and high foreheads. The women tattoo extensively, stain their faces with indigo, and dye their front teeth black and their canine teeth red. The law allows polygamy, but the richest seldom have more than two or three wives. North of Chad mixture with the Tebu has given rise to the Kanembu.

The Kuka country is occupied by the Shuwas, of Arab origin, speaking a good dialect of Arabic, who came from the east Sahara 300 years ago. They are divided into numerous distinct clans, with villages of rudely constructed huts, of an exaggerated conical form. Another tribe, La Salas, inhabits low fertile islands in Lake Chad, separated from the mainland by fordable channels.

The Bornuese are noted horsemen, and, in war, horses, as well as riders, used to wear light iron mail. The Shuwas warriors wear only a light shirt, and the Kanembu spearmen go almost naked, and fight with shield and spear. Notwithstanding the heat, the body is enveloped in successive robes, the number indicating the rank of the wearer. The head likewise is enclosed in numerous turbans. The prevailing language in Bornu is the Kanuri. It has no affinity, according to Heinrich Barth, with the great Berber

family. S. W. Koelle published grammar in 1854 as well as a volume of tales and fables, with translation and vocabulary.

The towns in Bornu are surrounded with walls 35 or 40 ft. in height and 20 ft. in thickness, having at each of the four corners a triple gate, composed of strong planks of wood, with bars of iron. The abodes of the principal inhabitants form an enclosed square, with a separate house for each wife; the chief's palace consists of turrets connected together by terraces. These are well built of a reddish clay, highly polished, so as to resemble stucco; the interior roof, though composed only of branches, is tastefully constructed. Maidugari, since 1908 the seat of native government, is a thriving commercial town some 70 m. south-west of Lake Chad. The former capital, Kuka (*q.v.*), and Ngornu (the town of "blessing"), are near the shores of Lake Chad. On the Yo are still to be seen extensive remains of Old Bornu or Birni and Gambarou or Ghambaru, destroyed by the Fula about 1809. Dikwa, the capital chosen by Rabah, lies in the Cameroon District.

HISTORY

The history of Bornu goes back to the 9th century A.D., but its early portions are very fragmentary and dubious. The first dynasty known is that of the Sefuwa, or descendants of Sef, which came to the throne in the person of Dugu or Duku, and had its capital at Njimiye (Jima) in Kanem on the north-east shores of Lake Chad. The Sefuwa are of Berber origin. Mohammedanism was adopted towards the end of the 11th century, and has since continued the religion of the country. From 1194 to 1220 reigned Selma II., under whom the power of the kingdom was greatly extended; and Dunama II., his successor, was also a powerful and warlike prince. In the following reigns the prosperity of the country began to diminish, and about 1386 the dynasty was expelled from Njimiye, and forced to seek refuge in the western part of its territory by the invasion of the Bulala. Mai Ali (I.) Ghajideni, who founded the city of Birni, rendered his country once more redoubtable and strong. His successor, Idris II., completely vanquished the Bulala and subjugated Kanem; and under Mohammed V., the next monarch, Bornu reached its highest pitch of greatness. A series of for the most part peaceful reigns succeeded till about the middle of the 18th century, when Ali (IV.) Omarmi entered upon a violent struggle with the Tuareg or Imoshagh. Under his son Ahmed (about 1808) the kingdom began to be harassed by the Fula, who had already conquered the Hausa country. Expelled from his capital by the invaders, Ahmed was only restored by the assistance of the fakir Mohammed al-Amin al-Kanemi, who, pretending to a celestial mission, hoisted the green flag of the Prophet and undertook the deliverance of his country. The Fula appear to have been taken by surprise, and in ten months were driven completely out of Bornu. The conqueror invested the nearest heir of the ancient kings with all the appearance of sovereignty—reserving for himself, however, under the title of sheik, all its reality. The court of the sultan (*shehu*) was established at New Bornu, or Birni, which was made the capital, the old city having been destroyed during the Fula invasion; while the sheik, in military state, took up his residence at the new city of Kuka. Fairly established, he ruled the country with a rod of iron, and at the same time inspired his subjects with a superstitious notion of his sanctity. His zeal was peculiarly directed against moral or religious offences. The most frivolous faults of women, as talking too loud and walking in the street unveiled, rendered the offender liable to public indictment, while graver errors were visited with the most ignominious punishments, and often with death itself. Kanemi died in 1835, and was succeeded by his son, Sheik Omar, who altogether abolished the nominal kingship of the Sefuwa.

During Omar's reign, which lasted about 50 years, Bornu was visited by many Europeans, who reached it via Tripoli and the Sahara. The first to enter the country were Walter Oudney, Hugh Clapperton, and Dixon Denham (1823). They were followed in 1851–55 by Heinrich Barth. Later travellers included Gerhard Rohlfs (1866) and Gustav Nachtigal. All these travellers were well received by the Kanuri, whose power from the middle of the 19th century began to decay.

After the visit of Nachtigal the country was visited by no European traveller until 1892, when Col. P. L. Monteil resided for a time at Kuka. At this time a danger was threatening from the south-east, where the negro adventurer, Rabah, once a slave of Zobeir Pasha, was menacing the kingdom of Bagirmi. After making himself master of the fortified town of Manifa, Rabah proceeded against Bornu, defeating the army of the sultan Ahsem in two pitched battles. In Dec. 1893 Ahsem fled from Kuka, which was entered by Rabah and soon afterwards destroyed, the capital being transferred to Dikwa in the south-east of the kingdom. Rabah had raised a large, well-drilled army, and proved a formidable opponent to the French in their advance to Lake Chad from the south. However in 1900 he was killed at Kussuri near the lower Shari, by the combined forces of three French expeditions which had been converging from the Congo, the Sahara, and the Niger.

After the defeat of Rabah French military expeditions occupied both the German and British portions of Bornu, but in 1902 on the appearance of British and German expeditions the French withdrew to their own country, east of the Shari. The British placed on the throne of Bornu Shehu Garbai, a descendant of the ancient sultans, and Kuka was again chosen as the capital of the state. From that date Bornu, as a province of the Protectorate of Nigeria, has been under effective administrative control. The people proved industrious, large areas were brought under cultivation, and taxes were collected without difficulty. Owing to its increasing commercial importance the native capital was moved, in 1908, to Maidugari. Following the conquest of the Cameroons the part of Bornu which had been under German rule was placed in 1919 under British mandate. For administrative purposes it was added to Bornu province but with a distinct native government under its own emir and council. This re-union of the dismembered parts of Bornu had beneficial results. Road and river communications were much improved, and the population (partly by immigration) more than doubled in the period 1900-25. Surveys for an extension of the Nigerian railway system to Bornu were undertaken in 1927-28 (see also NIGERIA and RABAH).

BIBLIOGRAPHY.—Heinrich Barth's *Travels in North and Central Africa* (1857, new ed. 1890), contains an exact picture of the state in the period (c. 1850) preceding its decay. The earlier *Travels* of Denham and Clapperton (1828) may also be consulted, as well as Rohlf's *Land und Volk in Afrika* (1870), Nachtigal, *Sahara und Sudan*, vol. i. (1879); and Monteil, *De St.-Louis à Tripoli par le lac Tchad* (1895). Lady Lugard's *A Tropical Dependency* (1905) deals with Bornu up to that date. C. K. Meek, *The Northern Tribes of Nigeria* (1925) deals with ethnology; F. W. H. Migeod, *Through Nigeria to Lake Chad* (1924), the *Annual Reports on Nigeria* issued by the Colonial Office, London; also the *Annual Report: Northern Provinces* (Lagos), first issued in 1928.

BORODIN, ALEXANDER PORFYRIEVICH (1834-1887), Russian musical composer, natural son of a Russian prince, was born in St. Petersburg on Nov. 12, 1834. He was brought up to the medical profession, and in 1862 was appointed assistant professor of chemistry at the St. Petersburg academy of medicine. He wrote several works on chemistry, and took a leading part in advocating women's education, helping to found the school of medicine for women, and lecturing there from 1872 till his death. But he is best known as a musician. His interest in music was stimulated from 1862 onwards by his friendship with Balakirev, and from 1863 by his marriage with a lady who was an accomplished pianist. He owed very much to the influence of Liszt at Weimar. His first symphony was written in 1862-1867; his opera *Prince Igor*, begun in 1869 was left unfinished at his death, but was completed by Rimsky-Korsakov and Glazounov (1889) and attained wide popularity in Russia while its brilliant Polovtsienne Dances became famous throughout Europe as a consequence of the performances of the Diaghilev Ballet. In the way of orchestral music his symphonic sketch "In the Steppes of Central Asia" is characteristically picturesque and not less noteworthy is his splendid second symphony in B minor, a work of the finest quality. He also wrote part of a third symphony (orchestrated after his death by Glazounov), a couple of admirable quartets and some delightful songs, but his total output was not very large, though sufficient even so to secure him a place among

the most gifted and distinguished Russian masters of his period. He died suddenly at St. Petersburg on Feb. 28, 1887.

BORODINO, a village of Russia, 70 m. W. by S. of Moscow, on the great Moscow-Smolensk road, at the junction of the Kolotscha, Voïna and Stontsa tributaries of the Moskva river, 55° 31' N., 35° 40' E. It is famous as the scene of a battle between the army of Napoleon and the Russians under Kutusov on Sept. 7, 1812, the last battle on Napoleon's march to Moscow. Though the battle is remembered chiefly for the terrible losses incurred by both sides, in many respects it is an illuminating example of Napoleon's later tactical methods, in which massed artillery was used as the key to the vital point of entrance in the enemy's position. After preliminary fighting on Sept. 5, both sides prepared for battle on the 6th, Napoleon holding back in the hope of confirming the enemy in his resolution to fight a decisive battle. For the same reason the French right wing, which could have manoeuvred the Russians from their position, was designedly weakened. The Russian right, bent back at an angle and strongly posted, was also neglected, for Napoleon intended to make a direct frontal attack. The enemy's right centre near the village of Borodino was to be attacked by the viceroy of Italy, Eugene, who was afterwards to roll up the Russian line towards its centre, the so-called "great redoubt," which was to be attacked directly from the front by Ney and Junot. Farther to the French right, Davout was to attack frontally a group of field works on which the Russian left centre was formed; and the extreme right of the French army was composed of the weak corps of Poniatowski. The whole line was not more than about 2 m. long, giving an average of over 20 men per yard. When the Russians closed on their centre they were even more densely massed, and their reserves were subjected to an effective fire from the French field guns. At 6 A.M. on Sept. 7 the French attack began. By 8 A.M. the Russian centre was driven in, and though a furious counter-attack enabled Prince Bagration's troops to win back their original line, fresh French troops under Davout and Ney drove them back again. But the Russians, though they lost ground elsewhere, still clung to the great redoubt, and for a time the advance of the French was suspended by Napoleon's order, owing to a cavalry attack by the Russians on Eugene's extreme left. When this alarm was ended the advance was resumed. Napoleon had now collected a sufficient target for the 400 guns which he had concentrated. A terrific bombardment by the artillery was followed by the decisive charge of the battle, made by great masses of cavalry. The horsemen, followed by the infantry, charged at speed, broke the Russian line in two, and the French squadrons entered the gorge of the great redoubt just as Eugene's infantry climbed up its faces. In a fearful *mêlée* the Russian garrison of the redoubt was almost annihilated. The defenders were now dislodged from their main line and the battle was practically at an end. Napoleon has been criticized for not using the Guard, which was intact, to complete the victory. It is a moot point, however, whether any further expenditure of men would have had good results. Napoleon had imposed his will on the enemy so far that they ceded possession of Moscow without further resistance. That the defeat and losses of the Russian field army did not end the war was due more to the national spirit and primitive national organization of the Russians, than to military miscalculations of Napoleon. As it was, the Russians lost about 42,000 men out of 121,000; Napoleon's army (of which one-half consisted of the contingents of subject allies—Germany, Poland, Switzerland, Holland, etc.) 32,000 out of 130,000 (Berndt, *Zahl im Kriege*). On the side of the French 31 general officers were casualties while the Russians lost 22 generals, amongst them Prince Bagration, who died of his wounds after the battle, and to whose memory a monument was erected on the battle-field by the tsar Nicholas I.

BOROEVIĆ VON BOJNA, SVETOZAR (1856-1920), Austro-Hungarian field-marshal, was born at Umetić in Croatia. He served through the campaign for the occupation of Bosnia in 1878, and afterwards on the general staff until he reached the rank of general. In the World War he first led the VI. Corps in the victorious battle of Komarow, and as commander of the 3rd Army

beat off the Russian attacks in the Carpathians until May 1915. He then took over the command on the Isonzo. His name is associated with the 11 victorious battles fought in the defence against Italian armies twice as numerous as the Austrians and considerably better equipped. After the collapse of the monarchy the Yugoslav Government refused the "black and yellow" general permission to return to his province. He died on May 23, 1920 at Klagenfurt.

BOROLANITE, one of the most remarkable rocks of the British Isles, found on the shores of Loch Borolan in Sutherlandshire, after which it has been named. In this locality there is a considerable area of granite rich in red alkali felspar, and passing, by diminution in the amount of its quartz, into quartz-syenites (nordmarkites) and syenites. At the margins of the outcrop patches of nepheline-syenite occur; usually the nepheline is decomposed, but occasionally it is well preserved; the other ingredients of the rock are brown garnet (melanite) and aegirine. The abundance of melanite is very unusual in igneous rocks, though some syenites, leucitophyres, and aegirine-felsites resemble borolanite in this respect. In places the nepheline-syenite assumes the form of a dark rock with large rounded white spots from $\frac{1}{4}$ to $\frac{1}{2}$ in. across. In Finland, melanite-bearing nepheline rocks have been found and described as Ijolite. (J. S. F.)

BORON, one of the non-metallic elements, occurring in nature in the form of boracic (boric) acid, and in various borates such as borax, tincal, and boracite (symbol B, atomic number 5, atomic weight 10.82, isotopes 10 and 11). It was isolated by J. L. Gay Lussac and L. J. Thénard in 1808 by heating boron trioxide with potassium in an iron tube. It may also be obtained by reducing the chloride by sodium or hydrogen, or the borofluoride by potassium; or boron trioxide may more conveniently be reduced by aluminium, in which case a large excess of the oxide must be used to minimise formation of a compound of aluminium and boron. The product is extracted by hydrochloric acid, and the remaining impurities are volatilised in a vacuum at 1,200°C.; the boron can then be melted at a still higher temperature in a current of hydrogen. The resulting metallic boron is a conductor of electricity and has a density of 2.5; the amorphous variety is a chestnut-coloured powder, density 2.45. Boron is totally unaffected by air at ordinary temperatures, but at high temperatures it burns to the nitride, BN, and the oxide, B₂O₃. It combines directly with fluorine at ordinary temperatures, and with chlorine, bromine, and sulphur on heating. It does not react with the alkali metals, but combines with magnesium at a low red heat to give the boride, Mg₃B₂ (see below). It reduces many metallic oxides, such as those of lead and copper, and decomposes water at a red heat. Hot sulphuric or nitric acid oxidises it to boric acid, and on fusion with alkali carbonates or hydroxides it gives the corresponding borate. As in the cases of silicon and carbon, its specific heat increases rapidly with increasing temperature. Boron dissolves in molten aluminium, and on cooling, transparent, colourless crystals are obtained with a lustre, hardness, and refractivity approaching that of the diamond. Its carbide, CB₃, is equally hard (H. Moissan).

Many of the compounds of boron are of great interest in connection with the theory of valency (*q.v.*), and they show a striking similarity to the corresponding compounds of silicon, in spite of the different valencies.

For many years the hydrides of boron baffled investigators, but they are now known as well-defined individuals. When magnesium boride is treated with hydrogen chloride, an evil-smelling gas is obtained which contains hydrogen and what was regarded as a hydride; it burns with a green flame to the oxide, and deposits elementary boron if passed through a hot tube. Sir W. Ramsay and H. S. Hatfield cooled the gas in liquid air and separated hydrides of supposed composition B₃H₈ and BH₃; it was left to A. Stock and his collaborators, however, in a series of brilliant researches, to demonstrate that this gas is a mixture of hydrides, the chief of which is borobutane or tetraborane, B₄H₁₀. They have now isolated a whole series of "hydroborons" analogous to the hydrocarbons. Boroethane or diborane, B₂H₆, is the simplest, for BH₃ appears to be incapable of existence; it is formed from the

above B₄H₁₀ by keeping it over mercury at the ordinary temperature, by exposing it to ultra-violet light, or by heating it for some hours at 100°C. It is a colourless, malodorous gas which condenses at -88°C. and freezes at -169°C.; it is much more stable and less inflammable than B₂H₆, and it is decomposed quantitatively by water: B₂H₆ + 6H₂O = 2H₃BO₃ + 6H₂. Also it reacts with hydrogen chloride or iodide to give chloro- or iodo-diborane. Tetraborane is synthesised from iododiborane and sodium: 2B₂H₄I + 2Na = B₄H₁₀ + 2NaI, in just the same way as butane from ethyl iodide (see CHEMISTRY: Organic); it condenses at 16°C. and freezes at -112°C.; it reacts with water or caustic soda to give hydrogen and boric acid or sodium borate. Pentaborane, B₅H₉; dihydropentaborane, B₅H₁₁; hexaborane, B₆H₁₀; and decaborane, B₁₀H₁₄ are also known. The last is a frequent decomposition product of other hydroborons, and is produced by the spontaneous decomposition of dihydropentaborane; it melts at 100°C. Hexaborane boils at about 100°C. under atmospheric pressure. A more systematic nomenclature for hydroborons was suggested by A. Stock and E. Pohland (*Berichte*, lix., 1926).

These hydroborons readily give rise to a number of compounds with ammonia, either by direct addition or by decomposition. Thus diborane gives B₂H₆, 2NH₃, or, more probably, BH₃, NH₃; tetraborane gives the same compound together with the ammine of dehydrodiborane: B₄H₁₀ + 4NH₃ = 2BH₃, NH₃ + B₂H₄ (NH₃)₂; pentaborane yields a tetrammine, B₅H₉ (NH₃)₄; and this on treatment with hydrogen chloride gives first tetrachloropentaborane tetrammine and then heptachloropentaborane tetrammine: B₅H₉ (NH₃)₄ + 4HCl = B₅H₅Cl₄ (NH₃)₄ + 4H₂; B₅H₅Cl₄ (NH₃)₄ + 3HCl = B₅H₂Cl₇ (NH₃)₄ + 3H₂. Excess of ammonia at 200°C. with diborane gives boronimide, B₂ (NH)₃, but if the ammine B₂H₆ (NH₃)₂ is heated, there is insufficient ammonia to replace all the hydrogen atoms by imino-groups and a relatively stable compound, B₃N₃H₆, is obtained, probably $\begin{array}{c} \text{NH}\cdot\text{BH} \\ \diagup \quad \diagdown \\ \text{BH} \quad \text{NH} \end{array}$; it forms a trihydrate, B₃N₃H₆ · 3H₂O.

Boron fluoride was first prepared by Gay Lussac and Thénard, and is best prepared by heating a mixture of the oxide and fluor-spar with concentrated sulphuric acid. It is a colourless, pungent, fuming gas which does not attack glass but is decomposed by sodium or potassium (see preparation of boron). It neither burns nor supports combustion, but reacts readily with water to give hydrofluoboric (hydroborofluoric) acid: 4BF₃ + 3H₂O = 3HBF₄ + H₃BO₃; this acid cannot be isolated in the free state, but many of its salts are known as borofluorides or fluoborates. Boron fluoride also reacts with gaseous ammonia to give a white crystalline solid, BF₃·NH₃; with excess of ammonia, colourless liquids, BF₃·2NH₃ and BF₃·3NH₃, are formed, but they lose ammonia on heating and are converted into the solid BF₃·NH₃.

Boron trichloride is prepared by heating the element in a stream of chlorine, or better, by passing chlorine over a heated mixture of the oxide with charcoal, the volatile chloride being condensed in a freezing mixture. It is a colourless, fuming liquid boiling at 18°C., and readily reacting with water to give boric and hydrochloric acids; it also unites with ammonia to give first the white crystalline compound, 2BCl₃·3NH₃, and then, with excess, boramide, B(NH₂)₃. The bromide may be prepared by the same methods as the chloride and has similar properties: it boils at 91°C. The iodide cannot be formed by direct union of the elements, but by the action of gaseous hydrogen iodide upon the amorphous element; it is also formed by the action of iodine on diborane. It is a white crystalline solid melting at 48°C. and boiling at 210°C. With a solution of phosphorus in carbon disulphide it gives a red powder, PBI₃, which may be sublimed in a vacuum at 200°C., condensing as red crystals, and when heated in a current of hydrogen yields the phosphide PB.

Boron nitride is formed when boron burns in air or nitrogen, or better by heating anhydrous borax with twice its weight of ammonium chloride in a platinum crucible. It is a white powder, insoluble in water and unaffected by most reagents, but dissolves slowly in hydrofluoric acid, and is slowly converted into the oxide and boric acid or a borate by the action of steam or caustic alkali solution.

Boron sulphide, B_2S_3 , can be obtained by the direct union of the elements at a white heat or from the iodide and boiling sulphur, but is better prepared by heating a mixture of the oxide and charcoal in a current of carbon disulphide vapour, or by heating the oxide with aluminium sulphide in an atmosphere of nitrogen. The almost colourless crystals have a disagreeable smell and are rapidly decomposed by water to hydrogen sulphide and boric acid. It combines with ammonia to give $B_2S_3 \cdot 6NH_3$, which decomposes on gentle heating to give the imide $B_2(NH)_2$, or on stronger heating to the nitride. A pentasulphide, B_2S_5 , is also known.

Boron forms only one oxide which is best prepared by strongly igniting the acid; it rapidly absorbs water to regenerate boric acid. It is not volatile below a white heat and is therefore able to displace sulphur trioxide when it is heated with alkali sulphates, forming the corresponding borate. It also forms compounds with most metallic oxides, and as many of these possess characteristic colours, they are utilised in the "borax bead" test in analysis (see CHEMISTRY: Analytical). It dissolves in fairly concentrated sulphuric and phosphoric acids to give sulphates (B_2O_3 , SO_3 , $4H_2O$ and $3B_2O_3$, SO_3 , $3H_2O$, according to M. Levi and L. F. Gilbert) and a phosphate, BPO_4 ; all these are very difficult to crystallise and very hygroscopic. Borax and boric acid are described under separate headings, and the perborates are included with the former.

Many organic compounds of boron are known; thus, ethyl and methyl borates, $B(OC_2H_5)_3$ and $B(OCH_3)_3$, are produced from the appropriate alcohol and either boron trichloride or sulphuric acid and a borate; they are colourless liquids of boiling points $119^\circ C$. and $72^\circ C$., respectively and are readily decomposed by water. The latter is utilised in the analysis of boron compounds (see below). Ethyl borate and zinc ethyl or methyl react to give boron triethyl or trimethyl, $B(C_2H_5)_3$, and $B(CH_3)_3$. These both combine with ammonia to give, e.g., $B(CH_3)_3 \cdot NH_3$, compare $BH_3 \cdot NH_3$. Mixed alkylene, alkylxy- and alkylene-hydroxy-compounds are known, and also compounds with acetylacetone: $[(C_2H_5O)_2B]Cl$, which ionises, and $[(C_2H_5O)_2BF_2]$, which is non-ionic (G. T. Morgan and R. B. Tunstall). The latter are of interest in that they show boron to have a co-ordination number of four. Phenylboric acid, $C_6H_5B(OH)_2$, is a powerful antiseptic.

Atomic weight determinations based on borax are untrustworthy since this suffers slight loss of sodium oxide on heating (see BORAX); determinations based on the boron trichloride are therefore preferred, and these give values of 10.82–10.84 (H. V. A. Briscoe and P. L. Robinson).

Soluble borates give a white precipitate with silver nitrate, and from their concentrated solutions sulphuric or hydrochloric acid precipitates boric acid. The acid gives a characteristic brown colour with turmeric paper, becoming bluish-black on addition of alkali. Borates heated with concentrated sulphuric acid and methyl alcohol give methyl borate (above), the vapour of which burns with a green flame. If this vapour is passed over heated lime, it is retained as B_2O_3 , and this method may be used quantitatively. Borates may also be estimated as potassium borofluoride, which is insoluble in an alcoholic solution of potassium acetate; if substances other than boric acid or potassium borate are present in solution, the boron must be separated by means of the methyl ester, which is absorbed in potash. Direct alkalimetric titration of boric acid is impossible owing to its extreme weakness as an acid, but if excess of glycerol or mannitol is added, and the solution is made just neutral to methyl-orange, the complex acid formed can be titrated as a monobasic acid, phenolphthalein being used as an indicator. (A. D. M.)

BOROROAN, an independent linguistic stock of South American Indians, so called from the Bororos who are its most important tribe. These Indians (known also as "Coroados," a term applied to various entirely unrelated tribes) occupy or once occupied a considerable area between the headwaters of the Paraguay and San Lourenço rivers on the west, and the upper Araguaya on the east, in southern Matto Grosso, Brazil. They are a short, warlike folk, practising some agriculture, but also depending largely on hunting and fishing. The men wear only a plantain leaf cover, the women a breech-clout and a bark corset-like garment.

Labrets are worn by the men. The bow and spear are their main weapons. Chiefs are selected for their ability as singers, the best singer in a village being the chief. These have very considerable power, and issue daily or rather nightly orders to their people. Boys are brought up in a separate men's-house. Monogamy is the rule, although polygamy is allowed. Infidelity leads to the woman being made a prostitute in the men's-house. Elaborate ceremonies are held, in which feats of strength are exhibited.

BOROUGH [BURROUGH, BURROWE, BORROWS], **STEVEN** (1525–1584), English navigator, was born at Northam in Devonshire on Sept. 25, 1525. In 1553 he took part in the expedition which was despatched from the Thames under Sir Hugh Willoughby to look for a northern passage to Cathay and India. Borough's ship, being separated from the others by a storm, sailed into the White Sea, and, in the words of his epitaph, he "discovered Moscouia by the Northerne sea passage to St. Nicholas" (Archangel). In a second expedition, made in the "Serchthrift" in 1556, he discovered Kara Strait, between Novaya Zemlya and Vaygach island. In 1560 he was in charge of another expedition to Russia, and, probably in 1588, he also made a voyage to Spain. 1563 he was appointed chief pilot and one of the four masters of the queen's ships in the Medway. He died on July 12, 1584.

His younger brother, **WILLIAM BOROUGH**, born in 1536, also at Northam, journeyed to Russia in 1553, and subsequently made many voyages to St. Nicholas. Later he transferred his services from the merchant adventurers to the Crown. As commander of the "Lion" he accompanied Sir Francis Drake in his Cadiz expedition of 1587. He was the author of *A Discourse of the Variation of the Compas, or Magneticall Needle* (1581). Some of his charts are preserved in the British Museum and Hatfield. He died in 1599.

BOROUGH. At no time before 1835 can a precise legal definition be found for the borough. Alike in the 11th and in the 18th century the popular use of the word covers so wide a variation in custom and so long a gradation of powers that both lawyer and historian are defeated in the attempt to frame an adequate generalization. The borough, nevertheless, plays a most important part in the history of English self-government. A natural economic centre which acquired mercantile and administrative independence, it became the field where the political instincts of the middle-class first found scope and thus training ground for a wider citizenship. The Plantagenet device of summoning representatives of the boroughs to parliaments transferred to the national stage men who were well used to responsibility. The life of numbers of vigorous independent political entities went to build up the House of Commons: it was the *communitas communitatum*, the assembly of the communities.

THE ENGLISH BOROUGH

There is no evidence for the theory of continuity of organization between the Roman colony and the old English borough. It is not until the Danish invasions of the 8th and 9th centuries that anything like municipal institutions is discernible. Mainly as a result of these invasions the English kings pursued a policy which both recognized and accelerated the growth of town life and town government. In the first place, mercantile transactions were confined to *ports*; that is, recognized marketing centres. Secondly, in the campaigns against the Danes the most effective military device was found to be the erection of burhs or forts, for the upkeep and garrisoning of which the men of the surrounding district were made responsible, and these garrisons of themselves must have brought more custom. Both commercial and military centres enjoyed special legal privileges, notably the borough-peace, under which offences against the peace incurred a heavier penalty if committed inside a borough. Thirdly, after the reconquest of the Danelaw the burhs or boroughs of the midlands became the centres of the new shires which were organized around and named after them. Lastly, by a law of about 960,

King Edgar recognized the existence of a special law court for the borough, and ordered that it should meet three times a year. Dwellers in the borough were apparently henceforth exempt from attendance at the hundred-moot though not from the shire-moot, and in their own moot could maintain and enforce their own special legal customs. Much archaic law and many interesting local customs were thus preserved and recorded at a later date in the borough customs edited by Mary Bateson. At the borough moot the borough-reeve presided, assisted by senior burgesses, called lawmen in the Danelaw and aldermen or wise men elsewhere, who declared the law in doubtful cases and otherwise upheld its authority. Besides the three compulsory full sessions, other meetings must have been held at shorter intervals for judicial purposes, at which other borough business could be discussed. To such smaller gatherings and their administrative activities may be traced the beginnings of a town council.

By the time of the Norman Conquest, then, the borough was well on the way to becoming a self-governing unit. It had legal, judicial and economic privileges; it was generally the seat of a mint and in most cases it was outside the hundred. It was still, however, for some purposes under the control of the earl and the sheriff, the heads of the shire government; and very frequently the chief gentry or *thegns* of the shire owned houses, held land, and had considerable influence in the shire borough, their private jurisdictions or *sokes* cutting across the sphere of action of the borough-reeve.

Effect of the Norman Conquest on the Borough.—The Norman Conquest, by linking up England with the Continent, stimulated the natural economic development of towns; it also led to the deliberate foundation of new boroughs by both king and barons. At least 25 boroughs were founded between 1066 and 1086. When the Domesday Survey was made in that year, some 90 boroughs were in existence, of which about a third had baronial lords. These, under the feudal theory then generally applied, held their privileges from their lords who held of the king, and so were known as *medial* or *mesne* boroughs. In a few instances, such as Leicester and Northampton, an older royal borough was granted to a magnate, Leicester was held by its earls until they became kings of England in 1399; Northampton reverted to royal control in the 12th century. A large proportion of seigniorial boroughs may be regarded as experiments that failed. The judgment of the local lords who founded them was often at fault. Nineteen of the 23 boroughs founded in Lancashire in the middle ages relapsed sooner or later into villages; municipal privileges could not make a borough where the economic *raison d'être* was lacking.

The 12th and 13th centuries are the period of the most rapid advance of the English borough. Besides the new foundations, additional privileges were being granted to boroughs already in existence. The revolutionary municipal movement on the Continent affected the English towns and in the 12th century communes after the French model were proclaimed in London and elsewhere. The government of England, however, kept a firm hand on the development of municipal independence, and the boroughs of England never ceased to be an integral part of the national administrative system, exercising their political powers by grant from and at the good pleasure of the crown. Even London, pre-eminent by its municipal privileges, was taught its place by being "taken into the king's hand" time after time, and never approached the status of the free cities of the Netherlands, Germany or Italy.

The Chartered Privileges of the Mediaeval Borough.—Some 760 borough charters are extant for the period 1066–1307, and many lost grants of privilege must have been made. Of these some 250 belonged to the reigns of Richard I. and John (1189–1216), which owing to the crown's urgent need for money and the burgesses' desire for liberties proved the period of greatest activity in charter granting. An analysis of these charters shows a very wide range of privileges. The only *sine qua non* of a borough was the much coveted *burgage* tenure, which freed the burgesses from the customary burdens of manorialism, enabling them to pay a money rent for their land and to sell and devise it

freely. Besides legal privileges the other main classes of privilege granted were mercantile, fiscal, jurisdictional and administrative. The commercial privileges included grants of markets and fairs, with accompanying trade monopolies, rights to take toll, freedom of the burgesses from toll elsewhere and the right to have a merchant guild with power to regulate the trade of the borough. The organization evolved for the exercise of these rights coincided in some boroughs with the town government and in others was kept distinct. Whilst each borough has its own history it may be said generally that advance towards self-government was achieved by emancipation, first from the fiscal, then from the judicial and finally from the administrative interference of the sheriff. In the 11th century the customary revenue due from the borough to the crown was generally collected and paid over by the sheriff, who accounted for a fixed sum known as the *farm* of the borough (*firma burgi*). In the first half of the 12th century special farmers were frequently appointed, who paid over their farms to the king and extorted what they could from the burgesses. Henry II. (1154–89) began the practice, made permanent by Richard and John, of selling to the burgesses the right to collect the farm themselves and account for it at the Exchequer by their own reeves. Once the borough had acquired the right to deal directly with the royal exchequer the appointment of its officials became of more than internal interest. Concession of the right to choose the reeve who accounted at the exchequer was followed by leave to choose a mayor (granted to London by Richard, and to Northampton, and possibly some other boroughs, by John) and borough coroners. Then came the extension of the jurisdictional powers of the borough courts, and finally, about the middle of the 13th century, the right to execute all royal writs. This meant that not only the shire coroners but also the sheriff was henceforth excluded from the borough until the borough officials had failed to execute the writs which he was now bound to pass on to them. After this, though the borough had to appear by 12 jurors before the justices in eyre, no royal official below the rank of a king's justice need be admitted into the borough. By the end of the 13th century the average borough had acquired sufficient powers and evolved an adequate staff for carrying on its own government and enforcing the law of the land without intervention from outside; and this self-sufficiency was in most cases reinforced, in the 16th century, by the grant of a special commission of the peace for the borough.

The Struggle of Classes Within the Borough.—From the first the full rights of a burgess were not enjoyed by all inhabitants of a borough. The "freedom," both political and mercantile, was carefully guarded. In the middle of the 13th century, at the time of the Barons' wars, vain efforts seem to have been made by the poorer townsmen in various boroughs (*e.g.*, London, Oxford, Bury St. Edmund's and Northampton) to obtain a share of the power monopolized by the wealthier burgesses. But in most cases the power remained in the hands of a ring whose members exercised in turn the functions of office and controlled the admission to the freedom of the borough. In many towns the contest took the form of a struggle between different guilds for the control of the town government. In the 14th century a typical form of government was that by a mayor and council, consisting largely of ex-officials, who exercised the judicial and administrative powers, and a town assembly or common council which, in form at least, elected the officials annually and had powers, varying from borough to borough, of legislation or registration of decrees. In the 15th century a renewed endeavour on the part of the lesser townsmen to influence the town government led to riots and disturbances which furnished the pretext for the limitation by law of the composition and of the powers of the assembly. Practical needs, combined with the development of the law of corporations, made the boroughs apply for charters of incorporation, and in these the national government definitely placed power and responsibility in the hands of the governing clique, and narrowed or even eliminated popular control. From the time of Henry VII. royal policy steadily strengthened the position of the oligarchy, and the borough more and more became identified with the close corporation that administered its govern-

ment. By the 19th century in only a few exceptional cases, notably at Berwick, Norwich and Ipswich, was there any trace of democracy in the borough constitution: it was only in connection with parliamentary elections that, here and there, the whole body of townsmen had any share in the liberties of their town.

The King and the Borough.—From the time of Henry III. onwards representatives of the boroughs were summoned to the king's parliaments. Whilst some boroughs may have found the duty of attendance irksome and costly, for it entailed liability to a higher rate of taxation as well as payment of the members' wages, there is evidence that in others the burgesses welcomed the opportunities thus afforded. At the outset Edward I. often summoned representatives of both boroughs and "merchant towns," but economic facts and the passive resistance of the smaller communities led to the dropping out of many names, and ultimately the right to receive a summons to parliament became a working means of classifying boroughs. As the House of Commons began to exercise effective political power, a new motive for royal interference in the boroughs began to operate. Both Elizabeth and James I. created new boroughs freely in order to secure submissive parliaments, and under Charles II. and James II. a determined attempt was made to control both the personnel and the policy of the corporations with the double object of influencing local administration and parliamentary representation. Under the Corporation Act of 1661 the town councils were purged of persons suspected of disaffection to the crown, and in 1682 a general attack on the borough franchises began. First London and then a series of other towns were charged, under writ of *quo warranto*, with having exceeded the powers granted in their charters. In the existing state of the law it was easy to give judgment for the king, and the charters were forfeited. The new charters which replaced them secured to the crown the veto on all important municipal appointments, and power to remove officials at will. A special commission of 1687 even ordered the election to the corporations of specific supporters of James' policy. The old charters were restored in 1688, and the corporations, guarded alike from royal interference and in most cases from popular control, became irresponsible close bodies, regarding the borough revenues as their own property and themselves practically as clubs, whose vested interests were sacred and whose policy it were impertinence to criticize. The material and social needs of the rapidly growing boroughs of the 18th century had for the most part to be supplied by other agencies, both statutory and voluntary. The advance of nonconformity further emphasized the unrepresentative character of the corporations, whose social and political bias even influenced, in some cases, the administration of justice by the borough magistrates. By 1830, with some shining exceptions, they were strongholds of corrupt and bigoted obscurantism in the midst of a country transformed by industrial development and alive with new political, economic and social movements.

Municipal Reform in the Nineteenth Century.—Parliamentary reform dealt the first blow to the powers of the close corporations. The parliamentary franchise varied from borough to borough; but even where the franchise was widest, the mayor, as returning officer, could and did determine the results of elections. When the tide of party feeling ran high the county magistrates bid against each other for the support of the corporations and the corporations spent the borough funds lavishly in the interests of their own party. At Leicester the corporation advanced £10,000 towards the expenses of the election of 1827 which was never repaid. By the creation of a uniform borough franchise the Reform Act of 1832 removed the main source of the corrupt political power of the corporations. The first reformed parliament set up in 1833 a Royal Commission of Inquiry into the existing state of municipal corporations, whose accurate and lucid reports give a vivid picture of the stagnation and decay of municipal institutions in the majority of the boroughs. The Municipal Reform Act of 1835 swept away the whole mass of obsolete and unrepresentative institutions, and set up the form of government by mayor, aldermen and council, elected by the ratepayers, which,

modified by a succession of later Acts consolidated in the Municipal Corporations Act of 1882, with various minor amendments of which the latest are 15 Geo. V., ch. 11., and 15 and 16 Geo. V., ch. 54, has since formed the code of borough administration in England. The Local Government Act of 1888 created the county borough, exempt from the jurisdiction of and with powers equivalent to those of the county council. By it any borough might apply to be constituted a county borough if it had a population of 50,000 and upwards: by the County Boroughs and Adjustments Act of 1926 the minimum was raised to 75,000, and procedure by private bill in place of the provisional order of the Ministry of Health was made obligatory. It may be doubted, however, whether the control by the central government does not unduly hamper the activity and enterprise of such county boroughs as Manchester, whose population is three times that of the self-governing dominion of Newfoundland, and whose annual budget exceeds that of some of the smaller European states.

IRISH AND SCOTTISH BOROUGHES

The Anglo-Norman influences which moulded the development of the English borough were extended, with the settlement of the Anglo-Norman nobles, to both Scotland and Ireland. From this point of view Ireland may be regarded as an English colony in which municipal institutions developed on lines similar to those of the mother-country, and the borough charters of the 12th and 13th centuries, the new foundations of the 17th and the corruption of the 18th, are closely paralleled. In Scotland, with the same general similarity, some difference in detail developed in the course of time. The royal burgh was the equivalent of the royal borough in England, but its mercantile privileges were greater. Scotland was, in effect, divided into a number of districts within each of which a royal burgh had the monopoly of trade, no other grants of market or fair were made, and no other borough could be created save by royal licence. The mesne boroughs were known as burghs of regality or of barony and were always, in theory, created by royal grant. Two other special features in Scotland were the association of the free burghs in the north of Scotland called the Hanse, by which a common standard of rights and duties was maintained among the members; and the convention or separate assembly of royal burghs, dating apparently from 1487, which saw to "the welfare of merchandise and the common profit of the burghs," revised the methods of municipal election, and assessed the division among the burghs of the parliamentary subsidy due from them. Representatives of the burghs sat in Scottish parliaments from 1295 onwards, and the existence of this separate convention is attributable to the comparative powerlessness of the lower house in the Scottish parliaments. By the 19th century municipal reform was even more urgently needed in Scotland than in England, and the Scottish Burghs bill of 1833, which set up representative town councils and vested them with the property and rights of the old corporations, served as an important precedent for the English measure of 1835.

(1923). (H. CA.)

In the United States, boroughs existed in colonial Virginia, first, in 1619, as mere election districts for the House of Burgesses. Later, in 1722, a borough charter, somewhat similar to the borough organization in England, was granted to Williamsburg, with others to Norfolk and Richmond, all given by the

governor. The name borough was dropped after the Revolution and now it is used only in the United States to designate the five administrative sub-divisions of New York City; Manhattan, The Bronx, Brooklyn, Queens and Richmond, which are co-terminous with the five counties of New York, The Bronx, Kings, Queens and Richmond (Staten Island). Each of these New York City boroughs has a President elected by the voters, and he is a member of the city's Board of Estimate. These boroughs have taken over the work to a great degree of the several municipalities which were merged into the greater New York City when it was created in 1898. The term borough is also applied to incorporated towns or villages in New Jersey, Pennsylvania, Connecticut and Minnesota.

BOROUGHBRIDGE, market town, West Riding of Yorkshire, England, 22m. N.W. of York on a branch of the L.N.E. railway. Pop. (1921) 807. It lies in the central plain of Yorkshire on the river Ure near its confluence with the Swale. About $\frac{1}{2}$ m. to the west of Boroughbridge are three prehistoric monoliths known as the Devil's Arrows.

When the site of the Great North Road was altered, towards the end of the 11th century, a bridge was built across the Ure, and called Burgh bridge or Ponteburgem. This caused a village to spring up, and it afterwards increased so much as to become a market town. It was deeply concerned in the war with Scotland in the early 14th century and a battle was fought here in 1322. In 1504 the bailiff and inhabitants of Boroughbridge received a grant of two fairs, and Charles II. created three new fairs in the borough. It has maintained its agricultural interests. Boroughbridge is in the Ripon parliamentary division.

BOROUGH ENGLISH, a custom which prevailed in certain ancient English boroughs, and in districts attached to them (where the lands are held in socage), and also in certain copyhold manors (chiefly in Surrey, Middlesex, Suffolk and Sussex), by which in general lands descend to the youngest son. It was found most frequently among the unfree class. Generally Borough English, apart from specialties, may be said to differ from gavelkind in not including collaterals.

The origin of the custom has been much disputed. It is first mentioned by Glanvil, without, however, any explanation. Littleton's explanation is that custom casts the inheritance upon the youngest, because after the death of his parents he is least able to support himself, and more likely to be left destitute of any other support. Blackstone derived Borough English from the usages of pastoral life, the elder sons migrating and the youngest remaining to look after the household. It appears to have been customary in the early Irish tribal system. Elton claims it to be a survival of pre-Aryan times. It was referred to by the Normans as "the custom of the English towns." In the *Yearbook*, 22 Edw. IV., fol. 32b, it is described as the custom of Nottingham, which is made clear by the report of a trial in the first year of Edward III., where it was found that in Nottingham there were two districts, the one the *Burgh-Frauncoyes*, the other the *Burgh-Engloyes*, where descent was to the youngest son, from which circumstance the custom has derived its name. The custom has been abolished by S. 45 of the Administration of Estates Act, 1925. (See also GAVELKIND; INHERITANCE; PRIMOGENITURE; TENURE.)

BORROMEAN ISLANDS, four islands on the west of Lago Maggiore off Baveno and Stresa. Isola Bella is famous for its château and terraced gardens, built by Count Vitaliano Borromeo (d. 1690); north-east of this is the Isola Madre, the largest of the group, with a château; north again, off Pallanza, is the little Isola S. Giovanni.

BORROMEO, CARLO (*bör-rō-mä'ö*) (1538-1584), saint and cardinal of the Roman Church, son of Ghiberto Borromeo, count of Arona, and Margarita de' Medici, was born at the castle of Arona on Lago Maggiore on Oct. 2, 1538. When in 1560 his uncle, Cardinal Angelo de' Medici, was raised to the pontificate as Pius IV., Borromeo was made protonotary and created car-

dinal with the administration of Romagna and the March of Ancona, and the supervision of the Franciscans, the Carmelites and the knights of Malta. He was thus at the age of 22 practically the leading statesman of the papal court. Soon after he was raised to the archbishopric of Milan. In compliance with the pope's desire, he lived in great splendour; yet his own temperance and humility were never brought into question. Owing to his influence over Pius IV., he was able to facilitate the final deliberations of the Council of Trent, and he took a large share in the drawing up of the Tridentine catechism (*Catechismus Romanus*).

On the death of Pius IV. (1566), the skill and diligence of Borromeo contributed much to the suppressing of the cabals of the conclave. He had been all powerful during the later years of Pius IV., but he did not use this power, as he no doubt might have done, to secure his own election as pope. By the choice of Michele Ghislieri, he ensured the triumph of his own ideals of asceticism and piety, and the suppression of corruption in the hierarchy. Subsequently, he devoted himself wholly to the reformation of his diocese. He made a series of pastoral visits, and restored decency and dignity to divine service. In conformity with the decrees of the Council of Trent, he cleared the cathedral of its gorgeous tombs, rich ornaments, banners, arms, sparing not even the monuments of his own relatives. He divided the nave of the church into two compartments for the separation of the sexes. He extended his reforms to the collegiate churches (even to the fraternities of penitents and particularly that of St. John the Baptist), and to the monasteries; and he established seminaries, colleges and communities for the education of candidates for holy orders. He founded the fraternity of the Oblates, a society whose members were pledged to give aid to the Church when and where it might be required. He further paved the way for the "Golden" or "Borromeo" league formed in 1586 by the Swiss Catholic cantons of Switzerland to expel heretics, if necessary by armed force. In 1576, when Milan was visited by the plague, he went about giving directions for accommodating the sick and burying the dead, avoiding no danger and sparing no expense. Borromeo met with much opposition to his reforms. The governor of the province, and many of the senators, fearing encroachment upon the civil jurisdiction, addressed remonstrances and complaints to the courts of Rome and Madrid. But Borromeo had more formidable difficulties to struggle with, in the inveterate opposition of several religious orders, particularly that of the Humiliati (Brothers of Humility). He died at Milan on Nov. 4, 1584. He was canonized in 1610, and his feast is celebrated on Nov. 4.

Besides the *Noctes Vaticanae*, to which he appears to have contributed, the only literary relics of this intrepid and zealous reformer are some homilies, discourses and sermons, with a collection of letters. His sermons were published at Milan, 1747-48, and have been translated into many languages. Contrary to his last wishes a memorial was erected to him in Milan cathedral, as well as a statue 70ft. high on the hill above Arona, by his admirers who regarded him as the leader of a Counter-Reformation.

His nephew, FEDERIGO BORROMEO (1564-1631), was archbishop of Milan from 1595, and in 1609 founded the Ambrosian library in that city.

BORROMINI, FRANCESCO (1599-1667), Italian architect, was born at Bissone on Sept. 25, 1599. He was the chief exponent of the style known in architecture as "baroque," which marked a fearless and sometimes reckless departure from the traditional laws of the Renaissance. A pupil of Carlo Maderna, he became after his master's death architect of St. Peter's under Bernini's direction. Borromini developed a highly decorative style. He was much employed in the middle of the 17th century at Rome. His principal works are the church of St. Agnese in Piazza Navona, the church of La Sapienza in Rome, the church of San Carlino alle Fontane, the church of the Collegio di Propaganda,

and the restoration of San Giovanni in Laterano. He died by his own hand at Rome on Aug. 2, 1667. Engravings of his chief compositions are to be found in the posthumous work, *Francisci Borromini opus Architectonicum* (1727).

BORROW, GEORGE HENRY (1803–1881), English traveller, linguist and author, was born at East Dereham, Norfolk, on July 5, 1803, of a middle-class Cornish family. From 1816 to 1818 Borrow attended the grammar school at Norwich. After leaving school he was articled to a firm of Norwich solicitors, where he neglected law, but studied languages. Encouraged by William Taylor, the friend of Southey, he picked up a knowledge of French, German, Danish, Welsh, Irish, Latin, Greek and, for he was already attracted by the gipsies, Romany. On the death of his father, in 1824, he went to London to seek his fortune as a literary adventurer. In 1826 he published a volume of *Romantic Ballads* translated from the Danish. Dissatisfied, Borrow began tramping. As he stood considerably more than 6ft. in height, was a fairly trained athlete, and had a countenance of extraordinary impressiveness, if not of commanding beauty—Greek in type, with a dash of the Hebrew—we may assume that there had never before appeared on the English high-roads so majestic-looking a tramp as Borrow. He soon found himself on Salisbury Plain. Then his extraordinary adventures began. He met the splendid road-girl, born at Long Melford workhouse, whom he has immortalized under the name of Isopel Berners. It would be a mistake to accept *Lavengro* and *The Romany Rye* as a strict autobiographical record. One of his biographers, Mr. Edward Thomas, has said of *Lavengro*, “a representation of a man’s life in the backward dream of memory.”

As agent to the Bible Society, Borrow visited St. Petersburg (1833–35), where he published *Targum, or Metrical Translations from Thirty Languages and Dialects* (1835). He then visited Spain, Portugal and Morocco (1835–40). From 1837 to 1839 he acted as correspondent to the *Morning Herald*. The result of these travels and adventures was the publication, in 1841, of *Zincali, or The Gypsies in Spain*. In 1843 appeared *The Bible in Spain*, which suddenly made Borrow famous. Every page of the book glows with freshness, picturesqueness and vivacity. In 1840 he married Mary Clarke, the widow of a naval officer. Probably Borrow would never have told the world about his vagabond life in England as a hedgesmith had not *The Bible in Spain* made him famous as a wanderer. *Lavengro* appeared in 1851 with a success which, compared with that of *The Bible in Spain*, was at the time only partial. In 1857 he published the sequel, *The Romany Rye*. In 1844 he travelled in south-eastern Europe, and in 1854 he made a tour with his step-daughter in Wales. This tour he described in *Wild Wales*, published in 1862. In 1874 he brought out a volume of ill-digested material upon the Romany tongue, *Romano Lavo-lil, or Word-book of the Gypsy Language*. He died at Oulton, July 26, 1881. The variety of Borrow’s attainments is shown by his translation of the Church of England *Homilies* into Manchu, of the Gospel of St. Luke into the Git dialect of the Gitanos, of *The Sleeping Bard* from the Cambrian-British and of *Bluebird* into Turkish.

BIBLIOGRAPHY.—A complete list of the works of George Borrow will be found in T. J. Wise, *Bibliography of the Writings of Borrow* (1912). See also Knapp, *Life, Writings and Letters of George Borrow* (1899); H. Jenkins, *The Life of George Borrow* (1912); E. Thomas, *George Borrow* (1912); C. K. Shorter, *George Borrow and his Circle* (1913); and introductions by T. Watts-Dunton, T. Seccombe and others to various editions of individual works. Borrow’s *Letters to the British and Foreign Bible Society* appeared in 1911.

BORSIPPA (mod. BIRS or BIRS-NIMRUD), ancient city about 15m. S.W. of Babylon and 10m. from Hillah, on the Hindieh canal. It was the sister city of Babylon, and in the inscriptions is often called Babylon II.; its patron god was Nebo (q.v.). Borsippa is not mentioned in the oldest inscriptions, but comes into importance first after Hammurabi had made Babylon his capital, about 2100 B.C. He built or rebuilt the temple E-Zida at this place, dedicating it to Marduk (q.v.), subsequent kings recognizing Nebo as the deity of E-Zida and making him the son of Marduk; and his temple was second only to that of Marduk in Babylon. As with Babylon, the time of Nebuchadnezzar was the

period of Borsippa’s greatest prosperity; there is evidence that the temple school and the school of astronomy for which Borsippa had for centuries been famous were still in existence in the late 6th century B.C., but, in general, it shared the fate of Babylon, falling into decay after the time of Alexander.

The site of the ancient city is represented by two large ruin mounds. Of these the north-westerly, the lower but larger of the two, is called Ibrahim Khalil, from a shrine of Abraham which stands on its highest point; eastern legend has it that at this spot Nimrod sought to throw Abraham into a fiery furnace. Excavations were first conducted here by the French in 1852, and in 1879–80 Hormuzd Rassam worked more extensively though still unsystematically, finding many inscribed tablets and the like, now in the British Museum; but by far the greater part still remains unexplored. The south-westerly mound, the Birs proper, an ambitious but incomplete and ruinous *ziggurat* built on the site of a predecessor by Nebuchadnezzar, has been supposed by some to have afforded local attachment for the story of the Tower of Babel (q.v.). It rises from a hill over 100ft. high as a pointed mass of vitrified brick split down the centre, over 40ft. high, about which lie huge masses and single enamelled bricks, generally bearing an inscription of Nebuchadnezzar, twisted and broken, apparently by great heat. In 1854 Rawlinson showed it to be the “house of the seven divisions of heaven and earth,” of E-Zida, the temple of Nebo. It was a pyramid of seven solid terraces ornamented with the seven planetary colours, the lowest being 272ft. square and perhaps 45ft. high, and on the seventh being an ark or tabernacle. It was destroyed by Xerxes and partly restored by Antiochus I. but was in ruins long before the middle ages.

See H. C. Rawlinson, *Journal of the Royal Asiatic Society* (1860); J. P. Peters, *Nippur* (1896); H. Rassam, *Asshur and the Land of Nimrod* (1897); M. Jastrow, *Religions of Babylonia and Assyria* (1898); also BABYLON, BABEL.

BORSTAL SYSTEM. In the domain of criminal law, the notable change in public attitude and opinion with regard to the treatment of juvenile crime finds expression, so far as Great Britain is concerned, in the two acts of parliament of 1908, viz., *The Prevention of Crime (Borstal) Act* and *The Children Act*.

In the middle of the 19th century strong protests were made against a penal system under which young persons and even children were subject to the harsh penalties of imprisonment, and penal servitude and transportation were commonly inflicted on young and old alike. Effort was then concentrated on the attempt to substitute for such penalties a system of industrial and reformatory treatment; and in 1854 the principle was established that at least up to the age of 16 this method should, in suitable cases, be adopted. In 1894 two public enquiries into the administration of prisons and of Home Office schools arrived, almost simultaneously, at the same emphatic conclusion; viz., “that the age 16–21 was the dangerous age; that we must concentrate on that; on the incipient criminal,” or, as he was officially christened, the juvenile adult. At this time about 20,000 young criminals of this age, 16–21, were coming every year to prison. They constituted a veritable recruiting ground or nursery for the dangerous professional criminal of later years. To find a remedy for this was the purpose of what has now become known as the Borstal System.

Under the acts above quoted, the following principles were established:—

1. The age of criminal “majority” was extended to 21, with power to raise to 23.
2. In lieu of the ordinary sentence of imprisonment, a special form of detention was devised, under special rules, of which the purpose was to develop mentally, physically and morally all inmates (not prisoners). The duration to be for not less than one year nor more than three.
3. Except in very special cases, no sentence of imprisonment could be passed on any person under 16.

The new system took its name from the village of Borstal, Kent, where the early experiments on boys between the ages of 16 and 21 were carried out in an old convict prison, prior to the passing of the act. The act gives power to the court to order

detention in any case, 16-21, "where it shall appear to the court that by reason of criminal habit or tendency it is expedient that the offender shall be subject to such instruction and discipline as appears most conducive to his reformation and to the repression of crime."

The rules and regulations are based on the principle that, up to a certain age, every offender may be regarded as potentially a good citizen; that his lapse into crime may be due either to physical degeneracy or bad social environment; that it is the duty of the State at least to try to effect a cure, and not to class the offender offhand and without experiment with the adult professional criminal. The Act of 1908 further provided for the establishment of an association, whose special duty would be to provide for the after-care of all persons of both sexes discharged from Borstal Institutions. This association, known as the Borstal Association, is a highly organized method of care and supervision. Without this supplementary work of patronage the Borstal System could not have attained the conspicuous success which can be claimed for it, because, of the 6,000 lads released after training in Borstal establishments since the act came into operation, only about 35% have again come into conflict with the law. Broadly, about two out of every three Borstal lads are reclaimed.

This result is achieved by the "personality" of the superintending staff, from the Borstal commissioner himself to, in a descending scale, governor, house master, and a carefully selected instructing staff, each with a strong optimism and belief that by an appeal to what is best in each individual—his honour, corporate spirit, pride in his house, love of sport, and rivalry in games and competitions: by all these subtle weapons, wisely and steadily employed, it is possible, though not easy, to recreate young natures and dispositions not yet thoroughly depraved.

When the day of freedom comes, gained after long and patient trial and test, in the form of a conditional licence to the care of the Borstal Association, which is only granted when "there is a reasonable probability that the offender will abstain from crime," the licensee faces life again with a changed outlook. The Borstal System ranks as a work well done, justifying the ideals of its founder. He determined to save the young and careless from a wasted life of crime. Through his vision and persistence a system of repression has been gradually replaced by one of leadership and training. We shall remember him as one who believed in his fellow-men. (See CRIMINOLOGY.)

There are now in England four Borstal institutions—at Chatham, Feltham and Portland for youths, and that for girls at Aylesbury. Portland is a particularly interesting institution, as it takes the worst and most difficult cases in surroundings that seemed at first sight exceedingly unfavourable. Under the present management, however, the authorities have met with extraordinary success, and have been able to promote to a wonderful degree the spirit of self-development in the inmates, while allowing them a large measure of freedom.

The recently established juvenile prison at Wandsworth serves a most useful purpose. Whilst boys are there on remand, all their peculiarities, physical and mental, their social conditions and special temptations, are carefully studied, and a report on these is available for the court which ultimately determines their future.

BIBLIOGRAPHY.—The reader should consult the quarterly review published by the Borstal Institution, Rochester. From July 1923 to Oct. 1924 it appeared as *The Borstalian*; and from Jan. 1925 onwards as *The Phoenix*. (W. C. HA)

BORT or BOART, an inferior kind of diamond, unfit for cutting, but useful as an abrasive agent. The typical bort occurs in small spherical masses, of greyish colour, rough or drusy on the surface, and showing on fracture a radiate crystalline structure. These masses, known in Brazil as bolas, are often called "shot bort" or "round bort." Much of the bort consists of irregular aggregates of imperfect crystals. In trade, the term bort is extended to all small and impure diamonds, and crystalline fragments of diamonds, useless as gem-stones. A large proportion of the output of some of the South African mines consists of such material. This bort is crushed in steel mortars to form the diamond powder used by lapidaries. (See DIAMOND.)

BORY DE SAINT-VINCENT, JEAN BAPTISTE GEORGE MARIE (1780-1846), French naturalist, was born at Agen. He was naturalist with Captain Nicholas Baudin's expedition to Australia in 1798, but left the vessel at Mauritius, and spent two years in exploring Réunion and other islands. Joining the army on his return, he was present at the battles of Ulm and Austerlitz, and in 1808 went to Spain with Marshal Soult. In 1815 his name was consequently placed on the list of the proscribed; but after wandering in disguise from place to place he was allowed quietly to return to Paris in 1820. In 1829 he was placed at the head of a scientific expedition to the Morea, and in 1839 he had charge of the exploration of Algeria. He edited the *Dictionnaire classique d'histoire naturelle*; among his separate productions were *Essais sur les Îles Fortunées* (1802), and *Voyage dans les Îles d'Afrique* (1803).

BORZHOM, a town in the Georgian Socialist Soviet Republic, on the Kura river in a gorge of the Little Caucasus. Lat. 41° 48' N., Long. 43° 10' E. Alt. 2,750 ft. Pop. (1926) 5,243. It is a popular health and summer resort, with a warm, mild climate, hot springs (71½°-82°F.), and beautiful parks, and is popularly called "The Pearl of the Caucasus." Its mineral waters are bottled and exported.

BOSA, an episcopal see on the west coast of Sardinia, province of Cagliari, 30 m. W. of Macomer by rail. Pop. (1921) 6,905. The Malaspina castle stands above the town. There are some tanneries, and the fishing industry is important. The district produces oil and wine. The present town of Bosa was founded in 1112 by the Malaspina of Genoa, 1½ m. from the site of the ancient town (Bosa or Calmedia), where a well-preserved church still exists. The old town is mentioned by Pliny and Ptolemy as a station on the coast-road in the *Lineraries*.

BOSANQUET, BERNARD (1848-1923), was born on June 14, 1848, the son of the Rev. R. W. Bosanquet, of Rock Hall, Northumberland. He was educated at Harrow and at Balliol college, where he came under the influence of Jowett, T. H. Green and W. L. Newman. From 1871 to 1881 Bosanquet was a fellow and tutor at University college, but from 1881 he made his home in London, devoting himself to philosophical writing and to work on behalf of the Charity Organization Society and of various associations. He married in 1895 Helen Dendy. Eight years later, he returned to academic life as professor of moral philosophy at St. Andrews, a post which he held until 1908. In 1911 and 1912 he delivered in the University of Edinburgh his Gifford lectures on *The Principle of Individuality and Value* and *The Value and Destiny of the Individual*. He died in London on Feb. 8, 1923.

Although Bosanquet, like Bradley, owed much to Hegel, his first writings, *Knowledge and Reality* (1885) and *Logic* (1888), show the influence of Lotze, whose *Logic and Metaphysics* he had already edited and translated in 1884. The fundamental principles in these works, which are brought out more clearly in the later and smaller *Essentials of Logic* (1895) and *Implication and Linear Inference* (1920), turn on the dynamism of logical thought and the notion of system and coherency, and are summed up in his remark: "Logic, or the spirit of totality, is the clue to reality, value and freedom."

In middle life, Bosanquet turned to aesthetics and ethics. Previously in 1886 he had introduced a comparatively new subject into British philosophy by his translation of the Introduction of Hegel's *Philosophy of Fine Art*. His own *History of Aesthetics* (1892) and the later *Three Lectures on Aesthetics* (1915) show his belief that aesthetics can reconcile, as he himself says, "this world and the other, the *a posteriori* and the *a priori*, the natural and the supernatural." In his ethical and social philosophy, the more practical side of which appears in his *Suggestions in Ethics* (1918), he shows the same desire to think of reality as a concrete unity wherein "the other world" and "this," pleasure and duty, egoism and altruism are reconciled. This desire he says was inspired by Plato's passion for the unity of the universe, a passion which reappeared in Christianity as the doctrine of the divine spirit present in human society. In social life, the most valuable thing, for Bosanquet, is that communal will which grows out of individual co-operation and at the same time supports the indi-

vidual, making him free and bestowing upon him the fruits of participation in the whole. This doctrine is developed at length in the famous *Philosophical Theory of the State* (1899) and *Social and International Ideals* (1917).

In later life, Bosanquet became more interested in metaphysics. In the Gifford lectures (*see above*), he started with Hegel's conception of the dynamic character of human knowledge and experience, and insisting that the content and the object of thought are inseparable, and that thought, as he expresses it in *Three Chapters on the Nature of Mind* (published posthumously in 1923), is "the development of connections" and "the sense of the whole," arrived at an indispensable reality beyond and behind experience, a reality which determines the true mutual relations of all beings. He observes in his paper on the formation of his philosophy for *Contemporary British Philosophy* (1924) that experience has value in so far as the fullness of the whole is reflected in it, and knowledge is true in proportion as a system has adequate determination and the minimum of alternative possibilities. It was his over-emphasis on the incoherencies and hazards of finite personality which led him to deny to this ultimate reality or the Absolute the applicability of the word "personality" and to prefer "individuality." And just as he believed that it could not be the supreme end of the Absolute to give rise to beings such as he experienced himself to be, so he concluded that the desire for personal immortality is unworthy, since the content of the self and the continuance of that for which we care most is secured in the Absolute.

Apart from the works mentioned above, Bosanquet's more important writings are *Civilization of Christendom* (1893), *Companion to Plato's Republic* (1895), *Psychology of the Moral Self* (1897) and *Meeting of Extremes in Contemporary Philosophy* (1921). A number of his papers which appeared in various philosophical journals were edited by J. H. Muirhead and R. C. Bosanquet under the title *Science and Philosophy* (1927). *See also* the short biography *Bernard Bosanquet* by his wife (1924).

BOSBOOM-TOUSSAINT, ANNA LOUISA GEER-TRUIDA (1812-1886), Dutch novelist, was born at Alkmaar in north Holland. In 1851 she married the Dutch painter, Johannes Bosboom (1817-1891). Her first romance, *Almagro*, appeared in 1837, followed by the *Graaf van Devonshire* (*The Earl of Devonshire*) in 1838; the *Engelschen te Rome* (*The English at Rome*) in 1840, and *Het Huis Lauernesse* (*The House of Lauernesse*) in 1841, an episode of the Reformation, translated into many European languages. These stories, mainly founded upon some of the most interesting epochs of Dutch history, betrayed a remarkable grasp of facts and situations, combined with an undoubted mastery over her mother tongue, though her style is sometimes involved, and not always faultless. Ten years (1840-50) were mainly devoted to further studies, the result of which was revealed in 1851-54, when her *Leycester in Nederland*, *Vrouwen van het Leycestersche Tydperk* (*Women of Leicester's Epoch*), and *Gideon Florensz* appeared, a series dealing with Robert Dudley's adventures in the Low Countries. After 1870 Mrs. Bosboom-Toussaint abandoned historical romance for the modern society novel, but her *Delftsche Wonderdokter* (*The Necromancer of Delft*, 1871) and *Majoor Frans* (1875) did not command the success of her earlier works. *Major Frank* has been translated into English (1885). She died at The Hague where her novels have been published in a collected edition (1885-88).

BOSCAN ALMOGAVAR, JUAN (1490?-1542), Spanish poet, was a Catalan of patrician birth, and, after some years of military service, became tutor to the duke of Alva. His poems are divided into sections which mark stages of his poetical evolution. The first book contains poems in the old Castilian metres, written before 1526, in which year he became acquainted with the Venetian ambassador, Andrea Navagiero, who urged him to adopt Italian measures; this advice gave a new turn to Boscan's activity. The remaining books contain a number of pieces in the Italian manner, the longest of these being *Hero y Leander*, a poem in blank verse. He also published, in 1534, an admirable translation of Castiglione's *Il Cortegiano*. Italian measures had been introduced into Spanish literature by Santillana and Villalpando; Boscan naturalized them definitively and founded a poetic school.

The best edition of his poems was issued at Madrid in 1875 by W. J. Knapp. *See* F. Flamini, *Studi di storia letteraria italiana e straniera* (Livorno, 1895).

BOSCASTLE, small seaport, watering place and coastguard station, North Cornwall, England, 5m. N. of Camelford station, on the Southern railway. Pop. (civil parish of Forrabury) 775 in 1921. The village rises steeply above a very narrow cove, sheltered, but difficult of access, vessels having to be warped into it by means of hawsers. A mound on a hill above the harbour marks the site of a Norman castle. The parish church of St. Symphorian, Forrabury, also stands high, overlooking the Atlantic from Willapark Point. The tower is without bells, and the tradition that a ship bearing a peal hither was wrecked within sight of the harbour, and that the lost bells may still be heard to toll beneath the waves, has been made famous by a ballad of the Cornish poet Robert Stephen Hawker, vicar of Moorwinstow. The coast scenery near Boscastle is severely beautiful, with abrupt cliffs fully exposed to the sea, and broken only by a few picturesque inlets such as Crackington Cove and Pentargan Cove. Inland are bare moors, diversified by narrow dales, rising to the mountain mass of Brown Willy (1,300ft.).

BOSCAWEN, EDWARD (1711-1761), British admiral, was born Aug. 19, 1711, and died at Guildford, Jan. 10, 1761. He was the third son of Hugh, 1st Viscount Falmouth. He early entered the navy, and in 1739 took part in the siege of Porto Bello. At the siege of Cartagena, in March 1741, at the head of a party of seamen, he took a battery of fifteen 24-pounders, while exposed to the fire of another fort. On his return to England in the following year he married, and entered Parliament as member for Truro. In 1744 he captured the French frigate "Médée," commanded by M. de Hocquart, the first ship taken in the war. In May 1747, at the battle off Cape Finisterre, Hocquart again became his prisoner, and the French ships, ten in number, were taken. On July 15 he was placed in command of the expedition to the East Indies. On July 29, 1748, he arrived off Fort St. David's, and soon after laid siege to Pondicherry; but the sickness of his men and the approach of the monsoons led to the raising of the siege. Soon afterwards he received news of the peace and Madras was delivered up to him by the French. In April 1755 he intercepted the French squadron bound to North America and took the "Alcide" and "Lys" of 64 guns each. Hocquart became his prisoner for the third time, and Boscawen returned to Spithead with his prizes and 1,500 prisoners. For this exploit, he received the thanks of Parliament. In 1758 he was appointed admiral of the blue and commander-in-chief of the expedition to Cape Breton, when, in conjunction with Gen. Amherst, he took the fortress of Louisburg and the island of Cape Breton—services for which he again received the thanks of the House of Commons. In 1759, being appointed to command in the Mediterranean, he pursued the French fleet, commanded by M. de la Clue, and after a sharp engagement in Lagos Bay, took three large ships and burnt two, returning to Spithead with his prizes and 2,000 prisoners. The victory defeated the proposed concentration of the French fleet in Brest to cover an invasion of England. In Dec. 1760 he was appointed general of the marines, with a salary of £3,000 per annum, and was also sworn a member of the privy council.

BOSCH or **BOS, JEROM** (c. 1460-1516), a name given from his birthplace, Hertogenbosch, to Hieronymus van Aeken, the Dutch painter. He was probably a pupil of Albert Ouwater, and may be called the Breughel of the 15th century, for he devoted himself to the invention of bizarre types, *diableries*, and scenes of the kind generally associated with Breughel, whose art is to a great extent based on Bosch's. He was a satirist much in advance of his time, and one of the most original and ingenious artists of the 15th century. He exercised great influence on Lucas Cranach, who frequently copied his paintings. His works were much admired in Spain, especially by Philip II., at whose court Bosch painted for some time; several pictures by him are in Madrid. One of his chief works is the "Last Judgment" at the Berlin gallery, which also owns a little "St. Jerome in the Desert" "The Fall of the Rebellious Angels" and the "St. Anthony"

triptych are in the Brussels museum, and two important triptychs are at the Munich gallery. The Lippmann collection in Berlin contains an important "Adoration of the Magi," the Antwerp museum a "Passion," and a practically unknown painting from his brush is at the Naples museum.

BOSCOVICH, ROGER JOSEPH (1711?–1787), Italian mathematician and natural philosopher, one of the earliest of foreign *savants* to adopt Newton's gravitation theory, was born at Ragusa in Dalmatia on May 18, 1711, according to the usual account, but ten years earlier according to Lalande (*Éloge*, 1792). In his 15th year he entered the Society of Jesus. He studied mathematics and physics at the Collegium Romanum; and in 1740 was appointed professor of mathematics in the college. He published dissertations on the transit of Mercury, the Aurora Borealis, the figure of the earth, the observation of the fixed stars, the inequalities in terrestrial gravitation, the application of mathematics to the theory of the telescope, the limits of certainty in astronomical observations, the solid of greatest attraction, the cycloid, the logistic curve, the theory of comets, the tides, the law of continuity, the double refraction micrometer, various problems of spherical trigonometry, etc. In conjunction with Christopher Maire, an English Jesuit, he measured an arc of two degrees between Rome and Rimini, and in 1755 published *De Litteraria expeditione per pontificam ditionem ad dimetiendos duos meridiani gradus a PP. Maire et Boscovich*. The value of this work was increased by a carefully prepared map of the States of the Church. A French translation appeared in 1770. In 1771 he published at Vienna his famous work, *Theoria philosophiae naturalis redacta ad unicam legem virium in natura existentium*, containing his atomic theory (see MOLECULE). During a visit to England on one of the numerous diplomatic missions with which he was entrusted, Boscovich was elected a fellow of the Royal Society.

In 1764 Boscovich was called to the chair of mathematics at the University of Pavia, and this post he held, together with the directorship of the observatory of Brera, for six years. On the suppression of his order in Italy (1773) he accepted an invitation from the king of France to Paris, where he was naturalized and appointed director of optics for the marine, an office instituted for him, with a pension of 8,000 livres. He remained there ten years, but his position became irksome and at length intolerable. In 1783 he returned to Italy, and spent two years at Bassano, where his *Opera pertinentia ad opticam et astronomiam*, etc., appeared in 1785 in five volumes quarto.

BOSE, SIR JAGADIS CHANDRA (1858–) Indian physicist. After graduating from St. Xavier's college, Calcutta, he entered Christ's college, Cambridge, gaining high honours in 1884. In 1885 he became professor of physical science at the Presidency college, Calcutta. His first appearance before the British Association at Liverpool in 1896 was to demonstrate an apparatus for studying the properties of electric waves almost identical with the coherers subsequently used in all systems of wireless. He also invented an instrument for verifying the laws of refraction, reflection and polarization of electric waves.

His discovery of a parallelism in the behaviour of the receiver to the living muscle led him to a systematic study of the response of inorganic matter as well as animal tissues and plants to various kinds of stimulus. After laborious researches he proved to the satisfaction of various scientific bodies that the life mechanism of the plant is identical with that of the animal. His crescograph is a recorder of plant growth capable of magnifying a small movement as much as ten million times. In 1915 he became professor emeritus of the Presidency college and thereupon devoted himself to founding the research institute in Calcutta which bears his name. He was knighted in 1917 and has been a member of many scientific deputations both in Europe and America.

See Patrick Geddes, *The Life and Work of Sir Jagadis C. Bose* (1920) and Sir J. C. Bose: *His Life and Speeches* (Madras, 1920).

BOSNIA AND HERCEGOVINA, two Balkan provinces successively Turkish, in Austrian occupation and annexed to Austria, but since the post-war settlement included in the Serbo-Croat-Slovene state or Yugoslavia. See BALKAN PENINSULA and YUGOSLAVIA.

HISTORY

Mediaeval Period.—Under Roman rule Bosnia formed part of Illyria (*q.v.*); only with the coming of the Slavs did it develop an identity of its own, existing precariously between Hungary and Croatia on the north and Byzantium and the rising Serbian power on the south and east. Bosnia's first ruler of mark was the Ban Kulin (1180–1204), whose reign is depicted by the Ragusan chroniclers as one of great prosperity. In it we find the beginnings of the mining industry, and also of the strange heresy of the Bogomiles (*q.v.*). Both he and his second successor, Ninoslav, were infected by the new doctrine. The Papacy was eager to extend Catholicism in the Balkans, and the crusade waged by it through the medium of Hungary against Bogomilism was a counterpart of the abortive attempts to detach the Serbian and Bulgarian dynasties from the Orthodox faith. The Tartar invasion of 1241 temporarily checked Hungarian aggression, but in 1254 Béla IV. asserted the suzerainty of the Hungaro-Croatian kings over the Bans of Bosnia. In the years 1293–99 two powerful Croat nobles, Paul and Mladen Subić, obtained from the last Arpád kings of Hungary the banships of Croatia, Dalmatia and Bosnia, but in 1322 these were again separated by Charles Robert. Stephen Kotromanić was invested with Bosnia, held loyally to Hungary and extended his rule to the principality of Hum or Zahumlje, the future Hercegovina, which had led a more or less independent existence since the early 10th century, though sometimes subjected by Byzantium or Serbia. He thus acquired a short coastline at the mouth of the Neretva and was in close relations with Venice and Ragusa. He found it expedient to accept Catholicism, thereby securing the support of the west and of Hungary against the encroachments of Tsar Dušan. His connection with Hungary was still further strengthened in 1353, when his daughter Elisabeth married Louis the Great.

Kotromanić died in the same year, and was succeeded by his nephew Tvrtko, who, after a stormy minority, found his situation much eased by Serbia's rapid decline after the death of Tsar Dušan. Tvrtko took advantage of the dissensions among the great Serbian nobles and, in return for military aid to Prince Lazar, obtained from him a cession of territory near Sjenica, strengthened his hold over Hum and expelled the Balšić family from the little principality of Travunja (Trebinje) in 1375–76. In 1376 he assumed the title "Stephen Tvrtko, in Christ God King of the Serbs and Bosnia and the Coastland." He had himself crowned at Mileševu at the grave of St. Sava, with the two crowns of Bosnia and Serbia. Henceforth he and all his successors asserted their right to the Serbian throne. He was almost at once recognized by Ragusa and Venice. He married a Bulgarian princess, and on Louis the Great's death in 1382 took advantage of his cousin Elisabeth's distress to obtain the peaceful cession of Cattaro. Elisabeth and her daughter becoming involved in conflict with the turbulent Croat nobility, Tvrtko fished in troubled waters and aimed definitely at the conquest of the coast. This design was delayed by the Turkish invasion; for Tvrtko understood the danger and sent a strong contingent to Lazar's aid at Kosovo (1389). But after this disastrous battle Tvrtko's interest turned westwards once more, and in 1390 he secured the submission of Spalato, Trau and other Dalmatian cities, and assumed the title of "King of Dalmatia and Croatia." In 1391, however, he died before he could consolidate his power, and his brief attempt to unite the Southern Slavs failed.

Struggles with the Turks.—His brother, Stephen Dabiša, had to surrender Croatia and Dalmatia to Sigismund of Hungary, and dying in 1395 left the throne to a minor, whose mother vainly defended him against the great Bosnian magnates. The first Turkish inroad into Bosnia (1398) helped to rally the country round Stephen Ostoja (1398–1404 and 1408–18), who is believed to have been an illegitimate son of Tvrtko. Neither he nor his son Ostojić (1418–21) were capable of arresting the slow decline of Bosnia, which was a prey to warring factions among the nobles and weakened by the old religious struggle. In 1421 Tvrtko II. asserted his right to his father's throne; but he, too, was unequal to the situation and became involved in

profitless conflicts with his own Voivodes (*q.v.*)—such as Radosav Pavlović, who made war on his own account upon the Republic of Ragusa (1432)—and with his neighbours Stephen Lazarević and George Branković of Serbia. In 1433, while at war with the latter, he was attacked by his own rebellious vassal, Sandalj Hranić, and forced to fly to Hungary, where he remained three years in exile. Bosnia thus offered an easy prey to the Turks, who imposed in 1436 an annual tribute of 25,000 ducats. Meanwhile Stephen Vukčić, the nephew of Hranić, made himself master of the south and ruled as "Great Voivode" of the districts, which thus acquired the name of Hercegovina (Herzegovina) or "the Duchy." Tvrtko in his need looked to Venice and Hungary, but did not survive King Vladislav's great campaign against the Turks in 1444. Leaving no son, he was succeeded by Stephen Thomas, an illegitimate son of Ostojić, who threw himself into the arms of John Hunyády (*q.v.*), then the soul of Christendom's defence against the Turks. In the belief that Bosnia's hope of rescue lay in the west, Stephen Thomas turned away from the Bogomiles, who had grown stronger than ever since the beginning of the century, and accepted Catholicism; but he made the fatal blunder of persecuting his former co-religionists (1450), and the proselytism of the Legate and the Franciscans increased the internal disintegration. Many Bogomiles fled abroad; some even appealed to the Turks for help. Vukčić, whose daughter Catherine had married Stephen Thomas, was involved in war with Ragusa just when all Christian forces should have been united against the Turkish danger (1453); Hunyády's death left Bosnia almost defenceless, and the accession of Mohammed II. had increased the danger. After the death of George Branković (1456), Stephen Thomas seized a large section of Serbian territory, and in 1458 his son Stephen succeeded as despot of Serbia, with the active approval of King Matthias and the Hungarian parliament. But in 1459 the Turks overran Serbia; rightly or wrongly, the king of Bosnia was blamed by Hungary and the pope as responsible for the disaster. Stephen Thomas died in 1461 and his son Tomašević, relying on help from the west, refused tribute to the Sultan. Thereupon Mohammed invaded Bosnia in person (1463), captured and executed King Tomašević on a hill near Jajce, and reduced the country to a Turkish province. The kingdom was at an end, but Matthias in the same year recovered the north-west districts, including Jajce and Banjaluka, and held it as a banat under the Hungarian Crown. Hercegovina still resisted under Stephen Vukčić, and after his death in 1466 under his three sons; but in 1483 it also was completely overrun by the Turks. Finally the banat of Jajce fell into Turkish hands in 1528, as a result of the collapse of Hungarian power at Mohács two years earlier.

Bosnia as a Turkish Province.—Under Turkish rule Bosnia and Hercegovina formed more than ever a world of their own, isolated not merely from Europe but even from Constantinople itself. The religious discords which had rent them in mediaeval times were perpetuated in a new form; for the great nobles—partly to save their lands and power, partly because as Bogomiles they preferred Islam to militant Catholicism—apostatized as a class. Thus a large section of the native population became Muslim, few true Turks settling in the two provinces. A governor imposed by the Porte resided at Banjaluka or Travnik, and later at Sarajevo, but interfered very little with local affairs so long as the taxes were paid. The real power lay in the hands of 48 hereditary *kapetans*, exercising feudal jurisdiction over their tenants and liable to provide military service for the sultan. Thus there grew up the institution of the *čiflik*—a whole village holding its lands from one of the big lords or lesser land-owning begs, on condition of paying him one-third of its total product. Though called "Turks" for ecclesiastical reasons, the Muslims of Bosnia continued to speak the purest Serb and never adopted polygamy. The new era did not make for prosperity; the famous mediaeval mining industry decayed and finally disappeared, trade and commerce, though upheld for a time by the Ragusans, languished after the great earthquake of 1667, which dealt so deadly a blow to their republic; the manufacture of weapons and wrought metals alone survived. Many Bosnians, how-

ever, rose to high distinction in the Turkish service—among them such famous grand viziers as Mohammed Sokoli (or Sokolović).

During the 16th and 17th centuries Bosnia was an important Turkish outpost in the constant warfare with the Habsburgs and with Venice. When Hungary was at last reclaimed from the Turkish yoke, the imperialists in their turn penetrated into Bosnia, and in 1697 Prince Eugene captured Sarajevo. By the Treaty of Karlowitz (1699) the Save, forming the northern boundary

MOSTAR, THE FORMER CAPITAL OF HERCEGOVINA, IS SITUATED ON THE NERETVA ABOUT 30 MILES FROM SARAJEVO. AFTER THE WORLD WAR, HERCEGOVINA WAS CEDED BY AUSTRIA TO YUGOSLAVIA

of Bosnia, became also the northernmost limit of the Turkish empire; and by that of Požarevac (Passarowitz, 1718) Novi and part of Bosnia east of the Una were ceded to Austria. These were restored to Turkey in 1739, and the frontiers remained unchanged till 1878.

In the 19th century the great Bosnian families, intensely conservative and fanatical, resented all interference from Constantinople and denounced Mahmud II. as the "Giaour (or Infidel) Sultan." A first revolt broke out in 1821, while the Porte was occupied with the Greeks, and a second during the Russo-Turkish War of 1828, under the leadership of Mustafa Skodra Pasha, a reputed descendant of the Crnojević dynasty, who made his headquarters at Scutari. Even more formidable was the rising of 1831; Hussein Kapetan, known as "the Dragon of Bosnia," preached a holy war against the sultan and denounced reform. He and Mustafa together overran most of Macedonia, northern Albania and even parts of Bulgaria. After a severe struggle the Grand Vizier Reshid Pasha quelled the rebellion, helped largely by internal dissensions. Eventually the Dragon was driven across the frontier into Croatia, and ended his days in banishment at Trebizond. In 1837 the abolition of the Kapetanates led to fresh trouble, and the Hattisheriff of reforms with which Abdul Medjid inaugurated his reign was keenly resented. The Hercegovinian chief, Ali Pasha Rizvanbegović, who had sided with the Porte during the earlier rising, made himself virtually independent and had his own quarrels and reconciliations with Montenegro, regardless of the views of the Porte, whose authority was only effectually restored in 1850 by Omer Pasha, the famous renegade Croat, who had begun life in an Austrian frontier regiment, fled the country owing to embezzlement, embraced Islam and made a rapid career at Constantinople. By ruthless measures he destroyed the old feudal régime in Bosnia, introduced a new, centralized administration and a system of taxation which opened the door to every kind of licence and exaction. In 1862 the Christians in their turn revolted under Luka Vukalović. They were eventually reduced, but unrest was chronic and discontent universal; Christians and Muslims, despite acute differences, united in their dislike of Ottoman bureaucracy and corruption.

Crisis of 1875-78: Austrian Occupation.—In 1875 local troubles near Nevesinje, in Hercegovina, spread rapidly into insurrection throughout the two provinces. Only a few weeks earlier Francis Joseph had paid his first visit to Dalmatia, and

at Ragusa, so near to the disturbed area, had been ostentatiously greeted by Prince Nicholas of Montenegro, who urged joint Austro-Russian intervention at the Porte. In August the consuls of the three imperial Powers tried to mediate between the Turkish authorities and the insurgents, but without success; and the Sultan's decree of Oct. 2, offering reduction of taxes, religious liberty and a provincial assembly, was also rejected. Count Andrassy's note (Dec. 30, 1875), proposing a limited autonomy, did not go far enough, and the so-called Berlin memorandum of May 1876 failed owing to the abstention of the British Government. The situation was complicated by the Bulgarian rising and massacres and by a revolution in Constantinople itself. Excitement had been steadily growing in Serbia and Montenegro, union with which was the insurgents' avowed aim. Princes Milan and Nicholas hesitated to move, in view of the disapproval of the Powers, but their hands were forced, not merely by the mutual rivalry of Obrenović and Petrović—each aspiring to the throne of an enlarged and united southern Slav State—but also by the presence of Prince Peter Karagjorgjevic (head of the third native Serb dynasty) as a leader of the insurgent bands. The liberation of Bosnia had long been an aspiration of Serbian public opinion, and its partition between Serbia and Austria-Hungary had been seriously considered by Beust and Andrassy, though, since the Russophil current in Serbia again became predominant in 1871, Austria-Hungary developed the design of exclusive annexation by herself. On June 30 Serbia and Montenegro declared war upon Turkey, while the insurgents proclaimed union with them, and numerous Russian volunteers joined the Serbian army. Turkey's speedy victory upset the calculations on which Austria-Hungary and Russia had reached a secret agreement at Reichstadt (July 6). Serbia's renewed defeat in October, after the expiry of the armistice, ended her real hopes of winning Bosnia. Indeed, as early as September the tsar, in an autographed letter to Francis Joseph, had made clear that he also disapproved of "a large Serb State," and actually proposed Austria-Hungary's occupation of Bosnia-Hercegovina. By the secret convention of Budapest (Jan.-Mar. 1877) Russia recognized Austria-Hungary's right to occupy, as a condition of her neutrality in the impending war with Turkey. Serbia re-entered the war three days after Plevna's surrender; but could no longer influence events. At the Congress of Berlin (*see* BERLIN, CONGRESS OF) her aspirations and those of the insurgents were entirely disregarded, and Bosnia-Hercegovina assigned to Austria-Hungary by a mandate of all Europe, on the proposal of Lord Salisbury. Francis Joseph and Andrassy could have secured approval for full annexation if they had wished, but mainly for reasons of internal politics preferred the more provisional formula of occupation. The insurgents attempted armed resistance, and Austria-Hungary had to mobilize an army of 200,000 men. Gen. Filipović occupied Sarajevo on Aug. 19, 1878, and with the fall of Bihać a month later the rising was virtually at an end (*see* also EASTERN QUESTION).

Period of Austrian Occupation.—The two provinces were at first administered by a special commission inside the foreign office at Vienna, under Joseph Szilávy, but when in 1880 he became joint Austro-Hungarian finance minister they were placed permanently under the control of that ministry, the local administration being concentrated in Sarajevo under a governor, a so-called *Zivilatatus*, and several heads of departments. In 1882 Benjamin Kállay became finance minister and for 21 years directed every department of Bosnian policy. Six years' residence as Austro-Hungarian diplomatic agent in Belgrade had given him a unique knowledge of Southern Slav problems, but his whole influence was exercised in an anti-national sense. He tried to evolve a "Bosnian" consciousness, to check Serb national feeling, to create dissensions between Serb and Croat and between Orthodox, Muslim and Catholic, and to prevent so far as possible all intercourse of the two provinces with Serbia and even with Croatia. Meanwhile he set himself to establish public order and material prosperity, and achieved really remarkable results; he built a network of roads and railways, and many public institutions, founded an incorruptible bureaucracy and a system of

law, and fostered trade and industry. But though he also opened a number of admirable secondary and technical schools, primary education was sadly neglected, and no serious attempt was made to solve the land question, which continued to envenom the whole situation. Further defects in Kállay's régime were the reduction of the Orthodox hierarchy to a state of subservience, and the creation of a widely ramified police system. His whole outlook towards the Southern Slav problem had been that of a Magyar, interested in disunion between Serb and Croat for reasons of Hungarian internal policy; and on his death (1903) Bosnian affairs were again entrusted to a Magyar, Baron Stephen Burián. During the next decade there was a rapid growth in national feeling in the provinces, stimulated by events in Serbia after the fall of the Obrenović régime and in Croatia and Dalmatia (*q.v.*) since the departure of Count Khuen. Burián, faced by the clamour of the Bosnian Serbs for self-government, made certain concessions. In 1905 the Orthodox Church received a charter of autonomy and its Serbian nationality was recognized for the first time. In 1907 an assembly of 71 Serb delegates from every district was allowed to put forward a programme of reform, in which the land question figured prominently, with, most significant of all, the demand for an autonomous position *as part of the Turkish empire*. Meanwhile the Croats of Bosnia were organizing politically, and the Catholic archbishop of Sarajevo, Mgr. Stadler, was extremely active, with the backing of the Viennese Clericals, and aroused heartburnings among the Muslims by his proselytizing tendencies.

Annexation by Austria-Hungary.—Faced by the growing ferment inside the provinces, Austria-Hungary was already convinced of the need for some change in status, when the Turkish Revolution of 1908 brought matters to a head. The Young Turks contended that Bosnia-Hercegovina must be represented in the new parliament at Constantinople, and the Bosnian nationalists saw in this demand a convenient legal basis for their agitation. Influenced also by the strategic considerations pressed upon him by the general staff, Baron Aehrenthal advised Francis Joseph to annex Bosnia-Hercegovina to the dual monarchy and thus solve once and for all their constitutional status. This was done by an imperial rescript of Oct. 7, 1908, and the opposition of the Triple Entente Powers to this attempt to amend the public law of Europe by a one-sided and arbitrary act, instead of by formal revision at a fresh congress, made the Bosnian question the main issue in a prolonged international crisis. In Serbia in particular the annexation was keenly resented, as giving permanence to a situation which the Serbs had persisted in regarding as provisional and which shut the door upon national unity. Serbia's main backing came from Russia, who was secretly embarrassed by the existence of a whole series of engagements to support Austria-Hungary's claim to Bosnia (Reichstadt, 1876; Budapest, 1877; at the Congress of Berlin, 1878; and under the *Dreikaiserbund* of June 11, 1881). Some obscurity still surrounds the interview between Aehrenthal and Izvolsky at Buchlau in Sept. 1908, at which it is alleged that Russia's consent to the annexation was given in return for Austro-Hungarian support regarding the straits. On March 25, 1909, Russia yielded to German pressure, and in April the annexation was recognized by all the Powers, without a fresh congress being convoked. From this time dates the acute friction between Austria-Hungary and Serbia which culminated in the explosion of 1914. (*See* BISMARCK, OTTO, PRINCE VON.)

Vienna was committed to the grant of some measure of representative government to Bosnia and Hercegovina, and as neither Austria nor Hungary would consent to its being attached to the one rather than to the other, or to its partition between them, a hybrid form of constitution was devised, by which the two provinces received a diet and special laws of association and assembly, but were not represented in the two central parliaments and delegations, and thus had no say in foreign affairs. The new constitution, proclaimed on Feb. 17, 1910, had the capital defect of stereotyping sectarian and social differences by dividing the electorate into three "Curiae" (electoral colleges) and by assigning in each of these a fixed proportion of seats to the Ortho-

dox, Muslim and Catholic elements. The diet was expressly excluded from any control of the executive, which remained under the governor (*Landeschef*), his deputy (*Ziviladlatus*), the departmental heads in Sarajevo, and the joint ministry of finance in Vienna as supreme instance.

These carefully hedged concessions were very badly received. The emperor's visit to Bosnia in the summer of 1910 was intended to symbolize to the outside world the permanence of Austro-Hungarian rule; but the opening of the diet was marred by an attempt on the life of the governor, Gen. Varešanin, by the student Žerajić, who at once committed suicide. Burián now tried to win the Serbian element for co-operation with the Government, and openly described them as the most progressive element in the country. But the situation in Croatia (*q.v.*) reacted more and more on Bosnia, rendered Burián's half-measures ineffectual, and strengthened the self-confidence of the Serbs. In Feb. 1912 he was succeeded by Ritter von Bilinski, a prominent Polish Conservative who enjoyed the confidence of Francis Joseph; but any hope of clearing up the internal situation was frustrated by Hungary's establishment of a dictatorship in Croatia (April 1912), and by the victories of Serbia in the Balkan War (October–November)—events which roused the whole Yugoslav population of Austria-Hungary to feverish excitement.

The Bosnian group was specially active among the Yugoslav students, who began to found organs of their own in Prague, Vienna and Zagreb as well as Sarajevo. The younger generation devoted their efforts to inculcating revolutionary ideas among the university and middle school youth in Bosnia and the neighbouring provinces. They were completely successful, and the confidential memoranda prepared by high officials in Sarajevo and Vienna on the very eve of the World War show them to have been altogether at a loss as to what policy to adopt.

The Bosnian situation was further complicated by the increasing jealousy between the provincial Government in Sarajevo and its nominal superior, the finance ministry in Vienna, or, in personal terms, between the military governor, Potiorek, representing the views of the general staff and of the archduke Francis Ferdinand, and the civilian minister Bilinski as the confidant of the emperor. In May 1913 Potiorek, despite Bilinski's disapproval, had closed the Bosnian diet and dissolved various Serbian societies and the headquarters of the Serb Radicals. He continually urged the adoption of still more stringent measures, and tended increasingly to act without consulting Bilinski. The most notorious instance was the decision reached between Potiorek and Francis Ferdinand that the latter should attend the military manoeuvres in Bosnia in June 1914. Bilinski was not consulted or even notified, and the entire arrangements remained in military hands. To this circumstance must be ascribed a large share of the blame for the assassination of the archduke Francis Ferdinand and his consort, the duchess of Hohenberg, during their visit to Sarajevo on June 28, 1914.

The Sarajevo Murder.—This outrage was the work of Bosnian revolutionary students (*see* EUROPE; SERBIA). The governor, Potiorek, far from being blamed for his lack of precautions, remained in high favour, was placed in command of the Austro-Hungarian forces invading Serbia and was mainly responsible for their severe defeat at Rudnik in Dec. 1914. After the murder, the mob of Sarajevo had, with police connivance, sacked many Serbian houses and institutions, and destroyed the Serbian printing presses and newspaper offices. During the following winter numerous treason trials were instituted against the youth of Bosnia—65 from the gymnasia of Sarajevo and Trebinje, 22 from Banjaluka, nine from Mostar and 38 from Tuzla—thus demonstrating the widespread nature of the movement. Most notorious of all was the Banjaluka treason trial (Nov. 1915–April 1916), in which 98 out of the 151 prisoners were condemned to sentences varying from 20 years to two months, and 16 to death (afterwards reprieved).

Union with Yugoslavia.—During the war all political life ceased, but when Austria's Balkan front collapsed in Oct. 1918 a national committee was formed in Sarajevo, which acted in close accord with the Yugoslav national council at Zagreb. After its

formal recognition of union with Serbia, the fate of Bosnia was bound up with that of the new Yugoslavia. Many vital problems of local concern, however, survived. The very difficult Bosnian land question, which Austria-Hungary failed to solve in her 40 years' rule, was solved all too drastically and on party lines. The State promised the big Muslim landlords compensation, but did not fulfil its pledge, once more for party reasons; but though the large estates were split up, a new agricultural and urban proletariat was created. Sarajevo and other towns lost much of their prosperity, owing to the centralist tendencies of Belgrade (*see* YUGOSLAVIA). (R. W. S.-W.)

BIBLIOGRAPHY.—The best modern history of Bosnia is by Vjekoslav Klaić, *Geschichte Bosniens* (Leipzig, 1884), which may be supplemented by his larger *History of the Croats (Povijest Hrvata)*, and K. Jireček's *Geschichte der Serben* (Gotha, 1911 and 1918). *See* also the smaller works of Dr. Milan Prelog, *Povijest Bosne*, up to 1878 (3 parts, Sarajevo, 1912), and of Saivet Beg Bašagić, *Kratka Uputa u Proslost Bosne i Hercegovine* (Short Introduction to the Past of Bosnia-Hercegovina), written from the Croat and Muslim angle respectively. On Roman times *see* Dr. Carl Patsch, *Bosnien in römischer Zeit* (Sarajevo, 1911). Important collections of sources are: F. Miklosich, *Monumenta Serbica* (Vienna, 1858), A. Theiner, *Vetere Monumenta Historica Hungariorum Sacrum Illustrantia* (1860), and *Vetere Monumenta Slavorum Meridionalium* (Rome and Zagreb, 1863 and 1875); J. Šafarik, *Acta Archivi Veneti spectantia ad historiam Serborum* (Belgrade, 1860–62); V. Makušev, *Monumenta Historica Slavorum Meridionalium* (Belgrade, 1885). For more modern times *see* Pertusier, *La Bosnie* (1822); Leopold von Ranke, *Die letzten Unruhen in Bosnien* (1832); *Türkische Zustände* (1) A. V. Hilferding, "Bosnien," (2) Prokop Čokorilo, "Herzegovina," 1831–57, Arthur J. Evans, *Through Bosnia and Herzegovina on Foot* (1876) and *Illyrian Letters* (1878); J. Koetschet, *Aus Bosniens letzter Turkenzeit* (Vienna, 1905), and *Osman Pascha* (Sarajevo, 1909); Fra J. Jelenić, *Kultura i Bosanski Franjevci* (Culture and the Bosnian Franciscans) (Sarajevo, 1912–15).

The most useful surveys of conditions under Austrian rule are to be found in *Bosnien-Herzegovina: Die österreichisch-ungarische Monarchie in Wort und Bild* (Vienna, 1901), and F. Schmid, *Bosnien und die Herzegovina* (Leipzig, 1914). For the diplomatic side of the annexation *see* A. Fournier, *Wie wir zu Bosnien kamen* (1909), and vol. xvii. of *Die Grosse Politik*. The best Serbian thesis on the annexation is J. Cvijić, *L'Annexion de la Bosnie* (1908). For the land question *see* Ciro Truhelka, *Geschichtliche Grundlage der bosnischen Agrarfrage* (1909), and Grunberg, *Die Agrarverfassung in Bosnien* (Leipzig, 1911). For the revolutionary movement *see* B. Jevtić, *Sarajevski Atentat* (Sarajevo, 1924), and R. W. Seton-Watson, *Sarajevo* (1926).

BOSPORUS or BOSPHERUS. By the ancients this name, signifying a strait, was especially applied to the *Bosporus Cimmerius* (*see* below), and the *Bosporus Thracius* (Gr. *Βόσπορος* ox-ford, traditionally connected with Io, who, in the form of a heifer, crossed the Thracian Bosporus in her wanderings). It now denotes the latter strait, which unites the Black sea with the Sea of Marmora and forms part of the boundary between Europe and Asia. The channel is 18m. long, and has a maximum breadth at the northern entrance of 2½m, a minimum breadth of about 800yd., and a depth varying from 20 to 66 fathoms in mid-stream. In the centre there is a rapid current from the Black sea to the Sea of Marmora, but in the opposite direction a counter-current sets in below the surface and along the shores. The scenery on both sides is varied and beautiful, determined by a great variety of volcanic rocks in the north, and of sandstones, conglomerates and calcareous deposits elsewhere. Many villages line each well-wooded shore, while on the European side are numerous fine residences of the wealthy class of Constantinople. By treaty of 1841, confirmed by the Treaty of Berlin in 1878 and at other times, no ship of war other than Turkish may pass through the strait (or through the Dardanelles) without the countenance of the Turkish authorities. They in turn are under the control of an International Straits commission which is in permanent session at Constantinople, and was established in 1918. (*See* also CONSTANTINOPLE.)

BOSPORUS CIMMERIUS, the ancient name for the Straits of Kerch or Yenikale, connecting the Black sea and the Sea of Azov (*see* CIMMERII). The straits are about 25m. long and 2½m. broad at the narrowest, and are formed by an eastern extension of the Crimea and the peninsula of Taman, a continuation of the Caucasus. This in ancient times seems to have formed

a group of islands. The whole district was dotted with Greek cities; on the west side, Panticapaeum (Kerch, *q.v.*), often called Bosphorus, and Nymphaeum (Eltegen); on the east Phanagoria (Sënnāja), Cēpi, Hermonassa, Portus Sīndicus, Gorgippia (Anapa). These were mostly settled by Milesians, but Phanagoria was a colony of Teos, and Nymphaeum had some connection with Athens. The towns have left hardly any architectural or sculptural remains, but the numerous barrows in their neighbourhood have yielded gold work, vases from Athens, textiles and specimens of carpentry and marquetry. The numerous terracottas are rather rude in style.

The locality was governed from 480 to 438 B.C. by the Archæanactidae, who gave place to a tyrant Spartocus (438–431 B.C.), a Thracian. He founded a dynasty which endured until c. 110 B.C. The Spartocids have left many inscriptions which tell us that the earlier members of the house ruled as archons of the Greek cities and kings of various native tribes, notably the Sindi of the island district. Satyrus (431–387) established his rule over the whole district, adding Nymphaeum to his dominions and laying siege to Theodosia, a commercial rival by reason of its ice-free port and direct proximity to the cornfields of the eastern Crimea. It was reserved for his son Leucon (387–347) to take this city. He was succeeded by his two sons, Spartocus II. and Paerisades; succeeding princes repeated the family names, but we cannot assign them any certain order. The last of them, a Paerisades, called in the help of Diophantus, general of Mithridates VI. (the Great) of Pontus, against the power of the natives, promising to hand over his kingdom to that prince. He was slain by a Scythian Saumacus who led a rebellion against him. The house of Spartocus was well known as a line of enlightened and wise princes, they maintained close relations with Athens, their best customers for the Bosphoran corn export; we have many references to this in the Attic orators. The Athenians granted Leucon Athenian citizenship and set up decrees in honour of him and his sons. Mithridates the Great entrusted the Bosphorus Cimmerius to his son Machares, who, however, deserted to the Romans. But even when driven out of his own kingdom by Pompey, Mithridates was strong enough to regain the Bosphorus Cimmerius. After the death of Mithridates (63 B.C.), Pharnaces (63–47) made his submission to Pompey, but tried to regain his dominion during the civil war. He was defeated by Caesar at Zela, and was slain by Asander who ruled as archon, and later as king, until 16 B.C. In 8 B.C. Aspurgus, son of Asander, founded a line of kings which endured until A.D. 341. Their kingdom covered the eastern half of the Crimea and the Taman peninsula, and extended along the east coast of the Sea of Azov to Tanais at the mouth of the Don, a great mart for trade with the interior. They carried on a perpetual war with the native tribes, and in this were supported by their Roman suzerains, who lent the assistance of garrison and fleet. In A.D. 255 the Goths and Borani were enabled to seize Bosphoran shipping and raid the shores of Asia Minor. The kingdom succumbed to the Huns. In later times it was revived under Byzantine protection, and Byzantine officers built fortresses and exercised authority at Bosphorus, which was constituted an archbishopric.

The Bosphoran kingdom is interesting as the first Hellenistic State, the first, that is to say, in which a mixed population adopted the Greek language and civilization. It depended for its prosperity upon the export of wheat, fish and slaves, and this commerce supported a class whose wealth and vulgarity are exemplified by the contents of the numerous tombs.

We possess a large series of coins of Panticapaeum and other cities from the 5th century B.C. The gold *staters* of Panticapaeum bearing Pan's head and a griffin are specially remarkable for their weight and fine workmanship.

BOSQUET, PIERRE FRANÇOIS JOSEPH (1810–1861), French marshal, was born at Mont de Marsan, Landes, on Nov. 8 1810, and died at Toulouse, Feb. 5 1861. He entered the artillery in 1833 and served in Algeria with great distinction from

1834 to 1853, when he returned to France a general of division. Bosquet was among the earliest chosen to serve in the Crimean War, and at the battle of the Alma his division led the French attack. When the Anglo-French troops formed the siege of Sevastopol, Bosquet's corps of two divisions protected them against interruption. His timely intervention at Inkerman (Nov. 5 1854) secured the victory for the allies. During 1855 Bosquet's corps occupied the right wing of the besieging armies opposite the Mamelon and Malakov. He himself led his corps at the storming of the Mamelon (June 7), and at the grand assault of Sept. 8 he was in command of the whole of the storming troops. In the struggle for the Malakov he received a serious wound. In 1855 Bosquet became a senator and a marshal of France.

BOSS, a round protuberance; the projecting centre or "umbo" of a buckler (O.E. *boce*, a swelling; cf. Fr. *bosse*); in geology a projection of rock through strata of another species; in architecture, the large projecting stone at the intersection of the ribs of a Gothic vault, sometimes moulded and frequently decorated by rich foliage, grotesque figures or heraldic and symbolic forms. In industry boss is a colloquial term for master, employer or foreman, originating in the United States, but now used in all parts of the English-speaking world. The word is apparently derived from the Dutch *baas*, master. It is also used in American, but not in English, politics. Thus, we find Bryce, in his *American Commonwealth*, writing: "He dispenses places, rewards the loyal, concocts schemes . . . he is a boss."

BOSSI, GIUSEPPE (1777–1816), Italian painter and writer on art, was born at Busto Arsizio, near Milan, and died at Milan on Dec. 15, 1816. The greater part of his life was given to the study of Leonardo da Vinci. At the desire of Prince Eugene he made the copy of "The Last Supper," from which the mosaic by Raffaelli at Vienna was executed. His most important work is *Del Cenacolo di Leonardo da Vinci* (1810).

BOSSU, RENÉ LE (1631–1680), French critic, was born in Paris. He studied at Nanterre, and in 1649 became one of the regular canons of Sainte-Geneviève. He wrote *Parallèle des principes de la physique d'Aristote et de celle de René Descartes* (1674), and a *Traité du poème épique*, highly praised by Boileau, the leading doctrine of which was that the subject should be chosen before the characters, and that the action should be arranged without reference to the personages who are to figure in the scene.

BOSSUET, JACQUES BÉNIGNE (1627–1704), French divine, orator and writer, was born at Dijon on Sept. 27, 1627, the son of a judge of the *parlement* at Dijon, afterwards at Metz. The boy was sent to school with the Jesuits till 1642, when he went up to the college of Navarre in Paris. There he gained a great reputation for hard work; fellow-students nicknamed him *Bos suetus aratro*—an ox broken to the plough. In 1652 he was ordained priest. The next seven years he spent at Metz, where his father's influence had got him a canonry at the early age of 13; to this was now added the more important office of archdeacon. He was plunged into the thick of controversy, for nearly half Metz was Protestant, and Bossuet's first appearance in print was a refutation of the Huguenot pastor Paul Ferry (1655). To reconcile the Protestants with the Roman Church became the great object of his dreams; and for this purpose he began to train himself carefully for the pulpit, an all-important centre of influence in a land where political assemblies were unknown, and novels and newspapers scarcely born. In 1659 he settled in Paris, and three years later mounted the pulpit of the Chapel Royal.

Bossuet possessed the full equipment of the orator, voice, language, flexibility and strength. He never needed to strain for effect; his genius struck out at a single blow the thought, the feeling and the word. What he said of Martin Luther applies peculiarly to himself: he could "fling his fury into theses," and thus unite the dry light of argument with the fire and heat of passion. These qualities reach their highest point in the *Oraisons funèbres*. Bossuet was always best when at work on a large canvas; besides, here no conscientious scruples intervened to prevent him giving much time and thought to the artistic side of his subject. For the *Oraison*, as its name betokened, stood

midway between the sermon proper and what would nowadays be called a biographical sketch. At least, that was what Bossuet made it; for on this field he stood not merely first, but alone. His three great masterpieces were delivered at the funerals of Henrietta Maria, widow of Charles I. (1669), her daughter, Henrietta, duchess of Orleans (1670), and the great soldier Condé (1687).

Apart from these State occasions, Bossuet seldom appeared in a Paris pulpit after 1669. In that year he was gazetted bishop at Condom in Gascony, though he resigned the charge on being appointed tutor to the dauphin, only child of Louis XIV. Bossuet wrote for his pupil's instruction (or rather, to fit himself to give that instruction) a remarkable trilogy. First came the *Traité de la connaissance de Dieu et de soi-même*, then the *Discours sur l'histoire universelle*, lastly the *Politique tirée de l'Écriture Sainte*. The three books fit into each other. The *Traité* is a general sketch of the nature of God and the nature of man. The *Discours* is a history of God's dealings with humanity in the past. The *Politique* is a code of rights and duties drawn up in the light thrown by those dealings. Not that Bossuet literally supposed that the last word of political wisdom had been said by the Old Testament. His conclusions are only "drawn from Holy Scripture," because he wished to gain the highest possible sanction for the institutions of his country—to hallow the France of Louis XIV. by proving its astonishing likeness to the Israel of Solomon. Then, too, the veil of Holy Scripture enabled him to speak out more boldly than court-etiquette would have otherwise allowed, to remind the son of Louis XIV. that kings have duties as well as rights. Louis had often forgotten these duties, but Louis' son would bear them in mind. The tutor's imagination looked forward to a time when France would blossom into Utopia, with a Christian philosopher on the throne. That is what made him so stalwart a champion of authority in all its forms: "*le roi, Jésus-Christ et l'Église, Dieu en ces trois noms*," he says in a characteristic letter. Philosophy proved that a God exists, and that He shapes and governs the course of human affairs. History showed that this governance is, for the most part, indirect, exercised through certain venerable corporations, civil as well as ecclesiastical, all of which demand implicit obedience as the immediate representatives of God. Thus all revolt, whether civil or religious, is a direct defiance of the Almighty. Cromwell becomes a moral monster, and the Revocation of the Edict of Nantes is "the greatest achievement of the second Constantine." Not that Bossuet glorified the *status quo* simply as a clerical bigot. The France of his youth had known the misery of divided counsels and civil war; the France of his manhood, brought together under an absolute sovereign, had suddenly shot up into a splendour only comparable with ancient Rome. Why not, then, strain every nerve to hold innovation at bay and prolong that splendour for all time? Bossuet's own *Discours sur l'histoire universelle* might have furnished an answer, for there the fall of many empires is detailed. But then the *Discours* was composed under a single preoccupation. To Bossuet the establishment of Christianity was the one point of real importance in the whole history of the world. Over Mohammed and the East he passed without a word; on Greece and Rome he only touched in so far as they formed part of the *Præparatio Evangelica*. And yet Bossuet made a heroic attempt to grapple with origins and causes, and in this way his book deserves its place as one of the very first of philosophic histories.

In 1681 he became bishop of Meaux; but before he could take possession of his see, he was drawn into a violent quarrel between Louis XIV. and the pope (see GALLICANISM). Here he found himself between two fires. To support the pope meant supporting the Jesuits; and he hated their casuistry and *dévotion aisée* almost as much as Pascal himself. To oppose the pope was to play into the hands of Louis, who was frankly anxious to humble the Church before the State. So Bossuet steered a middle course. Before the general assembly of the French clergy he preached a great sermon on the unity of the Church, and made it a magnificent plea for compromise. As Louis insisted on his clergy making an anti-papal declaration, Bossuet got leave to draw it up,

and made it as moderate as he could. And when the pope declared it null and void, he set to work on a gigantic *Defensio Cleri Gallicani*, only published after his death.

The Gallican storm a little abated, he turned back to a project very near his heart. Ever since the early days at Metz he had been busy with schemes for uniting the Huguenots to the Roman Church. In 1668 he converted Turenne; in 1670 he published an *Exposition de la foi catholique*, so moderate in tone that adversaries were driven to accuse him of having fraudulently watered down the Roman dogmas to suit a Protestant taste. Finally in 1688 appeared his great *Histoire des variations des églises protestantes*, perhaps the most brilliant of all his works. For the moment the Protestants were pulverized by this vigorous work; but before long they began to ask whether variation was necessarily so great an evil. Between 1691 and 1701 Bossuet corresponded with Leibnitz with a view to reunion, but negotiations broke down precisely at this point. Individual Roman doctrines Leibnitz thought his countrymen might accept, but he flatly refused to guarantee that they would necessarily believe to-morrow what they believe to-day. "We prefer," he said "a Church eternally variable and for ever moving forwards." Next, Protestant writers began to accumulate some startling proofs of Rome's own variations; and here they were backed up by Richard Simon, a priest of the Paris Oratory, and the father of biblical criticism in France. He accused St. Augustine, Bossuet's own special master, of having corrupted the primitive doctrine of Grace. Bossuet set to work on a *Défense de la tradition*, but Simon calmly went on to raise issues graver still. Under a veil of politely ironical circumlocutions, such as did not deceive the bishop of Meaux, he claimed his right to interpret the Bible like any other book. Bossuet denounced him again and again; Simon told his friends he would wait until "the old fellow" was no more. Another Oratorian proved more dangerous still. Simon had endangered miracles by applying to them lay rules of evidence, but Malebranche abrogated miracles altogether. It was blasphemous, he argued, to suppose that the Author of nature would break through a reign of law He had Himself established. Bossuet might scribble *nova mira, falsa*, in the margins of his book and urge on Fénelon to attack them; Malebranche politely met his threats by saying that to be refuted by such a pen would do him too much honour. These repeated checks soured Bossuet's temper. In his earlier controversies he had borne himself with great magnanimity, and the Huguenot ministers he refuted found him a kindly advocate at court. Even his approval of the Revocation of the Edict of Nantes stopped far short of approving dragonades within his diocese of Meaux. But now his patience was wearing out. A dissertation by one Father Caffaro, an obscure Italian monk, became his excuse for writing certain violent *Maximes sur la comédie* (1694) wherein he made an outrageous attack on the memory of Molière, dead more than 20 years. Three years later he was battling with Fénelon over the love of God, and employing methods of controversy at least as odious as Fénelon's own (1697-99). All that can be said in his defence is that Fénelon, 24 years his junior, was an old pupil, who had suddenly grown into a rival; and that on the matter of principle most authorities thought him right.

In the midst of these controversies Bossuet died. Meaux found him an excellent and devoted bishop, much more attentive to diocesan concerns than his more stirring occupations would seem to allow. Bossuet was one of the greatest controversialists of his own or any age. But his best praise is to have brought all the powers of language to paint an undying picture of a vanished world, where religion and letters, laws and science, were conceived of as fixed unalterable planets, circling for ever round one central Sun.

BIBLIOGRAPHY.—The best ed. of Bossuet's sermons is the *Oeuvres oratoires de Bossuet*, ed. by Abbé Lebarq. (1890-96). His complete works were edited by Lachat (1862-64). The correspondence, ed. by Ch. Urbain and E. Levesque, was issued in 1909 (*Les Grands écrivains de la France*). A complete list of the innumerable works relating to him will be found in the Bossuet number of the *Bibliothèque des bibliographies critiques*, compiled by Canon Charles Urbain, and pub. by the Société des Études Historiques (1900). See M. Rebillion *Bossuet* (1900), and M. Gustave Lanson *Bossuet* (1901). In English there is

a modest *Bossuet* by Mrs. Sidney Lear (1874), two remarkable studies by Sir J. Fitz-James Stephen in the second vol. of his *Horae Sabbaticae* (1892) and *Bossuet: a study* by Ella K. Sanders (1921).

BOSTANAI (c. 660), the man who restored the dignity of Prince of the Captivity, or Exilarch (*q.v.*) of Mesopotamian Jewry after the Muslim conquest. The office was filled by his descendants until its extinction.

BOSTON, THOMAS (1676–1732), Scottish divine, author of *The Fourfold State*, was born at Duns on March 17, 1676. In 1699 he became minister of the small parish of Simprin, where he found in 1704 a book which had been brought into Scotland by a commonwealth soldier. This was "E. F.'s" famous *Marrow of Modern Divinity*, a compendium of the opinions of leading Reformation divines on the doctrine of grace and the offer of the Gospel. On Boston's recommendation, Hog of Carnock reprinted *The Marrow* in 1718; Boston also published an edition with notes of his own and, with eleven others, defended the book against the act of the general assembly (1720) which condemned it. The book, whose authorship is sometimes attributed to Edward Fisher (fl. 1627–65), became the standard of a far-reaching movement in Scottish Presbyterianism. The "Marrow Men" remained Calvinists, and therefore could not preach a universal atonement; they were in fact extreme particular redemptionists. In 1707 Boston was translated to Ettrick, where he died on May 20, 1732. *The Fourfold State* (1720) treats of the four states of humanity, primitive integrity in the Garden of Eden, the fall, salvation on earth, and its consummation in heaven. But even more popular in Scottish peasant homes were Boston's *Crook in the Lot* and his *Autobiography* (1776; ed. D. Low 1908).

See A. Thomson, *Life of Thomas Boston* (1895).

BOSTON, a municipal and parliamentary borough and seaport of Lincolnshire, England, on the river Witham, four miles from its mouth in the Wash, 107m. N. of London by the L.N.E. railway. Pop. (1921) 16,102. It lies in a flat agricultural district, drained by numerous cuts, some of which are navigable. Boston (Incanhoe, St. Botolph or Botolph's Town) derives its name from St. Botolph, who in 654 founded a monastery here, which was destroyed by the Danes, 870. Although not mentioned in Domesday, Boston was probably granted as part of Skirbeck to Alan, earl of Brittany. The excellent commercial position of the town at the mouth of the Witham explains its speedy rise into importance. King John by charter granted the bailliff of Boston sole jurisdiction in the town. By the 13th century it was a great commercial centre second only to London in paying £780 for two years to the tax of one-fifteenth levied in 1205. In 1257 a market was granted to the abbot of Crowland and in 1308 to John earl of Brittany. The great annual mart was held before 1218 and attended by many German and other merchants. Edward III. made it a staple port for wool in 1369. The Hanseatic and Flemish merchants largely increased its prosperity, but on the withdrawal of the Hanseatic League about 1470 and the break-up of the gild system Boston's prosperity began to wane, and for some centuries it remained almost without trade. Nevertheless it was raised to the rank of a free borough by the charter of 1546, confirmed in 1547, 1553, 1558, 1573 and 1608. Two annual fairs and two weekly markets, granted by the 1546 charter, are still held. The Great Mart survives only in the Beast Mart held on Dec. 11. The church of St. Botolph, on an early site, is a Decorated building, one of the largest and finest parish churches in the kingdom. A chapel in it was restored by citizens of Boston (Mass.), U.S.A., in 1857, in memory of the connection of that city with the English town. The western (mainly Perpendicular) tower, 200ft. high, commonly known as Boston Stump, forms a landmark for 40 miles. There are a 15th century guildhall; Shodfriars Hall, a half-timbered house; the free grammar-school, founded in 1554, with a fine gateway of wrought iron of the 17th century brought from St. Botolph's church; and the Hussey Tower, part of a mansion of the 16th century. In the 18th century the river had silted up so far as to exclude vessels exceeding about 50 tons. In 1882–84 a dock some seven acres in extent was constructed, with an entrance lock giving access to the quay sides for vessels of 3,000 tons. The bed of the river was deepened to 27ft. for three miles below the town, and a new cut of three

miles was made from the mouth into deep water. An iron swing-bridge connects the dock with the L.N.E. railway. Imports include timber, grain, cotton and linseed, pit-props, granite, sugar and cement; and exports are coal, machinery and manufactured goods. The deep sea and coastal fisheries are important. Engineering, oil-cake, tobacco, and the sale of agricultural produce are the principal industries. The parliamentary county of Holland with Boston returns one member. The municipal borough is under a mayor, six aldermen, and 18 councillors. Area 2,727 acres.

BOSTON, the capital city of the State of Massachusetts, U.S.A. comprising the greater part of Suffolk county, 42° 21' 27.6" N., 71° 3' 30" W. Pop. (1920) 748,060 (238,919 being foreign-born whites); 1925 (municipal police census) 779,620. The city is the terminus of the Boston and Albany (New York Central), the New York, New Haven and Hartford, and Boston and Maine railways. These roads have in the past 50 years absorbed other minor systems of a local nature, leaving as the only independent road the short narrow gauge, Boston, Revere Beach and Lynn.

Physical Features.—Boston and its harbour stands at the head of Massachusetts bay. It occupies much of the Boston basin, a territory lying within a ring of hills. It stands on a surface of granite, conglomerate, slate and lavas between geological "faults" at the Blue hills on the south and Arlington heights on the north. It was, in its colonial days, rocky and irregular, a peninsula lying between the south bay, the Charles river and the Back bay flats. The town was almost an island, being connected with the Massachusetts mainland by the very narrow Roxbury neck. As originally built it covered and surrounded three hills, Beacon, Copp's and Fort. No city has undergone greater physical changes than Boston since the Revolutionary War. To-day there are only a few blocks in two sections on the water front which were on the original boundary. A town of 780ac. is now a city of 28,019ac. of land area, so increased by annexation of surrounding territory and by 2,944ac. of made land. The total present area including water is 30,598ac. or 47.81 sq. m. (land area alone 43.78). Of the hills which dominated Boston in colonial days, Copp's hill alone stands unaltered. Fort hill, near the water front, has been entirely levelled and Beacon hill, once a rigid peak sustaining the Beacon from which it was named, has now a rounded top approached by a gradual and gentle rise almost from the water front, which with the gilded dome of the State capitol dominates the landscape. Although the city is almost surrounded by made land and the narrow neck which connected it with the mainland has long since been quite obliterated, the greatest project of reclamation was that commenced in 1856 in filling in the so-called Back bay, a very large tract in the rear of the city. Boston Common then had its western boundary on the river. The bay and the flats were filled in so that the Common simply touches on that side the Public Garden, a large conventionally laid out park which in turn is touched by Commonwealth avenue, a long residential street traversing the made land and reaching far out of the city. Here was once the most aristocratic residential section of the city.

Additions.—The municipalities and sections added to Boston by annexation are as follows: East Boston, an island in the harbour settled by Samuel Maverick almost coincidentally with the mainland and having no regular municipal entity, annexed in 1637. In 1804 South Boston, a peninsula coming close to the city was annexed. It contains Dorchester heights, the fortification of which, by the Continental army, made British occupation of the city untenable in 1776. In 1868 Roxbury, which until the filling in of the Back bay had been the only town through which Boston could be approached by land, was annexed. It was a city at the time and like Boston and the surrounding colonial towns, has an individual history of its own. Six years later, in 1874, four communities were added: the city of Charlestown, and the towns of Dorchester, Brighton and West Roxbury. No further annexations were made until 1912 when Hyde Park was added from Norfolk county. Boston proper, once containing the greatest number of residents, has lost in population in favour of the outlying districts until Dorchester (1928) now has the greatest population of any district, 171,733 to 168,295 in the original town.

Population.—The population of Boston has increased as follows: (1790) 18,320; (1800) 24,937; (1810) 32,787; (1820) 42,228; (1830) 61,392; (1840) 93,383; (1850) 136,881; (1860) 177,840; (1870) 250,526; (1880) 362,839; (1890) 448,447; (1900) 560,892; (1910) 670,585; (1920) 748,060.

Although the foreign-born citizens do not outnumber those born in the United States, the old fashioned citizen of colonial antecedents, the type generally accepted by the public as Bostonian, is in very great minority.

Boston has the same urban conditions as large American cities elsewhere—the spread of population beyond its limits. The bulk of the inhabitants of Brookline, Cambridge, Newton, Milton, Somerville, Malden and other cities and towns within the Boston basin, are to all intents and purposes part of the citizenship.

Streets.—The streets of Boston are in some instances nearly inadequate to the use of the public. Washington street, the main thoroughfare of the city, is one of the narrowest business streets in America. The reputation given Boston for its crooked streets comes principally from the laying out of the old colonial paths and lanes as they were used at the time of the first settlement. These streets are located mainly in the north and west ends and in some of the annexed suburbs. For the most part the modern streets are laid out at right angles and are as straight as it is possible for streets to be where the nature of the land does not give a city a long and narrow formation like that of Manhattan island.

Boston Harbour.—The harbour is practically land-locked and is only 6½ m. from open sea. The main ship channel is 35 ft. deep at low water. Its wharfage extends along what can roughly be called the three sides of an open rectangle, comprising the water front at South Boston, Boston proper and East Boston, with a broad passage north-east of Boston leading to the Charlestown water front along the Charles and Mystic rivers. This frontage is eight miles in length and comprises 40 m. of berthing space. The great Commonwealth pier at South Boston, constructed by the State just before the World War, is 1,200 ft. long and 400 ft. wide. This pier gives simultaneous berthing space to five 600 ft. ocean steamers. Its three steel and concrete warehouses contain 900,000 sq. ft. of floor space. The army base, also on the South Boston front, has over a mile of berthing space. This base, the second largest in the country, built for war purposes, has now to a very great extent been turned over to commercial use. There are other ample dock and pier facilities provided by the railroad terminals. The U. S. dry-dock in South Boston is the only one in the western hemisphere capable of accommodating the world's great liners, the Leviathan and the Majestic.

Boston is served by freight and passenger lines to the chief ports of Europe. Freight lines go to and from the Far East, South America and Australia. It has a large coastwise trade. In foreign trade it is the fifth city in the United States. In imports alone it is the second, also in volume of overseas passengers.

A large tract of land in East Boston was converted in 1922 into a large airport; this qualifies Boston to become an important air terminal with the development of commercial air navigation.

Federal Buildings.—The post office is in the Federal building on Post Office square, convenient to the office building centre of Boston. A new building, to cost half a million dollars, is now being erected on this site. It will be 12 storeys in height and will house not only the post office, but the sub-treasury, the Federal courts and other U. S. Government activities. The highest building in Boston is the custom house tower, erected by the United States on territory nationally owned and beyond municipal restriction. The old custom house was first occupied in 1856. To make needed enlargements the central part of the old building was extended into a tower of a fraction less than 500 feet. This was finished and occupied in 1915. There are no other buildings in the city so high, as their erection in the business district is restricted to 155 feet.

Ancient Landmarks.—Ancient landmarks still cherished in Boston include public buildings, residences, old graveyards and the Boston Common. The Common, purchased by the town from Blaxton, the original settler in 1634, was originally set aside for training and common pasturage. Since a burial ground was early

set off within it, it has never been encroached upon for any utilitarian purpose except when, in 1895, part of the Boston subway was built under its eastward edge. It contains various monuments, the foundation of Saint-Gaudens's Shaw memorial, a small artificial pond known, quite without reason, as the Frog pond and the "Parade ground," often used for military events.

The old Boston cemeteries are the King's chapel burying ground containing the bodies of John Winthrop and John Cotton; the old

BY COURTESY OF THE NEW YORK HISTORICAL SOCIETY

A SOUTH-WEST VIEW OF THE OLD STATE HOUSE AT BOSTON IN 1793
The old State House, built in 1748 and restored in 1880 was the seat of the royal Government of Massachusetts. The question of colonial rights was debated within its walls and the so-called Boston "Massacre" of 1770 took place near by

Granary, in which are interred John Hancock, Samuel Adams, James Otis, the parents of Franklin and many other Boston notables; and Copp's hill, wherein lie the Matthers. The burial ground on the south side of the Common is not so old as these colonial burial places, having been put to that purpose after the Revolution.

Christ church (1723), on Copp's hill, is the oldest Episcopal church in the city, from whose tower, it is said, lanterns were hung on April 18, 1775 to warn Paul Revere of the route of the British to Concord. The Old South meeting-house (1730-82) while still a church, was used for town meetings, orations and other patriotic purposes. The British turned it into a riding school during the siege of Boston. The Old State house (1748) was the seat of the provincial government. Here Otis delivered his oration against the writs of assistance and the Declaration of Independence was read to the people from the balcony. The Boston Massacre occurred almost beneath its windows. Faneuil hall and market (1762-63) was the gift to the city of Peter Faneuil. The hall, containing many historic paintings, has been for many years the public forum of Boston. It is called "The Cradle of Liberty." The greater market house adjoining it, known as Quincy market, was the first municipal improvement of importance after Boston became a city. King's chapel (1749-54) was the first Episcopal church built in Boston (the first edifice being erected in 1688). It was also the first Boston church to become Unitarian (see *History*). It was called the Stone chapel in the days of the Revolution, when royalty was anathema and its early name was not restored for many years.

The dominating building of Boston since it was built in 1795-98 has been the State capitol of Massachusetts, familiarly known as the State house, occupying the present summit of Beacon hill, the original portion having been designed by Charles Bulfinch. The central or original structure is of red brick, with pillared portico surmounted by a dome, which has been gilded since 1874. Additions were made in 1831, 1859, 1889 and 1914. It is now flanked by two great wings of white marble standing at right angles to the old edifice and joined to it by buildings of the same material, while a large addition in the rear bridging Mt. Vernon street, extends for two blocks. It has a total floor area of nearly half a million feet. It contains many paintings, tablets and

sculptures of a memorial nature and its Memorial hall contains glassed-in niches, in which are the Massachusetts battle flags of the Civil, Spanish American and World wars. Opposite it, on the Common, at the street boundary, is Saint-Gaudens's famous and beautiful bas-relief memorial to Robert Gould Shaw and his negro regiment which gained fame at Ft. Wagner.

Banks and Banking.—The Federal Reserve Bank of the New England district is situated in Boston. There are eleven National banks in Boston with a total capital of \$55,900,000, and deposits (June 30, 1928) of \$727,814,000. The trust companies number 17 with a capital of \$30,650,000 and deposits of \$409,523,000. There are 24 savings banks with \$620,614,511 and 54 co-operative banks with total assets of \$135,173,546. The Boston Clearing house ranks fourth among leading cities in total business.

Exports and Imports.—For the Massachusetts customs district (Boston and nine minor ports) in calendar year, 1926, the total value of exports was \$41,283,152 or \$6,210,723 less than in 1925; of imports, \$305,879,218 or \$15,687,610 less than in 1925; total foreign trade, \$347,162,370 or \$21,898,333 less than in 1925. Boston's total foreign trade for the year 1926 ranked seventh among American ports, New York, New Orleans, Galveston, Seattle, San Francisco and Detroit exceeding the former in value. As to imports alone, Boston ranked second, and as to exports, 22nd (the unusual decline in exports due largely to discrimination against Boston in through railway freight rates).

Manufactures.—The number of establishments conducted under so-called factory system having annual products valued at \$500 or over was 2,568 in 1926; the value of the year's product, \$591,191,184; average number of wage earners, 80,722; total wages paid in year, \$110,797,398; value of materials used, \$297,896,158; value added by manufacture, \$293,295,026. The leading industries ranked according to value of output were: printing and publishing, 277 establishments, with \$58,608,276 products; clothing, men's and women's, 348 with \$51,619,098; boots and shoes, 74 establishments with \$51,141,693; confectionery, 63 with \$36,655,365; foundry and machine-shop products, 110 with \$26,045,008; bread and other bakery products, 231 with \$23,769,854; electrical machinery, apparatus and supplies, 39 with \$21,822,061; druggists' supplies and patent medicines, 36 with \$13,746,758; furniture, 81 with \$10,619,990; house-furnishing goods, not elsewhere classified, 40 with \$10,192,543.

Educational Institutions.—Boston is the centre of a large district in which many notable educational institutions are situated; just beyond the city limits in Cambridge are: Harvard university, which while never in Boston, has had a profound influence on Boston life; Radcliffe college (for women); and the Massachusetts Institute of Technology, lately removed from Boston. Boston college, the great Jesuit college, is now located in Newton; Tufts college at Medford and Wellesley college at Wellesley are not far away. In Boston proper is Boston university with its numerous colleges and schools; the schools of medicine, dentistry and public health, the graduate school of business administration, the Bussey institution for graduate work and research in applied biology and the Arnold arboretum, a botanical garden, all of Harvard university. The Soldier's field, with its great stadium where the principal athletic contests take place is also situated in the city just across the river from Cambridge. Here also is Simmon's college, for women; Wentworth institute for technical mechanical training; the Emerson college of oratory, North Eastern university connected with the Young Men's Christian Association; the Suffolk law school for men and the Portia law school for women.

Public and Private Schools.—Boston's school system is the oldest in the country. The present Boston Latin school was the first public school in America, established in 1635. It is probable that elementary as well as higher branches were taught but its main purpose soon became what it is to-day, the fitting of young men for college. A similar school, the Grammar school, in the easterly part of Roxbury, now the Roxbury Latin school was founded in 1645. These two schools survive, both as free schools, the first a part of the Boston school system, the second as an endowed institution in which tuition is free to all boys living within

the wide limits of the original Roxbury survey. The Boston school system maintains a teaching force of 4,260 teachers for over 130,000 pupils in kindergarten, elementary, intermediate and high-school grades, besides a number of specialized schools including two Latin schools, schools of mechanic arts, practical arts, trade schools, a clerical school, continuation schools and a Teachers' college. The Roman Catholic church maintains an elaborate system of schools of grades paralleling those of the public system. Its high-school, which is maintained by Boston college, is in the buildings once occupied by the college itself. There are also convent schools for young ladies and there are private schools to be found in the city.

Libraries.—The Boston public library, now in Copley square, is one of the most famous libraries in the world. It was founded in 1852 and for many years occupied a convenient site opposite the southern boundary of the Common. Its present building was erected in 1888-95 at a cost of nearly \$2,500,000 and enlarged in 1918. It is a very simple and striking building in the Italian Renaissance style. The library contains a statue of Sir Henry Vane by MacMonnies and in Bates hall, the main reading room and in the corridors, are busts of notable Bostonians, eminent writers and benefactors of the institution. The most famous decorations in the library are the three series of mural paintings. That by Puvis de Chavannes, illustrates the ancient growth of literature and art. The John S. Sargent paintings with the notable frieze of the prophets and heavily decorated symbolic paintings depict the growth of religion. Edwin A. Abbey's contributions in the delivery room are illustrations of the legend of the Holy Grail. The main library building contained on Dec. 31, 1927, 1,027,364 volumes. It has a lecture hall and maintains a course of free lectures each year. Among the special collections owned by or loaned to the main library are, the New England library collected before 1758, the private library of President John Adams, the best existing collection of original letters bearing on the anti-slavery movement, the gold medal presented to Washington on the evacuation of Boston in 1776. The Boston public library maintains 32 branch libraries containing (Dec. 31, 1927) 391,125 volumes.

Another important library is that of the Boston Athenaeum, supported by endowments and the annual assessments on the share owners. It was incorporated in 1807 and occupies a large building on Beacon street near the State house. It contains about 300,000 vol. including a large part of the library of George Washington. Other important libraries are the Massachusetts State library of nearly half a million volumes; the Baker library of the Harvard graduate school of business administration of 100,000 books and 1,000,000 pamphlets; that of the Massachusetts Historical Society which includes about 125,000 vol. and the same number of pamphlets, and one of the largest collections of manuscripts in America; the New England Historical Genealogical library of about 60,000 books, 60,000 pamphlets and "innumerable manuscripts," as the librarian reports; the library of the Boston Society of Natural History of 51,000 books and 46,000 pamphlets; and that of the American Academy of Arts and Sciences of 300,000 volumes.

Art.—The Boston Athenaeum at one time maintained a large art gallery. This gallery led to the founding (1870) of another great endowed institution, the Boston museum of Fine Arts, the art works of the Athenaeum being the nucleus of its collection. Its first building was situated on Copley square; its present building, on the upper part of Huntington avenue, was opened in 1909 and is one of the chief art museums of America. It contains the well-known portraits by Stuart of George and Martha Washington, landscapes, portraits and other paintings by the eminent masters, ancient and modern; statues, busts and casts, a very noble tapestry gallery, a fine collection of ceramics and metal work. The museum's collection of oriental art is especially notable. It is free to the public.

Musical Organizations.—Symphony hall on Huntington avenue, is the home of the Boston Symphony orchestra. This orchestra, founded in 1881 by Henry L. Higginson, banker and civic philanthropist, is the chief musical organization of Boston

(4) BY COURTESY OF THE CHAMBER OF COMMERCE, BOSTON

1. View of Cambridge along the Charles river. In the distance is the Longfellow bridge. This bridge, built of granite, connects the West End of Boston with East Cambridge
2. The State House, on Beacon Hill, in Boston, built between 1795 and 1798, as seen from across the Boston Common. The original red brick structure has been flanked by two wings of white marble, the dome is gilded now, and additions have been built in the rear
3. The Old South Meeting House, Boston, an 18th century church, on the corner of Milk and Washington streets. It has the characteristic spire found on the churches throughout New England
4. The Old State House (1748), restored during the 19th century, and probably the oldest public building existing in the United States. Previous to, and during, the Revolution it was used both for patriotic meetings and for religious purposes
5. The Custom House, originally a low, pillared building of granite in the form of a Greek cross, now considerably reconstructed. A lofty tower which has been added to the original domed roof, makes it conspicuous as the highest building in Boston

VIEWS OF BOSTON HARBOUR

1. Aeroplane view of Boston harbour. In the foreground is the city of Boston, with the high Custom House tower conspicuously shown. A tip of the Charlestown navy yard is seen in the middle distance, and East Boston at the upper right
2. A view of the commercial district of Boston along the harbour water-front

and in the front rank in America. Symphony hall was erected in 1900. It is dignified and simple in its lines and its acoustics make it an ideal hall for music on a large orchestral scale. Nearby is the Jordan hall of Boston Conservatory of Music. A Symphony orchestra plays weekly on Sunday afternoons at one of the theatres. There are three choral societies in Boston, the Handel and Haydn, the Cecilia and the Apollo Clubs, and various other vocal and instrumental organizations.

The Boston Opera house also on Huntington avenue, is a large and modern building, built to house the Boston Opera company. When local opera was abandoned, it was taken over by a firm of commercial theatre managers and is used mainly for large theatrical productions, but notable grand opera companies visit it yearly.

Theatres.—Boston supports seven first class commercial theatres. The Hollis Street, Wilbur, Shubert, Plymouth, Colonial, Tremont, Majestic, and three theatres with resident companies, the St. James, Copley and the Repertory. The last mentioned was built by subscription at a cost of more than half a million dollars. It is a remarkably equipped theatre, having the most improved lighting and mechanical apparatus. It is conducted by a board of trustees and not for profit and is tax exempt, as an educational and non-commercial institution. The oldest theatre now existing is the Howard Athenaeum, once a fine legitimate house, now a burlesque theatre. The rise of the motion picture has led to the erection of a great number of motion picture and motion-picture and vaudeville theatres of which the most pretentious and by far the handsomest is the Metropolitan, which was built in 1926.

Water System.—The water supply of Boston is under the control of the Metropolitan district commission, the surrounding cities and towns being included in the Metropolitan district. Its present chief source is the great Wachusett basin, with its dam at Clinton, Mass., which feeds through aqueducts, the various local supply reservoirs. At the present time another great dam is being constructed nearly 60m. west of Boston, forming a basin which will utilize the flood flow of the Swift river. This basin will be connected by an aqueduct with the Wachusett reservoir.

Bridges.—The Charles river is spanned by about a dozen bridges between Boston and its northern shore. Among them may be mentioned the Charlestown and Warren bridges, connecting the city with the Charlestown district. The granite Longfellow bridge which connects the West End of Boston with East Cambridge, is the most striking and ornate large bridge over the river, built from a Russian original, with eight large towers. The Viaduct bridge is used at the Charles river dam by the elevated railway. Still farther west, the Harvard bridge connects the upper Back bay at Massachusetts avenue with the most direct road to Harvard square and the college buildings. The Larz Anderson bridge, erected as a memorial to Larz Anderson, American diplomat, connects Cambridge and Brighton district and the road between Harvard university and the Soldiers' field. The John W. Weeks Memorial bridge crosses the river opposite the Harvard graduate school of business administration.

Park System.—Boston's park system forms a semi-circle around the city. The Marine park at South Boston is connected by a parkway with the Franklin, the park of greatest acreage, which contains beside much pleasant woodland, a zoo, an aviary, tennis courts, golf links, a children's playground and some beautiful gardens in which the natural beauties are stressed beyond the artificial laying out. From Franklin park a parkway leads to the Jamaica pond, passing the Arnold arboretum, the Harvard college botanical garden which, being open to the public, is practically part of the system. On the shores of Jamaica pond is the Children's museum. From the Jamaica pond reservation the parkway extends along the Muddy river which separates Boston and Brookline, to the Back bay fens and thence to the Charles river embankment. Boston Common is connected with this system by the adjoining Public garden, laid out more conventionally than the natural gardens of Franklin park, with its tiny artificial lake on which are row-boats and foot-propelled "swan boats." From the Public garden a parkway runs through Commonwealth ave-

nue to the Back bay fens. The Metropolitan district commission has reserved much wild land in the district, some of which is in West Roxbury, within the city limits.

Churches.—There are two cathedrals in Boston, the cathedral of the Holy Cross (Roman Catholic) and St. Paul's cathedral (Episcopal). Neither is among the notable cathedrals of the country although St. Paul's (in the retail district opposite the Common) is a fine example of early 19th century architecture. It was built as a church and has only become a cathedral within the last 15 years. The most notable church edifice is Trinity church (Episcopal) on Copley square, built in the Romanesque style of southern France. It has a number of large memorial windows by LaFarge, William Morris, Burne Jones and others. Christ church, in the North End, is a fine example of the colonial meeting-house, as is the Old South not now used for church purposes. The First church in Roxbury, built in the first decade of the 19th century, is a beautiful example of 17th century Puritan meeting-house, that style of architecture surviving at that time. The largest and most magnificent church building is the so-called extension of the First church of Christ (Scientist), built adjoining the original Mother church, still standing and used as an emergency auditorium.

Transportation.—Local transportation is carried on by the Boston Elevated Railway company by surface tracks, an elevated system and a municipal system of subways, built by the city and leased to the road. The mileage of subway now in operation in Boston is 11.8m., including a tunnel under the harbour to East Boston. This subway system was begun in 1895.

Public Welfare.—The principal channel of charity is the Public Welfare Society, formerly the Associated Charities, which seeks to unite the charitable efforts of the various societies. Among the large hospitals of Boston are: Massachusetts General, the Peter Bent Brigham, the City, the Boston Homeopathic, the Robert B. Brigham, the Massachusetts Charitable Eye and Ear Infirmary and the Forsyth Dental Infirmary.

HISTORY

Colonial and Provincial Period.—It is probable that the early Norsemen explored Boston harbour. Capt. John Smith made explorations and mapped the locality in 1614. A party of prospectors from the Plymouth plantations visited it in 1621. It was known to the white man long before a real settlement was made and there were several individual settlers living within the borders of the present city, William Blaxton (Blackstone) on the Trimountaine peninsula, Thomas Walford in Charlestown and Samuel Maverick on Noddle's island. In 1628 the Massachusetts Bay settlement, the first great Puritan settlement, was inaugurated at Salem, under John Endicott as governor. He was joined in a few months by Winthrop, who in 1630 with his followers settled temporarily at Charlestown. Finding some difficulty in water supply, he crossed the river at the invitation of Blaxton and made his settlement in Shawmut, or Trimountaine, as it was variously called. The accepted day from which the city dates its beginning is Sept. 17, 1630 when it was ordered by the Court of Assistants that the town should be called Boston after the Boston in Lincolnshire, the leading town of the region from which the principal Puritan leaders had come.

For a short time, Boston, Newtowne (Cambridge) and Charlestown flourished in about equal degree but the excellent commercial situation of Boston soon put it to the fore and in 1632 it was made the capital of the Colony. During the first ten years 20,000 settlers came to Massachusetts Bay, most of whom landed in Boston, a great proportion settling there. Cromwell and Hampden were among those who contemplated settling in New England. Then the political tide turned in England and with the rise of the Puritan Party, the stream of emigration largely subsided.

The Congregational churches, the first in date to flourish in Massachusetts Bay, were the outcome of this Puritan influx. It is to be borne in mind that the Puritans, unlike the Pilgrims of Plymouth, were not Separatists. They were originally reformers within the English Church. But when they came to the new country they found nothing to reform, either in church or government, thus they were forced to create. This brought into being

a church almost the duplicate of that of the Separatists in the adjoining Colony, a self-sustaining, self-governing religious unit. The first church of the Boston settlement had been founded before they left Charlestown under a covenant adopted by Winthrop, Thomas Dudley, Isaac Johnson and the pastor, John Wilson. It bound the members "to walk in our ways according to the rule of the gospel, and in all sincere conformity to His (Christ's) holy ordinances, and in mutual love and respect to each other, so near as God shall give us grace." Under the intent to reform, qualified by the conditions of pioneering, there was thus brought about, naturally and peaceably, a great religious revolution. In Boston as well as in all the rest of Massachusetts Bay the religious test came to be applied to citizenship. In the General court held in Boston, it was ordered "that for time to come no man shall be admitted to the freedom of this body politic but such as are members of some of the churches within the limits of the same." This was at first no very oppressive test, for the early settlers were all of one mind religiously, but it did establish a State church. The church government was liberal. Within this church there was pure democracy. The ministers had great influence but they were not entrenched as to powers. A sermon regularly preceded election, but it was not to be one in which the citizenship were to be told for whom to vote, and when, in an election sermon Rev. John Cotton preached upon the inadvisability of superseding experienced officials, Gov. Winthrop was immediately defeated.

The town was governed by the town-meeting system. The citizens of the town met together at least once a year and usually oftener. There they fixed taxes, made appropriations, voted on municipal improvements and elected the town officers. It was absolutely democratic, the right of vote and speech on any and all matters belonged to every citizen within the assemblage. As the commercial advantages of Boston became known, the importance of the town increased. At the same time the difficulties of carrying on the Puritan theocratic government became more and more apparent. There was an influx into Boston of immigration which had nothing in common with the spirit of the pioneers. Self-betterment, commercial advantages, became its impetus in place of the zeal of the early settlers and their desire to worship freely without touch of rivalry or opposition. Not only did the Puritans oppose sects but they abused individuals. The banishing of Roger Williams (*q.v.*) and later of Anne Hutchinson (*q.v.*) are examples of personal intolerance.

The witchcraft delusion did not pass Boston by. It was a superstition which put its stamp on many communities in both the old and new worlds. It was to come to its most ghastly American fruition in Salem. In Boston there were two or three cases which culminated in the execution of the persons accused. The notable Boston divine, Cotton Mather, espoused the delusion and argued for it in various polemical books and even went to Salem and attended an execution, replying to the victim's speech, which had aroused the spectators almost to the point of rescue, and assuring them the sentence was just.

In spite of the rigour of Puritan rule it became increasingly difficult to maintain the theocratic principle in Boston. The colony as a whole was not discontented, but it was in Boston that the commercial population made itself felt. They were not impelled by religious reformation but by clear cold figures of pounds and shillings. They included able and intelligent men who did not join a Congregational church and therefore could not achieve the franchise. Nor could they worship in a church of their own faith. A party among the Puritans which espoused the trader's cause, came to be known as the Moderates and were strongly opposed by the radical Theocrats of the unyielding type. The struggle was finally carried to England, where the influence of the trading class brought about the abrogation of the old colonial charter in 1686. This led to the first defiance of authority in the New England Colonies. The abrogation of the charter was succeeded by a brief interval under the presidency of Joseph Dudley, son of one of the original settlers, Gov. Thomas Dudley. Then the new royal governor arrived in the person of Sir Edmund Andros. He was an honest and well-intentioned man but he governed autocrati-

cally. His administration drove the divided Puritans, radical and moderate, together again. The residents of Boston learning that William of Orange had landed in England, made common cause with that revolution and on April 18, 1689 they rose, seized and deposed Andros, kept him in comparatively easy confinement for nearly a year and sent him back to England.

A new charter was granted by William. It assured the Colonies in their liberties and freedom of worship, but it protected the English churchmen in their right of worship and extended the franchise so that it no longer rested on church membership. The election of governor was never restored to the people while under English rule. Under the Provincial Charter, which approximately began the 18th century, Boston and Massachusetts history are closely interwoven (*see MASSACHUSETTS*). In the middle of the 18th century, the population was about 15,000, the houses were principally of wood, some of brick and stone. The town maintained a town watch and an organization of fire wards but it suffered from destructive fires in 1676, 1690, 1711, 1747 and 1760. The town had 17 churches in 1750, the larger number being Congregational, but there were other denominations represented

as well, Episcopal, Anabaptist, French Huguenot and Quaker. Although the religious test had been abolished for suffrage, the town continued to make money grants to the Congregational churches and foster them officially.

Revolutionary Period.—

The period of the colonial wars quickly merges itself into the days of uncomfortable relations with the mother country, becoming more and more strained until open revolt merged itself into the American Revolution. (*See UNITED STATES: History.*) The questions were largely financial, although the Quebec act which recognized the entity of the Roman Catholic church in that province, gave the Protestant citizenship in the Colonies some uneasiness. The first important outward manifestation of discontent came in Boston when Paxton, the collector of customs, through a deputy at Salem petitioned the court for "writs of assistance" established under Charles II., which would enable the customs officers to enter homes and warehouses in the exercise of their duty. On a hearing of the petition, James Otis made a dramatic plea built largely around the legal axiom that "an Englishman's house is his castle." The writs having been established in legislation by the British Parliament, the court sustained the officers of the Crown. But Otis had profoundly stirred the people and as John Adams afterwards said, "then and there the child independence was born." This was in 1761. The Sugar act of 1764 was followed by the Stamp act of 1765, which was strenuously resisted. On Aug. 26, 1765, the most destructive and disgraceful riot of the period attacked the house of Hutchinson, then lieutenant governor, and later chief justice, gutted it and destroyed his magnificent library containing many irreplaceable sources of Massachusetts history.

Other and soberer methods were legitimately and effectively used. Business men refused to use the stamps. Trade came to a practical standstill as the tax stamps had to be affixed to invoices and other written evidences of transactions. Even the courts closed for lack of triable causes, for the writs and all other documents had to be stamped. The Stamp Act was a failure and nothing remained for Parliament to do but to repeal it, which it did in 1766. Of all the American towns Boston was the most enthusiastic in this opposition and at the back of Boston was the Caucus Club of active citizens bent on influencing opinion and action. The most influential member of this club was Samuel Adams, whose activities have given him the title of Father of the

FANUEIL HALL, BOSTON, BUILT IN 1762. CALLED THE CRADLE OF AMERICAN LIBERTY

American Revolution. With the repeal of the Stamp Act came the Declaratory Act in which Parliament declared its right to tax the Colonies. Under this declaration of policy the Townshend Acts were passed, placing duties on lead, glass, papers, paint and tea. This led to a prompt boycott by the Boston merchants. The merchant class were not revolutionaries at heart but they made common cause with Samuel Adams and the proletariat for trade purposes. Probably they thought they were making use of Samuel Adams for their own purposes while he was quite as certain that he was using them for his. The time was to come when he would lead them farther than they probably intended and they found themselves in a position from which they could not draw back. The matter was now so acute that it had mounted to chronic defiance and two regiments of regulars were despatched to the town and camped on the Common, being denied housing among the citizens. Friction was inevitable. At last, on March 5, 1770, a group began to harass a sentinel on King (now State) street near the town house. Finally the squad called to his support, fired, killing several men. The Boston Massacre, as it came to be called, showed that in view of the feeling of the moment, troops could not be quartered in the town without danger both to the citizens and the troops themselves. A committee with Samuel Adams as its head, demanded the withdrawal of the regiments to the castle. Hutchinson, now acting governor, demurred and sought to compromise on one regiment but to Adams's reply "both regiments or none," he yielded. It became evident to the British Parliament that these Acts could not be enforced and they were repealed except the tax on tea which was kept for the assertion of the principle involved. Samuel Adams and his associates led the opposition to the principle. Finally, three ships bearing cargoes of tea arrived in the harbour and were moored at Griffin's wharf. For several days there were conferences and meetings in which Adams played the leading part, looking toward the return of the ships without landing the tea. On Dec. 16, 1773, at the close of a town meeting, which adjourned with Adams's statement: "This meeting can do nothing more to save the country," a group of citizens, largely responsible men, disguised more or less thoroughly as Indians, proceeded to the wharf, boarded the vessels, opened their chests and threw the tea into Boston harbour. So entirely was the mob an orderly one and the radical act so conservatively carried out that it evinced not a spontaneous act, but a carefully premeditated one. It was an act which could only be passed unnoticed if the Government intended to waive all but ostensible sovereignty. This it was not prepared to do and the Boston Port bill was the result. This closed the port of Boston and, as this meant the ruin of the city, it precipitated formal revolt. More troops were sent to preserve order. Gage, in command, was a rather mild administrator and did his best in trying circumstances. The Colonies formed a skeleton military organization called Minute Men, prepared to muster on the shortest possible notice, and gathered ammunition and supplies. Gage promptly sent a detachment to that part of Charlestown now Somerville and destroyed some of these stores. In April 1775 he decided to send a secret expedition to capture or destroy military stores at Concord. His plans were suspected by the insurgents and his movements noted. On the evening of April 18 an expedition was sent out. By an agreed plan of signals Paul Revere, waiting at the Charlestown shore, learned the route by which it had started and on a horse borrowed for that purpose, rode through the country arousing the inhabitants. He was joined by William Dawes, who had left Boston by another route and by the time the regulars reached Lexington green, their pathway was obstructed by a small company of Minute Men. This was the first armed resistance. After an exchange of volleys, in which eight of the militia were killed, they gave way. The regulars proceeded to Concord but found that the greater part of the stores had been carried to safety. There occurred the fight at the Bridge (in which both sides lost men) and the withdrawal of the British. As the Minute Men came in from the country they harassed the British column until the withdrawal became a retreat and the retreat a rout. Thus the American Revolution began with British troops out of Boston, contesting with militia aroused by Boston

men. The war was accepted by the colonies. Siege was immediately laid to the town by a half ring of forts erected on the land-side. These New Englanders were reinforced by troops from the other Colonies. The Continental Congress, though it had not yet declared independence, made George Washington commander-in-chief of the American armies. Before he reached Cambridge, Gen. Ward, then in command, sent a detachment of troops under Prescott and Putnam, to fortify Bunker hill in Charlestown, which commanded the town on the north. Howe, then in command of the British forces, decided to carry the hill by storm. The colonials were courageous men and excellent marksmen. They repelled the first attack with great slaughter; a second was made, the steady Britishers reforming and mounting the hill again only to meet another sanguinary repulse. On the third attack the ammunition of the colonials was exhausted and after a bayonet struggle, they made an orderly and soldierly retreat. Technically a victory for the British, it was purchased at such a cost that it gave the colonies great encouragement and its anniversary is celebrated in Boston to this day. The siege continued unabated until, after the Colonials occupied Dorchester Heights closely overlooking the town, Howe evacuated the city on March 17, 1776. Boston was never again in the theatre of the war during the Revolution. Its entire population was not in accord with the revolt. Howe carried with him great numbers of loyalists to Halifax and others remained to bear reprisals.

Four years before the treaty of peace was signed, a convention was held in Boston and formed a State Government for Massachusetts. The town, under the Articles of Confederation and the Constitution maintained the old town-meeting system.

Post-Revolutionary Period.—From the time of the ratification of the treaty of peace until 1822 when it became a city, the history of Boston is blended with the broader history of national and State politics. It early became Federalist in its tendencies and was the chief Federalist centre of the country so long as that party existed, wavering but once and then briefly at the time of the negotiation of Jay's treaty. During the Shays's rebellion it strongly supported the firm policy of Gov. Bowdoin and returned a substantial majority for his re-election, although he was defeated in the State. It strongly supported the ratification of the Federal Constitution. The town was vigorously anti-Jeffersonian especially upon his embargo policy. Although the town was not averse to a declaration of war at the moment, this peaceful commercial warfare was almost as destructive to its life, as the Port bill had been a third of a century before. It was at this time that John Quincy Adams warned the administration that treason and secession were afoot in Boston. Although things did not go so far as that, there certainly was much discussion as to the State's relations to the Union and the possibilities contained in a separation. Bostonians were sent as delegates to the Hartford convention and its chairman, George Cabot, was a Bostonian. The action of this body, set New England and its chief city apart from the rest of the country, in the eyes of many of the inhabitants of other States as an independent thinking, superior feeling, critical section, a feeling to be soon intensified by the anti-slavery movement which had its beginning 20 years later.

A movement which had a deep effect on the life of Bostonians was the shift of religious belief from the Trinitarian to Unitarian Congregationalism, marking the disintegration in many of the old historic churches of the Puritan theology. Jonathan Mayhew, one of the patriot ministers of the middle of the 18th century, began the movement. It progressed slowly at first but with increasing momentum. By 1780 many pulpits were filled by liberal ministers. The rector of King's chapel, at the time of its separation after the Revolution from the Church of England, made his own revision of the prayer book, leaving out the Trinity. He was refused ordination by two American bishops and in 1782 he was ordained by the congregation. This was the first Unitarian Church organization in America (*see* UNITARIANISM). In 1825 the American Unitarian Association was organized and its headquarters has always been maintained in the city.

The City of Boston.—In 1822 Boston outgrew the town meeting. It then adopted a city charter, with a mayor, a board of

aldermen and a common council. The legislative branch for many years had certain administrative functions through its committees and elected certain officers such as assistant assessors. The first mayor was John Phillips, elected after one trial which had resulted in a stalemate between Josiah Quincy and Harrison Gray Otis. Both were chosen subsequently. Josiah Quincy, the second mayor, even to-day, goes down as the executive of the greatest activity, broadest municipal outlook, and practical sense of any mayor the city has had. The original charter has been changed many times by the State legislature. The mayor's term was extended, first to two years, then to four. The administrative functions of the committees of the city council have been abolished, and the police department put under State control, obviating or at least minimizing such scandals coming from the control of the police by predatory political machines, as have risen in other cities. The board of aldermen and the common council have been abolished, and a comparatively small single chamber has been substituted with powers greatly curtailed. A Finance commission has been created, appointed by the governor of the State, with powers of summoning witnesses and administering oaths; it has sometimes been effectual in uncovering official corruption and even more by the restraint its very existence puts on administrative abuses. Numerous efforts to abolish it on the part of corrupt politicians at elections have so far been fruitless. Party designations at elections have been abolished with the intent to concentrate municipal thought on local rather than national issues. Candidates are nominated on petition, thus abolishing party responsibility but leaving nothing else in its place.

After the organizing of the city under the original charter, the next important event was the Boston Anti-Slavery movement. The abolition movement began in 1831 when William Lloyd Garrison, a native of Newburyport, removed to Boston and began the publication of *The Liberator*. A year later the New England Anti-Slavery Society was organized by a small number of the uninfluential citizens. Their opponents consisted of the wealthy and aristocratic class. They had southern investments in business which was adjusted to slavery both north and south. In 1835 a public pro-slavery meeting was called and was presided over by the mayor of the city with the most aristocratic and exclusive Bostonians among the vice presidents and speakers. The sentiments of this meeting led to the mobbing of Garrison in his office on Oct. 21, 1835. Garrison was soon joined in his activities by Wendell Phillips, son of the first mayor, a young lawyer, stung to espouse the cause very largely by the defence of the conservatives in the murder of Lovejoy in Ohio. They attracted others. Even "the best people" found their enthusiastic kinsmen joining the movement. In 1850 the south played into the hands of the Abolitionists by the passage of the Fugitive Slave law. Opposition to the act reached its peak following the arrest of Anthony Burns on rendition process on May 24, 1854. The anti-slavery leaders determined upon mob violence. Clergymen, philanthropists, scholars, felt it their duty to engage in this attempt. But the sortie, which was planned to follow a protest meeting, failed through the tentative plans leaking out. Burns was carried to the ship by the entire military strength of the county, with loaded muskets and cannon loaded with grape at street corners, between rows of buildings draped in black as though for the death of a national ruler. Lincoln himself once inferentially stated that Boston more than any other city was responsible for the agitation which led to secession and the Civil War.

In the Civil War, Boston sent organized troops at Lincoln's first call to the relief of Washington. It organized the 54th Regiment consisting of coloured soldiers, the first black gesture of earned freedom. Like all large cities it had its disloyal elements whose disturbances culminated in a riot at the Cooper street armory at which the commander of the artillery swept the street with grape shot.

Before and after the Civil War Boston was the literary centre of the United States. America's chief essayists, historians, poets, philosophers and novelists lived in and around the city. Nearly contemporary with one another were Emerson, Hawthorne, Bancroft, Prescott, Motley, Parkman, Thoreau, Whittier, Longfellow,

Holmes, Lowell, R. H. Dana, Jr., and later Thomas Bailey Aldrich.

The greatest physical calamity within the history of the city was the great fire of Nov. 9-10, 1872. It broke out on a Saturday night in the wholesale district and spread rapidly over 67 ac. on which stood 767 buildings filled with merchandise. Property, real and personal, to the estimated amount of over \$75,000,000 was destroyed in less than 24 hours. Beyond the loss of 14 lives, the disaster was almost entirely commercial, as there was little residential property within the burned district. The city made a quick recovery and a new district was soon built of better material, with streets straightened and widened.

In Sept. 1919, the Boston Social club, formed of the great majority of the police patrolmen of Boston, began to agitate for certain reforms in their conditions, especially concerning salary. The commissioner (a State officer) was Edwin U. Curtis, ex-mayor of the city. He endeavoured to obtain a rise in pay for the force, but was balked by the mayor of the city. The members of the Social club then sought to join the American Federation of Labor and to organize a policemen's union. Curtis, treating his force as a military body in which a union can have no place, forbade the police from joining such a union. It was formed in face of his orders. Curtis ordered the leaders before a court of inquiry by whom they were found guilty and dismissed from the force. This was followed by the overwhelming majority of the patrolmen of Boston going on strike. A night of pillage ensued, followed by several days of spasmodic out-breaks in different parts of the city. A small force of volunteers joined the few loyal patrolmen, but no effective action could be taken because of friction between the mayor and the commissioner. Governor (later President) Coolidge then ordered out the entire State Guard and as commander-in-chief took control of the situation and immediately recalled Curtis to active command. Order was restored and the State guard continued to do police duty until a practically new police department was recruited and organized. The strikers were deemed deserters and have never been re-instated, though efforts have been made in their behalf.

Until the middle of the 19th century Boston, though it had changed in some measure in the prevailing religious opinions and had increased in population, had altered very little indeed in its racial balance. There was the same prevailing New England stock, coming with more or less directness from the 17th century settlers and about the same proportion of other nationalities which it has always possessed. But with the famine in Ireland, the Irish immigration began. It came in an ever increasing flood. Other nationalities, Hebrew (very largely from Russia), Italian, Canadian, Polish, Scandinavian, Armenian, Lithuanian and Balkan peoples have followed in large numbers. By the beginning of the 20th century it had become a non-Anglo-Saxon city, with strong influential threads of old time English, Scotch and Scotch-Irish running through the fabric. In influence it is predominantly Irish, as any list of its city government within 20 years will clearly show. It has been Puritan, then Unitarian; it is now Roman Catholic. It has had its spasms of ill feeling, its religiously proscriptive movements. Now the change is accepted and recognized. The Protestant churches have faced a difficult problem. Largely the old congregations have moved outside the city limits and there has been much church consolidation. The city, for years conservative in ordinary matters, has become largely, if not philosophically, radical. All the inevitable shifting of population which comes with great metropolitan growth, has come about in Boston. Yet it is only fair to say that its historical heritage has been potent and is cherished by its present population. It is no longer the centre of the New England idea but a typical American city, lacking in racial homogeneity, and having characteristics shared by its sister municipalities of metropolitan proportions.

Gardner Museum.—The Isabella Stewart Gardner museum is in the Back bay fens. It was originally built for a residence by Mrs. Gardner, in imitation of an Italian palace. Here she brought many art treasures. By her will the building and its contents were left to the public and is open to it at stated intervals. It is less formal than most art museums, and has the appearance of being inhabited.

Charles River Basin.—The Charles river dam was completed in 1910. This piece of engineering has removed the flats previously exposed at low water. The dam and machinery of control maintains the water of the basin at an even height. Covered canals on either side of the river take the excess sewage and deposit it beyond the dam in the tide water. The basin and the embankments are used for perch purposes and on the Boston side are memorials to Oliver Wendell Holmes and Edwin U. Curtis.

F. Cooper's *Lionel Lincoln*; O. W. Holmes' *Breakfast Table Series*; N. Hawthorne's *Scarlet Letter*; the early novels of Howells, Robert Gunst's *The Chippendales*; E. F. Paul's *Indelible*; T. R. Sullivan's *The Heart of Us*. (S. L. Co.)

BOSTON, a game of cards invented during the last quarter of the 18th century. It is said to have originated in Boston, Massachusetts, during the siege by the British. It seems to have been invented by the officers of the French fleet which lay for a time off the town of Marblehead, and the name of the two small islands in Marblehead harbour which have, from the period of the American Revolution, been called Great and Little Misery, correspond with expressions used in the game. William Tudor, in his *Letters on the Eastern States*, published in 1821, states somewhat differently that "A game of cards was invented in Versailles and called in honour of the town, Boston; the points of the game are allusive, 'great independence,' 'little independence,' 'great misery,' 'little misery,' etc. It is composed partly of whist and partly of quadrille, though partaking mostly of the former." The game enjoyed an extraordinary vogue in high French society, where it was the fashion at that time to admire all things American. "The ladies . . . filled my pockets with bon-bons, and . . . called me 'le petit Bostonien.'" It was indeed by the name of Bostonian that all Americans were then known in France.

The rules of Boston recognized in English-speaking countries differ somewhat from those in vogue in France. According to the former, two packs of 52 cards are used, which rank as in whist, both for cutting and dealing. Four players take part, and there are usually no partners. Counters are used, generally of three colours and values, and each hand is settled for as soon as finished. The entire first pack is dealt out by fours and fives, and the second pack is cut for the trump, the suit of the card turned being "first preference," the other suit of the same colour "second preference" or "colour," while the two remaining suits are "plain suits." The eldest hand then announces that he will make a certain number of tricks provided he may name the trump, or lose a certain number without trumps. A player may pass, and the next player bids. Succeeding players may "overcall," i.e., overbid, previous bidders. Players passing may thereafter bid only "misères." If a player bids seven but makes ten he is paid for the three extra tricks, but on a lower scale than if he had bid ten. If no bid should be made, a "misère partout" (general poverty) is often played, the trump being turned down and each player striving to take as few tricks as possible. Payments are made by each loser according to the value of the winner's bid and the overtricks he has scored. There are regular tables of payments. In America overtricks are not usually paid for.

BOSTON AND MAINE RAILROAD, THE, one of the principal systems in the North-eastern States of the United States, with important connections between New England and the South, the West and Canada, is the result of the gradual amalgamation of 111 separate railroads. Included are the former Boston and Lowell, first steam railroad projected in New England (incorporated June 5, 1830); the former Fitchburg railroad, the former Eastern railroad and the original Boston and Maine, an

outgrowth of the Andover and Wilmington (chartered in 1833). The present system operates 4,017 m. of track in Massachusetts, New Hampshire, Maine, Vermont and New York. It is administered from Boston, the principal terminal. Other terminals and important connection points are at Troy and Mechanicville-Rotterdam, N.Y., on the west; Portland, Me., on the east; Belkows Falls, White River Junction and Wells River, Vt., and Woodsville, Groveton and Berlin, N.H., on the north; and at Worcester, Lowell and Springfield, Mass., on the south. The Boston and Maine operates a fast freight service, bringing perishables, coal, raw materials and commodities into New England from the rest of the United States and Canada, and carrying manufactured and other products to the nation's markets. It is also one of the country's largest carriers of milk and potatoes. Serving a thickly populated section with local and commuting passenger service, the road also provides fast through service between Boston and Maine, and Canadian Maritime Provinces, Quebec and Montreal, and via the Mohawk trail and Hoosac tunnel to Chicago and the West; as well as connecting services between its northern points and New York, Philadelphia and Washington. The Boston and Maine serves visitors to many historic shrines and scenic and recreation spots of New England. The capital of the road (capital stock and funded debt) was, in 1928, \$220,128,583.26; leased road capital, \$19,757,700. (G. H.)

BOSTON FERN, a variety (*bostoniensis*) of the sword fern (*Nephrolepis exaltata*) originated in cultivation. It was introduced in 1895 by F. C. Becker and named in honor of the city of Boston, Mass., in the vicinity of which it was discovered. It is a strong, free-growing plant, with drooping, dark-green foliage, and is much less stiff in habit than the typical sword fern. It is one of the best ferns for decorative purposes, growing well indoors in pots or baskets, and is hardy out-of-doors in gardens and rockeries in the southern States. From this mutant, or from variants derived from it, have arisen numerous remarkable forms with very finely cut, crisped or otherwise peculiarly developed leaflets. Among these are the varieties *elegantissima*, *robusta*, *magnifica* and *superbissima* which are interesting also as examples of rapid evolutionary development. (See SWORD FERN.)

BOSTONITE, in petrology, a fine-grained, pale-coloured, grey or pinkish rock, which consists essentially of alkali-felspar (orthoclase, anorthoclase, microperthite, etc.). Some bostonites contain a small amount of interstitial quartz (quartz-bostonites); others have a small percentage of lime, which occasions the presence of a plagioclase felspar (lime-bostonite). Other minerals, except apatite, zircon and magnetite, are typically absent. They

have very much the same composition as the trachytes; and many rocks of this series have been grouped with these or with the orthophyres. Typically they occur as dikes or as thin sills, often in association with nepheline-syenite.

BOSTON IVY; see VIRGINIA CREEPER.

BOSTON POST ROAD, THE, extends from New York to Boston and is 235m. in length. It had its origin in the Old Post road of colonial days, but has since been relocated, shortened and improved. It forms part of the Atlantic highway and U. S.

highway No 1 and is wide enough for 4 rows of vehicles. A beautiful shore drive for much of the way, it passes through historic southern New England and includes Stamford, Bridgeport, New Haven, New London, Providence and Wrentham in its course.

BOSTRÖM, CHRISTOFFER JACOB (1797-1866), Swedish philosopher, was born at Piteå Jan. 1, 1797, and died March 22, 1866, at Uppsala. He studied at Uppsala, where he was professor of practical philosophy from 1840 to 1863. His philosophy was a rational idealism, founded on the principle that

the only reality is spiritual. From this he developed a political theory of the ideal state as a constitutional monarchy with willing and obedient subjects. See H. Höfding, *Filosofien i Sverig* (1879), and *History of Modern Philosophy* (Eng. trans. 1900). Boström's works were edited by H. Edfelt (2 vols. Uppsala, 1883).

BOSWELL, JAMES (1740–1795), the biographer of Samuel Johnson, was born at Edinburgh on Oct. 29, 1740. He was the eldest son of Alexander Boswell, who on being raised to the bench took the title of Lord Auchinleck. According to the son's account, he had "all the dignified courtesy of an old baron"; but he was also an ardent Whig, whilst James, at the age of five, "wore a white cockade and prayed for King James." But one of his uncles gave him a shilling and the boy promptly prayed for King George instead. "So you see," said Boswell to Johnson in later years, "that Whigs of all ages are made in the same way." James was sent to the High School and afterwards to the University of Edinburgh. Here his friendship began with William Johnson Temple, afterwards vicar of Mamhead in Cornwall; at the end of their first term Boswell suggested that they should write to each other and thus was begun a correspondence which was to last 37 years.

The earliest extant letters from Boswell to Temple are dated July 29 and Dec. 16, 1758, and are thoroughly characteristic of the series. Boswell thanks God that he is in pretty good health and spirits; the violence of his passion for Miss W—t has given place to a rational esteem of her good qualities; he has but little hope of her hand since she is now a fortune of £30,000, but how transporting to think of such a lady to entertain Temple at Auchinleck! Meantime he is vastly happy with the thoughts of the northern circuit, though he contrasts his laborious study of the law with Temple's less exacting course at Cambridge. He has begun to keep an exact journal and to contribute trifles to the magazines. A few of his poems are enclosed for Temple's delectation.

Here is the authentic Bozzy, who two years later described himself in doggerel verse but with accurate self-perception:

Boswell is pleasant and gay,
For frolic by nature design'd;
He heedlessly rattles away
When the company is to his mind
"This maxim," he says, "you may see,
We never can have corn without chaff";
So not a bent sixpence cares he,
Whether with him or at him you laugh.

In 1759 Boswell sat under Adam Smith in Glasgow and in the following year came to London for the first time, his mind "filled with the most gay ideas—getting into the Guards, being about Court, enjoying the happiness of the *beau monde*, and the company of men of Genius." The first of these ambitions was unfulfilled, the duke of Argyll declaring to Lord Auchinleck that the boy "must not be shot at for three shillings and sixpence a day." On his second visit to London in 1762 Boswell moved, to his delight, in gay circles. He formed an alliance with the poet Derrick and dedicated his poem "The Cub at Newmarket" to the duke of York. Another poem belonging to this period is "An Ode to Tragedy," dedicated by Boswell to himself as relishing "the productions of a serious muse" as strongly as "the most brilliant sallies of sportive fancy."

The *annus mirabilis* in Boswell's early career, however, was 1763, the year in which he met Samuel Johnson. Johnson was 53 years old—his dictionary published, his dictatorship established—Boswell was 23, a young Scotch lawyer and an ardent hunter of celebrities. Boswell's own description of the meeting in the back-parlour of Tom Davies's book-shop in Great Russell street is one of the best pages in English literature. Davies, after enjoying Boswell's temporary discomfiture, shrewdly reassured him: "Don't be uneasy: I can see he likes you very well." It was a true estimate. In a little more than a month Boswell was supping *à deux* with Johnson at the Mitre and sitting over a sober bottle till between one and two in the morning; the friendship ripened quickly and, *inter alia*, Johnson helped Boswell, who had earlier toyed with Roman Catholicism, to become "a rational Christian." Boswell was also making other and different friendships: he found John Wilkes, for instance, "a most agreeable companion." In

Aug. 1763 Johnson gave a signal proof of his attachment to Boswell by travelling with him to Harwich, whence Boswell embarked upon his Continental tour. At Utrecht he divided his time between study and amusement and, in spite of "many beautiful and amiable ladies," claimed to have repelled dissipation. With one lady, however, Isabella de Zuylen (Zélide) Boswell formed a remarkable friendship, addressing to her from Berlin a long letter of discursive frankness. Even more remarkable were his letters to Rousseau with whom, as with Voltaire, he determined to obtain an interview. These two men were to him "greater objects than most statues and pictures." To Rousseau Boswell described himself as "a man of singular merit." "Open your door," he wrote, "to a man who dares to say that he deserves to enter there. Trust a unique foreigner. You will never repent it. . . ." Later he was able to thank him for "a truly gracious welcome." Boswell was also successful in obtaining an hour's "very serious" conversation (the most brilliant he had ever heard) with Voltaire. At Naples, Boswell developed his intimacy with John Wilkes, who declared that Boswell, "the most liberal man he had ever met with," would be engraven upon his heart.

But the main objective of Boswell's continental tour was Corsica. He wished, he said, for "something more than just the common course of what is called the tour of Europe" and Corsica occurred to him as a place which nobody else had seen. Further, Corsica made a double appeal to Boswell's romantic sensibility: it suggested to him, first, the "state of nature" where there dwelt a "prisca gens mortalium" and, secondly, its people were a nation "actually fighting for liberty" against the Genoese under the heroic leadership of Pasquale Paoli. Boswell became a fervid enthusiast for the Corsican cause, regarding himself as the "ambasciadore Inglese" and writing careful paragraphs about his progress for *The London Chronicle*. Finally, he cultivated the society of Paoli with that minute and skilful care which he was afterwards to bestow upon Johnson. In the costume of a Corsican chief he obtained an interview with Chatham; but, politically, his advocacy of the cause of the Corsicans was a failure. "We cannot be so foolish," said Lord Holland, "as to go to war because Mr. Boswell has been to Corsica." Meanwhile *An Account of Corsica, The Journal of a Tour to that Island and Memoirs of Pascal Paoli* had been published in 1768 by Charles Dilly, who paid one hundred guineas for the copyright. The *Journal*, which was recognized by others besides Johnson as "in a very high degree curious and delightful," was Boswell's first literary experiment of importance and, in particular, the "Boswellizing" of Paoli was the first indication of Boswell's sureness of touch in biographical selection and composition. The writing of the *Account of Corsica* had, according to Boswell's own record, elevated his soul and made him *spernere humum*. On the other hand, he could never resist the allurements of sundry "little charmers." "Can I do better," he wrote to Temple, "than keep a dear infidel for my hours of Paphian bliss?" Then a little later he would be abashed and determine to keep the strictest watch over his passions. For a time his letters are full of the praises of Miss Blair; then Zélide reappears; then in 1768, "la belle Irlandoise" (Miss Mary Anne Montgomery) had for a time no rival; he had never, he wrote, been so much in love. But the charming Mary Anne would not treat him seriously and so he turned to his cousin Margaret Montgomerie, who had been commended to him by Sir Alexander Dick as a lady of "nutritive" conversation. "Indeed," wrote Boswell, "it is such as nourishes me and like sweet milk, tempers and smooths my agitated mind." The marriage took place at Lainshaw in Ayrshire in Nov. 1769. Sir Joshua Reynolds's portrait of Mrs. Boswell, now at Malahide castle, shows her to have been a beautiful woman.

As a lawyer, Boswell had not been wholly idle. He had been admitted as an advocate in 1766 and he told Temple that he earned 65 guineas in the winter of 1766–67. Shortly afterwards, the famous Douglas case came up for trial, the issue being whether Archibald Douglas was the real heir to the Douglas estates. In the court of session the claimant was defeated, but the decision was reversed by the House of Lords. Anything in the nature of a *cause célèbre* held a peculiar attraction for Boswell and in

June 1767 he wrote a little book entitled *Dorando, A Spanish Tale*, in which the Douglas case was summarized under a thin disguise. It was published just before the decision of the Scottish court was pronounced and three editions were published before it was suppressed. Later in the year Boswell wrote a more ambitious volume, *Essence of the Douglas Cause*, on the same subject.

For the first years after his marriage Boswell was not much in London and he found it hard to make Johnson a frequent or regular correspondent; accordingly, he begged Mrs. Thrale, as a generous rival, to put "the Oracle" in mind to write to him. In 1772, however, Boswell visited London and was busy with his biographical note-book. In particular, he beheld, with reverential awe, the spectacle of Johnson studying his large folio Greek Testament during the course of Passion Week. The year 1773 was even more memorable in Boswell's career. He arrived in London on April 2, having previously addressed a charming letter of congratulation to Goldsmith on the success of *She Stoops to Conquer*, its first night (March 15) coinciding with the birth of Boswell's eldest daughter, Veronica. It was during this visit to London that Boswell was elected to membership of the club and even more gratifying to him was Johnson's final consent to accompany him on a Scottish tour. The plan had been discussed ten years before, and on April 14, 1773, Boswell had the satisfaction of walking arm-in-arm with his friend up the High street of Edinburgh, though he could not prevent "his being assailed by the evening effluvia." From Edinburgh the travellers went north to St. Andrews, Dundee, Montrose and Aberdeen. At Aberdeen Johnson received the freedom of the city, "not in a gold box, but in good Latin." At Fort George they were entertained by Sir Eyre Coote and the 37th Foot; by the side of Lochness Johnson found a woman living in an earth hovel and hardly able to speak a word of English. Crossing the Atlantic in an open boat from Skye, Johnson "sat high on the stern like a magnificent Triton"; and at Rasay he declared, "This is truly patriarchal life: this is what we came to find." These and many other "exquisite traits of character" are recorded in Boswell's *Journal of a Tour to the Hebrides* (1785). A visit on the way back from the Hebrides to Boswell's home was less fortunate: in spite of Johnson's promise to eschew political discussion with Lord Auchinleck, the talk turned inevitably to politics and "Whiggism and Presbyterianism, Toryism and Episcopacy were terribly buffeted." Boswell in his *Journal* expressed the charitable hope that both men had subsequently met in happiness, and "in a place where there is no room for Whiggism."

For the ten years after the tour to the Hebrides, the record of Boswell's life is a not very edifying story of quarrels with his father, difficulties in money matters, and failure to resist the pleasures of fermented liquor—"not drunk, but intoxicated," was his own careful description of himself on a particular evening. He generally contrived to visit London in the spring and made the best of his opportunities for intercourse with Johnson, accompanying him to Lichfield, Ashbourne and Oxford. One of Boswell's note-books for the years 1776 and 1777 (see bibliography) is good evidence both of the minute attention he was giving Johnsonian detail at this time and also of the literary skill with which the new material was fashioned into biographical narrative. Nor was Boswell idle as a journalist. For the *London Magazine* he wrote a series of about 70 papers called *The Hypochondriack* (1777-83). In 1782 Lord Auchinleck died, and succession to the family estate fired Boswell with political ambitions. He attacked Fox's India Bill with a pamphlet entitled *A Letter to the People of Scotland* and for a time contemplated candidature for Parliament. The *Letter*, in Boswell's own opinion, was an "excellent pamphlet," but Johnson warned him that it might not make him a Minister of State. At Sir Joshua Reynolds's house, on June 30, 1784, Boswell dined with Johnson for the last time. After dinner they drove together as far as the entry to Bolt court. "When he had got down from the foot-pavement," writes Boswell, "he called out, 'Fare you well'; and, without looking back, sprung away with a kind of pathetick briskness . . ." On Dec. 13 Johnson died.

The remaining years of Boswell's life are marked by one not very important appointment (the recordership of Carlisle), by a number of pathetic failures—his second *Letter to the People of*

Scotland, his dearth of briefs at the English bar, his unlucky speculations, his vain attempts to enter parliament—and by one supreme achievement, the publication of his *Tour to the Hebrides* (1785) and of his *Life of Samuel Johnson* (1791). The immediate success of both volumes served to revive the author's waning self-esteem, but debts and dissipation induced a recurrent melancholy. Boswell had moved to London at the end of 1788. His wife, however, disapproved of London fogs and shortly returned to Auchinleck, where she died. Boswell reproached himself bitterly for leaving her—the reflection, he said, would pursue him to the grave. Two years later, however, he was contemplating "several matrimonial schemes"; among them one relating to the daughter of a dean, "a most agreeable woman, *d'un certain âge* and with a fortune of £10,000." But neither prospective dowries nor the spontaneous praise of literary critics could properly restore his earlier buoyancy. Worn out by the violence of his pleasures, he died in 1795.

The study of Boswell's personality has, until lately, suffered an undue neglect. Macaulay, by far the most powerful influence on Victorian literary taste, settled the matter to his own satisfaction in his famous essay of 1832 and, in spite of Carlyle's more penetrating view, it was Macaulay's essay that determined the English reader's attitude to Boswell for three generations. About Boswell the biographer Macaulay had no doubts: Eclipse was first and the rest nowhere. But what could be said of Boswell the man? "Servile and impertinent, shallow and pedantic, a bigot and a sot. . . ." How could such a man have written the greatest biography in literature? Macaulay is ready with his famous *lucus a non lucendo*: "If he had not been a great fool, he would never have been a great writer." But the "inspired idiot" theory has by now been many times exploded. A reading of Boswell's letters, or even of his *Advertisement* to the first edition of the *Life* is, indeed, sufficient to confute the suggestion that his triumph is accidental. He had been obliged, he said, to run half over London, in order to fix a date correctly, and was genuinely astonished at his own determination. Those of his proof-sheets which have been preserved contribute further evidence of his careful workmanship. "I am much pleased with this sheet as now arranged," he wrote on the "revise" of the first sheet. "As I have made a little alteration, which will only shorten a note a line or so, let me have another *Revise* . . ."; and again, on the fourth sheet, "Pray be very attentive that I may have no cancels and few Errata." Furthermore, Boswell was convinced not only that he was doing his work with thoroughness but that his "mode of biography" was "the most perfect that can be conceived." About this self-assessment there may still be legitimate difference of opinion, but few would dispute Boswell's claim that his book was "more of a *Life* than any work that [had] ever yet appeared." Boswell's peculiar skill lay in utilizing his qualities as a journalist in the building of his biographical structure. A born interviewer and note-taker, he realized that his notes and recollections were not merely to be thrown together to make a farrago of reminiscence, but were to be treated as the raw material of the literary artist. His instinct as a journalist prompted him to record a hundred incidents and conversations which the academic biographer would have discarded as considerable trifles; at the same time he knew that his first-hand knowledge, which was confined to a small portion of Johnson's life, must be supplemented by the hard labour of biographical research. As for the skill he displayed in welding his material into dramatic narrative, it is only necessary to recall such an account as that of the first meeting between Johnson and Wilkes. Finally, Boswell, for all his hero-worship, treated Johnson not merely as a commanding figure which inspired him to "Johnsonize the land," but as the centre of the 18th-century English scene. He knew that Johnson, whose greatest terror was loneliness, would appear at his best and most "characteristical" in the company of his contemporaries; and it is not the least of Boswell's glories that his book is at once an intimate portrait of the Great Lexicographer and an encyclopaedia of 18th-century social life. On his title-page he described his work as "exhibiting a view of literature and literary men in Great Britain for near half a century"; and

the title-page, like the rest of the book, was drafted with deliberate care and accuracy. From first to last Boswell was the conscious artist.

BIBLIOGRAPHY.—Boswell's commonplace-book was published by C. Rogers in 1876, with notes and a memoir, under the title *Boswelliana*; there is also a *Life* by Percy Fitzgerald (2 vols., 1891), and a shorter work by W. Keith Leask (1896). In *Young Boswell* (1922), a series of essays on Boswell's earlier career, C. B. Tinker introduced extracts from unpublished letters which were afterwards incorporated in his edition of *The Letters of James Boswell* (1924). This edition included the letters to J. W. Temple (originally published in 1857 and re-edited by T. Seccombe in 1908), the letters already printed in the *Life of Johnson* and elsewhere and nearly 100 letters not printed before. In 1927 the material upon which the definitive *Life* of Boswell will no doubt be based was sold by Lord Talbot de Malahide, a descendant of Boswell on his mother's side, to Colonel Ralph Isham, an American collector. Publication was begun in 1929; details of the mss. are not yet available, but it is known that they include memoranda of Boswell's interviews with Voltaire and with George III. Boswell's *Life of Johnson* went through ten editions before Croker's edition of 1831, which provoked the famous essays of Macaulay and Carlyle. (See JOHNSON, SAMUEL.) Of the early editions the sixth, edited by Malone (1811), is the safest. Napier's edition of 1884 contained some valuable material, but the edition *par excellence* is that of Birkbeck Hill (6 vols., 1887). Four volumes contain the *Life*, one the *Tour to the Hebrides*, and one a monumental *Index*. This edition is at present out of print and is being revised by L. F. Powell. There are many handy reprints of the *Life* (e.g., the Oxford, Globe and Everyman editions); the best illustrated edition is that of Roger Ingpen (first published in 1907 and re-issued in 1925). Of Boswell's other works the *Tour to the Hebrides* has been re-edited in company with *Johnson's Journey to the Western Islands* by R. W. Chapman (1924); and the *Journal of a Tour to Corsica* by S. C. Roberts (1922). One of the best collections of *Boswelliana* is that of R. B. Adam, of Buffalo. In particular, this collection contains one of Boswell's notebooks for the years 1776 and 1777. This has been published (1925) with the corresponding passages from the *Life* printed on opposite pages and with an introduction and notes by R. W. Chapman. R. B. Adam has also issued a privately-printed edition in facsimile of the proof-sheets of the *Life* which are in his possession. The Malahide collection will no doubt reveal similar treasures. A full bibliography of Boswell, by F. A. Pottle, is in the press. (S. C. R.)

BOSWORTH FIELD, BATTLE OF, a decisive battle fought on August 22, 1485, on ground 12m. W. of Leicester, from which city King Richard III. moved out with his host. Its military insignificance is altogether disproportionate to its political results, which were to place the Tudor dynasty on the English throne and largely to aggrandize the autocracy of the Crown. Richard's usurpation and tyrannous acts incited many among the English nobility to support Henry Tudor, Earl of Richmond, in his claim to the Crown as heir in the Lancastrian line. Richmond, who had fled to France, organized rebellion, and landed on August 7 at Milford Haven with a small group of friends and 1,800 mercenaries. This force was augmented as he marched through Wales; Shrewsbury opened its gates to him; and he reached Atherstone, in Warwickshire, on August 20, by which time a considerable English contingent had joined his banner. At the battle his army did not exceed 5,000 men. King Richard had thrice this strength in numbers, but the loyalty of his followers was questionable. The king arrayed his force on the gently rising slope of Ambion Hill, Leicestershire, in the customary three bodies, or "battles" Richmond's army was drawn up in two divisions.

Although so greatly outnumbered, the earl attacked, confident of treachery in his enemy's ranks. A short march to circumvent a morass brought him upon the lower slope, where the first collision occurred. The earl of Northumberland, in command of the royalist left wing, held back when an advance should have taken place. The fate of the battle was decided by the defection from the royalist cause of Lord Stanley, who threw his retainers from Lancashire and Cheshire upon the king's flank and rear. All attempts to keep an order of battle thereupon ended. Richard was advised to quit the field, but declared that he would die King of England, and, sighting Richmond's banner flying, he charged with maddened fury upon it, accompanied only by his bodyguard. He killed Sir William Blandon, Richmond's standard bearer, with a blow, unhorsed Sir John Cheney, and was said to have actually engaged Richmond himself, but being borne down by numbers his head was split open and his brains scattered. The golden crown

that had fallen from his head was picked up in a gorse bush, and Sir William Stanley (Lord Stanley's brother) set it upon the victor's head, while the ranks loudly acclaimed Richmond as king. The victor's losses were less than 100. The accepted estimate of 1,000 as Richard's losses is probably exaggerated. Richmond was crowned at Westminster five weeks later as King Henry VII.

(W. G. B.)

BOTANICAL ARTICLES. The scope and range of the subject is indicated in the article BOTANY, while more detailed treatment of various aspects is given in the articles on the main branches: thus PLANTS gives a general account of the structure, physiology and distribution of the members of the vegetable kingdom; the history of the rise of the orders and their relations to one another is dealt with in the article PALAEOBOTANY; special structures are the subject of articles as those on FRUIT, FLOWER, LEAF, etc. The main groups of plants are described in more detail, with an account of their evolutionary history as far as is known, in such articles as ALGAE, ANGIOSPERMS, BRYOPHYTA, GYMNOSPERMS, PTERIDOPHYTA, FUNGI, etc. The important economic status of the last-named group is fully dealt with, and their association with certain algae described at length in the article LICHENS. Among the flowering plants, in addition to the general articles already mentioned, there is a shorter article on each of the more important families, e.g., COMPOSITAE, GRASSES, LEGUMINOSAE, ROSACEAE, RANUNCULACEAE; while numerous short articles are devoted to individual plants, e.g., ACACIA, BARLEY, BREAD-FRUIT, DANDELION, DAISY, RUBBER, TOMATO, WHEAT, etc. The important group of the Bacteria is dealt with in the article BACTERIOLOGY and such phenomena as plant CHIMAERAS and WITCHES BROOM are also the subject of separate headings.

BOTANIC GARDEN. The original conception of a botanic garden was that literally implied by the name, that is, a garden, with the plants arranged according to some system of botanical classification. A botanic garden thus differed from a park, where the plants are usually arranged solely with reference to securing a beautiful landscape effect. The primary purpose of a park, moreover, is recreation, while that of a botanic garden has always been science and education. In time, however, these institutions developed along broader and more inclusive lines, and a botanic garden is properly defined as a scientific and educational institution whose purpose is the advancement and diffusion of a knowledge and love of plants.

A collection of living plants, out of doors or under glass, must always remain a major feature of botanic gardens, but the modern institutions possess, in addition, a herbarium, a library, experimental grounds for plant breeding and other investigations, laboratories, classrooms, lecture halls and, in some cases, botanical museums, together with scientific, educational and administrative staffs. Different institutions place the emphasis on different aspects of the work, and this may be determined by climate, area, tradition, resources or ideals.

Botanic gardens have gradually developed by a process of evolution from such gardens as the early olive orchards and the temple gardens, like that, for example, at Karnak, Egypt—one of the earliest of which there is authentic record, dating from the reign of Thotmes III., about 1500 B.C. It seems probable that the very earliest gardens were utilitarian in purpose—for the growing of food, fiber plants and fruit trees. Temple grounds, however, were early planted, and to this practice we are probably indebted for the preservation, until now, of the "maidenhair tree," *Ginkgo biloba*. (See GINKGO.) One of the first gardens, developed for the express purpose of facilitating the study of plants was that of Aristotle, an ardent student of plants, who wrote books on botany, now lost. This garden was in charge of his pupil, Theophrastus, who fell heir to it on the death of the master. It would thus appear that, in modern terminology, the first patron of botany of whom we have record was Aristotle (c. 350 B.C.), and the first "director" of a botanic garden, Theophrastus, who also wrote books on botany.

The history of botanic gardens during the period between those of antiquity and the 15th or 16th century appears never to have been traced in detail. During the 16th and 17th centuries the

herbalists (predecessors of the modern botanists) began to cultivate private gardens for the purpose of botanical study. Perhaps the best known of these is the garden of John Gerard, in Holland. (These private gardens were the forerunners of the modern botanic gardens.) The botanic garden idea spread rapidly in countries of older civilization during the 18th and 19th centuries. There were also vigorous attempts to establish botanic gardens in the United States, as Bartram's garden near Philadelphia, Penn. (1728), Evan's garden, also near Philadelphia (1828, an offshoot from Bartram's garden) and the Elgin Botanic garden, New York city (1801). Notwithstanding the phenomenal growth of the United States, the botanic garden idea was slow to take root, and it was nearly 60 years from the Elgin garden to the establishment of Shaw's garden (now the Missouri botanical garden), at St. Louis, Mo., in 1859. This garden appears to be the oldest existing botanic garden in America organized as an independent institution.

Modern botanic gardens in all countries are organized along closely similar lines. There is a director with a scientific (and sometimes an educational) staff, a head gardener, a number of gardeners and a force of labourers for the maintenance of walks, driveways and lawns. In the case of governmental gardens (e.g., Kew in London, Edinburgh in Scotland, Glasnevin at Dublin, Ireland, Berlin in Germany, Buitenzorg in Java, Singapore, Port-of-Spain in Trinidad, Hope and Casleton gardens in Jamaica, and others) the director reports to a governmental minister or bureau, and the financial support comes wholly or chiefly from governmental appropriations. In the case of independent institutions (e.g., Missouri botanical garden at St. Louis, the new California botanic garden at Los Angeles, the Boyce Thompson southwestern arboretum at Superior, Ariz. and others) there is a board of trustees who administer the permanent funds and other income. Gardens that form integral parts of universities or other institutions (e.g., Cambridge in England, Harvard at Cambridge, Mass., the Hortus Botanicus at Amsterdam, and Brooklyn at Brooklyn, N.Y.) are administered by the trustees of the given institution. A fourth group comprises those gardens which are supported in part by municipal or other governmental appropriations and in part by private funds administered by a board of trustees, as is the case, for example, with the New York botanical garden and the Brooklyn botanic garden. Various botanic gardens in Europe derive their support wholly or chiefly from the city in which they are located, as, for example, Bath (England), Bern (Switzerland), Marseilles (France) and Valencia (Spain).

Among botanic gardens that form an integral part of the botanical departments of colleges and other schools or are closely affiliated with them may be mentioned the following: Aberdeen, Dundee and St. Andrews universities in Scotland, Birmingham, Cambridge and Oxford universities, and the Royal Agricultural college at Cirencester (Gloucester) in England; Trinity college, Dublin, in Ireland; those at the universities of Budapest (Hungary), Czernowitz and Cluj (Rumania), Krakow and Lwow (Poland), Praha (Czechoslovakia), Vienna (Austria); at Ghent and Liège in Belgium; at Copenhagen in Denmark; at the Catholic university in Lille, France; at the medical college and the veterinary college in Lyons, France; at Strasbourg (France); at Madrid (Spain); at the universities of Bonn, Breslau, Göttingen, Halle, München and Würzburg in Germany; at Athens (Greece), Groningen, Leiden and Utrecht (Holland); Genoa and Modena (Italy); Kiev, Odessa and Leningrad (Russia); Basel and the Jardins Alpins de l'Université de Grenoble (Switzerland); Nikko and Tokyo (Japan); the Botaniska Trädgård of the University of Helsingfors (Finland); and, in the United States, those of the universities of California (Berkeley), Harvard (Cambridge, Mass.), Smith college (Northampton, Mass.) Mt. Holyoke college (South Hadley, Mass.), Michigan Agricultural college (East Lansing), the University of Michigan (Ann Arbor), the University of Minnesota (Minneapolis), the University of Pennsylvania (Philadelphia) and the Johns Hopkins university (Baltimore). Also, the University of British Columbia (Vancouver). Harvard university maintains a botanical garden in Cuba as well as in Cambridge, Mass.

There are approximately 325 botanic gardens outside of the United States. Among the more notable of these are the following, which are mentioned in the order of age, the year given being the date of their foundation.

Old World Gardens.—1. Pisa, Italy (1543), founded by order of the Grand Duke Cosmodi Medici I. This is one of the earliest gardens devoted to the public study of botany, and became famous under its second director, Andrea Caesalpini. His work, *De plantis libris XVI*. (1583) marks the beginning of modern systematic botany, and influenced botanical science for more than a hundred years.

2. *Muséum d'Histoire Naturelle*, Paris (1635), founded by Guy de la Brosse, physician to the French king. Its first name was *Jardin Royal des Plantes Médicinales*, but was changed to the present form in 1790. The garden proper, still generally known as the *Jardin Botanique*, occupies an area of 14 hectares.

3. *Chelsea Physic Garden*, London (1673), was established on the bank of the Thames by the Society of Apothecaries, for the express purpose of advancing the teaching of botany, and of providing study material for research and teaching. In the earlier years the garden grew medicinal plants in sufficient amount to supply the members of the society with crude drugs in commercial quantities. The original plot of 4 ac. was enlarged in 1722 by additional ground deeded as a gift by Sir Hans Sloan, with the provision that the growth of drug plants for commerce should cease, and the garden thenceforth be devoted exclusively to scientific and educational work. Its influence along these lines can scarcely be overestimated. Among its famous directors were Philip Miller, author of the classic *Dictionary of Gardening*, and John Lindley (appointed in 1835), author of *Flora Medica* and other important botanical works. Many important publications grew out of the work of the garden, including Curtis's *Botanical Magazine* and *Flora Londonensis*, Lindley and Moore's *Treasury of Botany*, and others. The private library of Charles Darwin is housed in the laboratory building.

4. *Der Staatliche Botanische Garten und Museum*, Berlin-Dahlem, Germany (1679), was established in Schöneberg, near Berlin, as an exhibition or model garden (*Mustergarten*). Here it remained for over 200 years. A new site was chosen at Dahlem where in 1897-1907 the present garden was laid out under the direction of Dr. A. Engler, who was director from 1889 to 1921. The area is approximately 100 acres. It is primarily a research institute for botanical science and instruction of Berlin university. The plantations comprise five main sections: (1) Plant Geography; (2) Morphology—Oecology; (3) The Arboretum; (4) Systematic Botany; (5) Economic Plants. The Conservatories contain a remarkable collection of tender and tropical plants. The Botanical Museum comprises the Herbarium and the public exhibits.

5. *Royal Botanic Gardens, Kew*, near London (1759). The nucleus of the collections at Kew was the plants grown by Lord Capel, who came into possession of Kew house by marriage in 1696. Frederick, prince of Wales, leased the property about 1730, and after his death his widow, Princess Augusta of Saxe Gotha, engaged a former pupil of the Chelsea Garden, William Aiton (q.v.), to develop a physic garden in 1757. From this year Kew ranks as a true botanic garden. The total area is 288 acres. It was Aiton, who inaugurated the plan of sending botanical exploring expeditions to foreign countries. The material collected on these expeditions has greatly enriched the scientific collections at Kew, and also our knowledge of the vegetation of the world from the standpoint, not only of pure science, but of economic botany as well. The gardens (as stated in a Kew guide book) stand in relation to botanical science much as Greenwich does in astronomy. The botanical survey of the empire has resulted in the publication of floras of all the overseas dominions. Among commercial plants distributed by Kew to new centres are bread-fruit, pineapple, banana, tea, coffee, cocoa, rubber, various fibres, timbers and dyes, and quinine and other drugs. The quinine plant (*Cinchona*) was introduced by Kew from South America to India in 1860. Most of the crude rubber used so extensively throughout the world is derived from trees of the Para rubber plant (*Hevea*

brasiliensis) raised from seeds collected by Sir Henry Wickham under the auspices of Kew in Brazil in 1875. Kew acts as botanical adviser to all Government Departments. The gardens maintain a school of horticulture for the training of gardeners, and are visited by more than a million people annually. Aiton resigned in 1841 and was succeeded by Sir William Hooker (1841-65), Sir Joseph Hooker, his son (1865-85), Sir W. T. Thistleton-Dyer (1885-1905), Sir D. Prain (1905-22) and Dr. A. W. Hill (1922-). One of the most important publications is the *Index Kewensis*,—an alphabetical list of every plant name published (numbering hundreds of thousands), with references to the place of publication. This project was originally conceived and financed by Charles Darwin.

Among other important European botanic gardens may be mentioned those at Amsterdam where deVries (*q.v.*), carried on his investigations leading to the formulation of the epoch-making mutation theory, Budapest (1771), Cambridge (1762), Christiania (1815), Coimbra (Portugal, 1773), Copenhagen (1600), Genoa, Hanbury (La Mortola, Ventimiglia, Italy, 1867), Helsingfors (1828), Leiden (1587) Leningrad (1843), Madrid (1755), Rome (1884), Upsala (1787), Ventimiglia (Italy, 1867).

In Asia and the Pacific islands: Tokyo (1638); Calcutta Sibour, (1787); Buitenzorg, Java (1817); Hongkong, Paradeniya, Ceylon (1822); Melbourne, Australia (1842) and Hobart, Tasmania (1844). In Africa: Durban (1849) and Kirstenbosch, Cape Town (1913). In South America: Rio de Janeiro (1808) and Buenos Aires (1892).

American Gardens.—*Missouri Botanical Garden* (St. Louis, 1859). This is known locally as "Shaw's Gardens," from the name of the founder, Henry Shaw, who first opened the garden (as a private garden) to the public in 1859. The area is about 75 acres.

The garden co-operates closely with the Henry Shaw School of Botany, at Washington university, St. Louis, and the director of the garden is professor in this school. The founder's will provides that there must be preached annually a sermon on the power, wisdom and goodness of God as shown in plant life. During the administration (1889-1912) of the first director, Dr. William Trelease (*q.v.*), the *Annual Reports*, enriched with scientific contributions, became known throughout the scientific world. Under his successor Dr. George T. Moore (1912-), the *Annals* were initiated, the scientific and educational work expanded, and a new tract of land (the Gray summit extension, of over 1,500 ac.) outside the smoke zone of the city was secured and developed for the growing of conifers and other plants. In 1926 a tropical station was established in the Panama Canal Zone where orchids and other tropical plants will be grown.

Arnold arboretum (Forest Hill, Boston, Mass.; 1872), the living tree museum of Harvard university. The principal collection of trees and shrubs was planted in 1886. The area of approximately 250 ac. includes meadow, hill and valley, and the permanent (endowment) funds are about \$2,000,000. There is a library of about 40,000 vol. and 10,000 pamphlets, and a herbarium of the woody plants of the world of about 300,000 sheets. No undergraduate instruction is given, but special research students are received. Publications: *Journal of the Arnold Arboretum*, *Plantae Wilsonianae*, *Bulletin of Popular Information*, *The Bradley Bibliography* (a 5 vol. guide to the literature of the woody plants of the world before the beginning of the 20th century), and other works. Soon after the death of the first director, Prof. Charles Sprague Sargent (*q.v.*), who served from 1872 to 1927, the office of director was abolished and Prof. Oakes Ames was made supervisor, and Mr. E. H. Wilson, keeper.

New York Botanical Garden (Bronx Park, New York city; 1894). This comprises an area of approximately 400 ac.; its permanent funds exceed \$2,400,000. There are two large ranges of conservatories, in one of which is a lecture hall. The museum building houses the public museum exhibits, the herbarium of some 2,000,000 specimens, the library of over 37,000 volumes, together with research laboratories and offices of administration. Courses of free public lectures are given throughout the year, and classes from the public schools visit the garden at frequent intervals for special instruction. The Garden has, from the beginning,

carried on systematic exploration of the West Indies, as well as of continental North America. Its publications include the *Journal* (monthly), *Mycologia* (bi-monthly), *Bulletin* (irregular, and containing the annual reports), *North American Flora* (being published in fascicles), *Memoirs* (irregular), and *Contributions*. The Garden is supported by both municipal and private funds, and has, from the beginning until now (1928) been developed under the directorship of Dr. N. L. Britton (*q.v.*). There is a close affiliation with Columbia University.

Brooklyn Botanic Garden (Brooklyn, N. Y., 1910). This includes an area about 50 acres; its work includes anything scientific or educational based upon plant life. Many popular courses are given for the general public both children and adults. Its educational program is probably more extensive than that of any other botanic garden. There is a children's garden and children's green-house and building. Boys and girls frequently take consecutive voluntary instruction for periods of five to ten years, finally entering upon a life work of botany, horticulture, or some other aspect of plant science or industry. The research work is mainly with the experimental aspects of botany (pathology, genetics, ecology, physiology), though including some systematic work. Graduate work done at the Garden is credited toward advanced degrees by New York university. The Garden co-operates extensively with public and private schools. The Library, containing over 12,000 volumes and over 10,000 pamphlets, is open free daily to the public. The herbarium contains: flowering plants, 84,000 specimens; Fungi, 72,000; Bryophytes, 11,000; Algae, 3,000. The conservatories contain tender and tropical economic and other plants. The Garden is supported in part by annual appropriations by the city of New York and in greater part by private funds. It was developed under the supervision of the first director, Dr. C. Stuart Gager (*q.v.*). Its publications include *American Journal of Botany* (monthly), *Ecology* (quarterly), *Genetics* (bi-monthly), *Memoirs*, *Contributions*, *Leaflets*, and *Record* (one number of which comprises the *Annual Report*).

United States Botanical Garden (Washington, D.C., 1850). This originally occupied about 13 acres near the Capitol grounds. The National Congress, in 1927, authorized the Secretary of Agriculture to establish a National Arboretum on a tract of about 400 acres lying upon the Anacostia river about four miles northeast of the centre of Washington. The Act provides that, "The arboretum shall be administered by the Secretary of Agriculture, separately from the agricultural, horticultural and forestry stations of the Department of Agriculture, but it shall be so correlated with them as to bring about the most effective utilization of its facilities and discoveries." The plans include a relocation of the old botanic garden.

Boyce-Thompson Institute for Plant Research, Inc. (Yonkers N.Y., 1921). This was established by a gift of William Boyce Thompson of approximately \$6,000,000, the larger part of which has been set aside as a permanent endowment fund. The institute was incorporated and the laboratories were opened in 1924. The stated purpose is the carrying out of every phase of research on plant life and the dissemination of information relative thereto. In 1928 a tract of about 325 acres on the eastern edge of Yonkers, was secured for the development of an arboretum, where it is planned to grow every hardy species of woody plant. This collection is primarily to serve as a basis for the study of methods of propagation, pathology, and disease control. Planting was begun in the spring of 1929.

Among other American botanic gardens there is space only to mention The Letchworth Park Arboretum (extending for some distance northward of Portage, N.Y., along both banks of the Genesee river); the Morton Arboretum (Lisle, Ill.), and the botanic gardens at various colleges and universities, among which may be mentioned: Harvard (Cambridge), Marsh (at Yale University, New Haven, Conn.), University of Pennsylvania, Smith (at Northampton, Mass.); Mt. Holyoke (at South Hadley, Mass.); Michigan (at Ann Arbor, Mich.); North Carolina (at Chapel Hill), Havana (Cuba), and Bermuda (Hamilton, Bermuda). (See ARBORETUM.) (C. S. G.)

BOTANICAL AND HORTICULTURAL SOCIETIES: *see* HORTICULTURAL AND BOTANICAL SOCIETIES.

BOTANICAL SOCIETY OF AMERICA. This society consists of a group of botanists, active in various fields, resident in the United States and Canada. It was founded in 1893 and reorganized in 1906, when a union of the original society with the Society for Plant Morphology and Physiology and the American Mycological Society occurred. Its membership is unlimited, being in 1928 about 1,200. Corresponding members, elected from prominent foreign botanists, may be chosen to the number of 40; in 1928 there were 19 such members. The publications of the Society are the *American Journal of Botany*, published by the society in co-operation with the Brooklyn Botanic Garden, and the *Miscellaneous Series*, containing *Year Book*, *Proceedings of the Society*, *Necrology*, *Historical Numbers*, *Programmes*, etc.

BOTANY, the science which includes everything relating to the vegetable kingdom, whether in a living or in a fossil state. The name is derived from the Greek *βοτάνη*, a plant. It embraces a consideration of the external forms of plants—of their anatomical structure, however minute—of the functions which they perform—of their classification—of their distribution over the globe at the present and at former epochs—and of the uses to which they are subservient. It examines the plant in its earliest state of development, and follows it through all its stages of progress until it attains maturity. It takes a comprehensive view of all the plants which cover the earth, from the minutest organism, only visible by aid of the microscope, to the tall forest tree. It marks the relations which subsist between all members of the plant world, including those between existing groups and those known only from their fossilized remains preserved in the rocks. We deal here with the history and evolution of the science.

Descriptive Botany to the Time of Linnaeus.—The plants which adorn the globe more or less in all countries have attracted the attention of mankind from the earliest times. Solomon "spake of trees, from the cedar of Lebanon to the hyssop on the wall." The Chaldeans, Egyptians and Greeks were the early cultivators of science, and botany was not neglected, although the study of it was mixed up with crude speculations as to plant life, and as to the change of plants into animals. About 300 B.C., Theophrastus wrote a history of plants, and described about 500 species used for the treatment of diseases. Dioscorides, a Greek botanist and a physician in the Roman Army, wrote on *Materia Medica*; his contemporary, the elder Pliny (A.D. 23–79) described about a thousand plants, many of them famous for their medicinal virtues. Asiatic and Arabian writers also took up this subject. Little, however, was done in the science of botany, properly so called, until the 16th century, when the revival of learning dispelled the darkness which had long hung over Europe. Otto Brunfels, a physician of Bern, has been looked upon as the restorer of the science in Europe. In his *Herbarium*, printed at Strassburg (1530–36), he gave descriptions of a large number of plants, chiefly those of central Europe, illustrated by beautiful woodcuts. He was followed by other writers—Leonhard Fuchs, whose *Historia Stirpium* (Basel, 1542) is worthy of special note for its excellent woodcuts; Hieronymus Bock, whose *Kreutter Buch* appeared in 1539; and William Turner, "The Father of English Botany," the first part of whose *New Herbal*, printed in English, was issued in 1551. The descriptions in these early works were encumbered with much medicinal detail, including speculations as to the virtues of plants. Plants which were strikingly alike were placed together, but there was at first little attempt at systematic classification. A crude system, based on the external appearance of plants and their uses to man, was gradually evolved, and is well illustrated in the *Herbal*, issued in 1597 by John Gerard (1545–1612), a barber-surgeon, who had a garden in Holborn.

One of the earliest attempts at a methodical arrangement of plants was made in Florence by Andreas Caesalpinus (1519–1603), who is called by Linnaeus *primus versus systematicus*. In his work *De Plantis* (1583), he distributed the 1,520 plants then known into fifteen classes, the distinguishing characters being taken from the fruit.

The Englishman John Ray (1627–1705) did much to advance

the science of botany, and was also a good zoologist. He promulgated a system which may be considered as the beginning of a natural system (*Methodus Plantarum*, 1682). He separated flowering from flowerless plants (ferns, mosses, seaweeds, fungi, etc.) and divided the former into Dicotyledons (with a pair of seed-leaves) and Monocotyledons (with a single seed-leaf). His orders (or "classes") were founded to some extent on a correct idea of the affinities of plants, and he far outstripped his contemporaries in his enlightened views of arrangement.

In 1669 Robert Morison¹ (1620–83), the first professor of botany at Oxford, published a systematic arrangement of plants, largely on the lines previously suggested by Caesalpinus. He divided them into eighteen classes, distinguishing plants according as they were woody or herbaceous, and taking into account the nature of the flowers and fruit. In 1690 Rivinus² promulgated a classification founded chiefly on the forms of flowers. J. P. de Tournefort³ (1656–1708), who about the same time took up the subject of plant-classification, was long at the head of the French school of botany, and published a systematic arrangement in 1694–1700. He described about 8,000 species of plants, and distributed them into 22 classes, chiefly according to the form of the corolla, distinguishing herbs and under-shrubs on the one hand from trees and shrubs on the other. Tournefort's system was for a long time adopted on the Continent, but was ultimately displaced by that of Carl von Linné, or Linnaeus (1707–78, *q. v.*).

Linnaean System of Classification.—The System of Linnaeus was founded on characters derived from the stamens and pistils, the so-called sexual organs of the flower, and hence it is often called the sexual system. It is an artificial method, because it takes into account only a few marked characters in plants, and does not propose to unite them by natural affinities. It is an index to a department of the book of nature, and as such is useful to the student. It does not aspire to any other character, and although it cannot be looked upon as a scientific and natural arrangement, still it has a certain facility of application which at once commended it. It does not of itself give the student a view of the true relations of plants, but by leading to the discovery of the name of a plant it is a stepping-stone to the natural system. Linnaeus himself regarded it as only a temporary convenience and in his *Fragmenta* published in his *Philosophia Botanica* (1751) endeavoured to arrange the genera he had already established according to their affinities under 67 orders.

The Linnaean system was strongly supported by Sir James Edward Smith (1758–1828), who adopted it in his *English Flora*, and who also became possessor of the Linnaean collection. The system was for long the only one taught in the schools of Britain, even after it had been discarded by those in Continental countries.

The French School.—A new era dawned on botanical classification with the work of Antoine Laurent de Jussieu (1748–1836). His uncle, Bernard de Jussieu, had adopted the principles of Linnaeus's *Fragmenta* in his arrangement of the plants in the royal garden at the Trianon. At an early age Antoine became botanical demonstrator in the Jardin des Plantes, and was thus led to devote his time to the science of botany. Having to arrange the plants in the garden, he followed the lines already suggested by his uncle, and developed a system founded in a certain degree on that of Ray, in which he adopted the simplicity of the Linnaean definitions, and displayed the natural affinities of plants. His *Genera Plantarum*, begun in 1778, and published in 1789, was an important advance, and formed the basis of all natural classifications. One of the early supporters of this natural method was Augustin Pyramus de Candolle (1778–1841), who in 1813 published his *Théorie élémentaire de la botanique*, in which he showed that the affinities of plants are to be sought by the comparative study of the form and development of organs (morphology), not of their functions (physiology). His *Prodromus Systematis Naturalis Regni Vegetabilis* was intended to be an arrangement and

¹R. Morison, *Praeludia Botanica* (1669); *Plantarum Historiae Universalis Oxon.* pars secunda (1680).

²Rivinus (Augustus Quirinus) paterno nomine Bachmann, *Introductio generalis in Rem Herbariam* (Lipsiae, 1690).

³J. P. de Tournefort, *Eléments de botanique* (1694); *Institutiones Rei Herbariae* (1700).

description of all known plants. This work was continued after his death, by his son Alphonse de Candolle, with the aid of other eminent botanists, and embraces descriptions of the genera and species of the families of Dicotyledons. The system followed by de Candolle is a modification of that of Jussieu.

In arranging plants according to a natural method, we require a thorough comparative knowledge of the form and structure of plant-organs and hence the advances made in these departments have materially aided the efforts of systematic botanists.

British and German Schools.—Robert Brown (1773–1858) was the first British botanist to support and advocate the natural system of classification. The publication of his *Prodromus Florae Novae Hollandiae* (in 1810), according to the natural method, led the way to the adoption of that method in the universities and schools of Britain. In 1827, Brown announced his important discovery of the distinction between angiosperms and gymnosperms, and the philosophical character of his work led Alexander von Humboldt to refer to him as *Botanicorum facile princeps*. In 1830, John Lindley published the first edition of his *Introduction to the Natural System of Botany* embodying a slight modification of de Candolle's system. From the year 1832 up to 1859 great advances were made in systematic botany, both in Britain and on the Continent of Europe. The *Enchiridion* and *Genera Plantarum* of S. L. Endlicher (1804–49), the *Prodromus* of de Candolle, and the *Vegetable Kingdom* (1846) of J. Lindley became the guides in systematic botany, according to the natural system.

The least satisfactory part of all these systems was that concerned with the lower plants or cryptogams, *i.e.*, plants without an obvious flower producing a seed, as contrasted with the higher or flowering plants (phanerogams). The development of the compound microscope rendered possible the accurate study of their life-histories; and the publication, in 1851, of the results of Wilhelm Hofmeister's researches on the comparative embryology of the higher Cryptogamia shed a flood of light on their relationships to each other and to the higher plants, and supplied the basis for the distinction of the great groups in ascending order Thallophyta (seaweeds, fungi, lichens) Bryophyta (mosses), Pteridophyta (ferns) and Phanerogamae (seed-bearing plants) the last named including Gymnospermae (seeds not enclosed in a fruit) and Angiospermae (seeds enclosed in a fruit).

Charles Darwin's *Origin of Species* (1859) and the consequent theory of evolution suggested a new point of view for botanists. It became evident that a natural system of classification should present not only existing relationships of plant-families but also their past relationships; a perfect system should be a genealogical tree representing the story of plant-life from its remote origin. But plant-families at the present day represent only the end branches of a great tree most of which has disappeared and the reconstruction of which with the aid of the fragments that have been preserved in the rocks must be a matter of conjecture. The study of phylogeny, *i.e.*, the reconstruction of the genealogical tree, has received much attention from botanists in recent years, some account of this will be found in the articles on the various groups GYMNOSPERMS, ANGIOSPERMS, etc.

Anatomy of Plants.—The study of the anatomy and physiology of plants did not keep pace with the advance in classification. Nehemiah Grew and his contemporary, Marcello Malpighi, were the earliest discoverers in the department of plant anatomy. Both authors laid an account of the results of their study of plant structure before the Royal Society of London almost at the same time in 1671. Malpighi's complete work, *Anatome Plantarum*, appeared in 1675 and Grew's *Anatomy of Plants* in 1682. Then for more than a hundred years the study of internal structure was neglected. In 1802 appeared the *Traité d'anatomie et de physiologie végétales* of C. F. B. de Mirbel (1776–1854), which was quickly followed by other publications by Kurt Sprengel, L. C. Treviranus (1779–1864), and others. In 1812, J. J. P. Moldenhauer isolated cells by maceration of tissues in water. The work of F. J. F. Meyen and Hugo von Mohl in the middle of the 19th century placed the study of plant anatomy on a more scientific basis. Reference must also be made to M. J. Schleiden (1804–81) and F. Unger (1800–70), while in Karl von Nägeli's investi-

gations on molecular structure and the growth of the cell membrane we recognize the origin of modern methods of the study of cell-structure included under cytology (*q.v.*). The work of Karl Sanio and Theodor Hartig advanced knowledge on the structure and development of tissues, while Anton de Bary's *Comparative Anatomy of the Phanerogams and Ferns* (1877) supplied an admirable presentation of the facts so far known. This work was made available for English readers in the translation by F. O. Bower and D. H. Scott (1884) and may be regarded as the beginning of the modern era of the study of the general arrangement of plant-tissues (anatomy) and the detailed structure of the tissues themselves (histology) which have been pursued by numerous workers in Great Britain, France, Germany and America, and in which the study of the structure of fossil plants has played an important part. This is treated in full in the article PLANTS: *Anatomy of, Modern Progress of the Subject*.

Fertilization.—The subject of fertilization was one which early excited attention. The idea of the existence of separate sexes in plants was entertained in early times, long before separate male and female organs had been demonstrated. The production of dates in Egypt, by bringing two kinds of flowers into contact, proves that in very remote periods some notions were entertained on the subject. Female date-palms only were cultivated, and wild ones were brought from the desert in order to fertilize them. Herodotus informs us that the Babylonians knew of old that there were male and female date-trees, and that the female required the concurrence of the male to become fertile. This fact was also known to the Egyptians, the Phoenicians and other nations of Asia and Africa. The Babylonians suspended male clusters from wild dates over the females; but they seem to have supposed that the fertility thus produced depended on the presence of small flies among the wild flowers, which, by entering the female flowers, caused them to set and ripen. The process was called palmification. Theophrastus, who succeeded Aristotle in his school in 322 B.C., frequently mentions the sexes of plants, but he does not appear to have determined the organs of reproduction. Pliny (A.D. 23–79) speaks particularly of a male and female palm, but his statements were not founded on any real knowledge of the organs. From Theophrastus down to Caesalpinus, who died at Rome in 1603, there does not appear to have been any attention paid to the reproductive organs of plants. Caesalpinus had his attention directed to the subject, and he speaks of a halitus or emanation from the male plants causing fertility in the female.

Nehemiah Grew seems to have been the first to describe, in a paper on the *Anatomy of Plants* read before the Royal Society in November 1676, the functions of the stamens and pistils. Grew speaks of the *attire*, or the stamens, as being the male parts, and refers to conversations with Sir Thomas Millington, Sedleian professor at Oxford, to whom the credit of the sexual theory seems really to belong. Grew says that "when the attire or apices break or open, the globules or dust falls down on the seedcase or uterus, and touches it with a prolific virtue." Ray adopted Grew's views, and states various arguments to prove their correctness in the preface to his work on European plants, published in 1694. In the same year R. J. Camerarius, professor of botany and medicine at Tübingen, published a letter on the sexes of plants, in which he refers to the stamens and pistils as the organs of reproduction, and states the difficulties he had encountered in determining the organs of cryptogamic plants. In 1703, Samuel Morland, in a paper read before the Royal Society (*Phil. Trans.* xxiii., 1474) stated that the farina (pollen) "is a congeries of seminal plants, one of which must be conveyed into every ovum before it can become prolific." In this remarkable statement he seems to anticipate in part the discoveries afterwards made as to pollen tubes. In 1711, E. F. Geoffroy, in a memoir presented to the Royal Academy at Paris, supported the views of Grew and others as to the sexes of plants (*Mém. Acad. Roy. Sci.*, 1711, 207). He states that the germ is never to be seen in the seed till the apices (anthers) shed their dust; and that if the stamina be cut out before the apices open, the seed will either not ripen, or be barren if it ripens. He mentions two experiments made by him to prove this—one by cutting off the staminal flowers in maize, and the

other by rearing the female plant of *mercurialis* apart from the male. In these instances most of the flowers were abortive, but a few were fertile, which he attributes to the dust of the apices having been wafted by the wind from other plants.

Linnaeus took up the subject in the inauguration of his sexual system. He divided plants into sexual and asexual, the former being phanerogamous or flowering, and the latter cryptogamous or flowerless. In the latter division of plants he could not detect stamens and pistils, and he did not investigate the mode in which their germs were produced. He was no physiologist, and did not promulgate any views as to the embryogenic process. His followers were chiefly engaged in the arrangement and classification of plants, and while descriptive botany made great advances the physiological department of the science was neglected. His views were not, however, adopted at once by all, for we find Charles Alston stating arguments against them in his *Dissertation on the Sexes of Plants* (1754); (See *Essays and Observations, Physical and Literary*; Medical Society of Edinburgh, i., 205 [1754]). Alston's observations were founded on what occurred in certain unisexual plants, such as *mercurialis*, spinach, hemp, hop and bryony. The conclusion at which he arrives is that the pollen is not in all flowering plants necessary for impregnation, for fertile seeds can be produced without its influence. He supports parthenogenesis in some plants. Soon after the promulgation of Linnaeus's method of classification, the attention of botanists was directed to the study of cryptogamic plants, and the valuable work of Johann Hedwig (1730-99) on the reproductive organs of mosses made its appearance in 1782. He was one of the first to point out the existence of certain cellular bodies in these plants which appeared to perform the functions of reproductive bodies, and to them the names antheridia and pistillidia were given. This opened up a new field of research, and led the way in the study of cryptogamic reproduction, which has since been much advanced by the labours of numerous workers. The interesting observations of Morland, already quoted, seem to have been neglected, and botanists were for a long time content to know that the scattering of the pollen from the anther, and its application to the stigma, were necessary for the production of perfect seed, but the stages of the process of fertilization remained unexplored, and no one attempted to raise the veil which hung over the subject of embryogeny.

In 1815, L. C. Treviranus, professor of botany in Bonn, roused the attention of botanists to the development of the embryo, but although he made valuable researches, he did not add much in the way of new information. In 1823, G. B. Amici discovered the existence of pollen-tubes, and he was followed by A. T. Brongniart (1801-76) and Robert Brown. The latter traced the tubes as far as the nucleus of the ovule. These important discoveries mark a new epoch in embryology, and may be said to be the foundation of the views now entertained, which were materially aided by the subsequent elucidation of the process of cytogenesis, or cell-development, by Schleiden, Schwann, Mohl and others. The whole subject of fertilization and development of the embryo has been more recently investigated with great assiduity and zeal, as regards both cryptogamous and phanerogamous plants, and details must be sought in the various special articles. The observations of Darwin as to the fertilization of orchids, *Primula*, *Lythrum*, and other flowering plants, and the part which insects take in this function, gave an explanation of the observations of Christian Konrad Sprengel, made at the close of the 18th century, and opened up a new phase in the study of botany, which has been followed by Hermann Müller, Federico Delpino and others. This phase of the subject, the transference of the pollen from the stamens to the stigma of the flower, is now distinguished as pollination, the term fertilization being restricted to the processes directly associated with the union of the male and female cells which occurs in all plant-groups. (An excellent handbook is Paul Knuth's *Handbook of Pollination*, Eng. trans., 1906-09.)

Physiology of Plants.—One of the earliest workers at plant physiology was Stephen Hales. In his *Vegetable Staticks* (1727) he gave an account of numerous experiments and observations which he had made on the nutrition of plants and the movement of sap. He showed that the gaseous constituents of the air con-

tribute largely to the nourishment of plants, and that the leaves are the organs which elaborate the food; the importance of leaves in nutrition had been previously pointed out by Malpighi in a short account of nutrition which forms an appendix to his anatomical work. The birth of modern chemistry in the work of J. Priestley and A. L. Lavoisier, at the close of the 18th century, made possible the scientific study of plant-nutrition, though Jan Ingenhousz in 1779 discovered that plants incessantly give out carbonic acid gas, but the green leaves and shoots only exhale oxygen in sunlight or clear daylight, thereby indicating the distinction between assimilation of carbonic acid gas (photosynthesis) and respiration. N. T. de Saussure (1767-1845) gave precision to the science of plant-nutrition by use of quantitative methods. The subjects of plant-nutrition and respiration were further studied by R. J. H. Dutrochet towards the middle of the century, and J. von Liebig's application of chemistry to agriculture and physiology put beyond question the parts played by the atmosphere and the soil in the nutrition of plants.

The phenomena of movements of the organs of plants attracted the attention of John Ray (1693), who ascribed the movements of the leaf of *mimosa* and others to alteration in temperature. Linnaeus also studied the periodical movements of flowers and leaves, and referred to the assumption of the night-position as the sleep-movement. Early in the 19th century, Andrew Knight showed by experiment that the vertical growth of stems and roots is due to the influence of gravitation, and made other observations on the relation between the position assumed by plant organs and external directive forces, and later Dutrochet, H. von Mohl and others contributed to the advance of this phase of plant physiology. Darwin's experiments in reference to the movements of climbing and twining plants, and of leaves in insectivorous plants, opened up a wide field of enquiry as to the relation between plants and the various external factors, which has attracted numerous workers. By the work of Julius Sachs and his pupils plant physiology was established on a scientific basis, and became an important part of the study of plants, for the development of which reference may be made to the article *PLANTS: Physiology*. The study of form and development has advanced under the name morphology, with the progress of which are associated the names of K. Goebel, Eduard Strasburger, A. de Bary, F. O. Bower and others (see *PLANTS: Morphology*), while more recently, as cytology (*q.v.*), the intimate study of the cell and its contents has attracted considerable attention.

Geographical Botany.—The department of geographical botany made rapid advance by means of the various scientific expeditions which have been sent to all quarters of the globe, as well as by individual effort, since the time of A. von Humboldt (see *PLANTS: Ecology and Distribution*). The question of the mode in which the floras of islands and of continents have been formed gave rise to important speculations by such eminent botanical travellers as Charles Darwin, Sir J. D. Hooker, A. R. Wallace, H. B. Guppy and others. The connection between climate and vegetation has also been studied. Quite recently, under the name of ecology, the study of plants in relation to each other and to their environment has become the subject of systematic investigation.

Study of Fossil Plants.—The subject of palaeontological botany (see *PALAEBOTANY*) has been advanced by the researches of both botanists and geologists. The nature of the climate at different epochs of the earth's history has also been determined from the character of the flora. The works of A. T. Brongniart, H. R. Goeppert and W. P. Schimper advanced this department of science. Among others who contributed valuable papers on the subject may be noticed Oswald Heer, who made observations on the Miocene flora, especially in Arctic regions; Gaston de Saporta, who examined the Tertiary flora; William Carruthers who studied the fossil Gymnosperms; Sir J. W. Dawson and Leo Lesquereux, and others who reported on the Canadian and American fossil plants. In Great Britain also W. C. Williamson, by his study of the structure of the plants of the coal-measures, opened up a new line of research which has been followed by Robert Kidston, Bertrand Renault, D. H. Scott, A. C. Seward, G. R. Wieland, C. R. Zeiller and others, and has led to important discoveries on

the nature of extinct groups of plants and also on the phylogeny of existing groups.

Study of Diseases of Plants.—Plant-pathology or the study of the diseases to which plants are subject, more especially under the frequently unnatural conditions attending cultivation, originated as a science mainly in the work of Anton de Bary on the life-history of those fungi which live parasitically on other plants (*Comparative Morphology of the Fungi, Mycetozoa and Bacteria*, Eng. trans., 1887). The science was developed by A. B. Frank and P. C. M. Sorauer in Germany, Marshall Ward in England and others, and the subject is becoming increasingly important from an economic point of view (see *PLANTS: Pathology*). A recent development has been the establishment of bureaux and institutes of Mycology for the study of diseases caused by fungi and the diffusion of information on the subject.

Study of Heredity.—The work of the Abbé Mendel in Moravia on the laws governing the transmission of characters in plant-breeding has during the last thirty years given rise to a new department of study, genetics (*q.v.*), in the development of which William Bateson took a leading part. This new development is of importance not only from a scientific aspect as throwing light on the problems of heredity (*q.v.*) but also economically from its relation to plant-breeding (*q.v.*).

Subdivisions.—Botany may be divided into the following departments:—

1. Structural, having reference to the form and structure of the various parts, including (*a*) Morphology, the study of the general form of the organs and their development—to be found treated in detail in a series of articles dealing with the great subdivisions of plants (see *ANGIOSPERMS, GYMNASPERMS, PTERIDOPHYTES, BRYOPHYTES, ALGAE, PROTOPHYTES, LICHENS, FUNGI and BACTERIOLOGY*) and the more important organs (see *STEM, LEAF, ROOT, FLOWER, FRUIT*); (*b*) Anatomy, the study of internal structure, including minute anatomy or histology (see *PLANTS: Anatomy*).

2. Cytology (*q.v.*), the intimate structure and behaviour of the cell and its contents—protoplasm, nucleus, etc

3. Physiology, the study of the life-functions of the entire plant and its organs (see *PLANTS: Physiology*).

4. Systematic, the arrangement and classification of plants (see *PLANTS: Classification*, under which reference will also be found to various special articles).

5. Distribution or Geographical Botany, the distribution of plants on the earth's surface (see *PLANTS: Ecology and Distribution*).

6. Palaeontology, the study of the fossils found in the various strata of which the earth is composed (see *PALAEOBOTANY*).

7. Ecology, the study of plants in relation to each other and to their environment (see *PLANTS: Ecology and Distribution*).

8. Plant-pathology or Phytopathology, the study of the diseases to which plants are subject (see *PLANTS: Pathology*).

9. Genetics, including plant-breeding, the study of the facts and causes of heredity (see *HEREDITY and PLANT-BREEDING*).

Besides these departments which deal with botany as a science, there are various applications of botany, such as forestry (see *FORESTS and FORESTRY*), agriculture (*q.v.*), horticulture (*q.v.*) and materia medica (for use in medicine; see the separate articles on each plant). (A. B. R.)

BOTANY BAY, an inlet on the coast of New South Wales, Australia, in lat. 34° S., c. 5 m. S of Port Jackson, which it resembles in being a drowned valley feature (Cook's and George's rivers) shut in by peninsular headlands (La Perouse and Kurnell). Historically it is of interest as marking Captain James Cook's first landing place upon Australian soil, of which he took possession in the name of the British Crown. The "Endeavour" lay off here April 29–May 7, 1770, the bays and creeks were explored, and Joseph Banks, the botanist, discovered a profusion of new flowers and plants. The bay, at first styled Sting-Ray harbour (Stingrays bay) was consequently renamed Botany bay, apparently by Cook himself upon his homeward voyage. In 1787 a penal settlement was established, and maintained there for some years until removed to near the site of Sydney. With

the growth of Sydney, the shores of Botany bay were abandoned for some time to the more unsavoury forms of industry (glue, tallow-rendering, wool-scouring works), but recently the suburbs of Sydney have flowed over and now occupy its shores. The headlands are national reserves, and Botany bay has become a pleasure resort of increasing popularity. A monument marks the traditional site of Cook's first landing.

BOTEV, CHRISTO (1847–1867), Bulgarian revolutionary and poet, was born in Kalofer, Central Bulgaria, on Dec. 24, 1847, son of a schoolmaster. Having experienced the tyranny of Turks and *chorbadjis* (rich Bulgarians), under which his poorer countrymen smarted, he went to Odessa to study (1864), but becoming involved in the Russian revolutionary movement he had to return home. His philippics against both classes of oppressor in Bulgaria were, however, so ardent that he had to fly to Rumania (1867). Here he lived in great poverty, devoting himself to the Bulgarian revolutionary movement, of which his literary genius and talent for organization made him the leader. Having been informed by optimistic colleagues in Bulgaria that the nation was ready to rise, he embarked on May 16, 1867, with 200 companions disguised as gardeners, on the Austrian steamer "Radetzky," which he seized and forced to land him at Cosludui. Dispersing irregular Turkish detachments, he reached Mt. Veslez, in the west Balkans, but was there surrounded and killed, after heroic resistance, by regular Turkish troops (May 20). Despite his failure and early death, Botev exercised an enormous influence over the Bulgarian national movement, through his personality and indefatigable literary work. His poems, in which the form is organically one with the thought, are the purest lyrics in the Bulgarian language.

BOT-FLY, the name given to flies of the family *Oestridae*, the larvae of which are parasitic in the bodies of hoofed animals. The best-known species are the horse bot-fly (*Gastrophilus equi*), the larvae inhabiting the stomach of the horse; the ox bot-fly or ox warble-fly (*Hypoderma bovis*), the larvae living under the skin of the back of cattle; and the sheep bot-fly (*Oestrus ovis*), the larvae parasitic in the nasal cavities of sheep. (See *DIPTERA; ENTOMOLOGY*.)

BOTHA, LOUIS (1862–1919), South African general and statesman, was born Sept. 27, 1862, near Greytown, Natal, of Boer parents, both of whom were children of "voortrekkers" from Cape Colony. The parents in 1869 migrated with their 13 children to Vrede in the O.F.S., and Botha got a thorough training in the rough and adventurous life of a border farmer. In 1884 he took part with Lukas Meyer in founding the New Republic in the Vryheid district of Zululand, and settled there with his bride Annie Emmett in 1886 as a farmer local official. In 1888 the New Republic joined the Transvaal, and Botha became field cornet of his district and for a short time native commissioner in Swaziland. In 1897 he was elected member for Vryheid and at Pretoria ranged himself with Joubert in opposition to Kruger's illiberal Uitlander policy and the system of shady concessions.

The South African War.—But, though he opposed the Boer ultimatum of October 1889, when war broke out Botha put all his skill and energy at the service of his people. At first a mere field-cornet under Meyer, three weeks later on Meyer's illness he succeeded him in command, under Joubert, of the forces round Ladysmith, and was responsible for the brilliant Boer successes at Colenso and Spion Kop. At the end of March 1900, after Paardeberg and Buller's entry into Ladysmith, Joubert died and Botha was put in command of the Transvaal forces. He could then do little beyond delaying Roberts's march to Pretoria, and after two final battles at Diamond Hill and Bergendal joined the Free State forces under De Wet in the guerrilla tactics which prolonged the war for over 18 months (see *SOUTH AFRICAN WAR*). But when Botha saw that victory was hopeless and annexation inevitable he welcomed the chance of making peace at Vereeniging (May 31, 1902), whereby the honour of his people was secured and their nationality preserved. And, having made peace, he was resolute in observing its terms and in co-operating frankly in the work of the British empire to which his people now belonged. Though he took no part in Crown Colony government and naturally devoted

his chief attention to the interests of the Boers, who looked on him as their leader, he was always ready to make friendly and informal representations to the government.

First Premier of the Transvaal.—When the Transvaal obtained responsible government in 1907, his *Het Volk* party won the first elections and Botha was called upon to form a ministry. One of his first duties was to attend the Colonial Conference in London, where he gained respect and sympathy by his straightforward declarations of loyalty to the empire and by his policy of racial conciliation in the colony. By his conciliatory policy in the Transvaal he promoted a better feeling between Dutch and English throughout South Africa and helped towards a closer union of the four colonies. He himself had long realized the need of such union and welcomed Lord Selborne's *Memorandum* of 1907 as a basis of discussion. The Transvaal delegation to the Convention of 1908-9, composed as it was of Dutch and English, most of whom had been fighting one another six years before, was, of all, the most effective and harmonious, owing chiefly to the tact and careful preparation of Botha and Smuts, who with their colleagues had worked out the policy which ultimately found expression in the constitution adopted. During the Convention Botha's influence was outstanding; while the final difficulty about the capital, which threatened to wreck the whole proceedings, was overcome by his personal appeal to his own die-hards.

First Premier of South Africa.—On the proclamation of the Union in May 1910 Botha was invited to form the first South African Ministry. Though he rejected the idea of a coalition ministry as impracticable at the time, he had no idea of governing solely in the interests of the Dutch; on the contrary he believed that the fusion of the two races could be best attained by showing that his South African party, mainly, but by no means entirely, Dutch in composition, could deal fairly with English as well as Dutch. Accordingly when one of his ministers made speeches provocative of racial feeling he excluded him from the ministry (Dec 1912); and he persuaded a great meeting of his party, in spite of strong opposition led by De Wet, to endorse his policy (1913).

The confidence of his own party and the Unionists' growing appreciation of his conciliatory policy gave him the needful backing in dealing with two serious domestic difficulties in 1913 and 1914. The first was the question of settlement by Indian immigrants, to which there was strong opposition in South Africa, while M. K. Gandhi, supported by the Indian Government, proved an able advocate of the Indians' views. Finally a compromise was reached with which Gandhi professed himself satisfied. The other difficulty was more serious. In July 1913 there was a strike of the white miners on the Witwatersrand, accompanied by violence and threats of a native rising. Much against his will Botha had to call on the Imperial troops to deal with a domestic difficulty, and after a collision between them and the Johannesburg mob, he and Smuts signed an unsatisfactory agreement with the strikers. In the following January a still more serious strike broke out. But this time the Government was prepared. The burgher force was called out, martial law was declared, and nine of the labour leaders were summarily deported without trial. The strike thereupon collapsed; and, though there was some criticism both in England and in South Africa at the high-handed methods of repression adopted, the South African Parliament endorsed the action taken by Botha and Smuts.

PART IN THE WORLD WAR

Defence of South Africa.—At the Imperial Conference of 1911 Botha had familiarized himself with the foreign policy and the military resources of the Empire. Accordingly, when war was declared against Germany in Aug. 1914, Botha, contrary to the view of many of his Dutch supporters, at once declared that South Africa, as a part of the Empire, was at war also. He offered to assure the defence of South Africa by the Union forces alone, so that the Imperial troops might be recalled for service in Europe. Further, on the invitation of the Imperial Government, he agreed to invade German Southwest Africa. But this was much further than a section of the Dutch in South Africa were prepared to go.

While preparations were being made for the campaign, C. F. Beyers, the commandant-general of the Union forces, and S. G. Maritz, the commander on the German border, revolted and in October were joined by De Wet.

Before the end of the year it is estimated that 12,000 rebels were in arms in the Transvaal and the Free State. Though all the leaders and most of the rank and file of the rebels had been his comrades in the South African War, Botha never hesitated as to his duty to suppress the rising. But, to avoid racial feeling as much as possible, he employed purely Dutch commandos of his loyal followers for the purpose. Moreover, in the two short campaigns in the Transvaal and the Free State he took command himself, saying, "It is my duty and it is the only thing for me to do." Little fighting was needed to quell the revolt: on Oct. 28 he defeated Beyer's force in the Transvaal; early in November he took the field against De Wet in the Free State; and on Dec. 2, De Wet himself was captured; while on Feb. 3 1915 Maritz's force surrendered. After this brief civil war, described by Botha as "the saddest experience of his life," he showed a wise clemency in his punishment of the leaders and at the end of two years had released all the prisoners.

Conquest of Southwest Africa.—He then turned his attention to the conquest of German Southwest Africa, delayed by the rebellion, and again took the chief command. He divided the Union forces, this time composed of men from both white races, into four columns, he himself taking under his immediate orders the column that started from Walvis Bay. In March 1915 the four columns started on a converging movement into the country, sweeping all the Germans before them. The chief difficulty came from the sandy and largely waterless country, which, in spite of an excellent organization of transport and commissariat, told heavily on the troops. Most of the fighting fell to Botha's own column, which occupied Windhoek on May 12 and obtained the final surrender of the German forces on July 9, 1915. After this Botha took no further share in active fighting, though with Smuts he helped to organize the South African Brigade for service overseas as well as the expeditionary force sent to German East Africa.

He was indeed much needed at home, for after the election of Oct. 1915, when his majority was seriously reduced, he had no easy task in governing the country, partly with the support of the Unionists. Some of his Dutch supporters were still discontented, and in 1916 and again in 1918 created trouble which, under anyone but Botha, might have led to another rising. His last voyage to Europe was to attend the peace negotiations of Versailles in 1919, as one of the delegates for South Africa. There he impressed all those present by his sound judgment, always used on the side of moderation, especially towards the conquered foe; for he never forgot that his own people also had been conquered and, as he said on signing at Versailles on June 28, 1919, "To-day I look back in thought to May 31, 1902."

He landed at Cape Town on July 24, already a very sick man, and on Aug. 28, 1919, died at his beloved farm, Rusthof in the Transvaal. The secret of Botha's power over every man who came into contact with him was his absolute sincerity, due to his simple belief in the guiding hand of God, combined with a chivalry and courtesy springing from a truly loving nature. "Never kill a man if you can capture him, or he will never have a chance to be sorry," was one of his sayings, illustrated by his every action. The service of this noble man to Britain and to South Africa can hardly be exaggerated. He fought a clean fight to the end against the whole might of Britain, but having once given his word to become with his people a part of the empire, he was better than his bond, and added to the best traditions of British statesmanship by his example, especially in doing all that in him lay to weld into one harmonious nation the Dutch and British elements in South Africa. "You in England," he said in 1911, "have given us the hand of friendship, and we have taken it and shall not let it go."

BOTHNIA, GULF OF, the northern part of the Baltic sea (*q.v.*). The name is preserved from the former territory of Bothnia, of which the western part is now included in Sweden, the eastern in Finland.

BOTHROP, a mining town in the extreme south-west of the district of Münster, in the Prussian province of Westphalia, Germany. Pop. (1925) 77,197.

BOTHWELL, JAMES HEPBURN, 4TH EARL OF (c. 1536–1578), duke of Orkney and Shetland, husband of Mary, queen of Scots, son of Patrick, 3rd earl of Bothwell, and of Agnes, daughter of Henry, Lord Sinclair, was born about 1536.

James Hepburn succeeded in 1556 to his father's titles, lands and hereditary offices, including that of lord high admiral of Scotland. Though a Protestant, he supported the government of Mary of Guise, shewed himself violently anti-English, and led a raid into England, subsequently in 1559 meeting the English commissioners and signing articles for peace on the border. The same year he seized £1,000 secretly sent by Elizabeth to the lords of the congregation. In retaliation Arran occupied and stripped his castle at Crichton, whereupon Bothwell in November sent Arran a challenge, which the latter declined. In December he was sent by the queen-dowager to secure Stirling, and in 1560 was despatched on a mission to France, visiting Denmark on the way, where he either married or seduced Anne, daughter of Christopher Thorsen, whom he afterwards deserted, and who came to Scotland in 1563 to obtain redress. He joined Mary at Paris in September, and in 1561 was sent by her as a commissioner to summon the parliament; in February he arrived in Edinburgh and was chosen a privy councillor on Sept. 6. He now entered into obligations to keep the peace with his various rivals, but was soon implicated in riots and partisan disorders, and was ordered in December to leave the city. In March 1562, having made up his quarrel with Arran, he was accused of having proposed to the latter a project for seizing the queen, and in May he was imprisoned in Edinburgh castle whence he succeeded in escaping on Aug. 28. On Sept. 23 he submitted to the queen. Moray's influence, however, being now supreme, he embarked in December for France, but was driven by storms on to Holy island, where he was detained, and was subsequently, on Jan. 18 1564, seized at Berwick and sent by Elizabeth to the Tower, whence he was soon liberated and proceeded to France. After these adventures he returned to Scotland in March 1565, but withdrew once more before the superior strength of his opponents to France. The same year, however, he was recalled by Mary to aid in the suppression of Moray's rebellion, successfully eluding the ships of Elizabeth sent to capture him. In Feb. 1566 Bothwell, in spite of his previous matrimonial engagements—and he had also been united by "handfasting" to Janet Betoun of Cranstoun Riddell—married Jane, daughter of George Gordon, 4th earl of Huntly. Notwithstanding his insulting language concerning Mary and the fact that he was the "stoutest" in refusing mass, he became one of her chief advisers, but his complete ascendancy over her mind and affections dates from the murder of Rizzio on March 9 1566. Mary took refuge with him at Dunbar, presented him, among other estates, with the castle there and the chief lands of the earldom of March, and made him the most powerful noble in the south of Scotland. In November she visited him at Dunbar, and in December took place the conference at Craigmillar at which both were present and at which the disposal of Darnley was arranged, Bothwell with some others subsequently signing the bond to accomplish his murder. He himself superintended all the preparations, visiting Darnley with Mary on the night of the crime, Sunday, Feb. 9 1567, attending the queen on her return to Holyrood for the ball, and riding back to Kirk o' Field to carry out the murder. After the explosion he hurried back to Holyrood and feigned surprise at the receipt of the news half an hour later.

According to Melville he had designs on the life of the young prince. On the demand of Lennox, Darnley's father, Bothwell was put upon his trial in April, but Lennox, having been forbidden to enter the city with more than six attendants, refused to attend, and Bothwell was declared not guilty. The queen's in-

tention to marry Bothwell, which had been kept a strict secret before the issue of the trial, was now made public. On April 19 he obtained the consent and support of the Protestant lords, who signed a bond in his favour. On May 3 his divorce from his wife was decreed by the civil court, on the ground of his adultery with a maidservant, and on the 7th by the Roman Catholic court on the ground of consanguinity. On the 12th Bothwell was created duke of Orkney and Shetland and the marriage took place on the 15th according to the Protestant usage, the Roman Catholic rite being performed, according to some accounts, afterwards.

Bothwell's triumph, however, was short-lived. The nobles, both Protestant and Roman Catholic, now united to effect his destruction. In June Mary and Bothwell fled from Holyrood to Borthwick castle, whence Bothwell, on the place being surrounded by Morton and his followers, escaped to Dunbar, Mary subsequently joining him. Thence they marched with a strong force towards Edinburgh, meeting the lords on June 15 at Catterberry Hill. Bothwell invited any one of the nobles to single combat, but Mary forbade the acceptance of the challenge. Meanwhile, during the negotiations, the queen's troops had been deserting; a surrender became inevitable, and Bothwell returned to Dunbar, parting from Mary for ever. Subsequently Bothwell left Dunbar for the north, visited Orkney and Shetland, and in July placed himself at the head of a band of pirates, and after eluding all attempts to capture him, arrived at Karm sound in Norway. On his identity becoming known he was sent to Copenhagen, where he gained King Frederick II.'s goodwill by an offer to restore the Orkneys and Shetlands to Denmark. In consequence the king refused all requests for his surrender. In Jan. 1568 he was removed to Malmö in Sweden. Mary demanded a divorce which was finally granted by the pope in Sept. 1570 on the ground of her prenuptial ravishment by Bothwell. After the downfall of Mary, Bothwell was placed in close and solitary confinement in the castle of Dragsholm or Adelsborg in Zealand. Here he became insane, and died on April 14 1578.

BOTHWELL, a town and parish of Lanarkshire, Scotland, on the right bank of the Clyde, 9m. E.S.E. of Glasgow by the L. N. E. R. and the L. M. S. R., and a residential quarter of Glasgow. Pop. of parish (1921) 60,256. The choir of the Gothic church of 1398 (restored at the end of the 19th century) forms a portion of the parish church. Joanna Baillie, the poetess, was born in the manse. On June 22, 1679, at the battle of Bothwell bridge between the Royalists, under the duke of Monmouth, and the Covenanters, the latter lost 500 killed and 1,000 prisoners. Near this bridge, on "Bothwell bank," are the picturesque Gothic ruins of Bothwell castle that once belonged to James Hamilton of Bothwellhaugh (fl. 1566–80), the assassin of the regent Moray; and near the present farmhouse the South Calder is spanned by a Roman bridge.

BOTOCUDOS, the foreign name for a tribe of South American Indians of eastern Brazil, also known as the Aimores or Aimbores. They appear to have no collective tribal name for themselves. Some are called Nacnanuk or Nac-poruk, "sons of the soil." The name Botocudos (from Port. *botoque*, a plug, owing to their practice of wearing wooden plugs in their lips and ears), cannot be traced much farther back than the writings of Prince Maximilian von Neuwied (*Reise nach Brasilien*, Frankfurt-on-Main, 1820).

The original home of the tribe comprised most of the present province of Espirito Santo, and reached inland to the headwaters of Rio Grande (Belmonte) and Rio Doce on the eastern slopes

of the Serra do Espinhaço, but the Botocudos are now mainly confined to the country between Rio Pardo and Rio Doce.

The Botocudos are nomads, wandering naked in the woods and living on forest products. They are below the medium height, but broad-shouldered. They are Mongolian in appearance, having flat faces, high cheekbones and light, yellowish-brown skin. (See BRAZIL; SOUTH AMERICA: *Ethnology*)

Anthropol. Instit.* vol. xiii. (1884); J. R. Peixoto, *Novos Estudos Craniológicos sobre os Botocudos* (Rio de Janeiro, 1882); Prof. C. F. Hartt, *Geology and Physical Geography of Brazil* (Boston, 1870), pp. 577-606.

BOTORI, a Japanese game played in schools, by two sides of equal number, usually about 100, each of which defends a pole about 8ft. high firmly set in the ground, the poles being about 200yds. distant from each other. The object of each party is to overthrow the adversary's pole while keeping its own upright. Pulling, hauling, and wrestling are allowed, but no striking or kicking. A game similar in character is played by the Sophomore and Freshman classes of Amherst college (Massachusetts), called the "flag-rush." Other American colleges have similar contests during the first semester of the college year. To gain possession of the opponent's pole gives the victorious class certain privileges during the ensuing term.

BOTOSANI, a town of Rumania, capital of the department of the same name; on a small tributary of the River Jijia, and in one of the richest agricultural and pastoral regions of the north Moldavian hills. Pop. (1924) 36,000. Botosani lies on a branch railway between Dorohoi and the main line from Cernowitz to Galatz, and does a considerable transit trade. It has extensive starch and flour mills; and its flour is highly prized in Rumania, besides being largely exported to Turkey and the United Kingdom. Botosani owes its name to the Mongol chief, Batu Khan, grandson of Jenghiz Khan, who occupied the country in the 13th century. There are large colonies of Armenians and Jews.

BO-TREE or **BODHI-TREE**, the name given by the Buddhists of India and Ceylon to the Pipul or sacred wild fig (*Ficus religiosa*). It was a tree of this species beneath which the Buddha is traditionally supposed to have attained perfect knowledge. The Bo-tree at the ruined city of Anuradhapura, 80m. N. of Kandy, grown from a branch of the parent tree sent to Ceylon from India by King Asoka in the 3rd century B.C., is still worshipped by pilgrims who come long distances to revere it. Usually a bo-tree is planted on the graves of the Kandy monks.

BOTRYTIS, a minute fungus which appears as a brownish-grey mould on decaying vegetation or on damaged fruits. Under a hand-lens it is seen to consist of tiny, upright, brown stalks which are branched at the tips, each branchlet being crowned with a naked head of pale-coloured spores. It is very common, growing everywhere in the open or in greenhouses, and can be found at almost any season. It has a bad record as a plant disease. The fungi placed in one genus *Botrytis* are in part stages in the life-history of members of the genus *Sclerotinia*. These are characterized by the possession of a *sclerotium*, which is a compact mass of fungal filaments from which a cup-like ascophore arises. (See *Ascomycetes* in article FUNGI)

BOTTA, CARLO GIUSEPPE GUGLIELMO (1766-1837), Italian historian, was born at San Giorgio Canavese in Piedmont. In 1786 he received his M.D. from Turin. In 1795 he withdrew to France, only to return to his native country as a surgeon in the French army, whose progress he followed as far as Venice. Here he joined the expedition to Corfu, from which he did not return to Italy till 1798. After 1814 he became a French citizen, and in 1817 he was appointed rector of the University of Rouen, but in 1822 was removed owing to clerical influence. In 1824 he published *Storia d'Italia dal 1789 al 1814*, on which his reputation principally rests. His continuation of Guicciardini (*Storia d'Italia in continuazione al Guicciardini, 1832*) is a careful and laborious work, but is not based on original authorities and is of small value. Though living in Paris he was in both these works the ardent exponent of that recoil against everything French which took place throughout Europe.

His son, **PAUL ÉMILE BOTTA** (1802-70), was a distinguished traveller and Assyrian archaeologist, whose excavations at Khorsabad (1843) were among the first efforts in the line of investigation afterwards pursued by Layard.

See C. Dionisiotti, *Vita di Carlo Botta* (Turin, 1867); C. Pavese, *Carlo Botta e le sue opere storiche* (Florence, 1874); Scipione Botta, *Vita privata di Carlo Botta* (Florence, 1877); A. d'Ancona e O. Bacchi, *Manuela della Letteratura Italiana* (Florence, 1894), vol. v., pp. 245 seq.

BOTTESINI, GIOVANNI (1823-1889), Italian contrabassist and musical composer, was born at Crema, Lombardy, Dec. 24, 1823. He studied at the Milan conservatoire, devoting himself especially to the double-bass. On leaving Milan he spent some time in America. His first opera, *Cristoforo Colombo*, was produced in 1847 at Havana. In 1849 he made the first of many appearances in England, where he enjoyed great popularity for many years in virtue of his extraordinary power as a double-bass virtuoso. Apart from his triumphs as an executant, Bottesini was a conductor of European reputation. He directed the first performance of Verdi's "Aida" at Cairo in 1871, and earned some success as a composer. He died at Parma, July 7, 1889.

BOTTICELLI, SANDRO, properly **ALESSANDRO DI MARIANO DEI FILIPEPI** (1444-1510), Florentine painter, was born at Florence in 1444, in a house in the Via Nuova, Borg' Ognissanti. This was the home of his father, Mariano di Vanni dei Filipepi, a struggling tanner. Sandro, the youngest child but one of his parents, derived the name Botticelli, by which he was commonly known, not, as related by Vasari, from a goldsmith to whom he was apprenticed, but from his eldest brother Giovanni, a prosperous broker, who seems to have taken charge of the boy, and who for some reason bore the nickname *Botticello* or Little Barrel. A return made in 1457 by his father describes Sandro as aged thirteen, weak in health, and still at school (if the words *sta al legare* are to be taken as a misspelling of *sta al leggere*, otherwise they might perhaps mean that he was apprenticed either to a jeweller or a bookbinder). Having shown an irrepressible bent towards painting, he was apprenticed in 1458-59 to Fra Filippo Lippi, in whose workshop he remained as an assistant apparently until 1467.

Some authorities hold that he must have attended for a while the much-frequented workshop of Verrocchio. But the "Fortitude" is the only authenticated early picture in which the Verrocchio influence may perhaps be traced. Like other artists of his time in Florence, Botticelli had begun to profit by the patronage of the Medici family. For the house of Lorenzo il Magnifico in the Via Larga he painted a decorative piece of Pallas with lance and shield. This is probably the fine picture of "Pallas and the Centaur," rediscovered after remaining for many years in the private apartments of the Pitti Palace and now in the Uffizi. But Sandro's more especial patron was another Lorenzo, the son of Pierfrancesco de Medici. For the villa of this younger Lorenzo at Castello Botticelli painted about 1477-78 the famous picture of "Primavera" or Spring now in the Uffizi at Florence. The design was inspired by Poliziano's poem the "Giostra" with reminiscences of Lucretius and of Horace (perhaps also, as has lately been suggested, of the Late Latin "Mythologikon" of Fulgentius). Venus, fancifully draped, with Cupid hovering above her, stands in a grove of orange and myrtle and welcomes the approach of spring who enters heralded by Mercury, with Flora and Zephyrus gently urging her on. In 1480 he painted in rivalry with Ghirlandaio a grand figure of St. Augustine on the choir screen of the Ognissanti, afterwards removed to another part of the church. About the same time we find clear evidence of his contributing designs to the workshops of the "fine-manner" engravers in the shape of a beautiful print of the triumph of Bacchus and Ariadne adapted from an antique sarcophagus (the only example known is in the British Museum) as well as in nineteen small cuts executed for the edition of Dante with the commentary of Landino printed at Florence in 1481 by Lorenzo della Magna.

At this time Botticelli was called to Rome to take part with other leading artists of the time (Ghirlandaio, Cosimo Rosselli, Perugino and Pinturicchio) in the decoration of Sixtus IV's chapel at the Vatican, the ceiling of which was afterwards destined to be

the field of Michelangelo's noblest labours. During the time of his stay in Rome (1481-82) Botticelli is recorded also to have painted another "Adoration of the Magi," his fifth or sixth embodiment of the same subject. Returning to Florence towards the end of 1482 Botticelli worked there for the next ten years until the death of Lorenzo Il Magnifico in 1492. To 1482-83 belongs the fine altar-piece of San Barnabo (a Madonna and Child with six saints and four angels), now in the Uffizi. Very nearly of the same time must be the most popular and most often copied, though very far from the best-preserved of his works, the round picture of the Madonna with singing angels in the Uffizi, known from the text written in the open choir-book as the "Magnificat." Somewhere near this must be placed the beautiful and highly-finished drawing of "Abundance" which has passed into the British Museum, as well as a small Madonna in the Poldi-Pezzoli collection at Milan, and the fine full-faced portrait of a young man, probably some pupil or apprentice in the studio, at the National Gallery. His superb altar-piece of the Madonna between the two saints John, now in the Berlin gallery, was painted for the Bardi chapel in the church of San Spirito in 1486. In the same year he helped to celebrate the marriage of Lorenzo Tornabuoni with Giovanna degli Albizzi by an exquisite pair of symbolic frescoes, the remains of which, after they had been brought to light from under a coat of whitewash on the walls of the Villa Lemmi, were removed in 1882 to the Louvre. Within a few years of the same date (1485-88) should apparently be placed that second masterpiece of fanciful classicism done for Lorenzo di Pierfrancesco's villa at Castello, the "Birth of Venus," now in the Uffizi, the design of which seems to have been chiefly inspired by the "Stanze" of Poliziano, perhaps also by the "Pervigilium Veneris"; together with the scarcely less admirable "Mars and Venus" of the National Gallery, and the most beautiful and characteristic of all his Madonnas the roundel of the "Virgin with the Pomegranate" (Uffizi). "The Annunciation" from the convent of Cestello now in the Uffizi, shows a design adapted from Donatello. The great altar-piece in the Uffizi with its *predelle* commissioned by the Arte della Seta in 1488 and finished in 1490 with the incomparable ring of dancing and quiring angels encircling the Virgin in the upper sky, is the last of his large altar-pieces.

Chiefly between the years of 1492 and 1495, the master undertook a set of drawings in illustration of Dante on a far more elaborate and ambitious plan than the little designs for the engraver which had been interrupted in 1481. Eighty-five of these drawings are in the famous manuscript acquired for the Berlin museum at the sale of the Hamilton Palace collection in 1882, and eleven more in the Vatican library at Rome. The series is one of the most interesting that has been preserved by any ancient master; it reveals an intimate knowledge of and profound sympathy with the text, full of Botticelli's characteristic poetic yearning and vehemence of expression, his half-childish intensity of vision; exquisite in lightness of touch and in swaying, rhythmical grace of linear composition and design. Most of the drawings remain in pen outline only, over a light preliminary sketch with the lead stylus; all were probably intended to be finished in colour, as a few actually are. To the period of these drawings would seem to belong the famous "Calumny of Apelles" at the Uffizi, inspired no doubt by some contemporary translation of the text by Lucian, and equally remarkable by a certain feverish energy in its sentiment and composition, and by its exquisite finish and richness of execution and detail.

Simone di Mariano, a brother of Botticelli long resident at Naples, returned to Florence in 1493 and shared Sandro's home in the Via Nuova. He soon became a devoted follower of Savonarola, and has left a manuscript chronicle which is one of the best sources for the history of the friar and of his movement. Sandro himself seems to have remained aloof from the movement almost until the date of the execution of Savonarola and his two followers in 1498. At least there is clear evidence of his being in the confidence and employ of Lorenzo di Pierfrancesco so late as 1496 and 1497, which he could not possibly have been had he then been an avowed member of the party of the Piagnoni. After Lorenzo's return, following on the overthrow and death of Savonarola

in 1498, we find no trace of any further relations between him and Botticelli, who by that time would seem to have become a declared devotee of the friar's memory.

The mystic vein of religious and political speculation into which Botticelli had by this time fallen has its finest illustration in the beautiful symbolic "Nativity," which passed in succession from the Aldobrandini, the Ottley, and the Fuller Maitland collections into the National Gallery in 1882 with the apocalyptic inscription in Greek which the master has added to make his meaning clear. In a kindred vein is a much-injured symbolic "Magdalene at the foot of the Cross" in private possession at Lyons. Other extant pictures by the master are four panels illustrating the story of St. Zenobius, of which one is at Dresden, two are in the National Gallery, London, one is in the Metropolitan Museum, New York, and the fourth is in the collection of Lord Lee of Fareham. In 1503-04 Botticelli served on the committee of artists appointed to decide where the colossal David of Michelangelo should be placed. In these and the following years we find him paying fees to the company of St. Luke, and the next thing recorded of him is his death, followed by his burial in the Ortaccio or garden burial-ground of the Ognissanti in May 1510. The story of his work and life is fully elucidated in the work of Mr. H. P. Horne—a masterpiece of documentary research and critical exposition.

BÖTTIGER, KARL AUGUST (1760-1835), German archaeologist, was born at Reichenbach on June 8, 1760, and died at Dresden on Nov. 17, 1835. In 1791 he was appointed rector of the gymnasium at Weimar, where he entered into a circle of literary men, including Wieland, Schiller, and Goethe. In 1804 he was called to Dresden as superintendent of the studies of the court pages. In 1814 he was made director of studies at the court academy, and inspector of the Museum of Antiquities.

His chief works are:—*Sabina, oder Morgenszenen im Putzzimmer einer reichen Römerin* (1803); *Griechische Vasengemalde* (1803); *Ideen zur Archäologie der Malerei*, 1. (1811) (no more published); *Kunstmythologie* (1811); *Vorlesungen und Aufsätze zur Alterthumskunde* (1817); *Amalthea* (1821-25); *Ideen zur Kunstmythologie* (1826-36). The *Opuscula et Carmina Latina* were published separately in 1837, with a collection of his smaller pieces, *Kleine Schriften* (1837-38), including a complete list of his works (56 pages). His biography was written by his son Karl Wilhelm Böttiger (1790-1862), for some time professor of history at Erlangen, and author of several valuable historical works.

BOTTLE, a vessel for containing liquids, generally as opposed to one for drinking from (though this probably is not excluded) and with a narrow neck to facilitate closing and pouring. The first bottles were probably made of the skins of animals. In the *Iliad* (iii. 247) the attendants are represented as bearing wine for use in a bottle made of goat's skin. The ancient Egyptians used skins for this purpose, and from the language employed by Herodotus (ii. 121) it appears that a bottle was formed by sewing up the skin and leaving the projection of the leg and foot to serve as a vent, which was hence termed *ποδών*. The aperture was closed with a plug or a string. Skin bottles of various forms occur on Egyptian monuments. The Greeks and

Romans also were accustomed to use bottles made of skins; and in the southern parts of Europe they are still used for the transport of wine. The first explicit reference to bottles of skin in Scripture occurs in Joshua (ix. 4), where it is said that the Gibeonites took "old sacks upon their asses, and wine-bottles old and rent and bound up." The objection to putting "new wine into old bottles" (Matt. ix. 17) is that the skin, already stretched and weakened by use, is liable to burst under the pressure of the gas from new wine. Skins are still most extensively used throughout western Asia for the conveyance and storage of water. It is an error to represent the bottles of the ancient Hebrews as being made exclusively of skins. In Jer. xix. 1 the prophet speaks of "a potter's earthen vessel." The Egyptians (see EGYPT: *Art and Archaeology*) possessed vases and bottles of hard stone, alabaster, glass, ivory, bone, and porcelain, bronze, silver and gold, and also of glazed pottery or common earthenware. In modern times bottles are usually made of glass, etc., occasionally of earthenware. The glass bottle industry has attained enormous dimensions, whether for wine, beer, or mineral waters; and labour-saving machinery for blowing and filling the bottles has been introduced, as well as for corking or stoppering, for labelling, and for washing them. (See BOTTLE MANUFACTURE.)

BOTTLE-BRUSH PLANTS, a genus of Australian plants, known botanically as *Callistemon*, and belonging to the myrtle family (Myrtaceae). They take their name from the resemblance of the head of flowers to a bottle-brush. They are well known in cultivation as greenhouse shrubs; the flower owes its beauty to the numerous long thread-like stamens which are much larger than the small petals. There are 12 species.

BOTTLE MANUFACTURE.

Many glass articles are covered by the term "bottle" as used in the industry, wide-mouth bottles, jars and cheap glass tumblers used as containers for jam or other foodstuffs being included, whilst the capacities run from a fraction of a fluid ounce for bottles to 15 gallons for carboys. The industry is widespread and constitutes a relatively important part of glass manufacture. Evidence of this is seen in the following table:

GLASS BOTTLE FACTORIES IN DIFFERENT COUNTRIES OF THE WORLD

| | Total glass factories. | Bottle factories. | Date of record. |
|----------------|------------------------|-------------------|-----------------|
| U.S.A. | 310 | 120 | 1925 |
| Canada | 10 | 6 | 1925 |
| Great Britain | 143 | 83 | 1927 |
| Germany | 355 | 46 | 1924 |
| Holland | 21 | 6 | 1925 |
| France | 120 | 30 | 1927 |
| Czechoslovakia | 188 | 13 | 1926 |
| Sweden | 50 | 12 | 1925 |
| Poland | 86 | 51 | 1925 |
| Austria | 27 | 9 | 1925 |
| Rumania | 23 | 10 | 1925 |

The Soviet Union *Year Book* for 1927 states that for the year 1925-26, 89,478 tons of bottles were manufactured, the total weight of all glass articles being 234,693 tons.

In England, bottle-making has for long constituted a very important branch of glassmaking. It is computed that 240,000 dozen bottles were produced in England in 1695 and Houghton, in his

FROM BAKER, "BLACK JACKS AND LEATHER BOTTLES"

15TH CENTURY LEATHER BOTTLE FOUND IN THE TOWN DITCH, AT THE OLD BAILEY, LONDON, IN 1913

17TH CENTURY BOTTLE This odd leather bottle is said to represent Charles II.

Letters on Trade (1696), gives a list of 88 glass factories, of which 39 made bottles. Statistics derived from the excise period when glass was taxed show that in 1770 the weight of common bottles was 283,540cwt. out of a total glass production of 411,050cwt.; in 1800, 314,150cwt. out of 487,850cwt.; and in 1840 (a year of more than average production), 462,070cwt. out of 728,000cwt.

Statistics of production in recent times are available only for Great Britain, the United States and Canada, obtained by a census of production. The latest available data for the U.S. and Great Britain are:

| Census date | Country. | No. of bottle factories. | Bottle type. | Quantity (gross). | Value. |
|-------------|----------------|--------------------------|------------------------------------|-------------------|---------------|
| 1925 | U.S.A. | 120 | Prescriptions and drugs | 4,756,661 | \$15,037,247 |
| | | | Beverage | 4,063,780 | 18,594,646 |

An idea of the very great increase in productive efficiency obtained by the wholesale introduction of machinery is gained from the fact that in 1899 the number of wage earners in the U.S. bottle industry was 28,370 and the production 7,780,000 gross, whereas in 1925 the wage earners numbered only 21,704, but the bottles made numbered 26,044,000 gross. In Great Britain the productive efficiency has also been greatly raised. Several factories now make three-quarters of a million bottles and more per week. On the continent of Europe, efforts are being made to follow the lead set by the U.S. and by Great Britain to stimulate output by the greater use of automatic machinery.

In the United States, the value of the glass bottle (or glass container) production (\$100,301,407) is greater than of either plate glass or ordinary window glass, and only a little less than the total (\$107,961,501) for all forms of sheet glass. The same is true of Great Britain, the aggregate for all forms of sheet glass being £6,058,000. The United States is the greatest producer in the world of glass bottles or containers as she is of sheet glass in its various forms.

Constituents of Glass for Bottles.—Glass for bottle-making is composed chiefly of three oxides, namely, silica (the chemical compound which constitutes quartz or silver sand), soda (sodium oxide) and lime (or calcium oxide). Other oxides may be present and their amount, as well as that of the chief constituents, is controlled by various factors including (a) the colour required, (b) the size of the bottle, (c) the method of manipulating the glass, whether by hand or by machine, (d) the conditions to which the bottle is to be subjected in use.

For making colourless glass, sand containing not more than 0.05-0.06% of iron oxide must be employed; the iron oxide in the source of lime should not exceed 0.1%—in Great Britain it is usually kept below 0.05%—the iron oxide in the glass should not be more than 0.09%. Pale green bottle glass may contain between 0.15 and 0.5% of iron oxide (ferric oxide). The dark green

bottles made in Great Britain and Europe for beer or whisky or wine contain usually 1.5-2.5%. Inferior sands may conveniently be used for dark green bottle glass. These impure sands also introduce alumina, from the clay or other mineral residues associated with them, which bestows on the glass toughness and diminished tendency to crystallize. In bottle factories on the Continent alumina is added to glassmaking mixtures in the form of some aluminous mineral, such as phonolith, disintegrated granite or volcanic rocks. Finally, the lime employed may contain magnesia. Indeed, in the Eastern U.S., the commercial limes most free from iron oxide are the dolomitic or magnesian limestones, and these are accordingly used widely there in making colourless glass.

The shades of green imparted by iron oxide may be modified by black oxide of manganese (2-3% in the glass), by which an olive green or golden green may be obtained according to both the relative and the total amounts of the oxides. The so-called "actinic" green glass is made by the addition of chromium oxide; such glass is melted in pot furnaces (*see below*). Amber glass melted in pots is usually coloured by a mixture of iron oxide (1.5-2.5% in the glass) and manganese oxide (2-4%); or, in tank furnaces, by a mixture of carbon (as coal, or graphite) and sulphur. Blue bottle glass is obtained by the addition of a small amount of cobalt oxide.

The chief raw materials for bottle glass are sand, soda ash (sodium carbonate), saltcake (sodium sulphate) and limestone or burnt lime or slaked lime. A mixture from which colourless glass for automatic machine operation is made contains: sand (iron oxide less than 0.06%) 1,000; soda ash 330-400; saltcake 10-15; pure limestone 180-230 (or 100-130 if burnt lime); white arsenious oxide 0-2. In addition, 300-600 parts of broken waste (colourless) glass, known as cullet, are added. To neutralize the greenish tinge of even small amounts of iron oxide, a "decolourizer" is added, containing essentially the element selenium with cobalt oxide, on the average about $\frac{1}{2}$ to 1 oz. of the former and $\frac{1}{16}$ oz. of the latter per 1,000 lb. of sand.

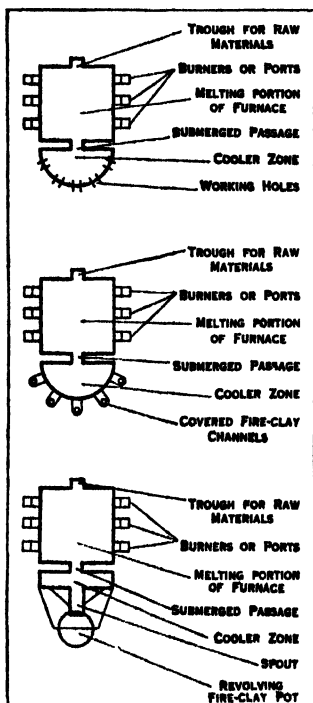

An increase in the lime content and reduction in the soda content increases the rate of setting of the glass, and hand-made bottles usually contain more lime and less soda than the automatic machine-made. Soda increase reduces the resistance of the glass bottles to the action of water or of fluid preparations placed in them, and bottles or jars should not contain more than 18% soda. Milk bottles and food containers which have to be processed under steam pressure should contain less than 17%.

Melting the Glass.—In modern plants the raw materials are weighed out and mixed in rotating drums, the broken cullet often being added at this stage. The melting may be done in fireclay pots in pot furnaces for the special qualities of chemists' bottles, but probably 98-99% of all bottle glass is now melted in tank furnaces (*see GLASS*). Figs. 1, 2 and 3 are outline sectional plans of such furnaces, the first for supplying hand-workers or semi-automatic machines, the second for gravity-fed machines, the third for Owens or Redfern machines.

The mixture of raw materials is fed into the melting portion of the furnace, heated by crossflames emerging from burners or

ports, travels forward by a submerged passage into a cooler zone, and thence either to "working holes" or, by way of covered fire-clay channels or a revolving shallow fireclay pot, to machines. Of gravity-fed automatic machines one up to eight may be operated by a single furnace; of Owens machines one or two.

Making the Bottle by Hand.—In making the bottle by hand the precise quantity of glass for the bottle is skilfully gathered

Fig. 2 (centre)—For automatic machines charged by glass feeding devices
Fig. 3 (below)—For Owens or Redfern machine (heating arrangement for revolving pot not shown)

FIG. 4.—DIAGRAMMATIC PLAN OF A GLASS PRESSING MACHINE

by rotation as a ball on the end of an iron blowpipe, like treacle on a spoon, smoothed by rolling on a smooth slab of iron or stone (called a "marver"), and distended by blowing a cavity into

FIG. 5.—DIAGRAM OF A PRESS-AND-BLOW MACHINE OPERATION

it and subsequently swinging the marvered glass until it is pear-shaped. It is then lowered into a hinged iron mould which is closed round it, and the glass is fully blown up to shape. The ragged-edged neck, as broken from the pipe, is next softened in a small subsidiary furnace and the soft glass pressed back by a tool to form a smooth, thickened lip. Thus the body is made first and the neck last.

Modern Bottle-Making Machines.—In machines, whether semi- or fully automatic, the neck is made first. Certain types of wide-mouth glass containers are made on automatic presses consisting essentially of a series of moulds (eight or ten) mounted on a circular rotating table with compressed air-operated plungers which descend into the molten glass and press out the article required (fig. 4).

FIG. 6.—DIAGRAM OF PRESS-AND-BLOW MACHINE OPERATION, SHOWING THE FINAL STAGE

With other machines the operations are three, namely, the formation of (a) the neck, (b) the parison or embryo of the body, (c) the completely blown-up and finished bottle, although processes (a) and (b) are combined. Corresponding to each of these operations is a separate cast-iron mould, namely, a neck or ring mould, a parison or blank mould, and a finishing mould. The neck mould is always fitted to the parison mould, above it when used in conjunction with a press-and-blow machine or when the

parison mould is filled by suction in a blow-and-blow machine.

In the press-and-blow machines (Hartford-Empire, W. J. Miller, Edward Miller and Moorshead machines), the complete parison (with neck) is made by a plunger which descends into the molten glass contained in the mould (fig. 5). It is then lifted out mechanically from the parison mould, transferred to the finishing mould and blown up to full size (fig. 6) by compressed air (about 40 lb. pressure). All the moulds are hinged, and open and shut automatically.

In the suction-filled parison mould adopted in the machines by Owens and more recently in the Redfern, Roirant and McNish

FIG. 7.—FILLING THE PARISON MOULD BY SUCTION (REDFERN MACHINE)

machines, a cast-iron plug is set within the neck mould and the glass sucked up (from a revolving shallow pot supplied by the main tank in the case of the Owens and Redfern machines) until it completely surrounds the plug (figs. 3 and 7). Subsequently the parison is automatically transferred to a finishing mould and blown up.

In the other type of blow-and-blow machine (Cox, O'Neill, Lynch, W. J. Miller, Edward Miller and Hartford-Empire machines) the parison mould is inverted over the neck or ring mould

so that the parison is formed in an inverted position. The charge of glass is dropped into the open end of the parison mould and flows down and round the plug fitted into the ring mould, being assisted in the process by compressed air blown in at the top (fig. 9); then the plug is withdrawn, a blowing head is introduced into its place, and sufficient air is blown in to form a distinct cavity in the parison (fig. 10). Automatically the parison is turned upwards, transferred to the finishing mould (fig. 11) and blown up fully.

The first bottle-blowing machine was invented by Ashley in England in 1887; the first fully automatic machine by Owens in America, between 1899 and 1902. All the later gravity-fed machines originated in America. Modern machines comprise a

FIG. 8.—AUTOMATIC DEVICE FOR DELIVERING GLASS TO MACHINES

number of units, each consisting of a neck, parison and ring mould, together with actuating mechanisms, blowing and cooling air pipes for machines and attendants, lubricators, etc. In some machines (Owens, Redfern, Graham, Moorshead) these units are mounted on arms radially from a central pillar; in pressing and in some press-and-blow machines (W. J. Miller, Edward Miller and Hartford-Empire) the moulds are mounted on a single table, whilst in others (O'Neill and Lynch) they are disposed on circular rotating tables, the parison moulds on one, the finishing moulds on the other. The later Owens, Redfern and Graham machines are made with 10 or 15 units; the latest O'Neill and Lynch machines carry six parison moulds and eight finishing moulds. The molten glass is supplied to the moulds of O'Neill, Lynch, W. J. Miller, Edward Miller, Hartford-Empire and Moorshead machines by automatic feeding devices. The glass flows from the furnace into the fire-clay channels (fig. 2), and is extruded through an orifice by a plunger or needle which rises and descends above it. Shears fixed below the orifice sever the extruded glass which falls into the mould below. These feeding devices (fig. 8) of which the best known are the Hartford-Empire, W. J. Miller and Rankin, were invented in America.

Annealing.—The hot bottles from the machine are conveyed either by hand or, where conditions admit, by a conveyor-belt to the annealing furnace or "lehr" where they cool off at a regulated rate. A lehr consists of a belt, 4 to 12 ft. wide, continuously travelling along a chamber or tunnel about 70 ft. long. At the front, where the bottles are inserted, is a combustion chamber about 20 to 22 ft. long providing a zone sufficiently hot (550° – 600°C) to remove any stresses in the glass previously introduced by chilling (see GLASS, ANNEALING). The hot zone is heated by gas or oil burners; but by thorough heat insulation, the heat supplied externally can be reduced, as in the Hartford-Empire Fireless Lehr, to a very small amount, the temperature being maintained by the bottles which are very hot (650° – 750°C) when they leave the machines. Sorters and inspectors stand at the cold end of the lehr, carefully but quickly inspect every bottle, and reject defective ones.

The productive capacity of the modern machines is very great. A ten-arm Owens machine will produce per minute 30 to 35 jars

FIGS. 9, 10, 11.—STAGES IN THE OPERATION OF A FEEDER-CHARGED BLOW-AND-BLOW MACHINE

of 2 lb. capacity, and by using multiple moulds on each arm for certain sizes the output can be raised to 130–260. An O'Neill or Lynch machine will produce 100–120 gross of quart bottles per day. Operation is continuous, night and day, including, in some factories, Sunday

See W. S. Walbridge, *American Bottles Old and New* (Toledo, Ohio, 1920); F. W. Hodkin and A. Cousen, *A Textbook of Glass Technology* (1925); R. Dralle, *Die Glasfabrikation* (Munich, 1926). (W. E. S. T.)

BOTTOMRY, a maritime contract in the nature of a mortgage of a ship by which money is borrowed for the necessities of the ship to enable it to proceed on its voyage. The keel or bottom of the ship (as representing the whole), with the cargo and freight, are made liable for the repayment of the money borrowed, with interest. The lender cannot recover either principal or interest if the ship is lost on the voyage (see the "Atlas" [1827] 2 Haggard Admiralty 53). In view of the risk which the lender runs, the rate of interest is usually a high one.

As the basis for this special kind of contract, there must be the necessity of resorting to a charge on the ship. It must be impossible to obtain the funds required in any other way than by a hypothecation of the ship. The lender on bottomry becomes entitled to a maritime lien giving him precedence of certain other claimants, but he takes the risk of non-recovery should the ship be lost. Contracts of this kind, according to Lord Stowell, in the "Alexander" (1812) 1 Dodson 278, "were invented for the purpose of procuring the necessary supplies for ships which may happen to be in distress in foreign ports, where the master and the owners are without credit, and where, unless assistance could be secured by means of such an instrument, the vessels and their cargoes must be left to perish." Though bottomry is of great antiquity, this kind of contract is now seldom resorted to in practice. Increased facilities for communication and altered methods of business have rendered bottomry bonds almost obsolete

In order to amount to bottomry the contract must be in writing. Though usually in the form of a bond, this is not essential so long as the writing shows the parties, the sum advanced, the ship, the voyage, the time for payment (usually on the safe arrival of the ship), that payment is conditional upon the safe arrival of the ship, and that the ship is hypothecated (see the "James W. Elwell" [1921] p. 351, and earlier cases there cited).

Respondentia is a contract similar to bottomry, the loan being obtained for the necessities of the cargo, and being charged upon it.

Communication if possible by the shipmaster with the shipowner before resort to bottomry is, by English law, necessary to the validity of a bottomry bond. A separate communication with the owners of the cargo where reasonable is also necessary. The lender must assure himself of the necessity for bottomry. The consent of a mortgagee of the ship need not be obtained, but, where practicable, the lender on bottomry should see that a mort-

gagee has notice of the necessity for the hypothecation before obtaining the bond (see the "St. George" [1926] p. 217). A bottomry bond does not transfer the property in the ship, but gives the lender a claim enforceable if necessary by legal proceedings in a court exercising Admiralty jurisdiction. The law by which the contract is governed is that of the ship's flag.

See Abbot's *Shipping* (1901); Roscoe's *Admiralty Practice* (1920); MacLachlan's *Shipping* (1923). (S. D. C.)

BOTULISM or ALLANTIASIS. The term botulism (Lat. *botulus*, sausage) seems to have been first applied in the early part of the 19th century to a type of sausage poisoning observed in Württemberg and some other parts of Germany. A recognizable description of this disease appeared, however, as early as 1735. Although the first outbreaks studied were traced to sausage it is now known that a variety of other foods, vegetable as well as animal, may give rise to this condition, so that the name botulism is to-day not wholly appropriate.

The symptoms of botulism are quite characteristic and, in contradistinction to several other forms of food poisoning, are mainly nervous rather than gastro-intestinal. They usually appear in from 18 to 24 hours after the eating of the poisonous food. Marked disturbance of vision occurs, double vision being especially frequent; drooping of the eyelids (ptosis) is common. Great difficulty in swallowing and in respiration is experienced. Muscular weakness is often extreme and may persist for a long time in those patients who recover. The mentality remains clear. There is little or no fever and the temperature may be subnormal. The case-fatality is high; in the large series of outbreaks in the United States recorded by Geiger, Dickson and Meyer it was slightly over 60%. In some group outbreaks every person partaking of the incriminated food has perished. This was the case in the famous Loch Maree outbreak in Scotland where every one of the eight persons who became ill after eating sandwiches made with a particular kind of potted meat died within a few days. In addition to the human outbreaks animals associated with man are sometimes affected and show, similarly, nervous symptoms and high fatality. Chickens that have eaten spoiled canned food—sometimes the same as that incriminated in a human outbreak—that has been thrown out into the chicken yard may suffer with a disease called "limberneck," in which the clinical picture is entirely analogous to that of botulism in inoculated animals. There is evidence that chickens also contract "limberneck" occasionally under natural conditions. Some investigators are of the opinion that "forage poisoning" in horses and cattle is sometimes a form of botulism, but there is not general agreement on this point.

The cause of botulism is a highly poisonous substance present in the food eaten. This poisonous substance is produced by a micro-organism, *Clostridium botulinum*, of which three varieties are usually recognized—Types A, B and C. These microbes possess two significant characters: they are highly resistant to heat, and they grow only in the absence of oxygen. The fact that most of the recent cases of botulism have been due to heat-

preserved foods protected from the access of air in cans or jars is thus readily explained. The elimination of most other micro-organisms by heat and the maintenance of conditions suitable for the development of *Clostridium botulinum* allow this organism to grow and produce its specific toxin. This toxin is formed when *Clostridium botulinum* is grown in pure cultures in the laboratory, and the symptoms and lesions produced by it in inoculated animals are entirely similar to those observed in botulism in man, and in "limberneck" in chickens. Type A produces the most, Type C the least, potent toxin. All three types are rather widely distributed in natural soils in various parts of the world and it is easy to see how they may get into all sorts of preserved foodstuffs. They are, however, particularly abundant in the soils of certain regions, the cause of the uneven distribution not being understood. In the United States most of the recorded outbreaks of botulism have occurred on the Pacific Slope or in the Rocky Mountain States—a circumstance that may be connected with the greater abundance of Type A in that region.

Knowledge of the nature and sources of botulism has aided greatly in its prevention. In the canning of foodstuffs it is possible to use sufficiently high temperatures and to insure proper heat penetration to kill even the resistant spores of the *Clostridium*. Methods based on exact determination of the degree of heat and the time of exposure necessary to effect complete bacterial destruction are now generally in use in the canning industry. It is obvious that such measures are more difficult to apply to food canned in the home, particularly in regions where the boiling point of water is lowered by the altitude, and it is perhaps significant that in recent years nearly all the outbreaks of botulism occurring in the United States have been due to home-canned food prepared in the Rocky Mountain region.

The individual consumer has some means of protecting himself against botulism. The foods that have caused botulism have in almost all the recorded instances shown signs of spoilage so that the rejection of any canned food of abnormal taste, smell or appearance constitutes a considerable safeguard. Fortunately, too, the toxin produced by *Clostridium botulinum* is itself quite readily destroyed by heat so that thorough heating of canned foods after their removal from the can is an additional factor of safety.

Once the symptoms of botulism have developed no satisfactory method of treatment has been found. Even the specific antitoxin, although more or less potent in animal experimentation, has never been used successfully in man; further experiments are, however, desirable.

Botulism has always been a very rare disease; it is becoming still more infrequent. In the United States were recorded 159 cases in the three-year period 1920–22, but only 85 in 1923–25 and 8 in 1926–27. The disease seems to have been practically eliminated as a hazard in the use of commercially canned foods, all the outbreaks for the past three years in the United States—where the consumption of commercially canned food is enormous—having been traced to home-canned foods.

See also FOOD POISONING.

BOTZARIS or **BOZZARIS, MARCO** (c. 1788–1823), leader in the war of Greek independence, born at Suli in Albania, was the second son of Kitzo Botzaris, murdered at Arta in 1809 by order of Ali of Iannina. In 1803, after the capture of Suli by Ali Pasha, Marco, with the remnant of the Suliots, crossed over to the Ionian islands, where he ultimately took service in an Albanian regiment in French pay. In 1814 he joined the Greek patriotic society known as the Hetairia Philike, and in 1820, with other Suliots, made common cause with Ali of Iannina against the Ottomans.

On the outbreak of the Greek revolt, he distinguished himself by his courage, tenacity and skill as a partisan leader in the fighting in western Hellas, and was conspicuous in the defence of

Missolonghi during the first siege (1822–23). On the night of Aug. 21 1823 he led the celebrated attack at Karpenisi of 350 Suliots upon 4,000 Albanians who formed the vanguard of the army with which Mustai Pasha was advancing to reinforce the besiegers. The rout of the Turks was complete; but Botzaris himself fell. Marco Botzaris's brother Kosta (Constantine) who fought at Karpenisi and completed the victory, lived to become a general and senator in the Greek Kingdom. Kosta died in 1853. Marco's son, Dimitri Botzaris (1813–70), was three times minister of war under the kings, Otho and George.

BOUCHARDON, EDMÉ (1698–1762), French sculptor, was born at Chaumont on May 29, 1698, and died on July 27, 1762, in Paris. He was a pupil of Guillaume Coustou, and spent ten years in Rome, where he made a striking bust of Pope Benedict XIII. (1730). His most famous work is the fountain in the Rue de Grenelle, Paris, begun in 1740.

See Comte de Caylus, *Vie d'Edmé Bouchardon* (1762), and Lady Dilke, *French Architects and Sculptors of the 18th Century* (1900).

BOUCHE FERMÉE, A, musical term signifying singing without words with closed, or nearly closed, mouth, the result being an inarticulate humming or buzzing. Formerly resorted to mainly for the purpose of amusing effects in humorous pieces, the device has more recently been employed with increasing frequency in quite serious works by modern composers.

BOUCHER, FRANÇOIS (1703–1770), French painter, was born in Paris on Sept. 29, 1703, and died there May 30, 1770. He was at first employed by Jean François Cars (1670–1739), the engraver, father of the engraver Laurent Cars (1699–1771), to make designs and illustrations for books. After four years spent in Rome he returned to Paris in 1731. He was made director of the Gobelins factory in 1755 and court painter in 1765, also director of the Academy and inspector of the tapestry manufacture of Beauvais, and was employed by Madame de Pompadour both to paint her portrait and to execute various decorative works. His Watteau-like style gave him the title of the Anacreon of painting. The Wallace collection, London, contains the largest number and some of his finest works. A portrait of Madame de Pompadour is in the National Gallery of Edinburgh. Boucher was also a master of etching.

See E. Michel, *François Boucher* (2nd ed. 1907); C. M. Bearn, *A Court Painter and his Circle* (1913).

BOUCHER, JONATHAN (1738–1804), English divine and philologist, was born near Wigton, Cumberland, on March 12, 1738, and died at Epsom on April 27, 1804. In early life he was a tutor in Virginia where he taught Washington's stepson. After a short stay in England for his ordination he returned to America and held various preferments there, becoming known as an eloquent preacher. He took the English side in the quarrel between England and the colonies and had to return to England, when he received a pension and the living of Epsom. Boucher contributed largely to William Hutchinson's *History of the County of Cumberland* (2 vols., 1794 seq.) and published *A View of the Causes and Consequences of the American Revolution* (1797), dedicated to George Washington, and consisting of thirteen discourses delivered in America between 1763 and 1775. His "Glossary of Provincial and Archaic Words," intended as a supplement to Dr. Johnson's *Dictionary*, was never published except in part, but passed into the hands of the English compilers of Webster's *Dictionary*.

BOUCHER DE CRÉVECOEUR DE PERTHES, JACQUES (1788–1868), French geologist and antiquary, was born on Sept. 10, 1788, at Rethel, Ardennes, and became a customs official. He died on Aug. 5, 1869, at Abbeville, where he was director of the douane. His leisure was chiefly devoted to the study of the Stone Age. About 1830 he had found, in the gravels of the Somme valley, flints which in his opinion bore evidence of human handiwork; but not until 1846, many years afterwards, did he make public the important discovery of a worked flint implement with remains of elephant, rhinoceros, etc., in the gravels of Menchecourt. His monumental *Antiquités celtiques et antédiluviennes* (1847–64) is a work in which he was the first to establish the existence of man in the Pleistocene or early Quater-

nary period. He was the author of several tragedies, two books of fiction, several works on travel, and a number of books on economic and philanthropic questions. To his scientific books may be added *De l'homme antédiluvien et de ses oeuvres* (1860).

See Alcuis Lédien, *Boucher de Perthes, sa vie, ses oeuvres, sa correspondance* (Abbeville, 1885); Lady Prestwich, "Recollections of M. Boucher de Perthes" in *Essays Descriptive and Biographical* (1901).

BOUCHES-DU-RHÔNE, a maritime department of south-eastern France situated at the mouth of the Rhône. Area, 2,026 square miles. Pop. (1926) 929,549. Formed in 1790 from western Provence, it is bounded on the north by Vaucluse, from which it is separated by the Durance, east by Var, west by Gard, and south by the Mediterranean, along which its seaboard stretches for about 120 miles. The western portion consists of the Camargue (*q.v.*) a marshy plain between the Rhône and the Petit-Rhône, and comprising the Rhône delta. A large portion of its surface is covered by lagoons and pools (*étangs*), the largest of which is the Étang de Vaccarès. To the east of the Camargue is situated the remarkable pebble-strewn Crau (*q.v.*); and farther east and north are east-west hill-ranges. The Étang de Berre, a lagoon nearly 60 sq.m. in area, is situated to the south-east of the Crau; it is now connected by a canal with the Rhône and by a canal tunnel through the Estaque hills with Marseille.

Bouches-du-Rhône has a Mediterranean climate, with the drawback of the mistral, the cold north-west wind from the central plateau of France. The proportion of arable land is small, though considerably increased by artificial irrigation and by draining. Cereals, chiefly wheat and oats, are grown in the Camargue and the plain of Arles, but they are of less importance than the olive-tree, which is grown largely in the east of the department and supplies the oil-works of Marseille. The vine is also cultivated, the method of submersion being used as a safeguard against phylloxera. In the cantons of the north-west large quantities of early vegetables are produced. Of live-stock, sheep alone are raised to any extent. Almonds, figs, capers, mulberry trees and silk-worms are sources of considerable profit. Iron is worked, but the most important mines are those of lignite; the department also produces bauxite, building-stone, lime, cement, gypsum, clay, sand and gravel, marble and sea-salt. Marseille, the capital (*q.v.*), is the most important industrial town. In its industrial establishments is concentrated most of the manufacturing activity of the department. To these must be added the potteries of Aubagne, the silk-works in the north-west cantons, various paper and cardboard manufactories, oil distilleries, metal foundries and soap factories. Fishing is also important. The foreign commerce of the department is for the most part concentrated in the capital; the minor ports are Martigues, Cassis and La Ciotat. Internal trade is facilitated by the canal from Arles to Port-de-Bouc and two smaller canals, in all about 35 m. in length, as well as by the canals mentioned above. The Rhône and the Petit-Rhône are both navigable within the department.

Bouches-du-Rhône is divided into the three *arrondissements* of Marseille, Aix and Arles (33 cantons, 115 communes). It belongs to the archiepiscopal province of Aix, to the region of the XV. army corps, and to the *académie* (educational division) of Aix. Its court of appeal is at Aix. Near Saint-Chamas there is a Roman bridge over the Touloubre, which probably dates from the 1st century B.C. and is thus the oldest in France. At Vernègues there are remains of a Roman temple known as the "Maison-Basse." The famous abbey of Montmajour, with Romanesque church and cloister, is 2½ m. from Arles. At Orgon there are the ruins of a château of the 15th century, and near La Roque d'Anthéron the church and other buildings of the Cistercian abbey of Silvacane, founded in the 12th century.

BOUCHOR, MAURICE (1855–), French poet, was born on Dec. 15 1855, in Paris. He published in succession *Chansons joyeuses* (1874), *Poèmes de l'amour et de la mer* (1875), *Le Faust moderne* (1878), in prose and verse, and *Les Contes parisiens* (1880) in verse. His *Aurore* (1883) showed a tendency to religious mysticism, which reached its fullest expression in *Les Symboles* (1888; new series, 1895), the most interest-

ing of his works. Bouchor was a sculptor as well as a poet, and he designed and worked the marionettes used in his imitations of the religious mysteries of the middle ages, the words being recited or chanted by himself or his friends behind the scenes.

These miniature dramas on religious subjects, *Tobie* (1889), *Noël* (1890) and *Sainte Cécile* (1892) were produced in Paris at the Théâtre des Marionnettes. A collection of his works in this genre, *Mystères bibliques et chrétiens*, appeared in 1920. With the musician, Julien Tiersot (born 1857), he made efforts for the preservation of the French folk-songs, and published *Chants populaires pour les écoles* (1897).

BOUCHOTTE, JEAN BAPTISTE NOËL (1754–1840), French revolutionary, was born at Metz on Dec. 25, 1754, and died on June 8, 1840. He was minister of war under the Convention, and rendered some services in the organization of the republican armies, choosing his officers with insight, among them Kléber, Masséna, Moreau and Bonaparte.

BOUCICAULT, DION (1822–1890), Irish-American actor and playwright, was born in Dublin on Dec. 26 1822, the son of a French refugee and an Irish mother, and died in New York on Sept. 18 1890. Before he was 20 he was fortunate enough to make an immediate success as a dramatist with *London Assurance*, produced at Covent Garden on March 4 1841, with a cast that included Charles Matthews, William Farren, Mrs. Nesbitt and Madame Vestris. Other plays followed, among the most successful of the early ones being *Old Heads and Young Hearts*, *Louis XI.* and *The Corsican Brothers*. In June 1852 he made his first appearance as an actor in a melodrama of his own entitled *The Vampire*, at the Princess's theatre. From 1853 to 1869 he was in the United States. On his return to England he produced at the Adelphi a dramatic adaptation of Gerald Griffin's novel, *The Collegians*, entitled *The Colleen Bawn*. This play was performed in almost every city of the United Kingdom and the United States, and made its author a handsome fortune, which he lost in the management of various London theatres. It was followed by *The Octoroon* (1861). Boucicault's next marked success was at the Princess's theatre in 1865 with *Arrah-na-Pogue*, in which he played the part of a Wicklow carman. This, and his admirable creation of Con in his play *The Shaughraun* (first produced at Drury Lane in 1875), won him the reputation of being the best stage Irishman of his time. In 1875 he returned to New York city and finally made his home there, but he paid occasional visits to London, where his last appearance was made in his play *The Jilt* in 1886. Boucicault was twice married, his first wife being Agnes Robertson, the adopted daughter of Charles Kean, and herself an actress of unusual ability.

BOUCICAUT, JEAN (JEAN LE MEINGRE, called BOUCICAUT) (c. 1366–1421), marshal of France, was the son of another Jean le Meingre (d. 1368) also known as Boucicaut, marshal of France. Boucicaut spent his life in fighting. He had served in several campaigns before he joined the expedition to Hungary (1396), and was taken prisoner by the Turks at Nicopolis. He was ransomed, and in 1399 appeared at Constantinople with 1,400 men and a good fleet to aid the Emperor against the Turks who were threatening the city. He defeated a Turkish fleet at Gallipoli, and arrived in the Golden Horn in time to prevent the capture of Galata by the Turks. He held the Turks in check for a year, and then returned to France to seek volunteers. But he was despatched not to Constantinople, but to establish on firmer foundations French dominion in Genoa. This involved him in a brief war with Venice. Genoa threw off the French yoke in 1409 during an absence of Boucicaut. He fought at Agincourt, where he was taken prisoner, and died in England. Boucicaut, who was very skilful in the tournament, founded the order of the *Dame blanche à l'écu vert*, a society the object of which was to defend the wives and daughters of absent knights.

An anonymous account of Boucicaut's life and adventures is entitled *Livre des faits du bon messire Jean le Meingre dit Boucicaut*, published in Paris by T. Godefroy in 1620. See J. Delaville le Roulx, *La France en Orient: expéditions du maréchal Boucicaut* (1886).

BOUDIN, LOUIS EUGÈNE (1824–1898), French marine painter, was born at Honfleur, the son of a pilot, on July 12 1824,

and died at Deauville on Aug. 8 1898. The father gave up the sea for a small stationer's shop in Havre. Troyon and Millet came to the shop and discovered the boy's talent for art, and Courbet and Alphonse Karr found their way there. Boudin went to Paris to study, and, after a short time, returned to his native place. He was a follower of Corot, and in his turn became the master of Monet. The École St. Siméon, named after the farm which was its headquarters, dates from 1856. In this colony Boudin was a leader. The group included Millet, Courbet, Diaz, Harpignies, Jongkind, Isabey, Monet and others. Boudin presently moved to Trouville and then married and set up house in Havre. From 1875 onwards he exhibited at the Salon but without attracting much notice until his "Corvette russe" was bought by the State for the Luxembourg gallery in 1888. In 1896 the "Rade de Villefranche" was bought for the same gallery, and Boudin, then over 70, received the Legion of Honour. He died two years later.

Boudin's best work is in his small canvases. As the painter of tidal rivers Boudin is pre-eminent, and Corot called him the "master of the sea." A large number of his sketches are at Havre.

See G. Cahen, *Eugène Boudin* (1899); W. Dewhurst, *Impressionist Painting* (1904).

BOUÉ, AMI (1794–1881), Austrian geologist, was born at Hamburg on March 16, 1794, and received his early education there and in Geneva and Paris. In 1841 he settled in Vienna. He died on Nov. 21, 1881. To the Imperial Academy of Sciences at Vienna he communicated important papers on the geology of the Balkan States (1859–70), and he also published *Mémoires géologiques et paléontologiques* (1832) and *La Turquie d'Europe: observations sur la géographie, la géologie, l'histoire naturelle*, etc. (1840).

BOUFFLERS, LOUIS FRANÇOIS, Duc DE, comte de Cagny (1644–1711), marshal of France, was born on Jan. 10 1644. He served in all the important French campaigns from 1663 onwards. In 1681 he became lieutenant-general. He commanded the French army on the Moselle, which opened the war of the League of Augsburg with a series of victories; then he led a corps to the Sambre, and reinforced Luxembourg on the eve of the battle of Fleurus. In 1691 he acted as lieutenant-general under the king in person; and was present with the king at the siege of Namur in 1692, and took part in the victory of Steinkirk. He was raised in 1692 to the rank of marshal of France, and in 1694 was made a duke. His chief later exploits were the heroic defence of Namur against William III. (1695), and the equally skilful defence of Lille (1708) against Prince Eugène, for which he was made a peer of France. He chose to serve under his junior, Villars, at Malplaquet (1709), and executed a safe retreat for the army. He died at Fontainebleau on Aug. 22 1711.

See "M.F." *Vie du Mal. de Boufflers* (Lille, 1860), and Père Delarue's and Père Poisson's *Oraisons funèbres du Mal. B.* (1712).

BOUFFLERS, STANISLAS JEAN, CHEVALIER DE (1738–1815), French statesman and man of letters, was born near Nancy on May 31, 1738. He was the son of Louis François, marquis de Boufflers. His mother, Marie Catherine de Beauveau Craon, was the mistress of Stanislas Leszczyński, and the boy was brought up at the court of Lunéville. He spent six months at Saint Sulpice, Paris, and there wrote his popular story, *Aline, reine de Golconde* (1761). Boufflers entered the order of the Knights of Malta, so that he might be able to follow the career of arms without sacrificing the revenues of a benefice he had received in Lorraine from king Stanislas. In 1785 he was sent to West Africa as governor of Senegal. He proved an excellent administrator, and did what he could to mitigate the horrors of the slave trade; and his departure in 1787 was regarded as a real calamity by both colonists and negroes. The *Mémoires secrets* of Bachaumont give the current opinion that Boufflers was sent to Senegal because he was in disgrace at court; but the real reason appears to have been a desire to pay his debts before his marriage with Mme. de Sabran. Boufflers was admitted to the Academy in 1788, and was a member of the states-general. During the Revolution he found an asylum with Prince Henry of Prussia at Rheinsberg. At the Restoration he was made joint-librarian of the Bibliothèque Mazarine. His wit and his skill in light verse had

won him a great reputation and he was one of the idols of the Parisian salons. His paradoxical character was described in an epigram attributed to Antoine de Rivarol, "*abbé libertin, militaire philosophe, diplomate chansonnier, émigré patriote, républicain courtois*." He died in Paris on Jan. 18, 1815.

His *Oeuvres complètes* were published under his own supervision in 1803. A selection of his stories in prose and verse was edited by Eugène Asse in 1878; his *Oeuvres choisies* by O. Uzanne in 1886; and the *Correspondance inédite de la comtesse de Sabran et du chevalier de Boufflers* (1778–88), by E. de Magnieu and Henri Prat in 1875.

BOUGAINVILLE, LOUIS ANTOINE DE (1729–1811), French navigator, was born in Paris on Nov. 11, 1729. He was the son of a notary, and in early life studied law, but soon abandoned the profession, and in 1753 entered the army in the corps of musketeers. At the age of 25 he published a treatise on the integral calculus. In 1755 he was sent to London as secretary to the French embassy, and was made a member of the Royal Society. In 1756 he went to Canada as captain of dragoons and aide-de-camp to the marquis de Montcalm. He afterwards served in the Seven Years' War from 1761 to 1763. After the peace, Bougainville undertook the colonization of the Falkland islands at his own expense. The French Government gave the colony to the Spaniards on condition of their indemnifying Bougainville. In Dec. 1766 he officially sailed on a voyage round the world. Passing through the Straits of Magellan, he visited Tuamotu; Tahiti, where the English navigator Wallis had touched eight months before; the Samoan group, which he named the Navigators islands; the new Hebrides and the Solomon islands. In March 1769 his vessels arrived at St. Malo. Bougainville's *Voyage autour du monde* (1771, modern ed. 1889) is written with simplicity and humour. He later projected a voyage of discovery to the north pole, but did not obtain the necessary support from the French Government. In his old age Napoleon I. made him a senator, count of the empire, and member of the Legion of Honour. He died in Paris on Aug. 31, 1811.

Bougainville's name is given to the largest member of the Solomon islands and to the strait which divides it from the island of Choiseul. It is also applied to the strait between Malli-collo and Espiritu Santo islands of the New Hebrides group, and the climbing plant *Bougainvillea* is named after him.

BOUGHTON, GEORGE HENRY (1834–1905), Anglo-American painter, born near Norwich, England, and brought up at Albany, N.Y. He studied art in Paris in 1861–62, and then lived mainly in London; he was much influenced by Frederick Walker, and the delicacy and grace of his pictures soon made his reputation. He was elected a member of the National Academy of Design in New York in 1871, an A.R.A. in 1879, and R.A. in 1896. His pictures of Dutch life and scenery were especially characteristic; and his subject-pictures, such as "Weeding the Pavement" (Tate Gallery, London), "The Road to Camelot" (Walker Art Gallery, Liverpool), "Golden Afternoon, the Isle of Wight" (Metropolitan Museum, New York), and "When the Dead Leaves Fall" (Municipal Gallery, Rome), had a great success. Boughton also executed many fine book illustrations, notably those for *Rip van Winkle* (1893) and for the Grolier Club of New York, *Knickerbocker History* (1886). He died in London on Jan. 19, 1905.

See articles by S. Colvin, *The Portfolio* (1871), and by A. L. Baldry (*Art. Journal*, Christmas number, 1904).

BOUGIE, a seaport of Algeria, chief town of an *arrondissement* in the department of Constantine, 120 m. E. of Algiers. The town, fortified afresh since the French occupation, is beautifully situated on Mount Guraya amid rich vegetation (rainfall 1.035 metres). Behind are Mounts Babor and Tababort, rising some 6,400 ft., crowned with pinsapo fir and cedar. The most interesting buildings in the town are the ancient forts, Borj-el-Ahmer and Abd-el-Kader, and the kasbah or citadel, bearing inscriptions stating that it was built by the Spaniards in 1545. Parts of the Roman wall exist, and considerable portions of that built by the Hammadites in the 11th century. The streets are steep, and many are ascended by stairs. The harbour, sheltered from the west by the Cape Carbon and from the east by a breakwater, was enlarged in 1897–1902. It covers 63 acres and has a depth of water of 23

to 30 feet. Bougie is the natural port of Kabylia, and its commerce—chiefly in oils, wools, hides and minerals—has greatly developed; a branch railway runs to Beni Mansur on the main line from Constantine to Oran. Pop. (1926) 15,941.

Bougie, if correctly identified, is the Saldæ of the Romans. Early in the 5th century Genseric the Vandal built walls and for some time made it his capital. En-Nasr (1062–1088), the most powerful of the Berber dynasty of Hammad, made Bougie the seat of his government, and it became the greatest commercial centre of the North African coast, attaining a high degree of civilization. Italian merchants of the 12th and 13th centuries had warehouses, baths and churches in the city. At the end of the 13th century Bougie passed under the Hafside, and in the 15th century it became a stronghold of the Barbary pirates. The Spaniards under Pedro Navarro captured it in 1510, fortified it and held it against two attacks by the corsair Barbarossa, but Salah Rais, pasha of Algiers, took it in 1555. Leo Africanus, in his *Africae descriptio*, speaks of the "magnificence" of the city (c. 1525), but it appears to have fallen into decay not long afterwards. When the French took the town in 1833 it consisted of a few fortifications and ruins.

BOUGUER, PIERRE (1698–1758), French mathematician, succeeded his father, John Bouguer, as regius professor of hydrography at Croisic in lower Brittany. In 1729 he published *Essai d'optique sur la gradation de la lumière*, the object of which was to define the quantity of light lost by passing through a given extent of the atmosphere. He found the light of the sun to be 300 times more intense than that of the moon, and thus made some of the earliest measurements in photometry. In 1730 he was made professor of hydrography at Havre, and succeeded P. L. M. de Maupertuis as associate geometer of the Académie des Sciences. He also invented a heliometer, afterwards perfected by Fraunhofer. In 1735 Bouguer sailed with C. M. de la Condamine for Peru, in order to measure a degree of the meridian near the equator. A full account of this operation was given in 1749 in *Figure de la terre déterminée*.

The following is a list of his principal works: *Traité d'optique sur la gradation de la lumière* (1729 and 1760); *Entretiens sur la cause d'inclinaison des orbites des planètes* (1734); *Traité de navire*, etc. (1746); *La Figure de la terre déterminée*, etc. (1749); *Nouveau traité de navigation, contenant la théorie et la pratique du pilotage* (1753); *Solution des principaux problèmes sur la manœuvre des vaisseaux* (1757); *Opérations faites pour la vérification du degré du méridien entre Paris et Amiens*, par Mess. Bouguer, Camus, Cassini et Pingré (1757).

See J. E. Montucla, *Histoire des mathématiques* (1802).

BOUGUEREAU, ADOLPHE WILLIAM (1825–1905), French painter, was born at La Rochelle on Nov. 30 1825, and died there on Aug. 18 1905. From 1843 till 1850 he studied at the École des Beaux-Arts, and in 1850 divided the Grand Prix de Rome scholarship with Baudry, the subject set being "Zenobia on the banks of the Araxes." On his return from Rome in 1855 he was employed in decorating several great houses, deriving inspiration from the frescoes which he had seen at Pompeii and Herculaneum, and which had already suggested his "Idyll" (1853). "The Martyr's Triumph," the body of St. Cecilia borne to the catacombs, was placed in the Luxembourg. Most of his works, especially "The Triumph of Venus" (1856) and "Charity," are popularly known through engravings.

BOUHOURS, DOMINIQUE (1628–1702), French critic, was born in Paris. He entered the Society of Jesus at the age of 16 and undertook educational work in various places until 1665 or 1666, when he returned to Paris, and published in 1671 *Les Entretiens d'Ariste et d'Eugène*, a critical work on the French tongue. He also wrote *La Manière de bien penser sur les ouvrages d'esprit* (1687), *Doutes sur la langue française* (1674), *Vie de Saint Ignace de Loyola* (1679), *Vie de Saint François Xavier* (1682), and translated the New Testament into French (1697).

See Georges Doucieux, *Un Jésuite homme de lettres au dix-septième siècle: Le père Bouhours* (1886). For a list of Bouhours' works see Backer and Sommervogel, *Bibliothèque de la Compagnie de Jésus*, i. pp. 1886 et seq.

BOUILHET, LOUIS HYACINTHE (1822–1869), French poet and dramatist, was born at Cany, Seine Inférieure, and was a schoolfellow of Gustave Flaubert. His *Fossiles* (1856) attracted

considerable attention, on account of the attempt therein to use science as a subject for poetry. These poems were included also in *Festons et astragales* (1859). His first play, *Madame de Montarcy* (1856), ran for 78 nights at the Odéon; and *Hélène Peyron* (1858) and *L'Oncle Million* (1860) were also favourably received. But of his other plays, some of them of real merit, only the *Conjuration d'Amboise* (1866) met with any great success. Bouilhet died at Rouen, and Flaubert published his posthumous poems with a notice of the author, in 1872.

See also Maxime du Camp, *Souvenirs littéraires* (1882); H. de la Ville de Mirmont, *Le Poète Louis Bouilhet* (1888); and E. Frère, *Louis Bouilhet* (1908).

• **BOUILLABAISSE**, a kind of stew, made of all kinds of fish, popular in the south of France, and particularly associated with Marseille.

BOUILLÉ, FRANÇOIS CLAUDE AMOUR, MARQUIS DE (1739–1800), French general. He served in the Seven Years' War, and as governor in the Antilles conducted operations against the English in the War of American Independence. On his return to France he was named governor of the three bishoprics, of Alsace and of Franche-Comté. He brutally suppressed the military insurrections at Metz and Nancy, which had been provoked by the harsh conduct of certain noble officers. Then he proposed to Louis XVI. to take refuge in a frontier town where an appeal could be made to other nations against the revolutionists. When this project failed as a result of Louis XVI.'s arrest at Varennes, Bouillé went to Russia to induce Catherine II. to intervene in favour of the king, and then to England, where he died in 1800, after serving in various royalist attempts on France. He left *Mémoires sur la Révolution française depuis son origine jusqu'à la retraite du duc de Brunswick* (1801).

BOUILLON, formerly the seat of a dukedom in the Ardennes, now a small town in the Belgian province of Luxembourg Pop. (1925) 2,610. It is picturesquely situated in the valley of the Semois, under the rocky ridge which preserves remains of the castle of Godfrey of Bouillon (qv), the leader of the first crusade. The stream almost encircles the castle, which provides beautiful views of the sinuous valley. In the 8th and 9th centuries Bouillon was one of the castles of the counts of Ardennes and Bouillon. Later, the family took the higher titles of dukes of Lower Lorraine and Bouillon, who all bore the name of Godfrey (Godefroy), and the fifth of them was the great crusader. In order to undertake the crusade, Godfrey sold the castle of Bouillon to the prince bishop of Liège, and the title of duke of Bouillon belonged to the bishopric till 1678. The bishops appointed "châtelains," one of whom was the celebrated "Wild Boar of the Ardennes," William de la Marck, and his descendants, "princes of Sedan and dukes of Bouillon," became semi-independent. The possession of Bouillon thenceforward became a constant cause of strife until in 1678 Louis XIV. garrisoned it under the treaty of Nijmegen. Bouillon remained French till 1814, and Vauban called it "the key of the Ardennes." In 1760 the elder Rousseau established here the famous press of the Encyclopaedists. By the Vienna Congress (1815) Bouillon went to the Netherlands.

BOUILLON, a watery extract made from beef, and widely used as an appetizer. The finely cut meat is slowly boiled in water, the solidified fat removed after cooling, and the liquid strained, thus removing the meat fragments and coagulable proteins. The bouillon cubes of commerce are made by adding salt and a plant extract, and evaporating nearly to dryness. The caloric value of bouillon is only one-fourth that of orange juice and one-seventh that of whole milk, and it is obviously by no means a nutritive beverage. Its active principles are the purin bases, to which its appetizing flavour is due, and which directly stimulate the secretion of gastric juice. It is widely used for invalids to encourage appetite and digestion.

BOUILLY, JEAN NICOLAS (1763–1842), French author, was born near Tours. Under the Revolution he helped to organize primary education, but retired in 1799. His numerous works include the musical comedy *Pierre le Grand* (1790), for Grétry's music, and the opera *Lea Deux Journées* (1800), music by Cherubini; also *L'Abbé de l'épée* (1800), and some other plays;

and *Causeries d'un vieillard* (1807), *Contes à ma fille* (1809), and *Les Adieux du vieux conteur* (1835). His *Léonore* (1798) formed the basis of the libretto of the *Fidelio* of Beethoven.

See Bouilly, *Mes récapitulations* (1836-37); E. Legouvé, *Soixante ans de souvenir* (1^{re} partie, 1886).

BOULAINVILLIERS, HENRY, COMTE DE (1658-1722), French political writer, was born at St. Saire, Normandy, on Oct. 11 1658, and died in Paris on Jan. 23 1722. He served in the army until 1697. His most important works, which only appeared after his death, were: *Histoire de l'ancien gouvernement de la France* (La Haye, 1727); *État de la France, avec des mémoires sur l'ancien gouvernement* (London, 1727); *Histoire de la pairie de France, et du parlement de Paris* (London, 1753); *Histoire des Arabes* (1731). Boulainvilliers was an aristocrat of the most pronounced type, attacking absolute monarchy on the one hand and popular government on the other. The feudal system was, in his opinion, the ideal form of human government. His books had considerable influence, for they were quoted by the friends of authority, and, eventually, with still more effect by the revolutionaries; for instance, the theory that the nobility owed their position to their conquest of the Gauls proved to be two-edged.

BOULANGER, the name of several French artists: **JEAN** (1606-60), a pupil of Guido Reni at Bologna, who had an academy at Modena; his cousin **JEAN** (1607-80), a celebrated line-engraver; the latter's son **MATTHIEU**, another engraver; **LOUIS** (1807-67), a subject-painter, the friend of Victor Hugo and director of the imperial school of art at Dijon; the best-known, **GUSTAVE RODOLPHE CLARENCE** (1824-88), a pupil of Paul Delaroche, a notable painter of oriental and Greek and Roman subjects, and a member of the Institut de France (1882), who decorated the Foyer de la Danse of the Paris Opéra with terpsichorean subjects; and **CLÉMENT** (1805-42), a pupil of Ingres (q.v.).

BOULANGER, GEORGE ERNEST JEAN MARIE (1837-1891), French general, was born at Rennes on April 29, 1837. He entered the army in 1856, and served in Algeria, Italy, Cochinchina and the Franco-German War, earning the reputation of being a smart soldier. He was made a brigadier-general in 1880 on the recommendation of the duc d'Aumale, then commanding the VII. Army Corps, and Boulanger's expressions of gratitude and devotion on this occasion were remembered against him afterwards when, as war minister in M. Freycinet's cabinet, he erased the name of the duc d'Aumale from the army list as part of the republican campaign against the Orléanist and Bonapartist princes. In 1882 he became director of infantry at the war office, and in 1884 he was appointed to command the army occupying Tunis, but was recalled owing to differences of opinion with M. Cambon, the political resident. He returned to Paris, and began to take part in politics under the aegis of M. Clemenceau and the Radical party; and in January 1886, when M. Freycinet was brought into power by the support of the Radical leader, Boulanger became war minister.

By introducing genuine reforms for the benefit of officers and common soldiers alike, and by seeking popularity in the most pronounced fashion, he came to be accepted by the mob as the man destined to give France her revenge for the disasters of 1870, and to be used simultaneously as a tool by all the anti-Republican intriguers. It should be added that Boulanger was taunted in the Senate with his ingratitude to the duc d'Aumale, and denied that he had ever used the words alleged. His letters containing them were, however, published, and the charge proved. Boulanger fought a bloodless duel with the baron de Lareinty over this affair. On M. Freycinet's defeat in Dec. 1886 he was retained by M. Goblet at the war office. M. Clemenceau, however, had by this time abandoned his patronage of Boulanger, who was becoming so inconveniently prominent that, in May 1887, M. Goblet was not sorry to get rid of him by resigning. The mob clamoured for their "brav' général," but M. Rouvier, who next formed a cabinet, declined to take him as a colleague, and Boulanger was sent to Clermont-Ferrand to command an army corps. A Boulangist "movement" was now in full swing. The Bonapartists had attached themselves to the general, and even the comte de Paris encouraged his followers to support him, to the dismay of those

old-fashioned Royalists who resented Boulanger's treatment of the duc d'Aumale. He was deprived of his command in 1888 for twice coming to Paris without leave, and finally on the recommendation of a council of inquiry composed of five generals his name was removed from the army list. He was almost at once elected to the Chamber for the Nord, on a programme for the revision of the Constitution. A popular hero survives many deficiencies, and neither his failure as an orator nor the humiliation of a discomfiture in a duel with M. Floquet, then an elderly civilian, sufficed to check the enthusiasm of his following. During 1888 his personality was the dominating feature of French politics, and, when he resigned his seat as a protest against the reception given by the Chamber to his revisionist proposals, constituencies vied with one another in selecting him as their representative. At last, in January 1889, he was returned for Paris by an overwhelming majority. He had now become an open menace to the parliamentary Republic. Possibly he might at this moment have effected the *coup d'état* which the intriguers had worked for, and might not improbably have made himself master of France; but the favourable opportunity passed. The government, with M. Constans as minister of the interior, had been quietly taking its measures for bringing a prosecution against him, and within two months a warrant was signed for his arrest. To the astonishment of his friends, on April 1 he fled from Paris before it could be executed, going first to Brussels and then to London. It was the end of the political danger, though Boulangist echoes continued for a little while to reverberate at the polls during 1889 and 1890. Boulanger himself, having been tried and condemned *in absentia* for treason, in Oct. 1889, went to live in Jersey. On Sept. 30, 1891, he committed suicide in Brussels.

BOULAY DE LA MEURTHE, ANTOINE JACQUES CLAUDE JOSEPH, COMTE (1761-1840), French politician and magistrate, son of an agricultural labourer, was born at Chamousey (Vosges) Feb. 19, 1761, and died in Paris Feb. 4, 1840. Called to the bar at Nancy in 1783, he presently went to Paris, where he rapidly acquired a reputation as a lawyer and a speaker. He fought at Valmy (1792) and Wissembourg (1793) in the republican army, but his moderate principles forced him, during the Terror, to go into hiding. He represented La Meurthe in the Council of Five Hundred, of which he was twice president, but his views steadily became more conservative. He became an active member of the plot for the overthrow of the Directory in Nov. 1799. He was rewarded by the presidency of the legislative commission formed by Napoleon to draw up the new constitution; and as president of the legislative section of the council of state he revised the draft of the civil code. As director of a special land commission he settled the titles of land acquired by the French nation at the Revolution, and placed on an unassailable basis the rights of the new proprietors. After Waterloo he tried to obtain the recognition of the duke of Reichstadt. In 1815 he was proscribed and spent four years in exile, and though he was allowed to return to France in 1819, took no further active part in politics. Boulay published two books on English history—*Essai sur les causes qui, en 1649, amenèrent en Angleterre l'établissement de la république* (1799), and *Tableau politique des règnes de Charles II. et Jacques II., derniers rois de la maison de Stuart* (The Hague, 1818)—which contained much indirect criticism of the Directory and the Restoration governments. His memoirs, with the exception of a fragment on the *Théorie constitutionnelle de Sieyès* (1836), remained unpublished.

His elder son, Comte **HENRI GEORGES BOULAY DE LA MEURTHE** (1797-1858), was a constant Bonapartist, and after the election of Louis Napoleon to the presidency, was named (Jan. 1849) vice-president of the republic. He zealously promoted popular education.

BOULDER, a city of Colorado, U.S.A., on Boulder creek, just east of the continental divide, 30m. north-west of Denver, at an elevation of 5,300 ft.; the county seat of Boulder county. It is served by the Burlington, the Colorado and Southern, and

the Union Pacific railways. The population in 1920 was 11,006. Protected by mountains from the winter winds, and cooled in summer by breezes from the Arapahoe, Isabel, Fair, St. Vrain, and other glaciers to the west, the average monthly mean temperature ranges from 32.9° F (February) to 70.1° (August); and the sun shines on 328 days out of 365. The water-supply, sufficient for a population of 100,000, comes from glacier-fed lakes; electric energy from a large plant four miles east of the city. Extensive fields of lignite coal underlie the eastern third of the county. There are mineral springs in the vicinity of Boulder, and mines producing gold, silver, tungsten, lead, copper, and fluor-spar. The Rocky Mountain National park of 378sq.m. is not far to the north-west and the Colorado National Forest lies a few miles west. Boulder canyon and others have great scenic beauty, and the city owns 6,000ac. of mountain park-lands. Glissading on the face of the glaciers is a popular sport, and trout abound in many lakes and streams. The Colorado Chautauqua, one of the oldest and largest independent chautauquas in the country, has its permanent grounds on a beautiful site 400ft. above the city. The University of Colorado, incorporated in 1861 and opened in 1877, is in Boulder, except for its medical school, which is in Denver. It has an annual enrolment of about 3,000 besides over 3,000 in the summer session. During the summer the university maintains a camp at Arapahoe Falls. The stadium, seating 25,000, is built in a natural ravine on the campus.

The first settlement here was made late in 1858, and placer gold was discovered near by in 1859. The town was laid out and organized in 1859; the first city charter was secured in 1871; and a city manager form of government was adopted in 1917. Oil was struck three miles north-east of Boulder in 1892, and production reached its peak in 1903. For 12 years natural gas was supplied to the city from a single well about a mile away. For some years after 1900 most of the tungsten mined in the United States came from Nederland and Eldora, 18m. and 22m. south-west of Boulder.

BOULDER, a large stone, weathered or water-worn (*cf.* Swed. *bullersten*, a large stone which causes a noise of rippling water in a stream, from *bullra*, to make a loud noise). A geological term for a large mass of rock transported to a distance from the formation to which it belongs; in mining, a mass of ore found at a distance from the lode.

BOULDER CLAY: *see* GLACIAL PERIOD.

BOULÉ, PIERRE MARCELIN (1861–), French scientist, was born Jan. 1 1861, at Montsalvy. Educated at Toulouse, he became assistant professor of geology at Clermont-Ferrand, and devoted himself to the study of palaeontology. He became a member of the commissions on historical monuments and the geological map of France and was also president of the French Geological Society and of the French Archaeological Institute. Later he became director of the Institute of Human Palaeontology. Among his many works are *Le plateau de Lannemezan* (1895), *Les volcans de la France centrale* (1900), *Les grottes de Grimaldi* (1906–19) and *Les hommes fossiles* (1923).

BOULĒ, the general term in ancient Greece for an advisory council. In the Homeric state there was a council of the leading nobles, who met, on the summons of the king, for consultation. It formed a means of communication between the king and the free-men assembled in the Agora (*q.v.*). In Sparta this form of government was retained (*see* GEROUSIA). In Athens the ancient council was called the Boulē until the institution of a democratic council, when, for purposes of distinction it was described as ἡ ἐν τῷ Ἀρεῶν Πάγῳ Boulē, "the Boulē on the Areopagus," or, more shortly, "the Areopagus" (*q.v.*). It is a mistake to call the second Boulē a "senate." There is no real analogy between the Roman senate and the Athenian council of Five Hundred.

Councils existed in other Greek states, both oligarchic and democratic. A Boulē was a necessary part of a Greek oligarchy; the transition from monarchy to oligarchy was begun by the transference of the powers of the monarch to the Boulē of nobles. In the Greek democracy, the democratic Boulē was equally essential. The assembly of the people was unsuited to the management of the details of State affairs. We therefore find councils of both kinds in almost all the states of Greece. At Corinth there was an

oligarchic council presided over by eight leaders. The Athenians, in imposing a constitution on Erythrae (about 450 B.C.) included a council analogous to their own. In Elis there was an aristocratic council of 90, which was superseded by a popular council of 600 (471 B.C.). In Argos there was an aristocratic council of 80 and later a popular council of much larger size.

The Boulē at Athens. History.—The origin of the second Boulē at Athens is involved in obscurity. It is generally held that Solon established the council. It has also been maintained that no Boulē existed before Cleisthenes. On the whole it is reasonable to conclude that it was Solon who invented the Boulē to act as a semi-democratic check upon the democracy. Nothing is known of the operations of this council until the struggle between Isagoras and Cleisthenes (Herod. v. 72). Solon's council was based on the four Ionic tribes. When Cleisthenes created the new ten tribes in order to destroy the local influence of dominant families, and to give the country demes a share in government, he changed the Solonian council into a body of 500 members, 50 from each tribe. After Cleisthenes, the council remained unaltered till 306 B.C., when its numbers were increased to 600. In A.D. 126–127 the old number of 500 was restored.

Constitution and Functions.—(a) Under Solon the council consisted of 400 members, 100 from each of the four Ionic tribes. All classes were eligible except the *Thêtes* (*see* SOLON), but the method of appointment is not known. According to Plutarch the functions of this body were from the first *probouleutic* (*i.e.*, it prepared the business for the Ecclesia, *q.v.*). Others hold that this function was not assigned to it until the Cleisthenean reforms. It seems probable that the probouleutic functions were devised by Solon as a method of maintaining the balance between the aristocratic archons (*see* ARCHON) and the democracy. (b) Under Cleisthenes (*q.v.*) the council reached its full development as a democratic representative body. Every full citizen of 30 years of age was eligible, and, unlike other civil offices, it was permissible to serve twice, but not more than twice. From the first the *Bouleutai* were appointed by the demes, in numbers proportionate to the size of the demē, and the method of sortition was employed. After nomination each had to pass, before the old council, an examination in which his private life was scrutinized. The councillors had to take an oath that they would act according to the laws, would give the best advice in their power, and would carry out the examination of their successors in an impartial spirit. At the end of the year each councillor had to render an account of his work. The council exercised disciplinary control over its members; it could suspend a member, pending a formal trial before the whole council. There was a complete system of secretaries (*grammateis*), private treasury officials, and a paid herald who summoned the Boulē and the Ecclesia. The meetings took place generally in the council hall (*Bouleuterion*), but on special occasions in other places.

Prytaneis.—The Ecclesia was unable to meet more than three or four times a month; the council was in continuous session, except on feast days. It was impossible that the Five Hundred should all sit every day, and to facilitate the despatch of business, the system of *Prytaneis* was introduced, probably by Cleisthenes. The year was divided into ten equal periods. During each of these periods the council was represented by the 50 councillors of one of the ten tribes, who acted as an executive committee. Each of these committees was led by a president (*Epistates*), who acted as chairman of the Boulē and the Ecclesia, and a third of its numbers lived during their period of office in the *Tholos* (Dome) or *Skias*, where they dined at the public expense. It was the duty of the Boulē (*i.e.*, the Prytany which was for the time in session) to prepare all business for the consideration of the Ecclesia. Their recommendation (*probouleuma*) was presented to the popular assembly (*see* ECCLESIA), which either passed it as it stood or made amendments. The recommendation of the council had no intrinsic force until, by the votes of the Ecclesia, it passed into law.

The Boulē had large administrative and judicial control. (1) It was before it that the *Pōlētai* arranged the farming of public revenues, the receipt of tenders for public works, and the sale of

confiscated property; it dealt with defaulting collectors, exacted the debts of private persons to the State, and drew up annual estimates. (2) It supervised the treasury payments of the *Apodektai* ("Receivers") and the "Treasurers of the God." (3) It had to arrange for the provision of triremes and the award of the trierarchic crown. (4) It arranged for the maintenance of the cavalry and the special levies from the demes. (5) It heard cases of *eisangelia* (impeachment) and had the right to fine up to 500 drachmas, or hand the case over to the *Heliaea* (the Supreme Court). The cases which it tried were mainly prosecutions for crimes against the State (e.g., treason, conspiracy, bribery). (6) The council presided over the *dokimasia* (consideration of fitness) of the magistrates (see *ARCHON*). (7) The council, as the only body in permanent session, received foreign envoys and introduced them to the Ecclesia, and with the Strategoi (see *STRATEGUS*) took treaty oaths, after the Ecclesia had decided on the terms. On two occasions the council was specially endowed with full powers: it was given full powers to investigate the affair of the mutilation of the *Hermi* (see *ALCIBIADES*) on the night before the sailing of the Sicilian expedition; the people gave it full powers to send ambassadors to Philip of Macedon.

It will be seen that this democratic council was essential to the working of the Athenian state. Without having any final legislative authority, it was a necessary part of the legislative machinery, and it may be regarded as certain that a large proportion of its recommendations were passed without alteration or even discussion by the Ecclesia.

Sandys' edition of the *Constitution of Athens*; Busolt, *Die griechischen Staats- und Rechtsgeschichte* (1902); Whibley, *Companion to Greek Studies* (1916), with useful bibliography.

BOULETERION, in Greek architecture, the building where the boule, or council, met. It was usually on or near the agora.

BOULEVARD (a Fr. word, earlier *boulevard*, from Dutch or Ger *Bollwerk*, cf. Eng. "bulwark"), originally, in fortification, an earthwork with a broad platform for artillery. It came into use owing to the width of the gangways in mediaeval walls being insufficient for the mounting of artillery thereon. The boulevard or bulwark was usually an earthen outwork mounting artillery, and so placed in advance as to prevent the guns of a besieger from battering the foot of the main walls. It was as a rule circular. Semicircular *demi-boulevards* were often constructed round the bases of the old masonry towers with the same object. In modern times the word is most frequently used to denote a promenade laid out on the site of a former fortification, and, by analogy, a broad avenue in a town planted with rows of trees.

BOULLE, ANDRÉ CHARLES (1642–1732), French cabinet-maker, who gave his name to a fashion of inlaying known as Boulle or Buhl work. He was born in Paris Nov. 11 1642, and died there Feb. 29 1732. The son of Jean Boulle, a member of a family of cabinet-makers who had already achieved distinction, he became very famous and was, indeed, the second cabinet-maker—the first was Jean Macé—who has acquired individual renown. At the age of 30 he had already been granted one of those lodgings in the galleries of the Louvre set apart for the most talented of the artists employed by the Crown. Boulle was given the deceased Jean Macé's own lodging in 1672 by Louis XIV. In the patent conferring this privilege he is described also as "chaser, gilder and maker of marqueterie."

He was employed for many years at Versailles, where the mirrored walls, the floors of "wood mosaic," the inlaid panelling and the pieces in marqueterie in the Cabinet du Dauphin were regarded as his most remarkable work. These rooms were long since dismantled and their contents dispersed, but Boulle's drawings for the work are in the Musée des Arts Décoratifs. Not only the most magnificent of French monarchs, but foreign princes and the great nobles and financiers of his own country crowded him with commissions, and the *mot* of the abbé de Marolles, "*Boulle y tourne en ovale*," has become a stock quotation in the literature of French cabinet-making.

Boulle was by no means the first Frenchman to practise the art of marqueterie, nor was he quite the inventor of the peculiar type of inlay which is chiefly associated with his name; but no artist, before or since, has used these motives with such astonishing skill, courage and surety. He produced pieces of monumental solidity blazing with harmonious colour, or gleaming with the sober and dignified reticence of ebony, ivory and white metal.

Boulle improved upon the work of Renaissance artists by inlaying brass devices into wood or tortoise-shell, which last he greatly used according to the design he had immediately in view, whether flowers, scenes, scrolls, etc.; to these he sometimes added enamelled metal. Indeed the use of tortoise-shell became so characteristic that any furniture, however cheap and common, which has a reddish background that might by the ignorant be mistaken for inlay, is now described as "Buhl"—a name invented by the British auctioneer and furniture-maker.

See Havard, *Les Bouilles* (1893); C. Asselineau, *André Boulle* (1872) and Comte François de Salvarté, *Les Ébénistes du XVIII. Siècle* (1927).

BOULOGNE or BOULLONGNE, the name of a family of French painters. LOUIS (1609–1674), who was one of the original members of the Academy of Painting and Sculpture (1648), became celebrated under Louis XIV. His traditions were continued by his children: GENEVIEVE (1645–1708), who married the sculptor Jacques Clérion; MADELEINE (1646–1710), whose work survives in the "Trophées d'armes" at Versailles, BON (1649–1717), a successful teacher and decorative artist; and LOUIS the younger (1654–1733), who copied Raphael's cartoons for the Gobelins tapestry, and besides taking a high place as a painter was also a designer of medals.

BOULOGNE, CONFERENCE OF (June 21–22, 1920), a meeting of the Supreme Council of the Allies, in which Japan, Greece and Belgium participated, as well as the principal European Allied Powers. Like the Conference of Hythe on May 15–17 (see *HYTHE, CONFERENCE OF*), it was preparatory to the Conference of Spa (see *SPA, CONFERENCE OF*). The question of allocating among the Allies the prospective reparation payments from Germany was taken up, and a counter proposal (the so-called "Boulogne agreement") was prepared, in view of the expected German offer of a lump sum, should that offer prove inadequate.

BOULOGNE-BILLANCOURT or BOULOGNE-SUR-SEINE (the former title was fixed by decree in 1925), town of northern France, in the department of Seine, on the right bank of the Seine, south-west of Paris and immediately outside the fortifications. Pop. (1926) 74,458. The town has a Gothic church of the 14th and 15th centuries (restored in 1863), founded in honour of Notre-Dame de Boulogne-sur-Mer. The settlement had previously been called Menuls-lès-St. Cloud. Laundering is extensively carried on as well as the manufacture of metal boxes, soap, oil and furniture, and there are numerous handsome residences. For the neighbouring Bois de Boulogne see *PARIS*.

BOULOGNE-SUR-MER, town of north France, capital of an arrondissement in the department of Pas-de-Calais, on the English channel at the mouth of the river Liane, 157m N.N.W. of Paris on the Northern railway, and 28m. by sea S.E. of Folkestone, Kent. Pop. (1926) 51,134. On the site of the Roman harbour Gessoriacum which later became Bononia, it was destroyed by the Normans in 882, but restored about 912. In Carolingian times it was head of a countship, long an object of dispute between Flanders and Ponthieu. It belonged to the houses of Ponthieu (965–1234), Brabant and Auvergne, until seized by Philip the Good, duke of Burgundy, in 1419. In 1477 Louis XI. of France reunited it to the Crown. In 1544 Henry VIII. of England took the town by siege, but it was restored to France in 1550. From 1566 to the end of the 18th century it was the seat of a bishopric. Boulogne stands upon hills skirting the right bank of the Liane with the industrial quarter, Capecure, on the left bank. The town includes Haute Ville and Basse Ville. The former, on the hill-top, is a comparatively small parallelogram surrounded by 13th century ramparts with boulevards outside. Here are the law court, château and *hôtel-de-ville* (18th century), and a belfry tower (13th and 17th centuries). At some distance north-west

stands the church of Notre Dame (1827-66), a well-known place of pilgrimage, on an old site. The modern town stretches from the foot of the hill to the harbour. The public buildings include a museum of antiquities, natural history, porcelain, etc., connected with the public library, containing 75,000 volumes and valuable manuscripts, many of them richly illuminated. The Colonne de la Grande Armée, begun in 1804 and finished under

AFTER AN ENGRAVING, BY COURTESY OF THE SOCIETY OF ANTIQUARIES OF LONDON

THE SUCCESSFUL SIEGE OF BOULOGNE BY HENRY VIII. IN 1544
Henry is seen, clad in armour, and with baton in hand, directing the artillery operations from the enclosure in the foreground. To the left, and in front of the king, is the Artillery Park crowded with ordnance stores, sandbags, guns and mortars. The English soldiers are entrenched at the foot of the town walls, in which the artillery are making breaches, while the archers take aim at the defenders. The Royal camp is in the immediate left foreground, surrounded by cavalry

Louis Philippe, commemorates Napoleon's projected invasion of England. The harbour is formed by the mouth of the Liane. The town and port were under British administration and devoted to military uses in 1914-18, and formed the main channel for reinforcements. The equipment of the port was largely developed in 1914-18 and the Loubet basin (1925) has increased the quay length. Railway improvements (1924) enable expresses from Calais to pass through Boulogne at high speed, and a scheme to rebuild the maritime station and construct a tunnel to connect with the main line at Outreau has been approved. Harbour works (1924) are to provide accommodation for large liners which, it is hoped, will make Boulogne a port of call. The Liane estuary, behind the old harbour, is to be converted into an inner harbour and dock for the important fishing industry. Boulogne imports hams, jute, wool, woven goods of silk and wool, kaolin, coal, slates, timber, machinery, and iron and steel, and exports wine, brandy, woven goods, fruit, potatoes and other vegetables, poultry, objects of art, stone and cement. Raw Italian silk is shipped in large quantities to England. Herring and mackerel fishing are very important, much fish being sent to Paris by railway; and boats are sent to the Newfoundland beds for cod. The fishermen live for the most part in a separate quarter called La

Beurrière, in the upper part of the town. Boulogne and its environs have foundries, cement factories, important steel-pen manufacturing, oil works, dye-works, fish curing works, flax mills, saw mills, and manufactories of cloth, ropes, fireproof ware, chocolate, boots and shoes, and soap. Shipbuilding is also carried on. Boulogne is the seat of a sub-prefect, and has tribunals of first instance, and of commerce, a board of trade arbitrators and a chamber of commerce.

BOULTON, MATTHEW (1728-1809), English manufacturer and engineer, was born on Sept. 3, 1728, at Birmingham. At Soho, 2 miles north of Birmingham, he undertook the manufacture of artistic objects in metal, and also the reproduction of oil-paintings by a mechanical process in which he was associated with Francis Eginton (1737-1805), who subsequently achieved a reputation as a worker in stained or enamelled glass. About 1767, Boulton made the acquaintance of James Watt. In 1772 Watt's partner, Dr. John Roebuck, got into financial difficulties, and Boulton, to whom he owed £1,200, accepted the two-thirds share in Watt's patent held by him in satisfaction of the debt. Three years later Boulton and Watt formally entered into partnership, and Boulton devoted all the capital he possessed or could borrow to making the steam-engine a commercial success. It was also owing to Boulton that in 1775 an act of parliament was obtained extending the term of Watt's 1769 patent to 1799. In 1800 the two partners retired from the business, which they handed over to their sons, Matthew Robinson Boulton and James Watt, junior. In 1788 Boulton turned his attention to coining machinery, and erected at Soho a complete plant with which he struck coins for the Sierra Leone and East India companies and for Russia, and in 1797 produced a new copper coinage for Great Britain. In the same year he took out a patent in connection with raising water on the principle of the hydraulic ram. He died at Birmingham on Aug. 18, 1809.

BOUNCING BET, a name commonly given in the United States to the European soapwort, which has become very widely naturalized in waste grounds and along roadsides.

BOUND or **BOUNDARY**, that which serves to indicate the limit or extent of land. In law, the exact boundary of land is always a matter of evidence; where no evidence is available, the court acts on presumption which may be rebutted. For example, the boundary of land on opposite sides of a road, whether public or private, is presumed to be the middle line of the road. Where two fields are separated by a hedge and ditch the boundary line will run on the field or outside edge of the ditch. As to parish boundaries, see PARISH.

BOUND BROOK, a borough of Somerset county, New Jersey, U.S.A., on the Raritan river and the Delaware and Raritan canal, 32m. south-west of New York city, at the foot of the Watchung hills. It is served by the Central railroad of New Jersey, the Lehigh Valley, the Baltimore and Ohio, and the Reading railways. The population in 1920 was 5,906. With the adjoining boroughs of South Bound Brook and Middlesex the urban unit in 1927 had a population of over 10,000. Bound Brook has a large lumber trade. The manufactures include chemicals, roofing materials, asbestos products, and oil-less bearings.

Several interesting colonial houses are still standing. The Staats homestead, in South Bound Brook, still occupied by a direct descendant of its builder, was the headquarters of Baron von Steuben during the Revolutionary war. Col. Philip Van Horne's house, known as Convivial Hall because of the famed hospitality of the colonel and his five daughters, was occupied for a time by Lord Stirling, and later by "Light Horse" Harry Lee. Washington's army twice camped on the hills back of the village, known as the Heights of Middlebrook, and the site is kept as a historical monument. It is said that Washington here first (1777) unfurled the Stars and Stripes as the national flag. In 1681 all the land now occupied by Bound Brook was transferred by deed from two Indian chiefs to Philip Carteret and six other men. Settlement soon followed, but the borough was not incorporated until 1891.

BOUNDS, BEATING THE, an ancient custom still observed in many English parishes. In times when maps were rare it was usual to make a perambulation of the parish boundaries

on Ascension day or during Rogation week. In the north of England the latter is still called "gang week" or "ganging days" from this "ganging" or procession. The priest of the parish with the churchwardens and the parochial officials headed a crowd of boys who, armed with green boughs, beat with them the parish border-stones. Sometimes the boys were themselves whipped or even violently bumped on the boundary-stones to make them remember. The object of taking boys was to ensure that witnesses to the boundaries should survive as long as possible. The custom is as old as Anglo-Saxon days, as it is mentioned in laws of Alfred and Aethelstan. It may have been derived from the Roman festival of Terminus, the god of landmarks, to whom cakes and wine were offered, sports and dancing taking place at the boundaries. In England a parish-ale or feast was always held after the perambulation, which assured its popularity. Beating the bounds had a religious side in the practice which originated the term, Rogation, the accompanying clergy being supposed to beseech (*rogare*) the divine blessing upon the parish lands for the ensuing harvest. This was prohibited by the Injunctions of Queen Elizabeth; but the perambulation continued as a quasi-secular function, so that evidence of the boundaries of parishes, etc., might be preserved (Gibson *Codex juris Ecclesiastici Anglicani* [1761] pp. 213-214).

BOUNTY, a gift or gratuity; more usually, a premium paid by a government to encourage some branch of production or industry, as in England in the case of the bounty on corn, first granted in 1688 and abolished in 1814, the herring-fishery bounties, the bounties on sailcloth, linen, and other goods. The most striking modern example of a bounty was that on sugar (q.v.). Somewhat akin to bounties are the subsidies granted to shipping (q.v.) by many countries. Bounties or, as they may equally well be termed, grants, are often given, more especially in new countries, for the destruction of beasts of prey; in the United States and some other countries bounties have been given for tree-planting; France has given bounties to parents in an endeavour to stay the fall in her birth-rate.

Bounty was also the name given to the money paid to induce men to enlist in the army or navy. During the American Civil War many recruits joined solely for the sake of the bounty offered, and afterwards deserted, they were called "bounty-jumpers." The term bounty was also applied in the British Navy to signify money payable to the officers and crew of a ship in respect of services on particular occasions.

Queen Anne's bounty (q.v.) is a fund applied for the augmentation of poor livings in the established church.

King's bounty is a grant made by the sovereign, of his royal bounty, to those of his subjects whose wives are delivered of three or more children at a birth.

"BOUNTY," MUTINY OF THE. At the end of 1787 Lieutenant William Bligh (q.v.) was sent to the Pacific in command of H.M.S. "Bounty." His severity provoked a mutiny (April 28, 1789), as a consequence of which Bligh and 18 loyal members of the crew were set adrift, after a journey approaching 4,000 m. in an open boat they all reached Batavia safely. The mutineers returned to Tahiti where some of them were subsequently captured. A party, however, migrated to Pitcairn island and founded a small colony which was not discovered till 1808. There was then only one survivor of the original crew of the "Bounty" on the island, John Adams, who survived until 1829 (See PITCAIRN ISLAND).

BOURASSA, HENRI (1868—), French-Canadian politician and journalist, was born Sept. 1, 1868. After a private education he studied law and was called to the bar in 1899. He established a name as a writer on political subjects, and was for a time editor and proprietor of *L'Interprète*. Later he became a leading contributor to *Le Nationaliste* and finally editor and joint proprietor of *Le Devoir*. In 1896 he was elected to the Dominion House of Commons as a Liberal. In 1899 he disagreed with Laurier regarding Canadian participation in the South African War and resigned as a protest against Laurier's policy. On his resignation he became the accredited leader of the Nationalist party and in 1900 and 1904 was elected to the Dominion Parliament in that interest. In 1907 he resigned in order to accept nomination for

the Quebec Legislature. He was a member of the Quebec Legislative Assembly from 1908 to 1912, when he resigned. During the World War Bourassa opposed both the enforcement of conscription in Canada and the naval policy of the Liberal party. In 1925 he returned to politics and was elected as an Independent to the Dominion House of Commons. He attended the Imperial Conferences in the autumn of 1926 as an unofficial observer, and took the opportunity of delivering speeches outside in which he declared that the maintenance of the British connection was desirable as an obstacle to the absorption of Canada by the United States. When, at the end of the year, action by Lord Byng raised the issue of the constitutional position of the Governor-General, Bourassa became the active ally of Mr. Mackenzie King, but in accordance with the consistent policy of his political career (that of a friendly neutral in relation to the Liberal party) he declined to accept office in Mr. King's new government.

BOURBAKI, CHARLES DENIS SAUTER (1810-1897), French general, was born at Pau on April 22, 1816, the son of a Greek colonel who died in the War of Independence in 1827. He entered St. Cyr, and in 1836 joined the Zouaves, becoming lieutenant of the Foreign Legion in 1838, and aide-de-camp to King Louis Philippe. It was in the African expedition that he first came to the front. In 1842 he was captain in the Zouaves; 1847, colonel of the Turcos, in 1850, lieutenant-colonel of the 1st Zouaves; 1851, colonel; 1854, brigadier-general. In the Crimean War he commanded a portion of the Algerian troops; and at the Alma, Inkerman and Sevastopol Bourbaki's name became famous. In 1857 he was made general of division, commanding in 1859 at Lyons. His success in the war with Italy was only second to that of MacMahon, and in 1862 he was proposed as a candidate for the vacant Greek throne, but declined the proffered honour. In 1870 the emperor entrusted him with the command of the Imperial Guard, and he played an important part in the fighting round Metz.

A curious incident of the siege of Metz is connected with Bourbaki's name. A man who called himself Regnier,¹ about Sept. 21, appeared at Hastings, to seek an interview with the refugee empress Eugénie, and failing to obtain this he managed to get from the young prince imperial a signed photograph with a message to the emperor Napoleon. This he used, by means of a safe-conduct from Bismarck, as credentials to Marshal Bazaine, to whom he presented himself at Metz, telling him on the empress's alleged authority that peace was about to be signed and that either Marshal Canrobert or General Bourbaki was to go to Hastings for the purpose. Bourbaki at once went to England, with Prussian connivance, as though he had a recognized mission, only to discover from the empress at Hastings that a trick had been played on him. He returned to France, offered his services to Gambetta, and received the command of the Northern Army, but was recalled on Nov. 19 and transferred to the Army of the Loire. In command of the hastily trained and ill-equipped Army of the East, Bourbaki made the attempt to raise the siege of Belfort, which, after the victory of Villersexel, ended in the repulse of the French in the three days' battle of the Lisaine. Other German forces under Manteuffel now closed upon Bourbaki and he was eventually driven over the Swiss frontier with the remnant of his forces (see FRANCO-GERMAN WAR). Bourbaki himself, rather than submit to the humiliation of a probable surrender, delegated his functions (Jan. 26, 1871) to General Clinchant, and in the night fired a pistol at his own head, but the bullet, owing to a deviation of the weapon, was flattened against his skull and his life was saved. In July 1871 he again took the command at Lyons, and subsequently became military governor. In 1881, owing to his political opinions, he was placed on the retired list. In 1885 he was an unsuccessful candidate for the senate. He died on Sept. 27, 1897.

¹The whole Regnier affair remained a mystery; the man himself—who on following Bourbaki to England made the impression on Lord Granville (see the *Life of Lord Granville*, by Lord Fitzmaurice, ii. 61) of being a "swindler" but honestly wishing to serve the empress—was afterwards mixed up in the Humbert frauds of 1902-03; he published his own version of the affair in 1870 in a pamphlet, *Quel est votre nom?* It has been suspected that on the part either of Bazaine or of the Germans some undisclosed intrigue was on foot.

Duchies of Lucca and Parma.—In 1748 the duchy of Parma was conferred on Philip, youngest son of Philip V. of Spain. He was succeeded by his son Ferdinand in 1765. Parma was ceded to France in 1801, Ferdinand's son Louis being made king of Etruria, but the French took possession of the duchy only after Ferdinand's death in 1802. Louis' son Charles Louis was forced to surrender Etruria to France in 1807, and he was given the

duchy of Lucca by the Congress of Vienna in 1815. In 1847, on the death of Marie Louise, widow of Napoleon, who had received Parma and Piacenza in accordance with the terms of the treaty of Paris of 1814, Charles Louis succeeded to the duchies as Charles II., at the same time surrendering Lucca to Tuscany. In 1849 he abdicated in favour of his son, Charles III., who married a daughter of the duke of Berry, and was assassinated in 1854, being succeeded by his son Robert. In 1860 the duchies were annexed by Victor Emmanuel to the new kingdom of Italy.

Bastard Branches.—There are numerous bastard branches of the family of Bourbon, the most famous being the Vendôme branch, descended from Caesar, natural son of Henry IV., and the Maine and Toulouse branches, descended from the two natural sons of Louis XIV. and Madame de Montespan.

See Désormeaux, *Histoire de la maison de Bourbon* (1782–88); Coiffier de Moret, *Histoire du Bourbonnais et des Bourbons* (1824); Achaintre, *Histoire généalogique et chronologique de la maison royale de Bourbon* (1825–26); Berand, *Histoire des sires et ducs de Bourbon* (1835); Dussieux, *Généalogie de la maison de Bourbon* (1872).

BOURBON, CHARLES, DUKE OF (1400–1527), constable of France, second son of Gilbert, count of Montpensier, was born on Feb. 17, 1490. In 1505 he married Suzanne, heiress of Peter II., duke of Bourbon, by Anne of France, daughter of King Louis XI., and assumed the title of duke of Bourbon. The addition of this duchy to the numerous duchies, countships and other fiefs which he had inherited on the death of his elder brother Louis in 1501, made him at the age of 15 the wealthiest noble in Europe. For his brilliant services at the battle of Marignano (Sept. 1515) he was made governor of the Milanese, which he defended against an attack of the emperor Maximilian. But dissensions arose between Francis I. and the constable. He was recalled from the government and in the hard fought campaign in the Netherlands against the emperor Charles V. the command of the vanguard, one of the most cherished prerogatives of the constables, was taken from him. The death of his wife without surviving issue, on April 28, 1521, weakened his territorial position, and afforded the mother of the king, Louise of Savoy, means to gratify her greed. As grand-daughter of Charles, duke of Bourbon (d. 1456), she claimed the female and some of the male fiefs of the duchy of Bourbon, while the king claimed those fiefs which were originally appanages, as escheating to the crown, and other claims were put forward. Before the *parlement* of Paris, before which the case was brought, was able to arrive at a decision, Francis handed over to his mother a part of the Bourbon estates, and ordered the remainder to be sequestered.

Bourbon, who for some time had been coquetting with the enemies of France, renewed his negotiations with the emperor and Henry VIII of England. It was agreed that the constable should raise in his own dominions an armed force to assist the emperor in an invasion of France, and should receive in return the hand of Eleonora, queen dowager of Portugal, or of another of the emperor's sisters. He now escaped across the frontier to the emperor's dominions, but he took no troops with him. The contemplated invasion of France by Henry VIII and Charles V. failed. In the spring of 1524, Bourbon was with the imperial army in Lombardy which forced the French across the Sesia (where the chevalier Bayard was mortally wounded). In Aug. 1524 he invested Marseilles, but being unable to prevent the introduction of supplies by Andrea Doria, the Genoese admiral in the service of Francis, he was forced to raise the siege and retreat to the Milanese. He took part in the battle of Pavia (1525), where Francis was defeated and taken prisoner. But Bourbon's troops were clamouring for pay, and the duke was driven to extreme measures to satisfy their demands. After the treaty of Madrid (1526), Bourbon had been offered the duchy of Milan. He now levied contributions from the townsmen, and demanded 20,000 ducats for the liberation of the chancellor Girolamo Morone (d. 1529), who had been imprisoned for an attempt to realize his dream of an Italy purged of the foreigner. He declined to recognize the truce which Charles's viceroy in Naples had concluded with Pope Clement VII., and decided to satisfy his starving soldiers with the sack of Rome. On May 5, 1527, the troops appeared before the walls of Rome. On the following morning

Bourbon attacked the Leonine city, and while mounting a scaling ladder fell mortally wounded by a shot, which Benvenuto Cellini in his *Life* claims to have fired. After Bourbon's death his troops took and sacked Rome.

See O. de Marillac, *Vie du Connétable de Bourbon* (1836); E. Armstrong, *Charles V.* (1902).

BOURBON-LANCY, watering-place, east-central France, department of Saône-et-Loire, 52m. S.S.E. of Nevers by rail. Pop. (1926), 2,068. The town on a hill about 2m. from the right bank of the Loire possesses thermal springs, used in the Roman period, and ancient baths have been found. The waters, saline and ferruginous, are used for drinking and bathing, in cases of rheumatism, etc. In the middle ages Bourbon-Lancy was an important stronghold and a fief of the Bourbon family. There are a bathing establishment, a large hospital, a secularized church (11th and 12th centuries), a belfry pierced by a gateway of the 15th century, and houses of the 15th and 16th centuries. Farm implements are made.

BOURBON L'ARCHAMBAULT, town, central France, department of Allier, on the Burge, 16m. W. of Moulins by rail. Pop. (1926) 1,850. There are thermal springs known since Roman times, a church (12th century), and ruins of a castle of the dukes of Bourbon (13th and 15th centuries), including a cylindrical keep. Stone is quarried in the vicinity. Bourbon (*Aquae Borvoni* or *Bormoni*) was anciently the capital of the Bourbonnais and gave its name to the great Bourbon family (q.v.). The affix Archambault is the name of one of its early lords.

BOURBONNAIS was formerly a province of France, bounded on the north by Nivernais and Berri, on the south by Auvergne, on the east by Burgundy and Forez, and on the west by Berri. It covered approximately the same area as the modern department of Allier. Bourbonnais was a purely feudal creation, and did not correspond to any ancient division of territory. It included part of the land formerly held by certain Gallic tribes mentioned by Caesar—the Arverni, the Aedui and the Bituriges-Cubi. It was later divided between Aquitaine and Lyonnaise. In the 18th century different parts of the province formed part of five dioceses, those of Bourges, Clermont, Autun, Nevers and Limoges. The principal towns of Bourbonnais are Moulins, the capital, and Gannat, Montluçon and La Palisse. The province has a military government with headquarters at Moulins. For judicial purposes it came under the *Parlement* of Paris.

See de Coiffier de Moret, *Histoire du Bourbonnais*, 2 vol. (1814–16); A. Allier, *Histoire de l'ancien Bourbonnais*, 2 vol. (1834–38); M. Fazy, *Histoire des Sires de Bourbon . . . et de la formation territoriale du Bourbonnais* (1924).

BOURBONNE-LES-BAINS, a watering-place of east France, department of Haute-Marne, east north-east of Langres. Pop. (1926) 2,646. Its hot saline springs (108°–150°F.) were known to the Romans under the name *Aquae Borvoni*. The waters are useful in skin troubles and rheumatism. The principal buildings are a 12th century church, the state bathing-establishment and the military hospital (1732); there are also the remains of a castle. Timber-sawing and plaster manufacture are carried on. In the neighbourhood are the buildings of the celebrated Cistercian abbey of Morimond.

BOURCHIER, ARTHUR (1863–1927), English actor, was born on June 22, 1863, and educated at Eton and Christ Church, Oxford. At the university he became prominent as an amateur actor in connection with the O.U.D.S., which he founded, and in 1889 he joined Mrs. Langtry as a professional. He also acted with Charles Wyndham at the Criterion, and was for a while in Daly's company in America. In 1894 he married Violet Vanbrugh, with whom he subsequently took the leading parts under his own management. In 1918 he married Miss Kyrle Bellew. Both as tragedian and comedian Mr. Bouchier took high rank on the London stage, and as actor-manager produced successful modern plays by Mr. Sutro and others. He played many Shakespearian parts, but he is best remembered for parts like the broker's man in *Tilly of Bloomsbury* and John Silver in *Treasure Island*. He used to say with pride that he was the only London actor-manager having his own theatre and working without a syndicate or a financial partner. He died in South Africa, Sept. 14, 1927.

BOURCHIER, THOMAS (c. 1404–1486), English archbishop, lord chancellor and cardinal, was a younger son of William Bouchier, count of Eu (d. 1420), and through his mother, Anne, a daughter of Thomas of Woodstock, duke of Gloucester, was a descendant of Edward III. Educated at Oxford and then entering the church, after holding some minor appointments, he became bishop of Worcester in 1434. In the same year he was chancellor of the University of Oxford, and in 1443 he was appointed bishop of Ely; then in April 1454 he was made archbishop of Canterbury, becoming lord chancellor of England early in 1455. Bouchier's short term of office as chancellor coincided with the opening of the Wars of the Roses, and at first he was not a strong partisan, although he lost his position as chancellor when Richard, duke of York, was deprived of power in Oct. 1456. Afterwards, in 1458, he helped to reconcile the contending parties, but when the war was renewed in 1459 he appeared as a decided Yorkist; he crowned Edward IV. in June 1461, and in 1465, his queen, Elizabeth Woodville. In 1457 Bouchier took the chief part in the trial of Reginald Pecock, bishop of Chichester, for heresy. In 1467 he was created a cardinal, and in 1475 he was one of the four arbitrators appointed to arrange the details of the treaty of Picquigny between England and France. After the death of Edward IV. in 1483, Bouchier persuaded the queen to allow her younger son, Richard, duke of York, to share his brother's residence in the Tower of London; and although he had sworn to be faithful to Edward V., before his father's death, he crowned Richard III. in July 1483. He was, however, in no way implicated in the murder of the young princes. The third English king crowned by Bouchier was Henry VII., whom he also married to Elizabeth of York in Jan. 1486. Bouchier died March 1486.

See W. F. Hook, *Lives of the Archbishops of Canterbury*, vol. v. (1860–84).

BOURDALOUE, LOUIS (1632–1704), French Jesuit and preacher, born at Bourges on Aug. 20, 1632, at the age of 16 entered the Society of Jesus, was appointed successively professor of rhetoric, philosophy and moral theology, in various colleges of the Order. His success as a preacher determined his superiors to call him to Paris in 1669 to occupy for a year the pulpit of the church of St. Louis. His eloquence ranked him in popular estimation with the great masters of style in the most brilliant period of Louis XIV.'s reign. On the revocation of the Edict of Nantes he went to Languedoc to confirm converts to Catholicism. Catholics and Protestants joined in praising his fervid eloquence in the Lent sermons preached at Montpellier in 1686. Bourdaloue died in Paris on May 13, 1704. His influence was due as much to his saintly character and to his gentleness as to his reasoning. Voltaire said that his sermons surpassed those of Bossuet (whose retirement in 1669, however, prevented Bourdaloue from being regarded as his rival); there is little doubt that their simplicity and coherence, and the direct appeal which they made to all hearers, gave them a superiority over the more profound sermons of Bossuet.

BIBLIOGRAPHY.—The only authoritative source for the Sermons is the edition of Père Bretonneau (14 vols., Paris, 1707–21, followed by the *Pensées*, 2 vols. 1734). Other editions not based on Bretonneau are inferior; some, indeed, are altogether spurious (e.g., that of Abbé Sicard, 1810). Among critical works are Henri Chérot, *Bourdaloue inconnu* (1898) and *Bourdaloue, sa correspondance et ses correspondants* (1898–1904); L. Pauthe, *Bourdaloue (les maîtres de la chaire au XVII^e siècle)* (1900); E. Griselle, *Bourdaloue histoire critique de sa prédication* (2 vols. 1901); *Sermons inédits; bibliographie, etc.* (Paris, 1901); Ferdinand Castets, *Bourdaloue, la vie et la prédication d'un religieux au XVII^e siècle*, *La Revue Bourdaloue* (1902–04); C. H. Brooke, *Great French Preachers* (sermons of Bourdaloue and Bossuet, 1904); F. Brunetière, "L'Éloquence de Bourdaloue," in *Revue des deux Mondes* (Aug. 1904), a general inquiry into the authenticity of the sermons and their general characteristics.

BOURDON, FRANÇOIS LOUIS (d. 1797), known as **BOURDON DE L'OISE**, French revolutionist, was *procureur* at the parlement of Paris. Representing the department of the Oise in the Convention, he voted for the immediate death of the king. He accused the Girondists of relations with the court, then turned against Robespierre, who had him expelled from the Jacobin club for his conduct as commissioner of the Convention with the army of La Rochelle. On the 9th Thermidor he was

one of the deputies delegated to aid Barras to repress the insurrection made by the commune of Paris in favour of Robespierre. Bourdon then became a violent reactionary, attacking the former members of the Mountain and supporting rigorous measures against the rioters of the 12th Germinal and the 1st Prairial of the year III. In the council of Five Hundred, Bourdon belonged to the party of "Clichyens," composed of disguised royalists, against whom the directors made the *coup d'état* of the 18th Fructidor. Bourdon was deported to French Guiana, where he soon died.

BOURDON GAUGE: see **PRESSURE GAUGE.**

BOURG or **BOURG-EN-BRESSE**, a town in the east of France, capital of department of Ain, formerly capital of the province of Bresse, 36m. N.N.E. of Lyons by the P.L.M. railway. Pop. (1926) 16,131. Bourg is at the south-western end of the Jura, on the left bank of the Reyssouze, a tributary of the Saône. It is an important railway junction. Roman remains have been discovered, but little is known of its early history. Raised to the rank of a free town in 1250, it was in the 15th century chosen by the dukes of Savoy as the chief city of Bresse. The town was finally ceded to France in 1601. In 1814 the town, in spite of its defenceless condition, resisted the Austrians, who pillaged it.

The church of Notre Dame is a 16th century transitional structure, with the Renaissance style prevailing. In the interior there are stalls and stained glass of the 16th century. The chief attraction for tourists, however, is the church of Brou, a suburb of Bourg, a remarkable monument of late Gothic (1506–32), unique in its uniformity of style. Marguerite of Bourbon, wife of Philibert II. of Savoy, had intended to found a monastery on the spot, but died too soon, and the church was built by her daughter-in-law Marguerite of Austria, in memory of her husband, Philibert le Beau of Savoy. The exterior, especially the façade, is richly ornamented, but the chief interest lies in the three mausolea with the marble effigies of Marguerite of Bourbon, Philibert le Beau and Marguerite of Austria. The rood loft, oak stalls and reredos in the Lady chapel are masterpieces in a similar style. In the former priory building the museums of Bourg are installed, including the Musée Lorin and the Musée Guillon. The church is now state property. Bourg is the seat of a prefect and a court of assizes, and has a tribunal of first instance, a tribunal and a chamber of commerce. Iron goods, mineral waters, tallow, soap, earthenware and flour are made. Trade is in grain, cattle and in the renowned poultry of Bresse (*q.v.*).

BOURGEOIS, LÉON VICTOR AUGUSTE (1851–1925), French statesman, was born in Paris May 21 1851, and received a legal education. He entered the civil service in 1876, rising in 1887 to be prefect of police. His political career opened in 1888 when he defeated Gen. Boulanger in the Marne and entered the chamber. He was a member of many administrations from 1888 onwards, and in 1895 himself formed a Radical ministry which fell in the constitutional struggle over the right of the senate to veto supply. He was minister of the exterior in the Sarrien cabinet of 1906, and was responsible for French policy at Algiers. In the meantime he had distinguished himself at the Hague Peace Conference (1899) and in 1903 was nominated a member of the permanent Court of Arbitration; he was the French delegate at the Hague Conference of 1907. In June 1914 he took over foreign affairs in the Ribot cabinet.

During the World War he was minister without portfolio in the Briand cabinet. He had been elected to the senate in 1905, and was president of that assembly from 1920–23.

Léon Bourgeois was one of the first to suggest a league of nations. For this reason he was appointed by his government to represent France during the negotiations of 1919 concerning the League. When this was constituted he was, until a year before his death, the principal representative of France, both in the Council and in the Assembly. In 1920 he was awarded the Nobel Peace Prize. He died Sept. 29 1925.

BOURGEOIS, a French word originally meaning a freeman of a *bourg* or borough; later extended to the whole class between the worker and the landed nobility, and now used generally of the capitalist class of any country.

In printing, the name of a type, in size ("nine point") between long primer and brevier. The type in which the main body of the *Encyclopædia Britannica* is set is bourgeois. The word, in this sense, is pronounced in English "burjoyce"; the French call type of this size *gaillarde*.

BOURGES, chief town of the department of Cher, central France, 144m. S. of Paris on the Orléans railway between Vierzon and Nevers. Pop. (1926) 36,021. Bourges is built in marshy country on a hillock cut off on three sides by the Canal of Berry, the Yèvre, the Auron and smaller streams. The old town with its narrow streets forms a centre, to the south and east of which lie the industrial suburbs. Bourges occupies the site of the *Avaricum*, of the Bituriges, mentioned by Caesar as an important settlement. In 52 B.C., it was completely destroyed, but under Augustus it was made the capital of Aquitania Prima. About A.D. 250 it became the seat of a bishop, the first occupant of the see being Ursinus. It was in the hands of the Visigoths from 475 to 507. In the middle ages it was the capital of Berry. In the 15th century it became the residence of Charles VII., "king of Bourges." In 1463 a university was founded in the city by Louis XI., which was for centuries one of the most famous in France for jurisprudence, but it has long ceased to exist. On many occasions Bourges was the seat of ecclesiastical councils as in 1438, when the Pragmatic Sanction of the Gallican Church was established, and in 1528, when Lutheran doctrines were condemned. Bourges preserves portions of the Roman ramparts, and of fortifications of the 13th century. The summit of the rise on which the city is built is crowned by the cathedral of St Étienne, one of the most important Gothic churches in France. Begun in the 12th century it was completed in the 16th, to which period belong the northernmost of the two unfinished towers flanking the façade and two of its five elaborately sculptured portals. The interior has double aisles—the inner aisles of remarkable height—and no transepts, and contains among many other works of art, magnificent stained glass of the 13th century. Beneath the choir there is a partially Romanesque crypt with traces of Roman fosses; the two lateral portals are also survivals of a Romanesque church. The hôtel Lallemand and the hôtel Cujas (now occupied by the museum) are of the Romanesque period. The hôtel de Jacques Cœur, the famous merchant, is now the law-court. It is in the Renaissance style, but two towers of the Roman fortifications were utilized in the construction of the south-west façade. The industrial activity of Bourges depends primarily on its ammunition works and on its being a military centre. The suburb of Mazières has large iron and engineering works, and there are manufactories of anvils, edge-tools, biscuits, woollen goods, oil-cloth, boots and shoes, fertilizers, brick and tile works, distilleries, tanneries, saw-mills and dye-works. The town has a port on the canal of Berry, and does a considerable trade in grain, wine, vegetables, hemp and fruit. Market gardening on the marshy soils of the neighbourhood is also important. Bourges is the seat of an archbishopric, a court of appeal, a court of assizes and a prefect. It has tribunals of first instance and of commerce, a board of trade-arbitrators and a chamber of commerce.

BOURGET, PAUL CHARLES JOSEPH (1852–), French novelist and critic, was born at Amiens on Sept. 2, 1852 the son of a teacher of mathematics. He received his early education at Clermont-Ferrand, and afterwards studied at the lycée Louis-le-Grand and at the École des Hautes Études. In 1872–1873 he produced a volume of verse, *Au bord de la mer*, which was followed by others, the last, *Les Aveux*, appearing in 1882. Meanwhile he was making a name in literary journalism, and in 1883 he published *Essais de psychologie contemporaine*, studies of eminent writers first printed in the *Nouvelle Revue*, and now brought together. In 1884 Bourget paid a long visit to England, and there wrote his first published story (*L'Irréparable*). *Cruelle Énigme* followed in 1885; and *André Cornelis* (1886) and *Mensonges* (1887) were received with much favour. *Le Disciple* (1889) showed the novelist in a graver attitude; while in 1891 *Sensations d'Italie*, notes of a tour in that country, revealed a fresh phase of his powers. In the same year appeared the novel

Cœur de femme, and *Nouveaux Pastels*, types of the characters of men, the sequel to a similar gallery of female types (*Pastels*, 1890). His later novels include *La Terre promise* (1892); *Cosmopolis* (1892), a psychological novel, with Rome as a background; *Une Idylle tragique* (1896); *La Duchesse bleue* (1897); *Le Fantôme* (1901), *Les Deux Sœurs* (1905); and some volumes of shorter stories—*Complications sentimentales* (1896), the powerful *Drames de famille* (1898), *Un Homme fort* (1900), *L'Étape* (1902), a study of the inability of a family raised too rapidly from the peasant class to adapt itself to new conditions. This powerful study of contemporary manners was followed by *Un Divorce* (1904), a defence of the Roman Catholic position that divorce is a violation of natural laws, any breach of which inevitably entails disaster and by *L'Émigré* (1907). *Études et portraits*, first published in 1888, contains impressions of Bourget's stay in England and Ireland, especially of the months he spent at Oxford; and *Outre-Mer* (1895) is his critical journal of a visit to the United States in 1893. He was admitted to the Academy in 1894.

Bourget dramatized his novel *Un Divorce*, and wrote other dramas, among which may be noted *La Barricade* (1910) and *Le Tribun*, described in the subtitle as *Chroniques de 1910 et 1911*. In these two plays he sought to portray the socio-political history of the time. But the form of drama did not permit of the analysis of emotion and of character in which Bourget was a master. He wrote some war-novels, but of his later works the greatest is undoubtedly the novel *Le démon du midi* (1914), which is a worthy successor of *Le Disciple*, and, like it, an invaluable contemporary historical document. Bourget's reputation as a novelist has long been assured. Deeply impressed by the singular art of Henry Beyle (Stendhal), he struck out on a new course at a moment when the realist school reigned without challenge in French fiction. His idealism, moreover, had a character of its own. It was constructed on a scientific basis, and aimed at an exactness, different from, yet comparable to, that of the writers who were depicting with an astonishing faithfulness the environment and the actions of a person or a society. With Bourget observation was mainly directed to the secret springs of human character. At first his purpose seemed to be purely artistic, but when *Le Disciple* appeared, in 1889, 'he preface to that remarkable story revealed in him an unsuspected fund of moral enthusiasm which steadily developed as the years passed.

See also C. Lecigne, *L'Évolution morale et religieuse de M. Paul Bourget* (1903), F. J. Landeur, *L'averité psychologique et morale dans les romans de P. Bourget* (1912). His *Oeuvres complètes* began to appear in a uniform edition in 1899.

BOURIGNON, ANTOINETTE (1616–1680), Flemish Quietist, b. at Lille, began life a Catholic, but took to self-imposed retirement, penance and mortification. Later she tried convent life and the management of an orphanage; both were failures on account of her distrust of human nature and her harsh, autocratic disposition. She soon became convinced that she was directly illuminated by God for the reforming of things temporal and spiritual, and accordingly began to attack Jesuits, Jansenists, Lutherans, Anabaptists and Quakers—in fact, every form of religious organization. Her works exhibit a curious medley of opinions, such as the denial of the Divine foreknowledge, of the eternity of the second Person of the Trinity and of the Atonement, and the theories of the corruptibility of Christ's human nature, of a good and evil spirit in man, of the necessity for detecting and exposing the faults of others, and of the dispensability of the Scriptures for the elect. She had many followers in Holland and France, and especially in Scotland, where her doctrines were denounced by the Presbyterian general assemblies of 1701, 1709 and 1710.

Her works were collected by her disciple, Pierre Poiret (1070), who also published her life (1679). Three have been translated into English. *The Light of the World* (1696); *A Treatise of Solid Virtue* (Amsterdam, 1699); *The Restoration of the Gospel Spirit* (1707). See *An Apology for M. A. Bourignon* (by G. Garden) (1699); *Étude sur Antoinette Bourignon*, by M.E.S. (1876); A. v. der Linde, *A. Bourignon das Licht der Welt* (Leyden, 1895); Hauck, *Realencyklopädie* (Leipzig, 1897); A. R. Macewen, *Antoinette Bourignon, Quietist* (1910).

BOURKE: see MURRAY-DARLING.

BOURMONT, LOUIS AUGUSTE VICTOR, COMTE DE GHAISNE DE (1773-1846), marshal of France, entered the *Gardes Françaises* of the royal army shortly before the Revolution, emigrated in 1789, and served with Condé and the army of the *émigrés* in the campaigns of 1792 and 1793, subsequently serving as chief of staff to Scépeaux, the royalist leader, in the civil war in lower Anjou (1794-96). Bourmont, excepted from the amnesty of April 1796, fled into Switzerland, but soon afterwards, having been made by Louis XVIII. a *maréchal de camp* and a knight of St. Louis, he headed a fresh insurrection which after some preliminary successes collapsed (1799-1800). He then made his submission to the First Consul, married, and lived in Paris; but his thinly veiled royalism caused his arrest a few months later, and he remained a prisoner for more than three years, finally escaping to Portugal in 1804. Three years later the French army under General Junot invaded Portugal, and Bourmont offered his services to Junot, who made him chief of staff of a division. He returned to France with Junot after the convention of Cintra, and was promptly re-arrested. He was soon released, however, on Junot's demand, and was commissioned as an officer in the imperial army. He served in Italy for a time, then went on the staff of the viceroy Eugène (Beauharnais), whom he accompanied in the Moscow campaign. He was taken prisoner in the retreat, but escaped after a time and rejoined the French army. His conspicuous courage at the battle of Lützen in 1813 led Napoleon to promote him general of brigade, and in 1814 his splendid defence of Nogent (Feb. 13) earned him the rank of general of division. At the first Restoration, Bourmont was naturally employed by the Bourbons, to whose service he had devoted his life, but he rejoined Napoleon on his return from Elba. On the eve of the campaign of 1815, and at the urgent request of Count Gérard, he was given a divisional command in the army of the north. On the first day of the Waterloo campaign Bourmont went over to the enemy. He made no attempt to defend his conduct, and acted as the accuser of Marshal Ney. A year later he was given command of a division of the royal guard; and in 1823 he held an important position in the army which, under the command of the duc d'Angoulême, invaded Spain. He commanded the whole army in Spain for a time in 1824, became minister of war in 1829, and in 1830 was placed in command of the Algiers expedition. The landing of the French and the capture of Algiers were directed by him with complete success, and he was rewarded with the *bâton* of marshal. But the revolution of 1830 put an end to his command, and, refusing to take the oath to Louis Philippe, he was forced to resign. In 1832 Marshal Bourmont took part in the rising of the duchesse de Berri, and on its failure retired to Portugal. Here, as always, on the side of absolutism, he commanded the army of Dom Miguel during the civil war of 1833-34, and after the victory of the constitutional party he retired to Rome. At the amnesty of 1840 he returned to France. He died at the château of Bourmont on Oct. 27, 1846.

Charles de Bourmont, a son of the marshal, wrote several pamphlets in vindication of his father's career.

BOURNE, FRANCIS (1861-), English cardinal, was born at Clapham, London, March 23 1861, the second son of Henry Bourne, a high official in the Post Office, and Ellen Byrne. Educated at Ushaw college and St. Edmund's college, Ware, he went later to Cardinal Manning's seminary at Hammersmith, London, and St. Sulpice in Paris, where he received the diaconate from Cardinal Richard in 1883. After a course at Louvain, he was ordained in 1884, and worked at Blackheath, Mortlake, and West Grinstead, afterwards becoming rector of St. John's diocesan seminary, Womersley. In 1895 he was made Monsignor by Leo XIII., and in 1896 he was consecrated titular Bishop of Epiphania and Coadjutor-Bishop of Southwark, to which see he succeeded in the following year. On the death of Cardinal Vaughan in 1903, Mgr. Bourne was nominated to Westminster as archbishop by Pius X. The cathedral, designed by Bentley, was finished at this time and was consecrated by the new archbishop. In 1911 he was made a cardinal. In connection with the meeting of the Eucharistic Congress in London in 1908 he arranged for a procession of the Host to take place in the streets, but eventually

this was cancelled as it was represented that it would lead to a breach of the peace. The policy of Cardinal Bourne has been to aim at steady progress by multiplying small churches so that the faithful throughout London should find Mass within half a mile. On the education question he has sailed on an even keel between Liberal and Conservative governments. Modernism he reprobated; his pastorals have been models of moderation, although one alarmed capital and another offended Sinn Fein. He declined to support the idea of a Catholic university or party in England, preferring that Catholics should join the national universities and parties. In Italy he claimed for the papacy an independence, similar to that of Belgium, based on international guarantees, not at the mercy of the Italian parliament, and allowing Italy to enjoy the honourable position of representing all nations in the guardianship of the papal sovereignty.

BOURNE, VINCENT (1695-1747), English classical scholar, became a fellow of Trinity college, Cambridge, in 1714. He passed most of his life as usher in Westminster school, and died on Dec. 2, 1747. He published three editions of his Latin poems, and in 1772 there appeared a handsome quarto volume containing all Bourne's pieces, but also some that did not belong to him. A number of the Latin pieces are translations of English poems. Cowper (an old pupil of Bourne's), Beattie and Lamb have combined in praise of his power of Latin versification.

See an edition (1840) of his *Poemata*, with a memoir by John Mitford.

BOURNE or **BOURN**, urban district of Kesteven, south Lincolnshire, England; lying in a fenny district 95m. N. by W. of London. Pop. (1921) 4,319. The church of St. Peter and St. Paul is Norman with Early English and later additions; it is part of a monastic church belonging to a foundation of Augustinian canons of 1138, of which the other buildings have almost wholly disappeared. Trade is principally agricultural. Bourne is famous through its connection with the ardent opponent of William the Conqueror, Hereward the Wake. Of his castle very slight traces remain. The Red hall, which now forms part of the railway station buildings, belonged to the family of Digby. The station is a junction of the L.N.E. and of the Midland and Great Northern Joint railways.

BOURNE, an intermittent stream or brook frequent in chalk and limestone country where the rock becomes saturated with winter rain, that slowly drains away until the rock becomes dry, when the stream ceases. A heavy rainfall will cause streams to run in winter from the saturated soil. These are the winter bournes that have given name to several settlements upon Salisbury Plain such as Winterbourne Gunning. The "bourne" may be a permanent "burn"—a term applied to a northern constant stream. (2) (O.Fr. *bourne*), a boundary; the first use of the word in English is in Lord Berners's translation of Froissart's *Chronicles* (1523). The figurative meaning of limit or goal of a traveller comes from Shakespeare's *Hamlet* (1602), "the undiscovered country, from whose bourne no traveller returns."

BOURNEMOUTH, municipal parliamentary and county borough and watering-place, Hampshire, England, 107½m. S.W. by S. of London by the Southern Railway. Pop. (1921) 91,761. The town is wholly of modern and remarkably rapid growth, for the population was but a few hundred in the middle of the 19th century. The village of that period, set in what is now known as the centre of the town, occupied the valley of the Bourne, a small stream whence it took its name. The sandy beach of Poole Bay is here backed by considerable sandstone cliffs scored with deep picturesque dells or chines. Though there is little evidence of settlement in our era before the middle of last century, it is in reality one of the oldest civilized regions in the country. For centuries preceding the Roman occupation it remained one of the chief entrances into South Britain. The prehistoric relations of Hengistbury Head to the east are specially interesting. The sheltered position and equable climate of Bournemouth began to attract attention about 1840; in 1855 a national sanatorium was erected, and a pier was constructed in 1861. Since 1870, when railway communication was provided, the growth of Bournemouth has been unprecedented in England. Suburbs rapidly extended in-

land and along the shore in both directions and extensions are still being undertaken, much building having taken place since 1918, e.g., at Pokesdown, Southbourne and Westbourne. The heath vegetation and pines have been largely replaced by houses, but the Municipality is controlling woodland destruction and planting afresh, and has preserved many parks and gardens besides the numerous private enclosures. There are some 800 ac. of public parks and pleasure grounds within the borough. The Undercliff Drive was extended to Boscombe, on the east side of the town, in 1914. Notable buildings include the new town-hall, municipal college (1912), central public library (1913) and the Russell-Cotes art-galleries and museum. The town was incorporated in 1800 and became a county borough in 1900. The boundaries of the borough were extended in 1914 to include part of Holdenhurst, and since that date new parishes have been formed and churches built. The broadcasting station was opened on Oct. 17, 1923. In 1924 a company was formed to join Bournemouth and Swanage by road with a ferry, on a submerged chain principle, for crossing Poole Harbour. It was opened in 1926, but the strong "race" here is expected to cause difficulties. The town is increasing its fame as a centre of music and of the other arts. A movement to develop university education was started in 1927. Besides its increasing permanent population there are large numbers of visitors at all seasons; and there is much tourist traffic by rail, road and steamboat. The railway stations are the Central and West (Southern and Somerset and Dorset railways), communications being maintained also by the G.W., L.N.E., and L.M.S. railways.

The corporation consists of a mayor, 11 aldermen and 33 councillors. Area (1926) 6,545 acres. In 1918 Bournemouth was made a parliamentary borough, returning one member. The census figure includes a large number of visitors, but the effective population (estimated mid-1925) is 85,840.

BOURNONITE, a mineral species, a sulphantimonite of lead and copper with the formula $PbCuSbS_3$. It is of some interest on account of the twinning and the beautiful development of its crystals. It was first mentioned by Philip Rashleigh in 1797 as "an ore of antimony," and was more completely described by the comte de Bournon in 1804, after whom it was named. The crystals are orthorhombic, and are generally tabular in habit owing to the predominance of the basal pinacoid; numerous smooth bright faces are often developed on the edges and corners of the crystals. Usually the crystals are twinned, the twin-plane being a face of the prism; the angle between the faces of this prism being nearly a right angle, the twinning gives rise to cruciform groups, and when it is often repeated the group has the appearance of a cog-wheel, hence the name *Rädelerz* (wheel-ore). The mineral is opaque, and has a brilliant metallic lustre with a lead-grey colour. The hardness is $2\frac{1}{2}$, and the specific gravity 5.8.

(L. J. S.)

BOURRÉE, a French name for a dance common in Auvergne and in Biscay in Spain; also a term for a musical composition or a dance-movement in a suite, somewhat akin to the gavotte, in quick time with two beats to the bar.

BOURRIENNE, LOUIS ANTOINE FAUVELET DE (1769-1834), French diplomatist, was born at Sens on July 9, 1769, and died at Caen on Feb. 7, 1834. He was educated at the military school of Brienne, where, he asserts, he was a friend of Napoleon Bonaparte, and later pursued legal and diplomatic studies at Vienna and at Leipzig. He returned to Paris in the spring of 1792, and renewed his acquaintance with Bonaparte.

He next obtained a diplomatic post at Stuttgart, from which he returned, in 1794, to find his name on the list of political *émigrés*, though it was eventually removed by Bonaparte's influence. Bourrienne was called to Italy by the victorious general at the time of the long negotiations with Austria (May-Oct. 1797), when his knowledge of law and diplomacy was of some service in the drafting of the terms of the treaty of Campo Formio (Oct. 17). In the following year he accompanied Bonaparte to Egypt as his private secretary, and left a vivid, if not very trustworthy, account of the expedition in his memoirs, and also accompanied him on the adventurous return voyage to Fréjus (Sept.-Oct. 1799). In the autumn of 1802 he incurred the displeasure of the first consul

owing to his very questionable financial dealings. In the spring of 1805 he was sent as French envoy to the free city of Hamburg. There it was his duty to carry out the measures of commercial war against England, known as the continental system; but he secretly relaxed the rules in favour of those merchants who plied him with *douceurs*. After gaining a large fortune, he was recalled to France in disgrace in 1813. In 1814 he embraced the royal cause, and during the Hundred Days (1815) accompanied Louis XVIII. to Ghent.

The fame of Bourrienne rests, not upon his achievements or his original works, which were insignificant, but upon his *Mémoires*, ed. M. de Villemarest (10 vols., 1829-31), frequently republished and translated. The best English edition of the *Mémoires* is that by Col. R. W. Phipps (1893), a new French edition was ed. by D. Lacroix (5 vols., 1899-1900). See *Bourrienne et ses erreurs, volontaires et involontaires* (1830), by Generals Bellard, Gourgaud, etc., for a discussion of the genuineness of his memoirs; also *Napoléon et ses destructeurs*, by Prince Napoleon (1887; Eng. trans., 1888).

BOURRIT, MARC THÉODORE (1739-1819), Swiss mountaineer, the son of a watchmaker at Geneva, devoted himself to the exploration of the Alps. In the years 1784-85 he was the first traveller to attempt the ascent of Mont Blanc (not conquered till 1786), but neither then nor later (1788) did he succeed in reaching its summit. On the other hand he reopened (1787) the route over the Col du Géant (11,060 ft.), which had fallen into oblivion.

His chief works are the *Description des Glacières de Savoie* (1773; English translation, Norwich, 1775-76), the *Description des Alpes pennines et rhétiennes* (1781), and the *Description des cols ou passages des Alpes* (1803).

BOURSAULT, EDMÉ (1638-1701), French dramatist and miscellaneous writer, was born at Mussy l'Évêque, now Mussy-sur-Seine (Aube). In Paris in 1652 he produced his first comedy, *Le Mort vivant*. This and some other pieces of small merit secured for him distinguished patronage in the society ridiculed by Molière in the *École des femmes*. Boursault was persuaded that the "Lysidas" of that play was a caricature of himself, and attacked Molière in *Le Portrait du peintre ou la contre-critique de l'École des femmes* (1663). Molière retaliated in *L'Impromptu de Versailles*, and Boileau attacked Boursault in *Satires 7 and 9*. Boursault replied to Boileau in his *Satire des Satires* (1669), but was afterwards reconciled with him. In 1671

THE BOURSE, OR ROYAL EXCHANGE IN BRUSSELS, BELGIUM. A HIGHLY DECORATED BUILDING IN THE STYLE OF LOUIS XIV. WAS DESIGNED BY SUYS AND OPENED IN 1874. THE PORTICO AND FAÇADE HAVE ALLEGORICAL FIGURES BY JACQUET AND, ON THE SIDE, WORK BY RODIN.

he produced a didactic work, *Ad usum Delphini: la véritable étude des souverains*, which so pleased the court that its author was about to be made assistant tutor to the dauphin when it was found that he was ignorant of Greek and Latin.

See his *Oeuvres choisies* (published in 1811) and the sketch of him in Saint-René Taillandier's *Études littéraires* (1881).

BOURSE, a Continental term for a stock exchange, derived from French usage, and first used for the Paris exchange. The derivation is from Med. Lat. *bursa*, a purse. The English form, "bourse," as in Sir Thomas Gresham's building, which was known

as "Britain's Burse," went out of use in the 18th century. The origin of the name is doubtful; it is not derived from any connection between purse and money, but rather from the use of a purse as a sign. At Bruges a house belonging to the family de Bursa is said to have been first used as an exchange, and to have had three purses as a sign on the front.

BOURSSE, ESAIAS (1630-1673), Dutch painter, born in Amsterdam, was a follower of Pieter de Hooch. His paintings are exceedingly rare, many of them pass under the names of Vermeer of Delft and Pieter de Hooch. Two of the paintings ascribed to the latter (one bears the false signature) at the Ryks museum in Amsterdam, are now recognized as being the work of Boursse. His subjects are interiors with figures, painted with great precision and with exquisite quality of colour. The Wallace collection has his masterpiece, an interior with a woman and a child in a cradle, reflecting something of the feeling of Rembrandt, by whom he was influenced. Other important examples are at the Ryks museum and at Aix-la-Chapelle. "Boy blowing Soap Bubbles," is in the Berlin museum.

BOUSSINGAULT, JEAN BAPTISTE (1802-1887), French agricultural chemist, was born in Paris and spent his early manhood in South America. On his return to France he held the chair of chemistry at Lyons, and then one of agricultural and analytical chemistry in Paris. His most important work, which was translated into other European languages, was *Agronomie, chimie agricole, et physiologie* (1860-74; 2nd ed. 1884). His writings included papers on the quantity of nitrogen in different foods, the amount of gluten in different wheats, investigations on the question whether plants can assimilate free nitrogen from the atmosphere (which he answered in the negative), the respiration of plants, the function of their leaves, the action and value of manures, and similar objects.

BOUSTROPHEDON, a term descriptive of a peculiar form of writing common among the early Greeks. The direction of writing was alternately right to left and left to right in horizontal lines, or, conversely, left to right and right to left. It was a transition between the earlier right to left writing and the later left to right style. The term was derived from two Greek words meaning "ox," and "to turn," from the resemblance of the writing to the winding course taken by oxen in ploughing.

BOUTEL DE MONVEL, MAURICE (1851-), French painter and illustrator, born at Orleans, studied in Paris under Cabanel, J. Lefebvre, Parrot and Carolus Duran. His first successes were obtained by his "Good Samaritan" (museum at Orleans) and "Arabes revenant du Marche" (museum at Amiens). But his talent lay chiefly with illustrations and water-colours, delicate in execution and charming in composition—"La Farce de M. Pathelin"; "Chansons et Rondes pour les Enfants"; "Chansons de France"; "Nos Enfants" and "La Vie de Jeanne d'Arc." He also executed three large mural decorations in the basilica at Domrémy illustrating scenes from the life of Jeanne d'Arc.

BOUTERWEK, FRIEDRICH (1765-1828), German philosopher and critic, was born at Oker, in Lower Saxony April 15, 1765, and studied law at Göttingen. From 1790, however, he became a disciple of Kant, and in 1793 published *Aphorismen nach Kants Lehre vorgelegt*. He became professor of philosophy at Göttingen (1802), where he died Aug. 9, 1828. Bouterwek is interesting for his criticism of Kant's theory of the "thing-in-itself" apart from perception. Bouterwek left the Kantian position through his opposition to its formalism, and inclined to the views of Jacobi, whose letters to him (published at Göttingen, 1868) shed much light on his thought. His chief works are *Ideen zu einer allgemeinen Apodiktik* (1799); *Aesthetik* (1806); *Lehrbuch der philos. Vorkenntnisse* (1810); *Lehrbuch der philos. Wissenschaften* (1813), and the *Geschichte der neuern Poesie und Beredsamkeit* (1801-19), of which the history of Spanish literature has been published separately in French, Spanish and English. The *Geschichte* is an uneven work of wide learning and generally sound criticism. Bouterwek also wrote three novels and a collection of poems (1802).

BOUTHILLIER, CLAUDE, SIEUR DE FOUILLETOUTRE (1581-1652), French statesman, began life as an advocate, and

in 1619 became councillor of state and a secretary to the queen-mother, Marie de'Medici. He received the title of secretary of state in 1628, and he was able to remain on good terms with both Marie de'Medici and Richelieu, in spite of their rivalry. In 1632 he became superintendent of finances. Richelieu employed him on many diplomatic missions, and the success of his foreign policy was due in no small degree to Bouthillier's ability and devotion. He held a unique position of influence in a court torn by jealousies and intrigues. Trusted by the king, the confidant of Richelieu, the friend of Marie de'Medici, and through his son, Léon Bouthillier, who was appointed in 1635 chancellor to Gaston d'Orléans, able to bring his influence to bear on that prince, he was an invaluable mediator; and he was, next to the cardinal, the most powerful man in the kingdom. Richelieu made him executor of his will, and Louis XIII. named him a member of the council of regency which he intended should govern the kingdom after his death. Bouthillier died in Paris Mar. 13, 1652.

His son, LÉON BOUTHILLIER (1608-1652), comte de Chavigny, was named secretary of state in 1632, and seconded his father's work, so that it is not always easy to distinguish their respective parts. He was arrested twice during the Fronde, but was for a short time in power during Mazarin's exile (April 1651).

BOUTS, DIERICK (1400?-1475), painter of the Netherlandish school, a follower of the Van Eycks. Before going to Louvain about 1445 he may have worked at Brussels under the influence of Roger van der Weyden. He died at Louvain on May 6, 1475. Two authentic works of this master are known, both painted towards the end of his life. One was ordered by the Confraternity of the Holy Sacrament for the church of St. Peter at Louvain in 1464. The picture consisted of five panels. Its wings, formerly in the museums at Munich and Berlin, were returned to Belgium under the Treaty of Versailles, and are now reunited to the centrepiece in the church of St. Peter. The central panel represents the "Last Supper," and the artist seems to have introduced his own portrait and that of his sons in the background. On the wings are shown the "Feast of the Passover," "Elijah in the Desert," the "Gathering of Manna," and "Abraham and Melchisedek." The other authentic work is a series of panels, which the artist undertook to paint for the town hall at Louvain. He only completed two of these, which are now in the Brussels gallery. They represent episodes in the life of the emperor Otto III.

These works reveal a master of rich and harmonious colour schemes, a landscape painter, one who placed his figures in three-dimensional spaces, correctly constructed according to the rules of perspective. He observed nature closely and his drawing as a portraitist was precise and full of character. His rendering of human anatomy was primitive and his compositions are somewhat angular, lacking the grace which his contemporary Roger van der Weyden gave to his pictures. The following is a list of the most notable works, which are generally attributed to the master on stylistic evidence. Probably his earliest extant painting is the little triptych at Madrid representing the "Annunciation," the "Visitation," and the "Epiphany." Then comes the large triptych in the cathedral at Granada representing the "Descent from the Cross," the "Crucifixion," and the "Resurrection," a replica of which is in the Colegio del Patriarca at Valencia. Other early works are: the "Entombment" in the National Gallery, London, the "Pietà" in the Louvre, Paris; the "Annunciation" at Petrograd. A "Crucifixion" in Berlin is of special interest because the skyline of Brussels is painted across the horizon in the background, making it probable that the artist worked there at the time. The following works were probably painted after the move to Louvain: "Moses and the Burning Bush" in the Johnson collection at Philadelphia; the "Virgin enthroned between St. Peter and St. Paul" in the National Gallery; the triptych in Munich, known by the name of "The Pearl of Brabant," representing the "Adoration of the Magi"; "John the Baptist" and "St. Christopher," a pair of panels, one at Lille and one at the Louvre, representing respectively Paradise and Hell; the triptych of the "Martyrdom of St. Erasmus" at St. Peter's, Louvain. Of several versions of the half-length figure of the "Madonna holding the Child,"

the one in the National Gallery (Salting collection) is among the finest. Of portraits the most notable is in the National Gallery, dated 1462, and believed by some to be a self-portrait. The Altman collection in the Metropolitan Museum also contains a portrait and a third is in the Warneck collection. After his death his two sons, Albert and Dierick, carried on his tradition in Louvain.

Bouts et ses Fils* (1863); Van Even, *Thierry Bouts dit Thierry de Harlem* (1865); *L'Ancienne École de Peinture de Louvain* (1870); Arnold Goffin, *Thierry Bouts* (1907); Paul Heiland, *Dirk Bouts und die Hauptwerke seiner Schule* (1902); Sir Martin Conway, *The Van Eycks and their Followers* (1921); Max Friedländer, *Dierick Bouts* (1925). (I. A. R.)

BOUTS-RIMÉS, literally "rhymed ends," the name given in all literatures to a kind of verse which Addison described as "lists of words that rhyme to one another, drawn up by another hand, and given to a poet, who was to make a poem to the rhymes in the same order that they were placed upon the list." The more odd the rhymes are, the more ingenuity is required to give a semblance of common-sense to the production. For instance, the rhymes *breeze*, *elephant*, *squeeze*, *pant*, *scant*, *please*, *hope*, *pope* are submitted, and the following stanza is the result.—

Escaping from the Indian *breeze*,
The vast, sententious *elephant*
Through groves of sandal loves to *squeeze*
And in their fragrant shade to *pant*;
Although the shelter there be *scant*,
The vivid odours soothe and *please*,
And while he yields to dreams of *hope*,
Adoring beasts surround their *pope*

The invention of *bouts-rimés* is attributed to a minor French poet of the 17th century, Dulot, of whom little else is remembered. About the year 1648, Dulot was complaining one day that he had been robbed of a number of valuable papers, and, in particular, of 300 sonnets. Surprise being expressed at his having written so many, Dulot explained that they were all "blank sonnets," i.e., that he had put down the rhymes and nothing else. The idea struck every one as amusing, and what Dulot had done seriously was taken up as a jest. *Bouts-rimés* became the fashion. The most curious incident in their history is the fact that the elder Alexandre Dumas, in 1864, took them under his protection. He issued an invitation to all the poets of France to display their skill by composing to sets of rhymes selected for the purpose by the poet, Joseph Méry. No fewer than 350 writers responded to the appeal, and Dumas published the result in 1865.

Dante Gabriel Rossetti and W. M. Rossetti constantly practised their pens in writing sonnets to *bouts-rimés*, Dante Gabriel writing off these exercises at the rate of a sonnet in five or eight minutes.

BOUTWELL, GEORGE SEWALL (1818–1905), American statesman, was born in Brookline, Mass., on Jan. 28, 1818. He was reared on a farm, and at an early age began a mercantile career at Groton, Massachusetts. There he studied law and in 1836 was admitted to the bar. In 1842–44 and again in 1847–50 he served in the state house of representatives, and became the recognized leader on the Democratic side. In 1851, by means of "Free-Soil" votes, he was chosen governor, and was re-elected by the same coalition in 1852. The passage of the Kansas-Nebraska Bill in 1854 had finally alienated him from the Democratic Party, and he became one of the founders of the new Republican Party in the state. He played an influential part in the Republican national convention in 1860, and in 1862 after the passage of the war tax measures he was appointed by President Lincoln the first commissioner of internal revenue, which department he organized. From 1863 to 1869 he was a representative in Congress. From 1869 to 1873 he was secretary of the treasury in President Grant's cabinet, and from 1873 until 1877 was a United States senator from Massachusetts. Under an appointment by President Hayes, he prepared the second edition of the *United States Revised Statutes* (1878). He opposed the acquisition by the United States of the Philippine Islands, became president of the Anti-Imperialistic League, and was a presidential elector on the Bryan (Democratic) ticket in 1900. He died at Groton, Mass., on Feb. 28, 1905. He published various volumes, including *The Constitution*

of the United States at the End of the First Century (1895), and *Reminiscences of Sixty Years in Public Affairs* (1902).

BOUVARDIA, a genus of handsome, evergreen, greenhouse shrubs, belonging to the family Rubiaceae, and including 30 species, natives of tropical America. The flowers are in terminal generally many-flowered clusters; the corolla has a large tube and a spreading four-rayed limb. The cultivated forms include a number of hybrids.

BOUVET, FRANÇOIS JOSEPH (1753–1832), French admiral, son of a captain in the service of the French East India Company, was born on April 23 1753. He went to sea at the age of 12 with his father. Bouvet served in the East Indies in the famous campaign of 1781–83. On the outbreak of the French Revolution Bouvet was promoted captain, and in 1793 to rear-admiral, and commanded a division in the fleet which fought the battle of June 1 1794 against Lord Howe. Until the close of 1796 he continued in command of a squadron in the French Channel fleet. In the December of that year he was entrusted with the van division of the fleet which was sent from Brest to attempt to land General Hoche with an expeditionary force in the south of Ireland. Bouvet, who found himself at daybreak on Dec. 17 separated with nine sail of the line from the rest of the fleet, opened his secret orders, and found that he was to make for Mizen Head. On Dec. 24 he anchored near Bear Island with part of his fleet. The storms which blew down Bantry Bay, made it impossible to land. On the evening of the 25th Bouvet's frigate was blown out to sea. Bouvet, being convinced that none of the ships of his squadron could have remained at the anchorage, steered for Brest, where he arrived on Jan. 1 1797. He was wrong in thinking that all his squadron had failed to keep their anchorage in Bantry Bay, and he was dismissed from command soon afterwards; Napoleon restored him to the service, and he commanded the squadron sent to occupy Guadeloupe during the peace of Amiens. He died on July 21 1832.

BOUVIER, JOHN (1787–1851), American jurist, was born in Codogno, France in 1787. In 1802 his family emigrated to America and settled in Philadelphia. He became a citizen of the United States in 1812 and was admitted to the bar in 1818. He is best known for his able legal writings. His *Law Dictionary Adapted to the Constitution and Laws of the United States of America and of the Several States of the American Union* (1839, revised and brought up to date by Francis Rawle, under the title of *Bouvier's Law Dictionary*, 1897), has always been a standard, a later edition of which was issued in 1916.

BOUVINES, a village on the French-Belgian frontier between Lille and Tournay, the scene of one of the greatest battles of the middle ages, fought on July 27, 1214, between the forces of Philip Augustus, king of France, and those of the coalition formed against him, of which the principal members were the emperor and King John of England. The plan of campaign seems to have been designed by King John to draw the French king south towards the Loire against himself, while his nephew, the emperor Otto IV., the princes of the Netherlands, and the main army of the allies should at the right moment march upon Paris from the north. John's part in the general strategy was perfectly executed; the allies in the north moved tardily. While John, after two inroads, turned back to his Guienne possessions on July 3, it was not until three weeks later that the emperor concentrated his forces at Valenciennes, and in the interval Philip Augustus had counter-marched northward and concentrated an army at Peronne. Philip then took the offensive himself, and in manoeuvring to get a good cavalry ground upon which to fight he offered battle (July 27) on the plain east of Bouvines and the river Marque—the same plain on which in 1794 the brilliant cavalry action of Willems was fought. He had a superiority in cavalry to compensate his decidedly smaller numbers of foot. The imperial army accepted the challenge and drew up facing south-westward towards Bouvines, the heavy cavalry on the wings, the infantry in one great mass in the centre, supported by the cavalry corps under

the emperor himself. The French army took ground exactly opposite to the enemy and in a similar formation, cavalry on the wings, infantry, including the *milice des communes*, in the centre, Philip with his own knights in rear of the foot. The battle opened with a confused cavalry fight on the French right, in which individual feats of knightly gallantry were more noticeable than any attempt at combined action. The fighting was more serious between the two centres; the Flemish infantry, who were at that time almost the best in existence, drove in the French; Philip led the centre body of cavalry to retrieve the day, and after a long and doubtful fight, in which he himself was unhorsed and narrowly escaped death, began to drive back the Flemings. In the meanwhile the French feudatories on the left wing had thoroughly defeated the imperialists opposed to them, and William Longsword, earl of Salisbury, the leader of this corps, was unhorsed and taken prisoner by the warlike bishop of Beauvais. Victory declared itself also on the other wing, where the French at last routed the Flemish cavalry and captured Count Ferdinand of Flanders, one of the leaders of the coalition. In the centre the battle was between the two mounted reserves led respectively by the king and the emperor in person. Here, too, the imperial forces suffered defeat, Otto himself being saved only by the devotion of a handful of Saxon knights. The day was already decided in favour of the French when their wings began to close inwards to cut off the retreat of the imperial centre. The battle closed with the celebrated stand of Reginald of Boulogne, a revolted vassal of King Philip, who formed a ring of 700 Brabançon pikemen, and not only defied every attack of the French cavalry, but himself made repeated charges or sorties with his small force of knights. Eventually, and long after the imperial army had begun its retreat, the gallant schiltrons were ridden down and annihilated by a charge of 3,000 men-at-arms. Reginald was taken prisoner in the mêlée; and the prisoners also included two other counts, Ferdinand and William Longsword, 25 barons, and over 100 knights. The killed amounted to about 170 knights of the defeated party, and many thousands of foot on either side, of whom no accurate account can be given. The battle is characteristic of normal mediaeval warfare, the centre and two wings fighting their separate battle, without guiding idea or superior guidance. Only Reginald, in basing his mobile action on a stable infantry pivot, showed a glimmer of tactical sense.

See C. W. C. Oman, *History of the Art of War in the Middle Ages*, vol. 1 (2nd ed. 1924); also G. Köhler, *Kriegsgeschichte*, i. (Breslau, 3 vols., 1886, etc.); and H. Delpech, *Tactique au XIII^e siècle* (2 vols. Montpelier, 1886).

BOVIANUM, the name of two ancient Italian towns. (1) Undecimanorum (*Boiano*), chief city of the Pentri Samnites, 9m. N.W. of Saepinum and 18m. S.E. of Aesernia, on the road from Beneventum to Corfinium, connecting the Via Appia and the Via Valeria. Cyclopean walls of the old (upper) city remain above the Roman and modern town in the plain. Bovianum was the seat of the Samnite assembly in the Social War. It acquired the name *Undecimanorum* when Vespasian settled the veterans of the Legio XI. Claudia there. (2) Vetus (near Pietrabbondante, 5m. S. of Agnone and 19m. N.W. of Campobasso), chief town of the Caraceni, remote among the mountains. Where Bovianum is mentioned the reference is generally to Bovianum Undecimanorum. Fortifications, a temple and a theatre with finely preserved stone seats are known.

BOVIDAE, the name of the family of hollow-horned ruminant mammals typified by the common ox (*Bos taurus*), and specially characterized by the presence on the skulls of the males or of both sexes of a pair of bony projections, or cores, covered in life with hollow sheaths of horn, which are never branched, and at all events after a very early stage of existence are permanently retained. The group is often called Cavicornia. For other characteristics see PECORA. The *Bovidae* comprise numerous genera and species, and include the oxen, sheep, goats, antelopes (*qq.v.*) and others which come under none of these designations. In stature they range from the size of a hare to that of a rhinoceros; and their horns vary in size and shape from the small and simple spikes of the oribi and duiker antlers to the enormous and various-

ly shaped structures borne respectively by buffaloes, wild sheep and kudu and other large antelopes. In geographical distribution the *Bovidae* present a remarkable contrast to the deer tribe, or *Cervidae*. Both of these families are distributed over the whole of the northern hemisphere, but whereas the *Cervidae* are absent from Africa south of the Sahara and well represented in South America, the *Bovidae* are unknown in the latter area, but are extraordinarily abundant in Africa. Neither group is represented in Australasia, Celebes being the eastern limit of the *Bovidae*. The present family doubtless originated in the northern half of the Old World, whence it effected an entrance by way of the Bering Strait route into North America, where it has always been but poorly represented in the matter of genera and species.

The *Bovidae* are divided into a number of sections, or sub-families, of which fuller mention of some of the more important representatives is made in other articles.

The first section is that of the *Bovinae*, which includes buffaloes, bison and oxen. The majority of these are large and heavily-built ruminants, with horns present in both sexes, the muzzle broad, moist and naked, the nostrils lateral, no face-glands, and a dewlap often developed in the males; the tail is long and generally tufted. The horns are of nearly equal size in both sexes, are placed on or near the vertex of the skull, and may be either rounded or angulated, while their direction is more or less outwards, with an upward direction near the tips, and conspicuous knobs or ridges are never developed on their surface. The tall upper molars have inner columns. The group is represented throughout the Old World as far east as Celebes, and has one living North American representative. (See ANOA, AUROCHS, BANTIN, BISON, BUFFALO, GAUR, GAYAL, OX and YAK.)

The second group, or *Caprinae*, includes the sheep and goats, which are smaller animals than most of the *Bovidae*, generally with horns in both sexes, but those of the females small. In the males the horns are usually compressed and triangular with transverse ridges or knobs, and either curving backwards or spiral. The muzzle is narrow and hairy; and when face-glands are present these are small and insignificant; while the tail is short and flattened. Unlike the *Bovinae*, there are frequently glands in the feet; and the upper molar teeth differ from those of that group in their narrower crowns, which lack a distinct inner column. When a face-pit is present in the skull it is small. The genera are *Ovis* (sheep), *Capra* (goats) and *Hemitragus* (tahr). Sheep and goats are very nearly related, but the former never have a beard on the chin of the males, which are devoid of a strong odour; and their horns are typically of a different type. There are, however, several more or less transitional forms. Tahr are short-horned goats. The group is unknown in America, and in Africa is only represented in the mountains of the north, extending, however, some distance south into the Sudan and Abyssinia. All the species are mountain-dwellers. (See UDAD, ARGALI, GOAT, IBEX, MOUFON, SHEEP and TAHR.)

The musk-ox (*q.v.*) alone represents the *Ovibovinae*, probably most nearly related to the next group.

Next come the *Rupicaprinae*, which include several genera of mountain-dwelling ruminants, typified by the European chamois (*Rupicapra*); the other genera being the Asiatic serow, goral and takin, and the North American Rocky mountain goat. These ruminants are best described as goat-like antelopes. (See ANTELOPE, CHAMOIS, GORAL, ROCKY MOUNTAIN GOAT, SEROW and TAKIN.)

Under the indefinable term "antelope" (*q.v.*) may be included the 12 remaining sections, namely *Bubalinae* (hartebeests and gnus), *Cephalophinae* (duikers), *Orestraginae* (klipspringers), *Neotraginae* (oribis, steinboks, etc.), *Madoquiniae* (dik-diks), *Pedunculinae* (waterbucks and reedbucks), *Aepycerotinae* (impalla), *Saiginae* (saiga), *Pantholopinae* (chiru), *Antilopinae* (black buck and gazelles, springbuck, etc.), *Oryginae* (sable antelope, oryx, etc.) and *Tragalaphinae* (bushbucks, elands, koodoos, four-horned antelopes). (R. Ly.)

BOVILLAE, an ancient town of Latium, a station on the Via Appia (already paved up to this point in 293 B.C.) 11m. S.E. of Rome. It was a colony of Alba Longa, and one of the 30 cities of

the Latin league. After the destruction of Alba Longa the *sacra* were, it was held, transferred to Bovillae, including the cult of Vesta (in inscriptions *virgines vestales Albanae* are mentioned, and the inhabitants of Bovillae are always spoken of as *Albani Longani Bovillenses*) and that of the *gens Julia*. This hereditary worship made it important when the Julian house rose to power. The knights met Augustus' dead body at Bovillae on its way to Rome, and in A.D. 16 the shrine of the family worship was dedicated anew, and yearly games in the circus were instituted. Milo and Clodius quarrelled here and Clodius was killed; his villa lay above the town, left of the Via Appia. Bovillae probably replaced Alba Longa as a local centre after the destruction of the latter by Rome, a case of deliberate choice of a strategically weak position. Remains of buildings of the imperial period—the circus, a small theatre, and edifices probably connected with the post-station—may still be seen south-west of the Via Appia.

BOW, a common Teutonic word for anything bent¹. Thus it is found in English compound words, e.g., "elbow," "rainbow," "bow-net," "bow-window," "bow-knot," "saddle-bow," and by itself as the designation of a great variety of objects. The Old English use of "bow" or stone-bow, for "arch," now obsolete, survives in certain names of churches and places, e.g., Bow church (St. Mary-in-Arcubus) in Cheapside, and Stratford-le-Bow (the "Stratford-atte-Bowe" of Chaucer). "Bow," however, is still the designation of objects so various as an appliance for shooting arrows (see ARCHERY), a necktie in the form of a bow-knot, a ring or hoop forming a handle (e.g., the bow of a watch), certain instruments or tools used in various crafts, and the stick strung with horsehair by means of which the strings of instruments of the violin family are set in vibration. It is with this last that the present article is solely concerned.

Bow in Music.—The modern bow consists of five parts, i.e., the "stick," the screw or "ferrule," the "nut," the "hair" and the "head."

The stick, in high-grade bows, is made of Brazilian lance-wood (*Duguetia quitarensis*) or of snake-wood (*Brosimum aubletii*), which alone combine the requisite lightness, elasticity and power of resistance; for the cheaper bows American oak is used, and for the double-bass bow beech. It is cut absolutely straight and parallel along its whole length with the fibre of the wood; it is

BY COURTESY OF MESSRS. WILLIAM E. HILL & SONS
THREE DESIGNS, SHOWING THE DEVELOPMENT OF THE VIOLIN BOW FROM THE TARTINI MODEL (UPPER TWO) TO THE IDEAL MODEL OF TOURTE (BELOW)

then bent by heat until it is slightly convex to the hair and has assumed the elegant *cambrure* first given to it by François Tourte (1747–1835). The length of the stick was fixed by Tourte at 29.34 to 29.52 in. The centre of gravity in a well-balanced violin bow should be at 19 cm. ($7\frac{1}{2}$ to $7\frac{3}{4}$ in.) from the nut.

The screw or ferrule, at the cylindrical end of the stick held by the hand, provides the means of tightening or loosening the tension of the hair.

The hair is chosen from the best white horsehair, and each of the hairs (some 120 in number) which compose the half-inch wide ribbon of the bow must be perfectly cylindrical and smooth. Tourte attached the greatest importance to the hairing of the bow, and bestowed quite as much attention upon it as upon the

"Bow," the forepart or head of a ship, must be distinguished from this word. It is the same word, and pronounced in the same way, as "bough," an arm or limb of a tree, and represents a common Teutonic word, seen in O.E. *bog*, Ger. *Bug*, shoulder, and is cognate with Gr. *πρῶτον*, forearm. The sense of "shoulder" of a ship is not found in O.E. *bog*, but was probably borrowed from Dutch or Danish. "Bow," an inclination of the head or body, though pronounced as "bough," is of the same origin as "bow," to bend.

stick. When passed between the fingers in the direction from root to tip, the hair glides smoothly and offers no resistance, but passed in the opposite direction it feels rough, suggesting a regular succession of minute projections. The outer epithelium or sheath of the hair is composed of minute scales which produce a succession of infinitesimal shocks when the hair is drawn across the strings; the force and uniformity of these shocks, resulting in vibrations of equal persistency, are considerably heightened by the application of resin to the hair. In hairing the bow, alternate hairs are laid in opposite directions, so that the up and down strokes may be equal, and a pure and even tone obtained.

The head, 1 in. long and $\frac{7}{16}$ in. wide at the plate, is cut in one piece with the stick, an operation which requires delicate workmanship; otherwise the head is liable to snap at this point during a *sforzando* passage.

The model bow here described, elaborated by François Tourte as long ago as between 1775 and 1780 according to Fétis, or between 1785 and 1790 according to Vidal, has not since been surpassed.

The question of the origin of the bow still remains a matter of conjecture, but it undoubtedly came from the East, having been borrowed by the Greeks of Asia Minor and the Arabs from a common source—probably India, by way of Persia.

The earliest bow known in Europe was associated with the rebab (q.v.), the most widely used bowed instrument until the 12th century, but its development began only from the time when it was applied to the guitar (q.v.) which then became the guitar fiddle (q.v.), the immediate forerunner of the viols.

As soon as Corelli (1653–1713) formulated the principles of the technique of the violin, marked modifications in the construction of the bow became noticeable. Tartini introduced further improvements, such as a lighter wood for the stick, a straight contour, and a shorter head, in order to give better equilibrium. The Tourtes, father and son, accomplished the rest.

BOWDICH, THOMAS EDWARD (1790–1824), English traveller and author, was born at Bristol in 1790. In 1814 he obtained a writership in the service of the African Company of Merchants and was sent to Cape Coast. In 1817 he was sent, with two companions, to Kumasi on a mission to the king of Ashanti, and chiefly through his skilful diplomacy the mission secured British control over the coast natives (see ASHANTI: History). An account of his mission and of the study he had made of the barbaric court of Kumasi, entitled *Mission from Cape Coast Castle to Ashantee*, etc., appeared in 1819 (republished 1873). His African collections he presented to the British Museum. Bowdich publicly attacked the management of the African committee, and his strictures influenced the decision of the British government to assume direct control over the Gold Coast. From 1820 to 1822 Bowdich lived in Paris, studying mathematics and the natural sciences, and was on intimate terms with Cuvier, Humboldt and other savants. In 1822 he went to Lisbon, where, from a study of manuscripts, he published *An Account of the Discoveries of the Portuguese in . . . Angola and Mozambique* (1824). In 1823 Bowdich arrived at Bathurst, at the mouth of the Gambia, intending to go to Sierra Leone and explore the interior, but he died before leaving Bathurst.

BOWDITCH, NATHANIEL (1773–1838), American mathematician, was born at Salem (Mass.). He was bred to his father's business as a cooper, and afterwards apprenticed to a ship-chandler. His taste for mathematics early developed itself; and he acquired Latin that he might study Newton's *Principia*. As clerk (1795) and then as supercargo (1796, 1798, 1799) he made four long voyages; and, being an excellent navigator, he afterwards (1802) commanded a vessel, instructing his crews in lunar and other observations. He edited Hamilton Moore's *Navigation*, and in 1802 published a valuable work, *New American Practical Navigator*. He undertook a translation of the *Mécanique céleste* of P. S. Laplace, with valuable annotations (vol. i., 1829). He died at Boston on March 16, 1838.

A life of Bowditch was written by his son Nathaniel Ingersoll Bowditch (1805–1861), and was prefixed to the fourth volume (1839) of the translation of Laplace. In 1865 this was elaborated into a

separate biography by another son, Henry Ingersoll Bowditch (1808–1892), a noted Boston physician.

BOWDLER, THOMAS (1754–1825), editor of the "family" Shakespeare, was born at Ashley, near Bath, on July 11 1754, and died at Rhyddings, south Wales, on Feb. 24 1825. In 1818 he published *The Family Shakespeare* "in ten volumes, in which nothing is added to the original text; but those words and expressions are omitted which cannot with propriety be read aloud in a family." Bowdler also expurgated Edward Gibbon's *History of the Decline and Fall of the Roman Empire* (published 1826).

From Bowdler's name we have the word to "bowdlerize," first known to occur in Gen. Perronet Thompson's *Letters of a Representative to his Constituents during the Session of 1836*, printed in Thompson's *Exercises*, iv. 126. The official interpretation is "to expurgate (a book or writing) by omitting or modifying words or passages considered indelicate or offensive."

In the ridicule poured on the name of Bowdler it is worth noting that Swinburne in "Social Verse" (*Studies in Prose and Poetry*, 1894, p. 98) said of him that "no man ever did better service to Shakespeare than the man who made it possible to put him into the hands of intelligent and imaginative children."

BOWDOIN, JAMES (1726–1790), American political leader, was born of French Huguenot descent, in Boston, Mass., on Aug. 7, 1726. He graduated at Harvard in 1745, and was a member of the general court of Massachusetts in 1753–56, and from 1757 to 1774 of the Massachusetts council, in which, on the approach of the American Revolution, he was a leading supporter of the opposition to the government. From Aug. 1775, until the summer of 1777 he was the president of the council. In 1779–80 he was president of the constitutional convention of Massachusetts. From 1785 to 1787 he was governor of Massachusetts, suppressing with much vigour Shays' Rebellion. Bowdoin was a member of the State convention which in Feb. 1788, ratified for Massachusetts the Federal constitution, his son being also a member. He died in Boston on Nov. 6, 1790. He took much interest in natural philosophy, and presented various papers before the American Academy of Arts and Sciences, of which he was from 1780 to 1790 the first president. Bowdoin college was named in his honour.

His son, JAMES BOWDOIN (1752–1811), was born in Boston on Sept. 22, 1752, graduated at Harvard in 1771, and served, at various times, as a representative, senator and councillor of the State. From 1805 until 1808 he was U.S. minister to Spain. He died on Naushon Island, Mass., on Oct. 11, 1811. To Bowdoin college he gave land, money and apparatus; and bequeathed to it his fine collection of paintings.

BOWELL, SIR MACKENZIE (1823–1917), Canadian politician, was born at Rickingham, England, Dec. 27 1823, and died at Belleville, Ontario, Dec. 11 1917. In 1833 he moved with his family to Belleville, Canada, where he finally became editor and proprietor of the *Intelligencer*.

Mackenzie was a member of the Macdonald and Thompson cabinets (1878–91), prime minister of Canada (1894–96), leader of the Conservative Party in the Senate (1896–1906) and president of the Colonial Conference at Ottawa (1894). He received the K.C.M.G. in 1895.

BOWEN, CHARLES SYNGE CHRISTOPHER (BARON BOWEN, OF COLWOOD) (1835–1894), English judge, was born on Jan. 1, 1835, at Woolaston, Glos., the son of a clergyman. From Rugby he went to Oxford and became a fellow of Balliol in 1858. He was called to the bar at Lincoln's Inn in 1861. Soon after he had begun to make his mark he was briefed against the claimant in the famous "Tichborne Case," both in the civil and criminal trials. Bowen's services to his leader, Sir John Coleridge, in the former helped to procure for him the appointment of junior counsel to the treasury when Sir John was attorney-general. In 1879 his acceptance of a judgeship in the queen's bench division gave him leisure. His subtle intellect and gentle irony were wasted upon common juries; but when, in 1882, he was raised to the court of appeal he was more at home. In August 1893, he was made a lord of appeal. But his health had broken down; he never sat to hear appeals, and he gave but one vote as a peer; his last public service was to pre-

side over the commission which sat in October 1893 to inquire into the Featherstone riots. He died on April 10, 1894.

Lord Bowen was regarded with affection by all who knew him. His judicial reputation rests upon the decisions delivered by him in the court of appeal, which are remarkable for their lucid interpretation of legal principles as applied to the facts and business of life; the advice given to the House of Lords in *Angus v. Dalton* (6 App. Cas. 740), and his judgments in *Abrath v. North Eastern Railway* (11 Q.B.D. 440); *Thomas v. Quartermaine* (18 Q.B.D. 685); *Vagliano v. Bank of England* (23 Q.B.D. 243) (in which he prepared the majority judgment afterwards reversed in the House of Lords); and the *Mogul Steamship Company v. M'Gregor* (23 Q.B.D. 598). He never forsook the cult of the classics; his translations of Virgil's *Eclogues*, and of the *Aeneid*, books i.–vi., are admirable, and his pamphlet, *The Alabama Claim and Arbitration considered from a Legal Point of View*, showed that even in a legal discourse he was still a lover of style.

See Sir Henry Stewart Cunningham, *Lord Bowen* (1897).

BOWEN, FRANCIS (1811–1890), American philosophical writer and educator, was born in Charlestown (Mass.) on Sept. 8, 1811. He graduated at Harvard in 1833, taught at Phillips Exeter academy, and became a tutor and instructor at Harvard. After several years of study in Europe, he settled in Cambridge (Mass.), and was editor and proprietor of the *North American Review* (1843–54). In 1850 he was named professor of history at Harvard; but his appointment was disapproved by the board of overseers on account of his reactionary political opinions. In 1853 he was made Alford professor of natural religion, moral philosophy and civil polity. He died in Boston (Mass.) on Jan. 22, 1890.

His writings include contributions to Sparks' *Library of American Biography*; *Lowell Lectures on the Application of Metaphysical and Ethical Science to the Evidences of Religion* (1840); *A Treatise on Logic* (1864); *American Political Economy* (1870); and *Gleanings from a Literary Life* (1880).

BOWER, WALTER (c. 1385–1449), Scottish chronicler, was born at Haddington. He was abbot of Inchcolm (in the Firth of Forth) from 1418, and in 1433 was one of the embassy to Paris on the business of the marriage of the king's daughter to the dauphin. He played an important part at the Council of Perth (1432) in the defence of Scottish rights. During his closing years he was engaged on the *Scotchchronicon*, a continuation of the *Chronica Gentis Scotorum* of Fordun (see FORDUN, JOHN OF). The task was finished in 1447. In the two remaining years of his life he was engaged on a reduction or "abridgment" of this work, which is known as the *Book of Cupar*, and is preserved in the Advocates' Library (now National Library of Scotland) Edinburgh (ms. 35. i. 7). Copies of the full text of the *Scotchchronicon*, by different scribes, are extant. There are two in the British Museum, in *The Black Book of Paisley*, and in Harl. ms. 712; one in the National Library of Scotland, from which Walter Goodall printed his edition (Edinburgh, 1759), and one in the library of Corpus Christi, Cambridge.

BOWERBANK, JAMES SCOTT (1797–1877), English naturalist and palaeontologist, was born in Bishopsgate, London, and succeeded in conjunction with his brother to his father's distillery, in which he was actively engaged until 1847. About the year 1836 he and six others founded "The London Clay Club." In the year 1840 Bowerbank published *A History of the Fossil Fruits and Seeds of the London Clay*, and two years later he was elected F.R.S. He was the real originator of the Palaeontographical Society. His *Monograph of the British Spongiadae* was published by the Ray Society, 1864–82.

BOWER-BIRD, the name applied to birds of the family *Ptilonorhynchidae*, allied to the crows and birds of paradise (*qq.v.*). Like the latter, the bower-birds are confined to the tropical parts of the Australian region. Their most characteristic feature is the habit of the males of forming "play-grounds," clearing a piece of ground for this purpose and decorating it with shells, fruits, stones, flowers and other gaily coloured objects. The gardener bower-bird (*Amblyornis inornatus*) builds a hut three feet in diameter of orchid stems covered with moss at the foot

of a small tree, the stalks radiating from the central support and the cabin being left open on one side. Here, on a bed of moss, the ornaments—flowers and berries, which are replaced as they fade—are arranged. The satin bower-bird (*Ptilonorhynchus holosericus*), abundant in the mountains of New South Wales, builds a long avenue of twigs, decorated at the entrance with shells, bones and feathers. The bower is used as a playground for both sexes though constructed by the male alone; it has nothing to do with the nest, which may be some distance away. (See BIRD; COURTSHIP OF ANIMALS.)

See R. B. Sharpe, *Monograph of the Paradisidae and Ptilonorhynchidae*.

BOWFIN, a fresh-water fish (*Amia calva*) of North America, the only living representative of its family, which dates back to the Cretaceous. It is a voracious fish, found in the Great Lakes, and southwards in sluggish waters. It is elongate in form, and mottled green in colour with a long dorsal fin, and with strong conical teeth in the jaws. The female reaches a length of 30 inches; the male is smaller, and is distinguished by a black ocellus on the tail.

BOWIE, JAMES (1796?–1836), American adventurer and pioneer. Accounts of Bowie are conflicting, but apparently he was born between 1790 and 1796 in Georgia (according to some, Kentucky) and taken to Louisiana in 1802. There in his young manhood he was engaged in smuggling negro slaves into the United States in co-operation with the pirates led by Jean Lafitte. He moved to Texas about 1828 where he seems to have been well received by the Mexicans. However, he took a prominent part in the revolt against Mexico, being a leader in the battles of Nacogdoches (1832), Concepción (1835) and the Grass fight (1835). He was one of the defenders of the Alamo (see SAN ANTONIO), but was ill with pneumonia at the time of the final assault, March 6, 1836, and was consequently unable to take any real part in the defence although he is said to have shot some of his assailants from his cot. He died the same day. Bowie's name is now perpetuated by a county in north-eastern Texas, and by its association with the famous hunting-knife, long the favourite weapon of the border. A large, fair, outwardly peaceable man, he won a great reputation throughout the Southwest by his strength and daring.

BOWKER, RICHARD ROGERS (1848–), American editor and bibliographer, was born in Salem, Mass., on Sept. 4, 1848. He graduated at the College of the City of New York in 1868 and then became literary editor of the *New York Evening Mail*. He was associated in an executive capacity with various business houses and founded the R. R. Bowker Company, publishers. His interests extended to politics as well as bibliography and sociology and he was a leader in the Independent Republican, or "mugwump," movement of 1879. As a publisher of bibliographical material he established *The Library Journal* in 1876 and thereafter conducted it as editor for more than 50 years. *The Annual Library Index*, *Publishers' Weekly* and *American Catalogue* are other bibliographical periodicals conducted under his supervision.

His books, which cover a wide range of subjects, include: *Work and Wealth* (1883), *Economics for the People* (1886), *Copyright—Its Law and Its Literature* (1886), *Primer for Political Education* (1886), *Civil Service Examinations* (1886), *Electoral Reform* (1889), *The Arts of Life* (1900), *Of Business* (1901), *Of Politics* (1901), *Of Education* (1903), *Of Religion* (1903), *Copyright—Its History and its Law* (1912), and *Economic Peace* (1923).

BOW-LEG (*Genu Varum*), characterized by separation of the knees when the ankles are in contact. Usually there is an outward curvature of both femur and tibia, with at times an interior bend of the latter bone. At birth all children are more or less bandy-legged. But in a normal child by the time it begins to walk the lower limbs are prepared, by their general direction and the rigidity of the bones, to support the weight of the body. If the child is rachitic or suffering from any ailment which prevents the due ossification of the bones, or is improperly fed, the bandy condition may persist and be intensified. Thus the chief cause of this deformity is rickets (*q.v.*). The remaining causes are occupation, especially that of a jockey, and traumatism, the

condition being very likely to supervene after accidents involving the condyles of the femur. In the rickety form the most important thing is to treat the constitutional disease, at the same time instructing the mother never to place the child on its feet. In many cases this is sufficient to effect a cure, but matters can be hastened somewhat by applying splints.

A far commoner deformity is *knock-knee* (or *Genu Valgum*). Here, there is approximation of the knees with separation of the feet when standing. Occasionally only one limb may be affected, but the double form is the more common. There are two varieties: (1) that due to rickets and occurring in young children, and (2) that met with in adolescents. In young children cod-liver oil is to be avoided, since it increases the body weight and so may do harm rather than good. The child if quite young must be kept in bed, and the limbs manipulated several times a day. Where he is a little older and it is more difficult to keep him off his feet, long splints should be applied from the axilla or waist to a point several inches below the level of the foot. It is only thus that a naturally active child can be kept at rest. The little patient should live in the open air as much as possible.

The other form of *Genu Valgum* usually occurs in young people who have outgrown their strength, yet have to carry heavy weights. Normally in the erect posture the weight of the body is passed through the outer condyle of the femur rather than the inner, and this latter is lengthened to keep the plane of the knee-joint horizontal. This throws considerable strain on the internal lateral ligament of the knee-joint, and after standing of long duration or with undue weight the muscles of the inner side of the limb also become over-fatigued. Thus the ligament gradually stretches, giving the knee undue mobility from side to side. If the condition be not attended to, the outer condyle gradually atrophies, owing to the increased weight transmitted through it, and the inner condyle lengthens. Flat-foot (see CLUB-FOOT) and lateral curvature of the spine (*scoliosis*) are often associated with this form of *Genu Valgum*. In the early stages attention to general health, massage and change of air, will often effect a cure. But in the more aggravated forms an apparatus is needed. If the patient has reached such an age that the deformity is fixed, the only remedy is operation.

BOWLES, SAMUEL (1826–1878), American journalist, was born in Springfield (Mass.), Feb. 9, 1826, and died there Jan. 16, 1878. With the exception of a brief period in Boston, he devoted his life to the *Springfield Republican*, established as a weekly by his father in 1824 and published as a daily after 1844. He is credited with being one of the leaders in the new journalism, giving his paper a national reputation by the vigour, incisiveness, and independence of its editorial utterances and the concise and convenient arrangement of its local and general news matter. Then and later the *Republican* office was a sort of school for young journalists, especially in the matter of pungency and conciseness of style, one of Bowles's maxims being "Put it all in the first paragraph." During the controversies resulting in the Civil War he was a general supporter of the Whig and Republican Parties, but he was later independent in politics. He is the author of *Across the Continent* (1865) and other books describing the West.

BIBLIOGRAPHY.—George S. Merriam's eulogistic *Life and Times of Samuel Bowles* (1885) is virtually a history of American political movements after the compromise of 1850. J. M. Lee's *History of American Journalism* (1923) ranks Bowles high, as does W. G. Bleyer's *Main Currents in the History of American Journalism* (1927).

BOWLES, WILLIAM LISLE (1762–1850), English poet and critic, was born at King's Sutton, Northamptonshire, of which his father was vicar. He was educated at Winchester and at Trinity college, Oxford. In 1789 he published *Fourteen Sonnets*, which was hailed with delight by Coleridge and his young contemporaries. They were a revival, a return to the older and purer poetic style, and by their tender tone of feeling and vivid appreciation of the life and beauty of nature stood out in strong contrast to the elaborated commonplaces which then formed the bulk of English poetry. Bowles entered the church and held various preferments, including a prebend and then a canonry of Salisbury. He became, in 1804, vicar of Bremhill, Wilts.

The principal longer poems published by Bowles are *The Spirit of Discovery* (1804), which was mercilessly ridiculed by Byron; *The Missionary of the Andes* (1815); *The Grave of the Last Saxon* (1822); and *St. John in Patmos* (1833). In 1806 he published an edition of Pope's works with notes and an essay on the poetical character of Pope. In this essay he laid down certain canons as to poetic imagery which were resented by all admirers of Pope and his style. The "Pope and Bowles" controversy brought into sharp contrast the opposing views of poetry, which may be roughly described as the natural and the artificial. Bowles maintained that images drawn from nature are poetically finer than those drawn from art, and that in the highest kinds of poetry the themes or passions handled should be of the general or elemental kind and not the transient manners of any society. These positions were vigorously assailed by Byron, Campbell, Roscoe, and others, and Bowles was almost solitary until Hazlitt and the *Blackwood* critics came to his assistance.

His *Poetical Works* were collected in 1855, with a memoir by G. Gilfillan.

BOWLING, an indoor game played upon an alley with composition balls and ten maple pins (Lat. *bullā*, a globe, through O.Fr. *boule*, ball). It has been played for centuries in Germany and the Low Countries, where it is still in high favour, but attains its greatest popularity in the United States, whence it was introduced in colonial times from Holland. The Dutch inhabitants of New Amsterdam, now New York, were much addicted to it, and from 1623 to 1840 it was played on the green, the principal resort of the bowlers being the square just north of the Battery still called Bowling Green. The first covered alleys were made of hardened clay or of slate, but the modern alleys are built up of strips of pine or maple wood, about 1 x 3 in. in size, set on edge, and fastened together and to the bed of the alley, the surface being carefully leveled and polished. The width of the alley is 41 to 42 in. and its whole length about 80 ft. From the head or apex pin to the foul-line, over which the player may not step in delivering the ball, the distance is 60 ft. On each side of the alley is a 9-9½ in. "gutter" about 3½ in. below the alley surface. Originally nine pins, set up in the diamond form, were used, but during the first part of the 19th century the game of "nine-pins" was prohibited by law. The danger of restrictive legislation was largely removed with the addition of a tenth pin, resulting in the game of "ten-pins," the pastime in vogue to-day. The ten pins are set up at the end of the alley in the form of a triangle in four rows, four pins at the back, then three, then two and one as head pin. The back row is placed 3 in. from the alley's edge, back of which is the pin-pit, 10 in. deep and 4 ft. long. The back wall is heavily padded with a heavy, swinging cushion which hangs 2 ft. 6 in. from pit edge of bed, and there are seats for the pin-boys, who set up the pins and place the balls in the sloping "railway" which returns them to the players' end of the alley. The pins are made of hard maple and are 1½ in. high, 2½ in. in diameter at their base and 1½ in. in circumference at the thickest point. The balls, which are made of composition, may be of any size not exceeding 27 in. in circumference and 16 lb. in weight. They are provided with holes for the thumb and middle finger. As many may play on a side as please, five being the number for championship teams, though this sometimes varies. An umpire usually officiates at important games. Two alleys immediately adjoining each other are used; the teams roll one *frame* (two balls) on one alley, and for the next *frame* alternate and use the other alley, so alternating with opposing players until the game is completed. Ten frames constitute a game, unless otherwise agreed upon. If all ten pins are knocked down by the first ball the player makes a *strike*, which counts him ten plus whatever he may make with the two balls of his next frame. If, however, he should then make another strike, ten more are added to his score, making 20, to which are added the pins he may knock down with his first ball of the third frame. This may also score a strike, making 30 as the score of the first frame, and, should the player keep up this high average, he will score the maximum, 300, in his ten frames. If all the pins are knocked down with two balls it is called a *spare*, and the player may add the pins made by the first ball of his second frame. This

seemingly complicated mode of scoring is comparatively simple when properly lined score-boards are used. A player must not allow any part of his foot to rest on the foul line during the delivery of the ball. Pins knocked down must be removed before the second ball is played. The score board is always open to public view, kept by the players. The spectators must not interfere with the progress of the game. The tens of thousands of bowling clubs in the United States and Canada under the jurisdiction of the American Bowling Congress meet once a year to revise the rules and hold contests for the national championships, which consist of individual players, two-men teams, five-men teams, and the champions in all events. The highest totals in the first three events were rolled by Wm. J. Knox of Philadelphia, Pa., in 1923 when he scored 2,019 points, 618 points on his five-man team, 686 on his two-man team, and 715 in his individual contest. The highest scores rolled by a five-man team were made by the Nelson-Mitchells of Milwaukee with 3,139 points in 1923. The highest scores rolled by a two-man team were made by C. Thoma and H. Thoma with 1,380 points in 1924. The highest score rolled by an individual A.B.C. champion is that of E. Votel of Braddock, Pa., with 731 points in 1926. At the 20th A.B.C. national championships, held in Buffalo, N.Y., in 1925, there were 2,200 five-man teams, 3,441 doubles and 6,817 individuals, a total of 24,699 bowlers, representing every State in America.

Several minor varieties of bowling are popular in America, the most in vogue being the "duck pin" game in which the regulation xx pins are 9½ in. in height; diameter, 4-7/8 in. including rubber band; bottom of pin 1½ in. Each player rolls two balls to each *frame*; all other rules of A.B.C. govern. Other games are: "cocked hat," which is played with three pins, one in the head-pin position and the others on either corner of the back row, and smaller balls are used. The maximum score is 90, and all balls, even those going into the gutter, are in play. "Cocked hat and feather" is similar, except that a fourth pin is added, placed in the centre. Other variations of bowling are "quintet," in which five pins, set up like an arrow pointed towards the bowler, are used; the "battle game," in which 12 can be scored by knocking down all but the centre, or king, pin; "head pin and four back," in which five pins are used, one in the head-pin position and the rest on the back line; "four back"; "five back"; "head pin," with nine pins set up in the old-fashioned way; "candle pin," also called "Kinsley" or "rubber neck"; "nine up and nine down," the same pins as with the regular game, the balls not exceeding 6 in.; the "Newport game," in which the player who scores the least number of winning innings is the loser, the pony or small ball being used.

The American bowling game is played to some extent in Great Britain, Norway, Sweden, Finland and Germany. In the latter country, however, the old-fashioned game of nine-pins (*Kegelespiel*) with solid balls and the pins set up diamond-fashion obtains universally. The alleys are made with less care than the American, being of cement, asphalt, slate, marble or wood.

BOWLING GREEN, a city of Kentucky, U.S.A., 118 m. S.W. of Louisville, at the head of navigation on the picturesque Barren river; the county seat of Warren county. It is served by the Louisville and Nashville railroad, by motor coaches to all points in the State and as far south as Nashville, and by river steamers. The population in 1920 was 9,638, of whom 2,099 were negroes; and was estimated locally (including suburbs) at 18,000 in 1927. It is the shipping-point for Kentucky rock asphalt, with which its own 25 m. of streets are paved, and for a famous white oolitic limestone, which bleaches with age. It is the centre of an oilfield that is still producing about 500,000 barrels a year. The manufactures include cut stone, evaporated milk, tobacco products, and hickory handles. It is the seat of Ogden college, opened in 1877; of the Bowling Green Business university; and of the Western Kentucky State Teachers' college, established in 1906 and incorporating the privately owned Southern Normal school, which had been in existence since 1875. Mammoth cave is 30 m. N.E. of Bowling Green; there are chalybeate springs 15 m. to the north-west, while three m. south Lost river disappears into a cave immediately under the Dixie highway and pursues a hidden course for several miles.

When the county court house was built in 1798, a town was established on the initiative of Robert Moore, around the public square. Trustees were appointed, and the name Bowling Green was adopted, probably because of Moore's bowling alley on the open green. It was incorporated as a city in 1810. During the Civil War it was on the right flank of the first line of Confederate defence in the West, and for some time was the headquarters of Gen. Albert Sidney Johnston.

BOWLING GREEN, a city of Ohio, United States, 20m. S.W. of Toledo; on Federal Highway 25, and served by the Baltimore and Ohio and the New York Central railways; the county seat of Wood county. The population in 1920 was 5,788. It is situated in a rich agricultural region, which abounds in oil and natural gas. There are foundries and machine shops, a large ketchup factory, and plants making rubber balloons and various articles of wood. There is a State normal college (1,000 students). Bowling Green was settled in 1832; incorporated as a town in 1855 and as a city in 1904.

BOWLS, one of the oldest of outdoor pastimes. It has been traced certainly to the 13th, and conjecturally to the 12th, century. William Fitzstephen (d. about 1190), in his biography of Thomas Becket, gives a graphic sketch of the London of his day and, writing of the summer amusements of the young men, says that on holidays they were "exercised in Leaping, Shooting, Wrestling, Casting of Stones (*in jactu lapidum*), and Throwing of Javelins fitted with Loops for the Purpose, which they strive to fling before the Mark; they also use Bucklers, like fighting Men." It is sometimes supposed that by *jactus lapidum* Fitzstephen meant the game of bowls; but though it is possible that round stones may sometimes have been employed in an early variety of the game—and there is a record of iron bowls being used, though at a much later date, on festive occasions at Nairn—nevertheless the inference seems unwarranted. The *jactus lapidum* of which he speaks was probably more akin to the modern "putting the weight," once even called "putting the stone."

A 13th Century Game.—It is beyond dispute, however, that the game, at any rate in a rudimentary form, was played in the 13th century. A ms. of that period in the royal library, Windsor (No. 20, E iv.), contains a drawing representing two players aiming at a small cone instead of an earthenware ball or jack. Another ms. of the same century has a picture—crude, but spirited—which brings into closer touch the existing game. Three figures are introduced and a jack. The first player's bowl has come to rest just in front of the jack; the second has delivered his bowl and is following after it with one of those eccentric contortions still not unusual on modern greens, the first player meanwhile making a repressive gesture with his hand, as if to urge the bowl to stop short of his own; the third player is depicted as in the act of delivering his bowl.

As the game grew in popularity it came under the ban of king and parliament, both fearing it might jeopardize the practice of archery, then so important in battle; and statutes forbidding it and other sports were enacted in the reigns of Edward III., Richard II., and other monarchs. Even when, on the invention of gunpowder and firearms, the bow had fallen into disuse as a weapon of war, the prohibition was continued. The discredit attaching to howling alleys, first established in London in 1455, probably encouraged subsequent repressive legislation, for many of the alleys were connected with taverns frequented by the dissolute and gamblers.

The word "bowls" occurs for the first time in the statute of 1511 in which Henry VIII. confirmed previous enactments against unlawful games. By a further act of 1541—which was not repealed until 1845—artificers, labourers, apprentices, servants and the like were forbidden to play bowls at any time save Christmas, and then only in their master's house and presence. It was further enjoined that any one playing bowls outside of his own garden or orchard was liable to a penalty of 6s. 8d., while those possessed of lands of the yearly value of £100 might obtain licences to play on their own private greens. But though the statute absolutely prohibited bowling alleys, Henry VIII. had them constructed for his own pleasure at Whitehall Palace and would bet upon his

skill when he played. In Mary's reign (1555) the licences were withdrawn, the queen or her advisers deeming the game an excuse for "unlawful assemblies, conventicles, seditions, and conspiracies."

Introduction of Bias.—Biased bowls were introduced in the 16th century. "A little altering of the one side," says Robert Recorde, the mathematician, in his *Castle of Knowledge* (1556), "maketh the bowl to run biasse waies." And Shakespeare (*Richard II.*, act. iii. sc. 4) causes the queen to remonstrate, in reply to her lady's suggestion of a game at bowls to relieve her ennui, "Twill make me think the world is full of rubs, and that my fortune runs against the bias." This passage is interesting also as showing that women were accustomed to play the game in those days. It is pleasant to think that there is foundation for the familiar story of Sir Francis Drake playing bowls on Plymouth Hoe as the Armada was beating up Channel, and finishing his game before tackling the Spaniards. Bowls, at that date, was looked upon as a legitimate amusement for Sundays,—as, indeed, were many other sports. When John Knox visited Calvin at Geneva one Sunday, it is said that he discovered him engaged in a game; and John Aylmer (1521–94), though bishop of London, enjoyed a game on a Sunday afternoon, but used such language "as justly exposed his character to reproach." The pastime found favour with the Stuarts. In the *Book of Sports* (1618), James I. recommended a moderate indulgence to his son, Prince Henry, and Charles I. was an enthusiastic bowler, unfortunately encouraging, by example, wagering and playing for high stakes, habits that ultimately brought the green into as general disrepute as the alley. It is recorded that the king occasionally visited Richard Shute, a Turkey merchant who owned a beautiful green at Barking Hall, and that after one bout his losses were £1,000. He was permitted to play his favourite game to beguile the tedium of his captivity. The signboard of a wayside inn near Goring Heath in Oxfordshire long bore a portrait of the king with couplets reciting how his majesty "drank from the bowl, and bowl'd for what he drank." During his stay at the Northamptonshire village of Holdenby or Holmby—where Sir Thomas Herbert complains the green was not well kept—Charles frequently rode over to Lord Vaux's place at Harrowden, or to Lord Spencer's at Althorp, for a game, and, according to one account, was actually playing on the latter green when Cornet Joyce came to Holmby to remove him to other quarters. During this period gambling had become a mania. John Aubrey, the antiquary, chronicles that the sisters of Sir John Suckling, the courtier-poet, once went to the bowling-green in Piccadilly, crying "for fear he should lose all their portions." If the Puritans regarded bowls with no friendly eye, as Lord Macaulay asserts, one can hardly wonder at it. But even the Puritans could not suppress betting. So eminently respectable a person as John Evelyn thought no harm in bowling for stakes, and once played at The Durdans, near Epsom, for £10, winning match and money, as he triumphantly notes in his *Diary* for Aug. 14, 1658. Samuel Pepys repeatedly mentions finding great people "at bowles."

After a long interval salvation came from Scotland. There along with its winter analogue of curling, bowls may now be considered, much more than golf, a national game. Yet it was not until well into the 19th century that the pastime acquired popularity in that country. It had been known in Scotland since the close of the 16th century (the Glasgow kirk session fulminated an edict against Sunday bowls in 1505), but greens were few and far between. There is record of a club in Haddington in 1709, of Tom Bicket's green in Kilmarnock in 1740, of greens in Candle-riggs and Gallowgate, Glasgow and of one in Lanark in 1750, of greens in the grounds of Heriot's hospital, Edinburgh, prior to 1768, and of one in Peebles in 1775. These are, of course, mere infants compared with the Southampton Town Bowling Club, founded in 1299—which still uses the green on which it has played for centuries and continues the quaint custom of describing certain successful players as "sir"—and are younger even than the Newcastle-on-Tyne club established in 1657.

These earlier clubs, however, did little or nothing towards organizing the game. In 1848 and 1849, when many clubs had come into

existence in the west and south of Scotland (the Wellcroft dating from 1835, is the oldest club in Glasgow), meetings were held in Glasgow for the purpose of promoting a national association. This was regarded by many as impracticable, but a decision of final importance was reached when a consultative committee was appointed to draft a uniform code of laws to govern the game. This body delegated its functions to its secretary, W. W. Mitchell (1803-1884), who prepared a code that was immediately adopted in Scotland as the standard laws. It was in this sense that Scottish bowlers saved the game. They were, besides, pioneers in laying down level greens of superlative excellence. Not satisfied with seed-sown grass or meadow turf, they experimented with sea-washed turf and found it answered well. The 13th earl of Eglinton also set an example of active interest which many magnates emulated. Himself a keen bowler, he offered for competition, in 1854, a silver bowl and, in 1857, a gold bowl and the Eglinton Cup, all to be played for annually. These trophies excited healthy rivalry in Ayrshire and Lanarkshire, and the enthusiasm as well as the skill with which the game was conducted in Scotland at length proved contagious. Clubs in England began to consider the question of legislation and to improve their greens. Moreover, Scottish emigrants introduced the game wherever they went, and colonists in Australia and New Zealand established many clubs which, in the main, adopted Mitchell's laws; while clubs were also started in Canada and in the United States, in South Africa, India (Calcutta, Karachi), Japan (Kobe, Yokohama, Kumamoto) and Hong-Kong. In Ireland the game took root very gradually, but in Ulster, owing doubtless to constant intercourse with Scotland, such clubs as have been founded are strong in numbers and play.

A Lead from Australia.—Serious efforts to organize the game were made in the last quarter of the 19th century, but this time the lead came from Australia. The Bowling Associations of Victoria and New South Wales were established in 1880, and it was not until 1892 that the Scottish Bowling Association was founded. Then in rapid succession came several independent bodies—the Midland Counties (1895), the London and Southern Counties (1896), The Imperial (1899), the English (1903); and the Irish and Welsh (1904). These institutions were concerned with the task of regularizing the game within the territories indicated by their titles, but it soon appeared that the multiplicity of associations was likely to prove a hindrance rather than a help, and, with a view, therefore, to reducing the number of clashing jurisdictions and bringing about the establishment of a single legislative authority, the Imperial amalgamated with the English B.A. in 1905. The visits to the United Kingdom of properly organized teams of bowlers from Australia and New Zealand in 1901, and from Canada in 1904, demonstrated that the game had gained enormously in popularity. The former visit was commemorated by the institution of the Australia Cup, presented to the Imperial Bowling Association (and now the property of the English B.A.) by Mr. Charles Wood, president of the Victorian Bowling Association. Accredited teams of players have, since the World War, visited the mother country at regular intervals from Australia, New Zealand, South Africa and Canada, and British teams have returned those visits.

Perhaps the most interesting proof that bowls is a true *Volks-spiel* is to be found in the fact that it has become municipalized. In Edinburgh, Glasgow, and elsewhere in Scotland, and in London, Birmingham, Liverpool, Manchester, Newcastle and other English towns, the corporations have laid down greens in public parks and open spaces. In Scotland the public greens are self-supporting, from a charge, which includes the use of bowls, of a few pence per hour for each player; in London the upkeep of the greens falls on the rates. Most of them are run at a loss. The formation of so many private clubs in the metropolis has led to a rapid development of the game. Many of these private organizations possess two greens.

There are two kinds of bowling green, the level and the crown. The crown has a fall which may amount to as much as 18 in. all round from the centre to the sides. This type of green is confined almost wholly to certain of the northern and midland

counties of England. But although the crown-green game is of a sporting character, it necessitates the use of bowls of narrow bias and affords but limited scope for the display of skill at building up "ends." It is the game on the perfectly level green which calls for science and strategy in the matter of bowl placement. Subject to the rule as to the shortest distance to which the jack must be thrown (25 yd.), there is no prescribed size for the lawn; but 42 yd. square forms an ideal green. The Queen's park and Titwood clubs in Glasgow have each three greens, and as they can quite comfortably play six rinks on each, it is not uncommon to see 144 bowlers playing their game simultaneously. An undersized lawn is really a poor green, because it involves playing from corner to corner instead of up and down—the orthodox direction. For the scientific construction of a green, the whole ground must be excavated, to a depth of 18 in. or so, and thoroughly drained, and layers of different materials (gravel, cinders, moulds, silver-sand) laid down before the final covering of turf, 2½ or 3 in. thick. Sea-washed turf is the best. It wears longest and keeps its "spring" to the last. Surrounding the green is a space called a ditch, which is nearly but not quite on a level with the green and slopes gently away from it. Beyond the ditch are banks generally laid with turf. A green is divided into spaces usually from 18 to 21 ft. in width, commonly called "rinks"—a word which also designates each set of players—and these are numbered in sequence on a plate fixed in the bank at each end opposite the centre of the space. In match play each "rink" is marked off from its neighbour by thin thread securely fastened flush with the turf.

The Game.—Every player uses four *lignum vitae* bowls in single-handed games, three in three-a-side matches, and two only in the single rink game. Every bowl must have a certain amount of bias, which was formerly obtained by loading one side with lead but is now imparted by the turner making one side more convex than the other, the bulge showing the side of the bias. No bowl used upon flat greens must have less than No. 3 bias—that is, it should draw about 6 ft. to a 30 yd. jack on a first-rate green: it follows that on an inferior green the player, though using the same bowl, would have to allow for a narrower draw. It is also a rule that the diameter of the bowl shall not be less than 4½ in. or more than 5½ in., and that its weight must not exceed 3½ lb. The jack, to which the bowler plays his bowls, is round and not less than 2½ in. in diameter. On crown-greens it is customary to use a small biased wooden jack to give the bowler some clue to the run of the green. The player delivers his bowl with one foot on a mat, made of india-rubber, the size of which is also prescribed by rule as 22 by 14 in., though, with a view to protecting the green, Australasian clubs employ a much larger size.

In theory the game of bowls is very simple, the aim of the player being to roll his bowl so as to cause it to rest nearer to the jack than his opponent's, or to protect a well-placed bowl, or to dislodge a better bowl than his own. But in practice there is every opportunity for skill. On all good greens the game is played in rinks of four a side, there being, however, on the part of many English clubs still an adherence to the old-fashioned method of two and three men a side games. The four players in a rink are known as the leader, second player, third player and skip, and their positions, at least in matches, are unchangeable. The leader has to place the mat and to throw the jack, and is always chosen to fill that place because of his skill in drawing close up to the jack. It is, therefore, his business to "be up." There is no excuse for short play on his part, and his bowls would be better off the green than obstructing the path of subsequent bowls. So he will endeavour to be "on the jack," the ideal position being a bowl at rest immediately in front of or behind it. The skip plays last and directs his men from the end that is being played to. The second man, also, must be able to draw accurately. Most frequently he will be required either to protect a good bowl or to rectify a possible error of the leader. His official duty is to mark the game on the scoring card. The third player, who does any measuring that may be necessary to determine which bowl or bowls may be nearest the jack, holds almost as responsible a position as the captain, whose place, in fact, he takes whenever the skip is temporarily absent. The duties of the skip will already be understood by

DIAGRAM OF THE FOUR RINKS FOR THE GAME OF POINTS IN BOWLS

The object of this game is to perfect the proficiency of the player in certain departments of bowls proper. The distance between Footer and Jack should be about 100 feet, and between Jack and ditch 9 feet. F Indicates the Footer, or mat; B is the bowl, and J the jack

inference. It may be that he has to draw a shot with the utmost nicety to save the end, or even the match, or to lay a cunningly contrived block, or to "fire"—that is, to deliver his bowl almost dead straight at the object, with enough force to kill the bias for the moment. The score having been counted, the leader then places the mat, usually at the place where the jack lay at the conclusion of the head, and throws the jack in the opposite direction for a fresh end. On small greens play, for obvious reasons, generally takes place from each ditch. The players play in couples—the first on both sides, then the second, and so on. The leader having played his first bowl, the opposing leader will play his first and so on.

Some Essential Rules.—Every newcomer to the game should learn to play both forehand and backhand. In forehand play the bowl, as it travels towards the jack, describes its segment of a circle on the right of the "rink." In backhand play it is sent along the left-hand side of the "rink." It must be always remembered that the biased side of the bowl is kept to the inside of the "rink." In throwing the jack, upon all occasions, there must be a clear distance of not less than 27yds. between the front of the mat (footer) and the ditch at the opposite end. A bowl which touches the jack during its original course on the green, although it also may have touched one or more bowls in its progress, is called "a toucher" and is accounted in play wherever it rests if within the "rink." These touchers must be distinguished by a chalk mark. A bowl which does not touch the jack in its original course on the green and runs into the ditch, or is driven into the ditch, is "dead" and must be immediately removed to the bank. If a jack be driven into the ditch within the limits of the "rink" its place must be accurately marked. Should the jack be driven wholly beyond the limits of the "rink," i.e., over the bank, it is counted "dead." Whenever a jack is "dead," the end is not to be counted as a played end. In single-handed bowls, 21 points are played for; in pairs, triples and single rink play, 21 ends are decided.

Scotland's Game of Points.—In Scotland, the game of points is frequently played, but it is rarely seen on English greens. There are four sections in the game, namely, drawing, guarding, trailing, and driving. In *drawing* (fig. 1), the object is to draw as near as possible to the jack, the player's bowl passing outside of two other bowls placed 5ft. apart in a horizontal line 15ft. from the jack, without touching either of them. Three points are scored if the bowl comes to rest within 1ft. of the jack, two points if within 2ft., and one point if within 3ft. Circles of these radii are usually marked around the jack for convenience's sake. In *guard-*

ing (fig. 2), two jacks are laid at the far end of the green 12ft. apart in a vertical line. A thread is then pinned down between them, and on each side of this thread three others are pinned down parallel with it and 6in. apart from each other. A bowl that comes to rest on the central line, or within 6in. of it, counts three points, a bowl 12in. away two points, and a bowl 18in. off one point. In *trailing* (fig. 3), two bowls are laid on the turf 3ft. apart, and straight lines are chalked from bowl to bowl across their back and front faces, and a jack is then deposited equidistant from each bowl and immediately before the front line. A semicircle is then drawn behind the bowls with a radius of 9ft. from the jack. Three points are given to the bowl that trails the jack over both lines into the semicircle and goes over them itself. If a bowl trail the jack over both lines, but only itself cross the first; or if it pass both lines, but the jack cross only the first, two points are awarded. A bowl passing between the jack and either of the stationary bowls, and passing over the back line; or touching the jack, yet not trailing it past the first line, but itself crossing the back line; or trailing the jack over the front line without crossing it itself, receives one point. In no case must the stationary bowls be touched, or the semicircle crossed by the trailed jack or played bowls. In *driving* (fig. 4), two bowls are laid down 2ft. apart, and then a jack is placed in front of them, 15in. apart from each, and occupying the position of the apex of an inverted pyramid. The player who drives the jack into the ditch between the two bowls scores three. If he moves the jack, but does not carry it through to the ditch, he scores two. If he pass between the jack and either bowl he scores one, although it is not easy to see what driving he has done. The played bowl must itself run into the ditch without touching either of the stationary bowls.

The Crown Green Game.—The crown green game of bowls flourishes in the large industrial cities and towns of Lancashire, Yorkshire, Derbyshire, Staffordshire, Notts, North Warwickshire, Cheshire, and North Wales. The amateur players are governed by the British Crown Green Association, which acts in unison with a number of county and district parks' associations. There are many championships, decided each season, open to individuals and to clubs, the two chief of course being the man-to-man championship, decided among the most conspicuous players from each county, and the inter-county championship, in which there appears little to choose between the men of Cheshire, Yorkshire, and Lancashire, judged upon past results. The players of Norfolk and Suffolk subscribe to a game played mainly upon crowned greens, but gradually through East Anglia, Notts, and South Warwickshire there is creeping a liking for the flat green style of play.

Early in 1928 there were fully 450,000 known and affiliated amateur bowlers in England and Scotland. In Lancashire there are many hundreds of professional players who compete at regular intervals for wagers of considerable importance. They hold two annual tournaments at Blackpool, each attracting an entry of about 1,000 bowlers. Their skill gives them high rank as accurate players—they use but two woods on crown greens as against four played by the flat green single-handed bowler—and their ability and accuracy can be rated at some 30% greater than that of the average amateur.

UNITED STATES

Bowls (often called lawn bowls in America) was the chief pastime of the early settlers of New York who found great enjoyment "bowling on the green" at what is now Bowling Green, a small park situated at the lower end of Broadway, near the Battery, formerly Castle Garden. The game as it was played in 1700–1800 is portrayed on a stained glass window at the rear of the corridor of the Bowling Green building, 11 Broadway. The game seems to have been dropped with the American Revolution, or shortly after, and was not played to any extent until Christian Schepfflin of Dunellen, N.J., who is often referred to as the father of lawn bowls, formed a club called the Dunellen Bowling club, in 1879, thereby bringing about a revival of the sport. In America the game is usually played on a lawn not less than 40 yd sq., as level as possible; a ditch 6 in. deep and 18 in. wide surrounds the green. A regulation court is surrounded by a terrace 2 ft. higher than the ditch and about 10 ft. wide where spectators may watch the game.

Lawn bowls undoubtedly fills a vacancy which has existed in the programme of American sports, just as it had in Canada. It possesses numerous features that no other outdoor game enjoys in that it can be played by persons of middle age or past and even by older people who might find golf and other sports too strenuous. Although the same general rules as described above apply in America, there are several minor variations in the game. In a single handed or pairs game each person uses four bowls, in a three-a-side or four-a-side game only two bowls are used. In single-handed games a scorer or umpire may tell the position of the bowls, if so agreed to by players, but cannot give any directions for play or consult with players as to the next play. In a four-a-side or three-a-side game the duty of keeping the score is that of the second player, who announces the score at the completion of each end or head. (J. B. P.)

BOWMAN, ISAIAH (1878–), American geographer, was born at Waterloo, Ontario, Can., on Dec. 26, 1878. He graduated at Michigan State normal college, Ypsilanti, in 1902, at Harvard in 1905, and in 1909 received the degree of doctor of philosophy at Yale. He was assistant in physiography at Harvard in 1904–05 and instructor in geography at Yale from 1905 to 1909 and assistant professor from 1909 to 1915 when he was appointed director of the American Geographical Society, New York city. In 1907 he was leader of the Yale expedition to South America; in 1911 geographer and geologist of the Yale expedition to Peru, and in 1913 was leader of the American Geographical Society's expedition to the central Andes. Besides various articles in the publications of the U.S. Geological Survey and numerous papers on South America, he was the author of *Forest Physiography* (1911); *South America* (1915); *The Andes of Southern Peru* (1916); *The New World—Problems in Political Geography* (1921); *Desert Trails of Atacama* (1923); *An American Boundary Dispute* (1923); *The Mohammedan World* (1924); and *The New World* (1926).

BOWNESS, Linlithgowshire: see Bo'NESS.

BOWNESS-ON-WINDERMERE, urban district, Westmorland, England, on the east shore of Windermere, 1½ m. south-

west of Windermere station on the L.M.S. railway. Together with the town of Windermere it forms an urban district, but the two towns were separate until 1905. Population of parish (1921) 3,860. Its situation is fine, the lake shore rising sharply, while the lake narrows and is studded with islands. The low surrounding hills are richly wooded. Bowness lies at the head of a small bay, is served by lake-steamers and by a steam-ferry, and is a favourite yachting and tourist centre. The church of St. Martin is ancient, and contains stained glass from Cartmel priory in Furness. See WINDERMERE.

BOWRING, SIR JOHN (1792–1872), English linguist, political economist and miscellaneous writer, was born at Exeter, on Oct. 17, 1792, and died at Claremont, near Exeter, on Nov. 23, 1872. In early life he came under the influence of Jeremy Bentham. He was a diligent student of literature and foreign languages, especially those of eastern Europe. The first-fruits of his study of foreign literature appeared in *Specimens of the Russian Poets* (1821–23), followed by *Batavian Anthology* (1824), *Ancient Poetry and Romances of Spain* (1824), *Specimens of the Polish Poets*, and *Servian Popular Poetry*, both in 1827. During this period he began to contribute to the newly founded *Westminster Review*, of which he became editor in 1825. In its pages he advocated free trade, parliamentary reform and popular education. Bowring, who had been the trusted friend of Bentham, was appointed his literary executor, and prepared a collected edition of his works (11 vols. 1843). Meanwhile he had entered parliament in 1835 as member for Kilmarnock, and in 1836 he was sent to France to enquire into the actual state of commerce between the two countries. He was engaged in similar investigations in Switzerland, Italy, Syria and some of the German States. After four years interval he again sat in parliament from 1841 to 1849 as member for Bolton. In 1849 he was appointed British consul at Canton, and superintendent of trade in China, a post which he held for four years. Knighted in 1854 he was again sent the same year to Hong-Kong as governor, invested with the supreme military and naval power. It was during his governorship that a dispute broke out with the Chinese over the case of the "Arrow"; and the irritation caused by his "spirited" or high-handed policy led to the second war with China. In 1855 he visited Siam, and negotiated with the king a treaty of commerce. Bowring's last employment by the British Government was as a commissioner to Italy in 1861, to report on British commercial relations with the new kingdom. In addition to the works already named he published *Sketch of the Language and Literature of Holland* (1829); *Poetry of the Magyars* (1830); *Cheslovakian Anthology* (1832); *The Kingdom and People of Siam* (1857); a translation of *Peter Schlemihl* (1824); translations from the Hungarian Poet, Alexander Petöfi (1866); a book on the decimal system and various pamphlets. His valuable collection of coleoptera was presented to the British Museum by his second son, Lewin Bowring, a well-known Anglo-Indian administrator who edited his *Recollections* (1877).

BOWS AND ARROWS are the typical weapons of hunting peoples throughout the world (except in Australia), valuable alike in food quest and in war. Numbers of stone arrowheads bear witness to their use in the later palaeolithic culture of western Europe, and wooden bows have been preserved in neolithic deposits of Switzerland and elsewhere. The bowmen were the pride of Assyria in the days of Nimrod, of Xerxes at Thermopylae and of England down to the 16th century, while archery provides toys for the young and sport for the more mature in the most civilized countries of the world.

Classification of Bows.—The simplest form is the plain or single stave bow, constructed out of a length of bamboo, a slender branch of a tree, or cut out of a solid log (fig. 1). Two notches are cut, one at each end, the string is tied in one, a loop slipped over the end of the bent stick into the other, and the bow is ready. More picturesque are the long bows of the Andaman islanders, 5 ft. to 7 ft. long, of an S shape, broadening out above and below the grip, fashioned only by a shell adze and a boar's tusk spokehave (fig. 12). Compound bows may be as simple as plain ones. The bow made from a flexible stick soon loses its

TYPES OF BOW AND ARROW USED BY PRIMITIVE TRIBES. AS A WEAPON OF THE HUNT, THE BOW AND ARROW HAS BEEN EMPLOYED BY RACES AS FAR APART AS THE ESKIMOS OF GREENLAND AND THE TRIBES OF NEW GUINEA, THE ISLANDERS OF THE ANDAMANS AND THE INDIANS OF THE AMAZON.

elasticity, or cracks, when pulled, so another stick is bound on to strengthen it. Thus hardwood and bamboo are lashed together in Melanesia, or glued together in Japan; layers of sinew strengthen North American bows; the marsh dwellers of the Central African lakes fit a piece of tough wood into the hollow of a split bamboo; and yew, fustic, hickory and other woods are glued together to make the backed bow of modern archers. *Composite* (bi-partite or tri-partite) bows are made of two or more materials, often animal products, usually attached transversely. These may be two-piece bows, often a pair of horns or antlers fastened together at the grip (fig. 2) or the more familiar three-piece, with its "Cupid's bow" curve (fig. 3). This is the characteristic Asiatic shape, horn being more easily obtained than good timber, and it seldom occurs beyond the range of Asiatic influence. Both types are made by the Eskimo, who depend on such materials as drift wood, whalebone or reindeer antler. A pair of antlers rivetted together makes a two-piece bow, or three pieces of drift wood a three-piece bow (fig. 4), but in either case a strong backing of sinew is added to give both strength and elasticity. The true Tartar bow often has a core of wood, with layers of horn and sinew on either side, completely concealed under a covering of bark and lacquer. It is usually reflex, being drawn contrary to the curve, and in some three-piece bows the joints almost act as hinges (fig. 3).

The bowstring varies in material, and in the way in which it is fastened to the bow. Dwellers in warm, well-forested parts use a strip of rattan or bamboo, or a worked string of some vegetable fibre, but animal sinew or a strip of hide is widespread, especially with the Asiatic bow. Rattan or bamboo strings, being intractable, are often attached indirectly to the stave by a separate flexible loop, but with other bowstrings direct attachment is more common, and the string is threaded through a hole in the bow, secured by a firm lashing, or looped over the ends and stopped from slipping by a shoulder, notch or other projection.

Arrows are influenced by bows and vice versa. Where effective metal-headed or poisoned arrows are used the bows are often weak; where the arrows are ineffective the bow must be strengthened. An arrow may be made all in one piece, of a stick with one end hardened in the fire, or may be of two pieces, a shaft of reed, cane or light wood, and a heavier sharpened foreshaft; more commonly a separate head of stone, bone, shell, metal, etc. (with or without barbs) is fixed to the shaft or foreshaft. The head may be tanged or socketed, and fixed by lashings or cementing or both; it is often unfixed, so that it rankles in the wound. Feathers or bits of leaf, leather or fur are added to light arrows to steady the flight, but arrows with heavy foreshafts are usually unfeathered. When the bowstring is a flat strip of rattan or bamboo, a nock in the butt of the arrow is rare, but in other cases the arrow is usually grooved to fit on to the string, or a separate nock is made and fitted on (fig. 8).

Poisoning of arrows with vegetable and animal poisons is common in Africa, South America and parts of Asia, and has been reported from other regions. The "poisoned arrows" of Melanesia are often dipped in putrid matter, but rely less on their toxic qualities than on magic and the evil consequence of the breaking off of the fine bone point in the wound. Spells and incantations play a large part in the preparation of all arrow poisons, and by suggestion add much to their deadliness.

The arrow may be shot off in various ways (figs. 6, 7, 9, 10). The easiest release is by holding the butt end of the arrow between the index finger and thumb, and pulling the bowstring out with it. The arrows need no nock, though knobs, lashing or grooves are often added at the butt end to help the grip. In the secondary release the arrow is still held by the index finger and thumb, but the other fingers help in pulling the string. In the Mediterranean release the thumb takes no part, the nocked arrow is fitted on to the string, which is drawn out by the fingers. This is the loose of modern archers, as of some of the most primitive, the Vedda and the Eskimo, and it occurs in a modified form in the Andaman islands. The Mongolian release is exactly opposite. Here the fingers are idle (save for steadying the arrow) and the thumb, protected by a ring or glove, does the work. This is universal in

Asia and parts of Africa, and some of the oriental drawing-rings of ivory, jade and precious stones are of great beauty. A very strong bow is sometimes drawn with the feet. The archer sits, and pushing the bow with his feet, draws the string towards him. This, an ancient custom in India, is reported from the Vedda in Ceylon and some hunting tribes of Brazil.

Pellets of clay or small stones are hurled from a pocket in a double bowstring in India, Burma, Siam, etc., and also in east Brazil (fig. 5).

Crossbows.—The crossbow, probably an Asiatic invention, is found only in the Old World. The bow is fixed to a transverse handle or stock with a notch or knob on it, which holds the string when the bow is drawn. This ensures greater accuracy and a longer range than can be claimed for the long bow. The arrow is placed against the string and both are released together, usually by a trigger. As a weapon "hateful to God and unfit for Christians" its use was forbidden, except against infidels, by the Lateran Council of 1139, on pain of excommunication; but prohibitions were futile, and it was in use on the Continent until the middle of the 17th century. A split hinged stock is found in West Africa (Fan, Yoruba, Mandingo, etc.), for shooting poisoned darts.

The twang of the taut bowstring suggested the elaboration of the weapon into a musical instrument, and with or without its gourd resonator, the musical bow is common in South Africa. Variations are found across India and the East Indies to Hawaii and the Marquesas; and westward, in the West Indies, Central America and Patagonia.

BOWTELL (sometimes written **BOLTEL**), in architecture, a term used to describe a large class of projecting mediaeval mouldings always of convex contour and usually approximating to a torus (*q.v.*) or a torus with small attached fillet (*q.v.*). A "roving bowtell" is one following an irregular curved line, as on the edges of pew ends, stall arms and the like.

BOW-WOOD, a name given to the North American tree more commonly called Osage orange (*q.v.*).

BOWYER, WILLIAM (1663–1737), English printer, was born in 1663, apprenticed to a printer in 1679, made a liveryman of the Stationers' company in 1700, and nominated as one of the 20 printers allowed by the Star Chamber. He was burned out in the great fire of 1712, but his loss was partly made good by the subscription of friends and fellow craftsmen, as recorded on a tablet in Stationers' Hall, and in 1713 he returned to his Whitefriars shop and became the leading printer of his day. He died on Dec. 27, 1737.

His son, **WILLIAM BOWYER** (1699–1777), was born in London on Dec. 19, 1699. Educated at St. John's college, Cambridge, he entered his father's business in 1722. He became printer to the House of Commons, the House of Lords, the Royal Society and the Society of Antiquaries. He died on Nov. 13, 1777, leaving unfinished a number of large works and among them the reprint of *Domesday Book*. He wrote a great many tracts and pamphlets, edited, arranged and published a host of books, but his principal work was an edition of the New Testament in Greek, with notes. His bequests to the printing trade are administered by the Stationers' company.

BOX. A container or receptacle of dimensions usually not exceeding 2 or 3 ft., made of various firm materials into many different shapes, and provided with a lid which opens by lifting or sliding, and which may be fastened by hinges, catches, hasps and locks. The same term is sometimes applied to a small, box-like compartment in the theatre, in which may be four, six or eight chairs. It is also applied in various ways, such as the "box" on a coach, a "shooting-box," etc., and is often used in a hyphenated sense, connected with the word which describes its contents or use, such as work-box, snuff-box, cash-box, hat-box, etc. It is perhaps best known in the home as a receptacle for family keepsakes, jewels, money, deeds and securities.

For centuries boxes have been constructed of innumerable materials, though wood, iron and brass have perhaps been the most common. The top centre illustration shows a Greek box of pottery, and to the left at the top, a 17th century Dutch box made partially of bone. Many types of decoration have been used to enhance the beauty of boxes, such as painting, enamelling, gilding and the inlaying of jewels, while others have been covered with various fabrics or carved in the material of which they were made. (See the hat-box in the illustration.)

TYPES OF BOXES, REPRESENTING THEIR USAGE AND METHODS OF ADORNMENT FROM THE DAYS OF ANCIENT GREECE TO MODERN TIMES

| C. Tibetan charm box | H. French jewel box |
| D. French snuff box | I. English bible box |
| E. English band box | |

There were in the 16th century many oak boxes carved with foliage scrolls, dragons, animals, profile heads of noted people; also inlays of many other kinds of wood. The ebony box, more common at a later date, gave even more opportunities for carved decoration, and many were mounted with silver corners. Considerable marquetry and gay colours were common on the walnut and mahogany boxes of the 17th century. Tortoise-shell money-boxes and work-boxes were best known about the reign of Charles II. The work-box, used by women, was perhaps the most widely used type. It was often fitted with a tray divided into small compartments, for a needle-case, a pin-cushion, reels of silk and cotton, and other necessary equipment for sewing.

The box may be considered one of the most primitive pieces of furniture as it is one of the first things made by man, and the fact that its size and construction lent itself so conveniently to decoration, and that it has always been among the prize possessions of man, means that it often has a tremendous historic interest and artistic value.

BOX CAR, a covered and enclosed flat car used in America for carrying freight, with sliding doors either at the sides alone or at both side-centre and ends. It is usually about 40 ft. in length, has an average capacity of from 50 to 55 tons, and is made of wood and steel, or steel alone. The evolution of this type of car from the first crude freight car that appeared on the tracks of the Baltimore and Ohio railroad in 1832 has resulted from the need of protection from the weather and the necessity of sealing under lock and key many varieties of general merchandise, among them canned and dry goods. The average trip of the box car has been computed at 14.9 days, with 10.1 hours out of every 24 spent in shifting and interchange movement. In the United States, of the 2,355,225 freight cars in use in 1922, 1,100,000 were ordi-

nary box cars. A large proportion of the remainder showed some modifications of the box car principle in regard to stock, refrigerating and furniture. Of a total of 643,853 freight cars believed to have been put in service in the United States from Jan. 1923 to Oct. 1, 1927, 248,008 were thought to be box cars, and this type of car also figured prominently in the 53,308,853 loadings estimated for 1926. Much of the 83,000,000 tons of freight reputed to arrive and leave New York annually by rail is transported in box cars. In England the term box wagon, rather than car, is used.

BOX-ELDER, the name commonly given in the eastern United States to a species of maple (*Acer Negundo*), various races of which are planted for shade and ornament (see MAPLE).

BOX GARDEN: see HAKO-NIWA

BOXING, the art of attack and defence with the fists protected by padded gloves, as distinguished from pugilism, in which the bare fists, or some kind of light gloves affording little moderation of the blow, are employed (M.E. *box*, a blow, probably from Dan. *bask*, a buffet). The ancient Greeks used a sort of glove in practice, but, although far less formidable than the terrible caestus worn in serious encounters, it was by no means so mild an implement as the modern boxing-glove, the invention of which is traditionally ascribed to Jack Broughton (1705-89), "the father of British pugilism." In any case gloves were first used in his time, though only in practice, all prize-fights being decided with bare fists. Broughton, who was for years champion of England, also drew up the rules by which prize-fights were for many years regulated, and no doubt, with the help of the newly invented gloves, imparted instruction in boxing to the young aristocrats of his day. The most popular teacher of the art was, however, John Jackson (1760-1845), called "Gentleman Jackson," who was champion from 1795 to 1800, and who is credited with imparting to boxing its scientific principles, such as countering, accurate judging of distance in hitting, and agility on the feet. Tom Moore, the poet, in his *Memoirs*, asserted that Jackson "made more than a thousand a year by teaching sparring." Among his pupils was Lord Byron, who, when chided for keeping company with a pugilist, insisted that Jackson's manners were "infinitely superior to those of the fellows of the college whom I meet at the high table," and referred to him in the following lines in *Hunts from Horace*.—

"And men unpractised in exchanging knocks
Must go to Jackson ere they dare to box."

His rooms in Bond street were crowded with men of birth and distinction, and when the allied monarchs visited London he was entrusted with the management of a boxing carnival with which they were vastly pleased. In 1814 the Pugilistic Club, the meeting-place of the aristocratic sporting element, was formed, but the high-water mark of the popularity of boxing had been reached, and it declined rapidly, although throughout the country considerable interest continued to be manifested in prize-fighting.

The sport of modern boxing, as distinguished from pugilism, may be said to date from the year 1866, when the public had become disgusted with the brutality and unfair practices of the professional "bruisers," and the laws against prize-fighting began to be more rigidly enforced. In that year the "Amateur Athletic Club" was founded, principally through the efforts of John G. Chambers (1843-83), who, in conjunction with the 8th marquess of Queensberry, drew up a code of laws (known as the Queensberry Rules) which govern all glove contests in Great Britain, and were also authoritative in America until the adoption of the boxing rules of the Amateur Athletic Union of America. In 1867 Lord Queensberry presented cups for the British amateur championships at the recognized weights.

Boxing is the art of hitting without getting hit. The boxers face each other just out of reach and balanced equally on both feet, the left from 10 to 20 in. in advance of the right. The left foot is planted flat on the floor, while the right heel is raised slightly from it. The left side of the body is turned a little towards the opponent and the right shoulder slightly depressed. When the hands are clenched inside the gloves the thumb is doubled over the second and third fingers to avoid a sprain when hitting.

The general position of the guard is a matter of individual taste. In the "crouch," affected by many American professionals, the right hip is thrust forward and the body bent over towards the right, while the left arm is kept well stretched out to keep the opponent at a distance. For speed and the use of a straight left, the basis of the classic style, the upright pose is decidedly more effective. Some boxers stand with the right foot forward, a practice common in the 18th century, which gives freer play with the right hand but is rather unstable. A boxer should stand lightly on his feet, ready to advance or retreat on the instant, using short steps, advancing with the left foot first and retreating with the right. Attacks are either simple or secondary. Simple attacks consist in straight leads; *i.e.*, blows aimed with or without preliminary feints, at some part of the opponent's body or head. All other attacks are either "counters" or returns after a guard or "block." A counter is a lead carried out just as one is attacked, the object being to block (parry) the blow and land on the opponent at the same time. Counters are often carried out in connection with a side-step, a slip or a crouch. In hitting a boxer seeks to exert the greatest force at the instant of impact. Blows may be either straight, with or without the weight of the body behind them ("straight from the shoulder" hits); jabs, or stabbing blows (delivered with either hand at close quarters); hooks, or side-blows with bent arm; upper cuts (short swinging blows from beneath to the adversary's chin); chops (short blows from above); or swings (round-arm blows, usually delivered with a partial twist of the body to augment the force of the blow). Of the dangerous blows, which often result in a knock-out, or in seriously weakening an adversary, the following may be mentioned.—On the pit of the stomach, called the solar plexus, from the sensitive network of nerves situated there; a blow on the point of the chin, having a tendency to destroy the sense of equilibrium; a blow under the ear, painful and often resulting in partial helplessness; and one directly over the heart, kidney or liver. As a boxer is allowed ten seconds after being knocked down in which to rise, an experienced ring-fighter will drop on one knee when partially stunned, remaining in that position in order to recover until the referee has counted nine.

Guarding is done with the arm or hand, either open or shut. If a blow is caught or stopped short it is called blocking, but a blow may also be shoved aside, or avoided altogether by slipping; *i.e.*, moving the head quickly to one side, or by ducking and allowing the adversary's swing to pass harmlessly over the head. Still another method of avoiding a blow without guarding is to bend back the head or body so as narrowly to escape the opponent's glove.

The rules of the Amateur Boxing Association (founded 1884) contain the following provisions. "An amateur is one who has never competed for a money prize or staked bet with or against a professional for any prize, except with the express sanction of the A.B.A., and who has never taught, pursued or assisted in the practice of athletic exercises as a means of obtaining a livelihood." The ring shall be roped and between 12 and 24 ft. square. No spikes shall be worn on shoes. Boxers are divided into the following classes by weight:—Fly-weight, not exceeding 8 st.; Bantam, not exceeding 8 st. 6 lb. (116 lb.); Feather, not exceeding 9 st. (126 lb.); Light, not exceeding 10 st. (140 lb.); Welter, not exceeding 10 st. 7 lb.; Middle, not exceeding 11 st. 6 lb. (158 lb.); Light-heavy or Cruiser, not exceeding 12 st. 6 lb.; and Heavy, any weight above. There shall be two judges, a referee and a time-

FIG. 1.—SPARRING FOR AN OPENING

By shifting your position about the ring and frequently resorting to feinting, draw your opponent out as much as possible. Then step in quickly and strike

keeper. The votes of the judges decide the winner of a bout, unless they disagree, in which case the referee has the deciding vote. In case of doubt he may order an extra round of two minutes' duration. Each match is for three rounds, the first two lasting three minutes, and the third four, with one minute rest between the rounds. A competitor failing to come up at the call of time loses the match. When a competitor draws a bye he must box for a specified time with an opponent chosen by the judges. A competitor is allowed one assistant (second) only, and no advice or coaching during the progress of a round is permitted. Unless one competitor is unable to respond to the call of time, or is obliged to stop before the match is over, the judges decide the winner by *points*, which are for attack, comprising successful hits cleanly delivered, and defence, comprising guarding, slipping, ducking, counter-hitting and getting away in time to avoid a return. When the points are equal the decision is given in favour of the boxer who has done the most leading; *i.e.*, has been the more aggressive. Fouls are hitting below the belt, kicking, hitting with the open hand, the side of the hand, the wrist, elbow or shoulder, wrestling or "roughing" on the ropes; *i.e.*, unnecessary shouldering and jostling.

The boxing rules of the American Amateur Athletic Association differ slightly from the British. The ring is roped but must be from 16 to 24 ft. square. Gloves must not be worn more than 8 oz. in weight. The recognized classes by weight are: Bantam, 105 lb. and under; Feather, 115 lb. and under; Light, 135 lb. and under; Welter, 145 lb. and under; Middle, 158 lb. and under; and Heavy, over 158 lb. The rules for officials and rounds are identical with the British, except that only in final bouts does the last round last four minutes. Two "seconds" are allowed. The rules for points and fouls coincide with the British. The amateur rules are very strict, and any one who competes in a boxing contest of more than four rounds is suspended from membership in the Athletic Association.

See R. Allanson Winn, *Boxing* (1897); Wm. Elder, *Boxing* (New York, 1902) (these two books are excellent for the technicalities of boxing). The article "Boxing," by B. Jno. Angle and G. W. Barroll, in the *Encyclopaedia of Sport*; J. C. Trotter, *Boxing* (1896); *Fencing, Boxing and Wrestling*, in the Badminton Library (1892).

French Boxing (*la boxe française*) dates from about 1830. It is more like the ancient Greek *pankration* (see PUGILISM)

FIG. 2.—LEFT LEAD TO FACE AND COUNTER TO BODY

In countering a left-hand lead to the face, raise your right hand across the face, and at the same time shoot the left straight to the body

than is British boxing, as not only striking with the fists, but also kicking with the feet, butting with the head and wrestling are allowed. It is a development of the old sport of *savate*, in which the feet, and not the hands, were used in attack. Lessons in *savate*, which was practised especially by roughs, were usually given in some low resort, and there were no respectable teachers. While Paris was restricted to *savate*, another sport, called *chausson* or *jeu marseillais*, was practised in the south of France, especially among the soldiers, in which blows of the fist as well as kicks were exchanged, and the kicks were given higher than in *savate*, in the stomach or even the face. Alexander Dumas père says that Charles Lecour first conceived

the idea of combining English boxing with *savate*. For this purpose he went to England, and took lessons of Adams and Smith, the London boxers. He then returned to Paris, about 1852, and opened a school to teach the sport since called *la boxe française*. Around him, and two provincial instructors who came to Paris about this time with similar ideas, there grew up a large number of sportsmen, who between 1845 and 1855 brought French boxing to its highest development. Among others who gave public exhibitions was Lecour's brother Hubert, who although rather under-

sized, was quick as lightning, and had an English blow and a French kick that were truly terrible. Charles Ducros was another whose style of boxing, more in the English fashion, but with low kicks about his opponent's shins, made a name for himself. Later came Vigneron, a "strong man," whose style, though slow, was severe in its punishment. About 1856 the police interfered in these fights, and Lecour and Vigneron had to cease giving public exhibitions and devote themselves to teaching. Towards 1862 a new boxer, J. Charlemont, was not only very clever with his fists and feet, but an excellent teacher, and the author of a treatise on the art. Lecour, Vigneron and Charlemont may be said to have created *la boxe française*, which, for defence at equal weights, the French claim to be better than the English.

See Georges d'Amoric, *The French Method of the Noble Art of Self Defence* (1898); J. Charlemont, *L'Art de la boxe française et de la canne* (1899).

Modern Developments.—In 1910, though France was beginning to cultivate it as a spectacular sport, the old indigenous kicking game of *La Savate* having fallen into disrepute, boxing was hardly known at all outside the English-speaking countries. In 1927 it was a cosmopolitan game, familiar to all the Western nations and actually gaining a foothold here and there in the East. During the period since 1910 it has once again become a real national sport, a game pursued for its own sake, in Great Britain; in America, although the number of amateur practitioners is still insignificant, the chief professional contests are the most crowd-compelling of popular spectacles.

The adoption of boxing as a recognized form of physical training in the Services for officers and men alike, while millions of men were being called to the colours as the World War ran its course, has been the principal factor in a revival of intelligent interest, which has not only increased the number of amateur boxers in Great Britain, but has also raised the status of the professional. Though it has not quite succeeded in throwing off its disreputable adherents, boxing is now generally admitted, except by a very few Puritanical moralists, to deserve the praise given to it in a letter to Tommy Burns, for a time the world's heavyweight champion, from the late Father Bernard Vaughan, who said "Boxing is an education—you learn self-control, to give and to take, to punish and be punished, smiling all the time." The average professional glove fighter is now almost always a decent

citizen, and for such experts as Driscoll, Basham, Wells, Summers, Britt, Frank Moran, McFarland, Tom Gibbons, Gene Tunney, to name only a few out of many, those who knew them well had a real regard and no little respect.

Some Great Boxers.—As regards technique, however, it cannot be said that any notable advance was made during the period in question. It is true that the best amateur form reached the professional championship standard. Outstanding amateurs, such as the cricketer, J. H. W. T. Douglas, who had the best of a private trial with Burns when the latter was still champion, and John Hopley, the Cambridge University heavy-weight, would certainly have attained the highest honours, if they had made boxing their profession. Hopley's hitting power and other physical gifts for the game were equal to those possessed by any holder of the world's heavy-weight championship, with the exception of Jeffries. The Amateur Boxing Association championships were sometimes made stepping-stones to a professional career, and several of those who adopted this plan did very well indeed in the professional ranks, even winning British championships. The short amateur contests, in which not a moment could be wasted,

were an excellent preparation for an intensive style of boxing in professional matches.

But, generally speaking, the best professional boxers of the period, especially as regards the heavier divisions, were not quite as good as those of the previous generations. Jeffries, Fitzsimmons, Corbett, Sharkey and Ruhlin were a quintette of great heavy-weights, especially Jeffries, each of whom combined unusual skill with extraordinary punching power and the real fighting temperament. They were succeeded by four very formidable coloured fighters, Johnson, Langford, McVea and Jeannette, of

whom the first-named was not much inferior to Peter Jackson—though the Jeffries he beat at Reno, in a fight that proved a provocation to racial riots all over U.S.A., was only the husk of the former world's champion.

Johnson lost his title to Willard in the contest at Havana. It is a debatable point whether Dempsey, who knocked out Willard, when the latter was untrained and past his prime, in three rounds, was the equal of any of the great heavy-weights mentioned above. Comparisons are unsatisfactory because the modern heavy-weight adopts a more intensive style than his predecessors, attempting to obtain a decision from the first, instead of using the preliminary rounds to test his opponent's methods and get an insight into

FIG. 4—DRAWING AWAY FROM RIGHT SWING

The easiest way to avoid a right swing to the face is to bend back from the waist and as your opponent's hand passes your face shoot your right over his arm to his face

his plan of campaign. But, whenever he was held for three or four rounds, Dempsey relapsed into mediocrity. Dempsey, owing to a long period of inactivity, was not the fast and resolute fighter he had been when he was beaten by Gene Tunney—a boxer rather than a fighter—on points in contests for the world's heavy-weight championship at Philadelphia and at Chicago in 1926 and 1927.

It is only in the lighter divisions that British and French boxers have reached the American standard, even in a period when, as has been suggested, championship form on the American side of the Atlantic showed a certain falling off. Wells, the most interesting and popular of the British heavy-weights, lacked the well-fortified physique and fighting temperament which are required for success, and was easily beaten by two second-rate Americans.

Among the little men, however, Great Britain and France have held their own fairly well. Ledoux, a pocket Hercules and Criqui, a glove fighter of genius handicapped by wounds received in the War, were two French boxers who were, for a time, in the world's championship class. Britain has had in Driscoll and Wilde, two real prodigies who were for years supreme at their weights. Driscoll was by general consent the perfect stylist, the boxer's boxer, in fact, whose method in its graceful effectiveness, severity and economy of exertion, will always be remembered as a classic model. Wilde, on the other hand, was an eccentric genius, who made the most of a physique which, like that of Fitzsimmons, seemed expressly invented to get the maximum hitting punch for the minimum weight. In America, the melting pot of racial types, such freaks of physique are far more common than in the European countries, where the human body is more or less standardized, and they are scientifically utilized for securing extraordinary results in various feats. That is yet another reason why America produces so many men with a special aptitude for pugilism. Hill and Teddy Baldock, despite an unexpected defeat incurred by the latter, look like becoming worthy successors of Driscoll and Wilde, both of whom could keep their Welsh temperaments on ice, so to speak.

Control of Boxing.—In Great Britain amateur boxing is admirably organized, the executive of the Amateur Boxing Asso-

FIG. 3—LEFT STRAIGHT TO BODY
Feint your opponent into a lead with his left then step in and crouch, driving your left straight from the shoulder

ciation consisting of men with a personal experience of the game and having its welfare at heart. On the professional side, however, no effective organization yet exists with full power to (1) rule out the unscrupulous promoter and the incompetent referee and (2) suspend the unfair boxer and insist that championship holders should meet an approved challenger within a reasonable limit of time. It is to be regretted that the National Sporting Club, though it has been a great influence for good, has not been able to establish itself as the final authority. The Lonsdale championship belts, each of which is worth £500, are much sought after and can only be won in the club arena. The boxer who wins one of them three times becomes its owner and is also entitled to a pension of £1 a week after reaching the age of 50. Outside promoters, however, are able to offer such large purses that the club is unable to secure control of all the British championship contests, at the various weights. However, a British Board of Control is now in being and is gradually strengthening its position, especially as regards the selection of referees, but it is unlikely to attain the authority of the Government Commission which absolutely controls professional boxing in the State of New York and can put any promoter or boxer out of the game, if such a course seems warranted at any time.

The Financial Side.—During the period the problem of the big purse presented itself in a form that would have seemed incredible in the days of Tom Sayers and John Heenan, who fought the most famous contest ever decided on English soil for stakes limited to £200. In 1887, when Kilrain and Jem Smith fought with the bare fists in France for a sum slightly exceeding £2,000, it was generally believed that the limit had been reached. It was so until 1906, when Joe Gans and Battling Nelson were matched for the light-weight championship of the world, and announced their intention of accepting the best bid for a much-discussed contest which, owing to the former's superlative skill and the latter's extraordinary power of endurance, created as much interest as a fight between leading heavy-weights.

It was then that Tex Rickard offered a purse of \$20,000, provided the contest took place in Goldfield, Nev. He held that huge profits could be made by staging bonâ-fide championship contests in open-air arenas constructed for the purpose, and making such arrangements that every ticket-holder would be sure of his (or her) seat, and an uninterrupted view of the boxing, while at the same time there would be no danger of a disturbance at the conclusion of a contest which had aroused the passions of the spectators.

At Rickard's first promotion, the contest between Joe Gans and Battling Nelson, which was a fight to a finish, lasting 42 rounds, the gate money amounted to nearly \$70,000 and the promoter's net profit exceeded \$10,000. The Johnson-Jeffries fight at Reno in Nevada (1910) brought gate receipts of \$270,755, Dempsey v. Willard at Toledo in Ohio (1919) \$452,522, and these huge figures were greatly exceeded when world's heavy-weight championships could be staged in, or within easy reach of, the greatest American cities. Dempsey v. Carpentier at Jersey City (1921) brought in \$1,626,580 and the million dollar total was also exceeded in the case of Dempsey v. Firpo in New York (1923). It was generally thought that the limit had now been reached: but it was exceeded by Tunney v. Dempsey at Philadelphia, and the record was broken at their second meeting at Chicago, when the huge sum of \$2,750,000 was taken in gate money, the winner's remuneration being nearly a million dollars! It is possible the limit has not yet been reached.

FIG. 5.—DUCKING A RIGHT-HAND SWING

As you duck a right-hand swing, get in a position to counter by sending either hand to the attacker's body

C. B. Cochran's Promotions.—In England, though the remuneration of the successful boxer has greatly increased since 1910, nothing approaching the higher American figures has yet been recorded. In the boxing boom which followed the World War, C. B. Cochran, who in 1914 had staged the Welsh-Ritchie match at Olympia and who was one of the bidders for the Carpentier-Dempsey contest, became a serious rival to the National Sporting Club. A consummate showman, he conceived the idea, and certainly realized it, of giving boxing shows which should be as well conducted as a theatrical performance. In his book of reminiscences entitled *The Secrets of a Showman* (1925) he gives the full financial details of some of these ventures. The contest

FIG. 6.—DRAWING BACK ON GUARD FROM STRAIGHT LEFT TO FACE

Bend back from the waist so that your opponent's fist falls several inches short, then lunge forward to strike at his body or face

between Wilde and the American bantam-weight Moore, which was won by the former after an amazing display of skill, hitting power and stamina, was perhaps the most interesting of his promotions, which were never mere money-making affairs.

The Cochran boxing shows, some of which were watched by the Prince of Wales, might almost be described as social functions, and they recalled the great days of the old prize ring, when men fought with the naked fists for 50 or 100 guineas a side in the presence of all the social celebrities of the day. At these well-conducted modern spectacles a small proportion, never more than 1%, were women. In France, where purses have never yet approached the English maximum, the number of women attending a contest in which a popular favourite, such as Carpentier or Criqui in their prime, is engaged, is apt to be very large. The same phenomenon has been noticed in Italy and Spain, and the Latin-American countries. It is all largely a question of national temperament, and the horror of seeing bloodshed, which is thought to be a characteristic of northern races, is not likely to prevent women, who are in the habit of attending bull fights, from watching boxing matches.

Effect of Big Purses.—Whether it is true to say that big purses and small personalities go together in the modern prize ring is a question worth asking, not easily answered. The fact that a successful boxer, if only he be reasonably thrifty, as many are in these latter days, can amass a competence, while being the subject of hero worship and living in the full glare of publicity, has certainly persuaded young men of a better type than the translated, but not transmuted, navvies and butchers of the old days to adopt boxing as a temporary profession. It is especially so in America, where the boxer of high repute is now almost always a quite intelligent person, who makes a keen study of his craft, lives decently, and behaves as a civilized member of the community.

The many failures of British boxers, when meeting American champions in the ring, have been the result, in nine cases out of ten, of their intellectual inferiority, and the lack of moral self-discipline that goes with it as a general rule. More than once England has had heavy-weight champions who had every physical requisite for the game, yet failed to make the most and best of themselves owing to their inability to learn from bitter experience, much less from experimental work in the gymnasium, or their unwillingness to keep fit between one special preparation for a fight and the next. The old bruiser type, whose chief asset was an insensitiveness to pain, still survives in England, but he has long since been scrapped as useless in America.

Large purses, it would seem, bring into the ring young men of brains as well as brawn, who are capable of perfecting their technique by taking thought to it and have the mental resources that enable them to endure with patience the tedious régime of

BOYLE'S 30-ACRES DURING THE DEMPSEY-CARPENTIER FIGHT AT JERSEY CITY, JULY 2, 1921

The Dempsey-Carpentier fight was witnessed by approximately 90,000 persons, including 2,000 women, the greatest number of women to have attended a boxing contest in the United States up to that time. The gate receipts totalled \$1,626,580. Dempsey retained his title by knocking out Carpentier in the fourth round.

training and practice year after year. But, once a championship has been achieved, they do not fight often enough to develop their gifts to the fullest extent. A world's champion finds it now so easy to make a large income by exhibition work on the music hall stage, by film acting, etc., that he will not risk the loss of his title until he is compelled to do so by the force of public opinion. The no-decision contest, which is so popular in America, enables him to keep up his form, but the practice of choosing opponents whom he is certain of beating tends to prevent any improvement in technique.

A Cosmopolitan Profession.—Professional boxing now receives recruits from many countries and races, the old idea that only men of English or Irish descent could excel at the game having long since been confuted. The Latin physique, perhaps in consequence of frugal eating and a racial preference for wines rather than malted liquors, is admirably adapted for a sport that requires a high degree of stamina. No oriental boxer has, as yet, reached the highest class, though Indians, Japanese and Chinese are occasionally seen in minor contests, and a Filipino, Villa, has actually held the world's fly-weight championship, but there seems no reason why the Eastern races, which have produced so many fine wrestlers, should not learn to excel in the sister-art in course of time. India has sent us some very skilful amateur boxers.

A proof that boxing is rapidly becoming popular in the Latin countries is found in the way renderings, often comical in appearance, of English technical terms have been adapted into the French, Italian and Spanish languages. Outside the British Isles, there are few amateur boxers of merit. Even in America those who take up the game for the game's sake are vastly inferior, both in quality and quantity, to the increasing multitude of British amateurs. There is no annual competition there comparable with the British Amateur Boxing Association championships, and there is nothing equivalent to the flourishing boxing clubs at Oxford and Cambridge in the great American universities. If the American athlete thinks he can excel in such an exacting man-to-man game, nine times in ten he adopts it as a professional vocation. And in France, though the brilliant victories of Carpentier gave rise to a temporary craze for what was significantly styled "Byronic Boxing," fencing has now regained its old position as the gentleman's art of self-defence, an indispensable accomplishment.

In the Scandinavian countries, however, and in Germany, there is a real enthusiasm for amateur boxing. Denmark produces excellent amateurs, and her representative teams have done very well in matches against teams selected by the Amateur Boxing Association. Such amateur international matches are a new development and are certain to become more numerous and more popular as spectacles in the near future. The impetus to boxing in Germany was given by returned prisoners of war who had acquired the rudiments of the game in concentration camps. Two sailors, Breitenstraeter and Prenzel, who were captured at the beginning of the World War and learned to box fairly well in the internment camp at Douglas, Isle of Man, were the pioneers of professional boxing in Germany. They started travelling boxing booths, and whenever demonstrations of the art were given, ex-prisoners of war attended in large numbers, and local clubs were formed. The popular impression that the excellence of the British soldier as a fighting man was due to his training in boxing greatly helped the new form of athletic propaganda, and Blücher's approval of pugilism was a stock quotation in many favourable newspaper articles. Professional boxing shows have become very

popular, especially in Berlin where they are rigorously controlled by a boxers' union, the *Verband Deutscher Faustkämpfer*, and a promoters' association, the *Verband der Boxkampf Unternehmer*. For a few appearances on a Berlin stage with sparring partners Dempsey received \$50,000 and all the travelling expenses of himself and his camp from London. To-day amateur boxing clubs exist in every German city and town and when the problem of obtaining competent instructors is solved, there can be little doubt that skilled exponents will be produced.

BOXING IN AMERICA

Boxing, pugilism, prize-fighting and ruffianism were synonymous in the public mind from the earliest days of prize-fighting in the United States down to the World War, when boxing was prescribed as a means of quickly fitting untrained men for action at the front. Boxing up to this time had a most dreadful inheritance in the way of reputation, due to the practices of the persons connected with prize-fighting in its early stages in America, and to the type of men who took active part in these prize-fights. As a rule, they were, both fighters and associates, sinister people with few scruples, vulgar and brutal to a marked degree. The populace realized this and branded as outcasts all persons who were in any way connected with this "sport." Almost every State in the Union passed laws prohibiting prize-fights. Occasionally, however, in spite of the laws, important contests would be held secretly in out of the way places. But they usually were terminated by the police, who would get the information that such a fight was being held and after stopping the match would place the principals under arrest. This kind of contest attracted few people, first because they were slow, uninteresting mauling affairs in which one man was trying to outlast his opponent, and, therefore, making few efforts to end matters for fear he would over-exert himself and be at the mercy of the other; and secondly the fear of being arrested, or possibly injured, in the free-for-all that usually accompanied the termination of these, made attendance at them quite a risky matter. The possibilities of arrest or injury naturally kept the self-respecting and prudent people away.

Despite the old laws prohibiting fighting having been modified, and new laws called Boxing laws permitting boxing contests in

certain States, boxing was still regarded as an outlaw "sport" and a brutalizing and degrading form of amusement, until the government, in 1917, through its directors of training camp activities, adopted it as an important means for quickly fitting untrained men for rigorous soldier-life. It was then that modern boxing was brought to the attention of its greatest calumniators, viz., the ministers of the gospel, religious and lay woman organizations and societies and those who did not know the difference between brutal prize-fighting and legalized, regulated, modern boxing. This was the moment of rebirth for boxing. The interest in boxing has grown rapidly and steadily ever since. As a sport for young boys

FIG. 8—STEPPING OUTSIDE OF STRAIGHT RIGHT LEAD
As you step outside of a straight right lead to the face, push the attacking arm over right shoulder with left hand and send right to body or face

during their impressionable and developing years, there is no equal to it; it develops self-reliance, self-control, self-confidence, individual and quick thinking, physical courage and sportsmanship. There is no other game or sport that can boast of these attributes.

That fighting or boxing has an appeal to the elemental and primitive in man, boxing's bitterest foes cannot deny. There is

something terrifically fascinating about it to both man and woman. Its grip on man is probably due to his fundamental urge—self-preservation. In boxing contests the spectators' imagination sees a test for physical supremacy, a struggle to preserve oneself; and for the right to live. There is no other source of amusement or entertainment, sport or game, that contains quite as much real drama as can be found in a contest between two evenly matched, well-trained boxers.

After the World War as boxing gained the recognition and interest of the general public; and those who took it up as a profession, just as a young man does law or medicine, were no longer looked upon as pariahs; many serious-minded and ambitious young men adopted it as a means of livelihood and profession. This brought an altogether new element into the sport, a thinking element; men who believed mental preparedness as important as physical preparedness; men who studied their game just as a surgeon does his anatomy. Naturally, this made for a marked increase in the knowledge of the "science" and raised the standard of the boxer proportionately, so that boxing methods must have improved just as sprinting and other athletic performances have bettered all records during the past decade. We have advanced in every other branch of athletic endeavour, so it seems only logical to assume that boxing has kept pace with the progress of its sister sports. Styles in boxing have variegated and changed considerably. New methods of attack and defence have been introduced and improved upon. Foot-work takes an important place in the repertoire of the modern boxer. The Classic style; *i.e.*, the upright stance, with the left hand and left foot extended, and the right arm crooked across the chest ready to parry an opponent's lead to the head or body, has been almost entirely discarded as obsolete. It has been found more efficient to learn to avoid leads by either slipping the head to one side or the other, depending on how you expect to counter, or, by ducking, pulling away or slipping inside the lead. This gives a boxer the free use of his two hands for hitting, being a great improvement over the older style of using one or both arms to parry, which effectually warded off the blows, but by doing so prevented the use of the hands to counter. It has been discovered it is tremendously more effective to use the hands to strike the opponent than to keep them busy parrying and blocking blows. So that now we have the "bobbing and weaving" style of attack with the hands poised in a hitting position ready to strike out at the first opening as the advance toward the opponent is made. Jack Dempsey, heavyweight champion 1919-26, has been the greatest exponent of this style up to date. Benny Leonard, lightweight champion 1916-25, was one of the greatest exponents of the splendid combination of rhythmic foot work and hard, accurate, straight hitting. Jack Britton, welterweight champion 1919-1922, though lacking a heavy blow, was, undoubtedly, the greatest exponent of pure boxing skill of his time. The three men mentioned were the outstanding boxing figures of their time, and while their "styles" differed somewhat outwardly, basically they were the same, in that they learnt to avoid blows by slipping and ducking the head so that they would at all times have the free use of both hands. This factor is, undoubtedly, the mainspring in the improvement of the modern boxer.

Mental fitness has as much to do with success as has physical. This is true not only in boxing but in every endeavour of life. The modern boxer realizes that unless he is mentally equipped his chances for success are very slim. He therefore cuts himself

FIG. 9.—LEFT HAND PUNCH OF THE NAVY DOUBLE PUNCH
By a series of feints draw the opponent in and deliver a punch with the right to his face. As he raises his guard, strike to the body with the left hand

free from all other business interests, believing he cannot have diversified interests and find success as a professional boxer. Boxing being a highly specialized sport, none can remain successfully in it unless he becomes a specialist. All successful boxers have done this, and it is not until they acquire money and make investments, in which they are compelled to take an active interest, that they meet reverses in the ring. This has been the case in four out of every five of the great champions, and goes to prove the point in question. Freedom from all outside interest, and worry of every nature; with a complete knowledge of the "science" of the game; a quick, active brain, with perfect co-ordination; and sound physical condition are necessary qualifications for a successful boxer of to-day. (G. T.)

Heavyweight Champions in the United States

1890-92 John L. Sullivan
1892-97 James J. Corbett
1897-99 Robert Fitzsimmons
1899-1906 James J. Jeffries
1906-08 Tommy Burns
1908-15 Jack Johnson
1915-18 Jess Willard
1919-26 Jack Dempsey
1926-28 Gene Tunney

BOXING DAY, the name given in Great Britain to the day after Christmas Day, on which Christmas "boxes," or presents, are given to errand boys, postmen, etc. It is a bank holiday (*q.v.*).

BOX-MAKING. One of the most important changes in manufacturing and marketing that has taken place within recent years has been the change from bulk goods to packed goods. Consumers have come to know by manufacturers' brands such commodities as tea, coffee, ice-cream, confectionery, cereals, toilet articles, pillow cases, safety razors, medical preparations, rubber goods, fountain pens, pencils, electrical appliances, sporting goods, silverware, stationery, tools—to indicate only a few distinct lines of merchandise.

Consequently, one of the first problems considered in marketing a new product is how it is to be packed. Many manufacturers by packaging their goods are able to trade-mark products that could not otherwise be identified. Thus standard articles and everyday necessities are distinguishable from competitive ones. Products that were formerly just beef suet, tooth paste or silk stockings have become things with various well-advertised trade names.

The demand for attractive paper boxes is constantly increasing. Manufacturers and retailers everywhere realize that pretty boxes are a powerful factor in selling merchandise. Sales prove it. Some hold that the paper box is responsible for 50% of the sales of merchandise over the counter. There was a time when a box was merely a container—a receptacle for a certain product, and nothing else. But since manufacturers discovered not only the hygienic appeal of the sealed box, but the value of the surface of the container, all that has been changed. Now, it would be difficult to discover any kind of seasonable gift that is not boxed—and artistically boxed—before it is offered for sale. It is, however, not yet generally appreciated that the paper box can give display value and package protection for one cost.

The modern boxmaker must not only be able to make boxes; he must possess creative talents, selling ability and business experience. He must understand art work, colour scheme, designing, engraving and printing—all of which have a material effect upon the success of both his and his customer's business. It is always possible for the creative boxmaker to design a package suitable for a particular product, with proper consideration for the relationship between cost of package and price of merchandise.

Some of the methods used by manufacturers in obtaining attractive boxes make use of: (1) elaborate art work; (2) embossed effects; (3) many colours; (4) luminous or phosphorescent paints; (5) metallic coated papers, made in gold, silver, aluminium and other shades. Often a clever selection of paper alone has been the means of securing a contract for a box maker, and an infinite variety of tinted effects can be obtained in many grades of paper for the various types of boxes which are now manufactured.

The tendency towards specializing is becoming more and more

pronounced in the paper box industry. There has been a tremendous increase in the use of window and store display material, and among the various kinds of paper board products manufactured are window and counter displays, cut-outs, mammoth sizes of cartons, and advertising novelties of every conceivable size, shape and variety. Cartons form an important branch of paper box manufacture. Comparatively inexpensive, suitably designed cartons serve the purpose of protecting their contents from dust, moisture and germs, and they can be made as effective as the ingenuity of the box maker and the artistic appreciation of his client will allow.

Manufacturing Boxes.—Operating a paper box factory has, in the course of experience developed methods and improvements common to all up-to-date plants.

Scoring or bending the cut boards is the next operation, and then, if required, piecing together the box body. Corner cutting follows, and thereafter corner staying to make the box rigid.

Banding or covering the box is an operation which requires careful preliminary planning. Perhaps the greatest cause of irritation in the banding department is delay in having the work ready for the girls. This matter depends largely upon good planning, and involves practically all the male operatives. The cutting and scoring control the situation, but the corner cutting and corner staying sections have to work in regular order and sequence or delay in the banding department is the result.

It is not generally realized that lacing can be done at a very high speed in one stroke on an ordinary banding machine. The usual method of fenting and lacing is by hand (for hinged lids) by use of the gluing tray or board and brush. The up-to-date method, however, is by the ordinary banding machine and a small attachment which conveys the calico and lace from the reel. It is interesting to note that the output by glue, board and brush, is about 30 gross per week of 48 hours, while the output by the banding machine method is about 115 gross per week of 48 hours, for one adult and one helper.

By means of a simple attachment to the banding machine, it is possible to band rims with covering paper, and also to affix a gluing strip in one operation. The rim is secured to the box after leaving block on banding machine, by the helper in attendance. In this way rims can be secured at the rate of 12 to 13 gross per day of 8½ hours.

For a hinged lid type of box, a back and strengthening strip are required. The lid goes through the same operations as the box, with the exception of piecing. In the finish of the box, the container itself, after banding, requires a bottom, and the lid requires a plain top or printed label.

Fancy boxes, which include folding boxes of novel shapes, require special treatment. One of the most popular containers recently introduced is a transparent box of celluloid which enables the buyer to see at a glance exactly what he is buying. The bottom of the box is made of thin, strong cardboard, and this adds considerably to the strength of the container.

Improvements in folding-box manufacture progressed from 1868 to 1882, when the principles of cutting and creasing folding boxes which still obtain were discovered. These consist of an arrangement of cutting and creasing blades so combined in a die that the contour of the folding-box blank, with its locks and other peculiarities, is sharply cut out by the former and its pliable bends are formed by the latter. These blades are held firmly in position by straight or accurately scrolled wooden blocks conforming to the dimensions of the folding box and its outline. A modern cutting and creasing press operates with velocity and accuracy. Its steel cylinder, which carries the box board over the die form, is made ready to permit the sharp blades to penetrate the board, at the same time giving a counter die reception to the dull creasing blades which form the bends. The cut and creased box-board sheet is held together by minute necks joining the blanks, and the whole is expelled from the slight recess of the dies by the numerous rubber crowns that prevail over its surface. The folding-box blanks are separated by hand and dexterously relieved of waste particles. The final gluing process is accomplished on high speed machines at the rate of from 100,000 to 500,000 in nine hours.

The newest German process for making transparent windows or inspection openings in paper and cardboard boxes with the aid of gelatine is characterized by the fact that in a single working process one or more such apertures can be gelatinized together with the piece of work itself.

Employment and Wages.—Some of the finest fancy boxes are produced in France, but no country holds a monopoly in this respect. America is the land of the carton. After thorough investigation by health departments all over the United States, rulings have been passed that many eatables must be packed in individual containers to prevent unnecessary fingering and contamination by unclean hands. These regulations have given a tremendous impetus to the carton industry. Nineteen American universities teach the use of paper boxes as part of the science of marketing, and more than 57,000 wage earners in that country are engaged in manufacturing boxes.

According to data collected at the biennial census of manufactures taken in 1926, the establishments engaged primarily in the manufacture of paper boxes and of decorated and fancy covered metal boxes in the United States, reported for 1925 a total production valued at \$281,943,969, an increase of 6.7% as compared with \$264,209,159 for 1923, the last preceding census year.

An approximate estimate of the number of workpeople employed in the paper box trade in Great Britain based upon an examination of the figures of the 1921 census in comparison with the estimated number of persons insured under the Unemployment Insurance acts suggests that the number of workpeople employed in this trade as defined for trade board purposes in Great Britain is about 31,500, of whom 3,500 are males and 28,000 females. The classifications in the various returns upon which this estimate is based do not, however, coincide precisely with the trade board definition of the paper box trade, and the figure must be regarded as no more than a rough approximation.

The selling value of the production of boxes of paper and cardboard in 1924 was £5,351,000. Boxes and cartons of paper and cardboard exported from Great Britain in the year 1924 amounted in value to £217,000, or about 4% of the value at the works of the ascertained production of such boxes, and the value of the net imports was £61,000. The net output of the factories and workshops to which the above statement applied amounted to £2,972,000, that sum representing the amount by which the total value of the output (£5,482,000) exceeded the cost of the materials purchased and used (£2,486,000) and the value of work given out (£24,000). The net output per head of persons employed in 1924 was £153, in 1912 £61 and in 1907 £52.

Minimum rates of wages have been fixed by the paper box trade board (Great Britain) and are dependent upon the "Cost of living" index figures. As from May 1, 1927, the minimum time-rate for male workers per week of 48 hours has been 66s. and for female workers 29s. 6d. (B. W. B.)

BOXWOOD, the wood obtained from the genus *Buxus*, the principal species being the well-known tree or shrub, *B. sempervirens*, the common box, in general use for borders of garden walks, ornamental parterres, etc. The other source of the ordinary boxwood of commerce is *B. balearica*, which yields the variety known as Turkey boxwood. The common box is grown throughout Great Britain (perhaps native in the chalk-hills of the south of England), in the southern part of the European continent generally, and extends through Persia into India, where it is found growing on the slopes of the western Himalayas. Only a very small proportion of the wood suitable for industrial uses is now obtained in Great Britain. The box is a very slow-growing plant, adding not more than 1½ or 2 in. to its diameter in 20 years, and on an average attaining only a height of 16 ft. with a mean diameter of 10½ inches. The leaves of this species are small, oval, leathery in texture, and of a deep glossy green colour. *B. balearica* is a tree of considerable size, attaining to a height of 80 ft., with leaves three times as large as those of the common box. It is a native of the islands of the Mediterranean, and grows in Turkey, Asia Minor, and around the shores of the Black Sea. The wood of both species possesses a delicate yellow colour;

It is very dense in structure and has a fine uniform grain, which has given it unique value for the purposes of the wood-engraver. A large amount is used in the manufacture of measuring rules, various mathematical instruments, flutes and other musical instruments, for turning, for inlaying, and for small carvings. The use of boxwood for turnery and musical instruments is mentioned by Pliny, Virgil and Ovid.

BOYACÁ, an inland department of Colombia, with an area of 16,460 sq.m., including the Casanare territory. Pop. in 1918, 657,167. The department is very mountainous, heavily forested and rich in minerals. The great Muso emerald mines are situated in the western part of Boyacá. The capital, Tunja (pop. in 1918, 10,680), is situated in the Eastern Cordilleras, 9,054 ft. above sea-level, and has a cool, temperate climate, though only 5½° N. of the equator. It was an important place in colonial times, and occupies the site of one of the Indian towns of this region (Hunsa) which had acquired a considerable degree of civilization before the discovery of America. Other towns of note in the department are Chiquinquirá (22,502), Moniquirá (12,908), Sogamoso (16,539), and Boyacá (7,660), where on Aug. 7, 1819, Bolívar defeated the Spanish army and secured the independence of New Granada.

BOYAR, a dignity of Old Russia conterminous with the history of the country (Russ. *boyarin*, plur. *boyare*). Originally the boyars were the intimate friends and confidential advisers of the Russian prince, the superior members of his *drushina* or body-guard, his comrades and champions. They were divided into classes according to rank, generally determined by personal merit and service. At a later day the boyars were the chief members of the prince's *duma*, or council. Their further designation of *luchshie lyudi* or "the best people" proves that they were generally richer than their fellow subjects; and from the 11th century the *drushina* asserts the privileges of an exclusively military caste with a primary claim upon the land.

Still later, when the courts of the northern grand dukes were established, the boyars appear as the first grade of a full-blown court aristocracy with the exclusive privilege of possessing land and serfs. Hence their title of *dvoryane* (courtiers), first used in the 12th century. On the other hand there was no distinction, as in Germany, between the *Dienst Adel* (nobility of service) and the simple *Adel*. The Russian boyardom had no corporate or class privileges (1) because their importance was purely local (the dignity of the principality determining the degree of dignity of the boyars); (2) because of their inalienable right of transmigration from one prince to another at will, which prevented the formation of a settled aristocracy; and (3) because birth did not determine but only facilitated the attainment of high rank; e.g., the son of a boyar was not a boyar born, but could more easily attain to boyardom, if of superior personal merit. It was reserved for Peter the Great to transform the *boyarstvo* or boyardom into something more nearly resembling the aristocracy of the West.

See Alexander Markevich, *The History of Rank-priority in the Realm of Muscovy in the 15th-18th Centuries* (Russ.) (Odessa, 1888); V. Klyuchevsky, *The Boyar Duma of Ancient Russia* (Russ.) (Moscow, 1888).

BOY-BISHOP, the name given to the "bishop of the boys" (*episcopus puerorum* or *innocentium*), who, according to a custom very wide-spread in the Middle Ages, was chosen in connection with the festival of Holy Innocents (see FOOLS, FEAST OF). In England the boy-bishop was elected Dec. 6, the feast of St. Nicholas, the patron of children, and his authority lasted till Holy Innocents' day (Dec. 28). The election made, the lad was dressed in full bishop's robes with mitre and crozier and, attended by comrades dressed as priests, made a circuit of the town blessing the people. The boy and his colleagues took possession of the cathedral and performed all the ceremonies and offices except mass. Originally confined to the cathedrals, the custom spread to nearly all the parishes. Several ecclesiastical councils had attempted to abolish or to restrain the abuses of the custom, before it was prohibited by the council of Basle in 1431. It was, however, too popular to be easily suppressed. In England it was abolished by Henry VIII. in 1542, revived by Mary in 1552 and finally abolished by Elizabeth. It survived in Germany, in the

so-called *Gregoriusfest*, in honour of St. Gregory, the patron of schools, at which a schoolboy was elected bishop. At Meiningen this custom survived till 1799.

See Brand, *Pop. Antiquities of Great Britain* (1905); Gasquet, *Parish Life in Medieval England* (1906); Du Cange, *Glossarium* (1884), s.v. "*Episcopus puerorum*."

BOYCE, WILLIAM (1710-1779), English musical composer, the son of a cabinet-maker, was born in London, on Feb. 7, 1710. As a chorister in St. Paul's he received his early musical education from Charles King and Dr. Maurice Greene. In 1734, having become organist of Oxford chapel, Vere street, Cavendish square, he set Lord Lansdowne's masque of *Peleus and Thetis* to music. In 1736 he left Oxford chapel and was appointed organist of St. Michael's church, Cornhill, and in the same year he became composer to the Chapel Royal, and wrote the music for John Lockman's oratorio *David's Lamentation over Saul and Jonathan*. In 1737 he was appointed to conduct the meetings of the three choirs of Gloucester, Worcester and Hereford. In 1743 was written the serenata *Solomon*, in which occurs the favourite song "Softly rise, O southern breeze." His next published work was the *Twelve Sonatas for two Violins, with a bass*, which long remained popular, and in 1745 he began to issue his *Lyra Britannica*, ultimately extended to 6 vols., containing his songs and cantatas. In 1749 he received the degree of doctor of music from the University of Cambridge, and in this year he became organist of the churches of All-Hallows the Great and Less, Thames street. In 1750 he wrote songs for Dryden's *Secular Masque* and in 1751 he set a piece (*The Shepherd's Lottery*) by Mendez. He became master of the king's band in succession to Greene in 1757, composing each year the music to the new year and birthday odes provided by the poet laureate, and in 1758 he was appointed principal organist to the Chapel Royal. As an ecclesiastical composer Boyce ranks among the best representatives of the English school. His two church services and his anthems, of which the best specimens are *By the Waters of Babylon* and *O, Where shall Wisdom be found*, are frequently performed. He wrote additional accompaniments and choruses for Purcell's *Te Deum* and *Jubilate*. He resigned most of his work before 1770, and spent his last years in collecting and editing the material for his *Cathedral Music* of which the first volume had appeared in 1760. This work, the third and last volume of which appeared in 1778, was projected by Boyce's predecessor as master of the king's band, Dr. Greene; its sub-title, "a collection in score of the most valuable and useful compositions for that service by the several English masters of the last 200 years," explains its scope. A new edition, by Joseph Warren, appeared in 1840. Boyce died on Feb. 7, 1779, and was buried under the dome of St. Paul's cathedral. Two volumes of his anthems and services were printed after his death under the supervision of his wife (1780) and of Dr. P. Hayes (1790).

BOYCE THOMPSON INSTITUTE FOR PLANT RESEARCH, INC., of Yonkers, N.Y., was founded and endowed by Col. William Boyce Thompson of Yonkers. The institute was formally opened on Sept. 24, 1924. It is incorporated under the membership corporation law of the State of New York as a non-profit sharing institution. It is a foundation for research on plants. It has laboratories, greenhouses and lands valued at \$1,500,000, and an endowment of \$8,500,000. The scientific staff numbers 30 with a total staff of 80 workers. The greenhouses and other growing chambers give accurate control of growth conditions for plants, including light (quality, daily duration and intensity), humidity, temperature and carbon dioxide concentration of the air. This apparatus is on sufficiently large scale to permit plants to be grown to maturity in large numbers.

The following departments have adequately equipped laboratories: physiology, pathology, morphology and anatomy, biochemistry, microchemistry, physical chemistry and entomology. While the departments are organized on the basis of technique, the problems are generally attacked as projects focusing all technique on them necessary for their solution, even adding lines of technique for particular problems when needed. As the institute enlarges, other departments of primary importance in solving plant problems, such as organic chemistry, physics and plant breeding,

will be added. The institute has sufficient land available for field plots so that laboratory findings can be tested out on a field basis. It is also developing an arboretum of 350 acres. This gives adequate opportunity for the study of problems on forest and ornamental plants, including propagation, diseases, insect pests, soil adaptation and hardiness.

The institute grants a number of fellowships of both graduate and post doctorate grade, giving temporary support to promising young investigators while they develop their researches as well as their research ability. These are open to both United States and foreign workers. It is also open to a limited number of Government, State and other plant research workers who care to make use of the facilities of the laboratories and the advice of its staff. The research funds of the institute are considerably augmented by plant research projects supported at the institution by individuals and by public and industrial organizations.

BOYCOTT, the refusal and incitement to refusal to have commercial or social dealings with any one on whom it is wished to bring pressure. As merely a form of "sending to Coventry" or (in Gladstone's phrase) "exclusive dealing," boycotting may be legally unassailable, and as such has been justified by its original political inventors. But in practice it has usually taken the form of what is undoubtedly an illegal conspiracy to injure the person, property, or business of another by unwarrantably putting pressure on all and sundry to withdraw from him their social or business intercourse. The word was first used in Ireland, and was derived from the name of Captain Charles Cunningham Boycott (1832-97), agent for the estates of the Earl of Erne in County Mayo. For refusing in 1880 to receive rents at figures fixed by the tenants, Captain Boycott's life was threatened, his servants were compelled to leave him, his fences torn down, his letters intercepted and his food supplies interfered with. It took a force of 900 soldiers to protect the Ulster Orangemen who succeeded finally in getting in his crops. Boycotting was an essential part of the Irish Nationalist "Plan of Campaign," and was dealt with under the Crimes act of 1887. The term soon came into common English use, and was speedily adopted into many foreign languages.

BOYD, ANDREW KENNEDY HUTCHISON (1825-1899), Scottish author and divine, was born in Auchinleck manse, Ayrshire, on Nov. 3, 1825, and died at Bournemouth on March 1, 1899. He studied at King's college, London, and at the Middle Temple, but returning to Scotland entered Glasgow university and there qualified for the Scottish ministry. He served in succession the parishes of Newton-on-Ayr, Kirkpatrick-Irongray near Dumfries, St. Bernard's, Edinburgh, and finally, in 1865, became minister of the first charge at St. Andrews. Here he advocated an improved ritual in the Scottish Church, his action resulting in the appointment by the general assembly of a committee, with Boyd as convener, to prepare a new hymnal. In 1890 he was appointed moderator of the general assembly. He wrote *Recreations of a Country Parson* (1859, 1861 and 1878), and *Graver Thoughts of a Country Parson* (1862-65 and 1875); *Twenty-five Years at St. Andrews* (1892), and *St. Andrews and Elsewhere* (1894). He was familiarly known to the public as a writer by his initials "A. K. H. B."

BOYD, ROBERT BOYD, LORD (d. c. 1470), Scottish statesman, was a son of Sir Thomas Boyd (d. 1439) and belonged to an old and distinguished family, one member of which, Sir Robert Boyd, had fought with Wallace and Robert Bruce. Boyd, who was created a peer about 1454, was one of the regents of Scotland during the minority of James III., but in 1466 he secured the person of the young king and was appointed his sole governor, and in 1467 he obtained the offices of chamberlain and justiciary for himself and the hand of the king's sister Mary, with the title of earl of Arran, for his eldest son Thomas. In 1469 he arranged the marriage between James III. and Margaret, daughter of Christian I., king of Denmark and Norway, and secured the cession of the Orkney Islands by Norway. But Boyd's enemies were now growing too strong for him, and he was found guilty of treason and sentenced to death in the same year. He escaped to England, and the date of his death is unknown.

BOYD, ROBERT, 4th LORD (d. 1590), took a prominent part in Scottish politics during the troubled time which followed the death of James V. in 1542. At first he favoured the reformed religion, but was afterwards a trusted adviser of Mary, queen of Scots, whom he accompanied to the battle of Langside in 1568. During the queen's captivity he was often employed on diplomatic errands, and was suspected of participation in the murder of the regent Moray. In great favour under the regent James Douglas, earl of Morton, he was banished in 1583 for his share in the Raid of Ruthven, a plot to seize James VI. He retired to France, but was soon allowed to return to Scotland. He died on Jan. 3 1590.

BOYD, WILLIAM, 4th EARL (1704-46), joined Charles Edward, the Young Pretender, in 1745, and fought at Falkirk and Culloden, where he was made prisoner, and was beheaded on Aug. 18 1746. The title of earl of Kilmarnock is now merged in that of earl of Eroll.

BOYD, ZACHARY (1585?-1653), Scottish divine, was educated at the universities of Glasgow and St. Andrews. For many years a teacher in the Protestant college of Saumur in France, he returned to Scotland in 1621, to escape the Huguenot persecution. In 1623 he was appointed minister of the Barony church in Glasgow, and he was rector of the university in 1634, 1635 and 1645. He bequeathed £20,000 Scots, to the university, besides his library and 12 volumes of mss. In later years he was a staunch Covenanter. His best known works are *The Last Battell of the Soul in Death* (1629), reprinted with a biography by G. Neil (Glasgow, 1831); *Zion's Flowers*—often called "Boyd's Bible" (1644); *Four Letters of Comfort* (1640, reprinted, Edinburgh, 1878).

BOYDELL, JOHN (1719-1804), English engraver, print publisher and lord mayor of London, was born at Dorrington. At the age of 21 he came to London and was apprenticed for seven years to an engraver. In 1746 he published a volume of views in England and Wales and started in business as a print-seller. He was sheriff in 1785, and in 1796 became lord mayor of London. In 1786 he published, by subscription, a series of prints illustrating Shakespeare's plays. The pictures from which these were made were commissioned from the most famous artists of the day, and were exhibited in Boydell's own gallery in Pall Mall. In 1802, the year of the production of Boydell's *Shakespeare*, the gallery contained 102 pictures, including canvases by Reynolds, Romney, Opie, Barry, Fuseli; Angelica Kaufmann, Stothard and others. Towards the close of his life Boydell sustained severe losses and was compelled to dispose of his Shakespeare gallery by lottery. (See also FUSELI.)

BOYER, ALEXIS (1757-1833), French surgeon, was born March 1, 1757, at Uzerches (Corrèze). The son of a tailor, he obtained his first medical knowledge in the shop of a barber-surgeon, and became professor of surgery at the École de Santé. In 1805 Napoleon nominated him imperial family surgeon, and, after the campaigns of 1806-07, conferred on him the Legion of Honour, with the title of baron of the empire and a salary of 25,000 francs. He was consulting surgeon to Louis XVIII., Charles X., and Louis Philippe. In 1825 he succeeded J. F. L. Deschamps (1740-1824) as surgeon-in-chief to the Hôpital de la Charité. He died in Paris on Nov. 23, 1833. Perhaps no French surgeon of his time thought or wrote with greater clearness and good sense than Boyer. His two great works are: *Traité complet de l'anatomie* (in 4 vols., 1797-99; 4th ed. 1815), and *Traité des maladies chirurgicales et des opérations qui leur conviennent* (in 11 vols., 1814-1826; a new ed. 7 vols. 1844-53, with additions by his son, Philippe Boyer).

BOYER, JEAN PIERRE (1776-1850), president of the republic of Haiti, a mulatto, was born at Port-au-Prince on Feb. 28, 1776. He received a good education in France, in 1792 entered the Haitian army, by 1794 was in command of a battalion, and during the British invasion (1794-98) distinguished himself under Rigaud. Forced by the intrigues of Toussaint l'Ouverture (q.v.) to flee to France, he returned to Haiti in 1802, as a member of Leclerc's punitive expedition, but on the attempt of the French to re-establish slavery, he joined the native resistance and was

instrumental in expelling the French from the island. When the republican government, formed by Dessalines, leader of the blacks, proved indescribably corrupt and cruel, Boyer united with Alexandre Pétion and Henri Christophe to accomplish its overthrow (1806). By a coup d'état Christophe set himself up as king in most of the conquered territory; Pétion, in a small section in the south, founded the republic of Haiti. Boyer supported Pétion, as his commandant repulsed Christophe's repeated assaults, and on Pétion's death in 1818, was acclaimed president of the republic for life. In 1820 he took advantage of the death of Christophe, and in 1822 of the weakness of the Spaniards (in Santo Domingo), to extend his sovereignty over practically the whole island. Having emancipated the slaves, he gave his attention to remedying the deplorable state of public security and national finance. In 1825, in return for an indemnity of 150,000,000 francs—reduced in 1838 to 60,000,000—he obtained France's recognition of Haitian independence; in 1826, England acknowledged his Government, and after her, several small nations. He encouraged the arts and sciences, and sponsored agriculture, but his rule was not popular. It was arbitrary; there was little economic improvement, and much discontent over the debt to France. In 1843 a widespread revolution compelled his resignation. He fled to Jamaica, and then to Paris, where, on July 9, 1850, he died.

See Walez, *Précis historique des négociations entre la France et Saint-Domingue, avec une notice biographique sur le général Boyer* (Paris, 1826).

BOYLE, JOHN J. (1851–1917), American sculptor, was born in New York city. He studied in the Pennsylvania Academy of Fine Arts, Philadelphia, and in the École des Beaux Arts, Paris. He was particularly successful in the portrayal of Indians. Among his principal works are: "Stone Age," Fairmount park, Philadelphia; "The Alarm," Lincoln park, Chicago; and a third study in primitive culture, the two groups, "The Savage Age" at the Pan-American exposition of 1901. His work also includes the seated "Franklin" in Philadelphia; and "Bacon" and "Plato," in the Congressional library, Washington, D.C. He died on Feb. 10, 1917, in his native city.

BOYLE, ROBERT (1627–91), English natural philosopher, seventh son and 14th child of Richard Boyle, the great earl of Cork, was born at Lismore castle, Ireland, Jan. 25 1627. While still a child he learned to speak Latin and French, and he was only eight years old when he was sent to Eton. In 1638 he went to travel abroad with a French tutor. Visiting Italy in 1641, he remained during the winter of that year in Florence, studying the "paradoxes of the great star-gazer" Galileo. On returning to England in 1644 Boyle gave up his life to study and scientific research, and soon took a prominent place in the band of inquirers, known as the "Invisible College," who devoted themselves to the cultivation of the "new philosophy." They met often in London, at Gresham college; some of the members also had meetings at Oxford, and in that city Boyle went to reside in 1654. Reading in 1657 of Otto von Guericke's air-pump, he set himself with the assistance of Robert Hooke to devise improvements in its construction, and with the result, the "machina Boyleana" or "pneumatical engine," finished in 1659, he began a series of experiments on the properties of air. An account of the work was published in 1660 as *New Experiments Physico-Mechanical touching the spring of air and its effects*.

Among the critics of the views put forward in this book was a Jesuit, Franciscus Linus (1595–1675), and it was while answering his objections that Boyle enunciated the law that the volume of a gas varies inversely as the pressure, which among English-speaking peoples is usually called after his name, though on the continent of Europe it is attributed to E. Mariotte, who did not publish it till 1676. In 1663 the "Invisible College" became the "Royal Society of London for improving natural knowledge," and the charter of incorporation granted by Charles II. named Boyle a member of the council. In 1680 he was elected president of the society, but declined the honour from a scruple about oaths. In 1668 he moved to London, where he died on Dec. 30, 1691.

Boyle's great merit as a scientific investigator is that he carried

out the principles which Bacon preached in the *Novum Organum*. Yet he would not avow himself a follower of Bacon or indeed of any other teacher. He himself performed experiments in the hope of effecting the transmutation of metals, and he was instrumental in obtaining the repeal, in 1689, of the statute of Henry IV. against multiplying gold and silver. With all the important work he accomplished in physics—the enunciation of Boyle's law, the discovery of the part taken by air in the propagation of sound, and investigations on the expansive force of freezing water, on specific gravities and refractive powers, on crystals, on electricity, on colour, on hydrostatics, etc.—chemistry was his peculiar and favourite study. His first book on the subject was *The Sceptical Chemist*, published in 1661, in which he criticized the "experiments whereby vulgar Spagyrist are wont to endeavour to evince their Salt, Sulphur and Mercury to be the true Principles of Things." He advanced towards the view that matter was ultimately composed of "corpuscles" of various sorts and sizes capable of arranging themselves into groups, and that each group constituted a chemical substance. He distinguished between mixtures and compounds, and showed that a compound might have different qualities from those of its constituents. He studied the chemistry of combustion and of respiration, and made experiments in physiology, where, however, he was hampered by the "tenderness of his nature" which kept him from anatomical dissections.

Besides being a busy natural philosopher, Boyle was interested in theology, and in 1665 would have received the provostship of Eton, if he had taken orders. He learned Hebrew, Greek and Syriac in order to pursue his scriptural studies, and spent large sums on Biblical translations. By his will he founded the Boyle lectures, for proving the Christian religion against "notorious infidels, viz., atheists, theists, pagans, Jews and Mahomedans," with the proviso that controversies between Christians were not to be mentioned.

BIBLIOGRAPHY.—The following are the more important of his works in addition to the two already mentioned: *Considerations touching the Usefulness of Experimental Natural Philosophy* (1663), followed by a second part in 1671; *Experiments and Considerations upon Colours, with Observations on a Diamond that Shines in the Dark* (1663); *Hydrostatical Paradoxes* (1666); *Origin of Forms and Qualities according to the Corpuscular Philosophy* (1666), a continuation of his work on the spring of air (1669); *Experiments and Notes about the Mechanical Origin or Production of Particular Qualities*, including notes on electricity and magnetism (1676); *Memoirs for the Natural History of the Human Blood* (1684); *Short Memoirs for the Natural Experimental History of Mineral Waters* (1685); *Medicina Hydrostatica* (1690); and *Experimenta et Observationes Physicae* (1691). His other writings include *Occasional Reflections upon Several Subjects* (1665), which was ridiculed by Swift in *A Pious Meditation upon a Broomstick*, and by Butler in *An Occasional Reflection on Dr. Carlton's Feeling a Dog's Pulse at Gresham College*; *Excellence of Theology compared with Natural Philosophy* (1664); *Discourse of Things above Reason* (1681); *High Veneration Man owes to God* (1685); *A Free Inquiry into the vulgarly received Notion of Nature* (1686); and the *Christian Virtuoso* (1690). Several other works appeared after his death, among them *The General History of the Air designed and begun* (1692); a "collection of choice remedies," *Medicinal Experiments* (1692–98); and *A Free Discourse against Customary Swearing* (1695). An incomplete and unauthorized edition of Boyle's works was published at Geneva in 1677, but the first complete edition was that of Thomas Birch, with a life, published in 1744, in five folio volumes, a second edition appearing in 1772 in six volumes, quarto. Boyle bequeathed his natural history collections to the Royal Society, which also possesses a portrait of him by the German painter, Friedrich Kerseboom (1632–90). See F. Masson, *Robert Boyle, a Biography* (1914).

BOYLE, town, Co. Roscommon, Ireland, on Great Southern railway, 106½ m. north-west by west from Dublin and 28 m. south by east from Sligo. Pop. (1926) 2,322. It is situated on both banks of the Boyle, an affluent of the Shannon, between Loughs Gara and Key. Three bridges connect the two parts of the town. There is considerable trade in agricultural produce. To the north of the town stand the extensive ruins of a Cistercian abbey founded in 1161, including remains of a cruciform church, with a fine west front, and Norman and Transitional arcades with carving of beautiful detail. There is a large dolmen by the road towards Lough Gara. Boyle was incorporated by James I., and returned two members to the Irish parliament.

BOYLE'S LAW, a relation, discovered by Robert Boyle, between the pressure, p , and the volume, v , of a gas, viz., $pv = \text{constant}$, at constant temperature. (See THERMODYNAMICS.)

BOYLESVE, RENÉ (1867-1926), pen name of René Tardiveau, French novelist, who was born at La Haye-Descartes (Indre-et-Loire). He began his education at the Jesuit college of Poitiers, and passed from there to Tours. He completed his studies at the *faculté de lettres* of Paris, the *faculté de droit* and the school of political science. His output as a novelist is considerable, but he has paid more attention to style and to the development of an agreeable descriptive talent than to characterization and psychology. His most important works are undoubtedly the novels dealing with provincial life, among which *Mademoiselle Cloque* (1899), *La Becquée* (1901), *L'Enfant à la Balustrade* (1903), *La Jeune Fille bien élevée* (1909) and its sequel, *Madelaine Jeune Femme*, may be specially noted. Two short psychological novels, *Mon Amour* (1908) and *Le Meilleur Ami* (1909), both in the purest French tradition, also deserve mention. The miscellaneous collections of stories (*La Marchande de Petits Pains pour les Canards*, 1913, *Le Bonheur à Cinq Sous*, 1917) are of less interest; but the fragments of a private diary, published after his death by Ch Du Bos under the title of *Feuilles Tombées*, show critical and introspective gifts of the rarest kind. In his latter days Boylesve was markedly influenced by Marcel Proust, whose essential originality he had been among the first to recognize. He was elected to the Académie Française in 1919. He died on Jan. 15, 1926.

BOYNE, a river in Ireland, rising in the Bog of Allen, near Carbery in Co. Kildare and flowing in a north-easterly direction past Trim and Navan to enter the Irish sea, 4 m. below Drogheda. On July 1, 1690, there took place on its banks a battle between the armies of King William III. and King James II. In June William assembled south-west of Belfast an army of 35,000 men of very heterogeneous composition, including English, Northern Irish, Dutch, French Huguenot and Danish units. As soon as his advance commenced, James, who was with some 25,000 Irish and French troops at Dundalk, fell back southwards, without fighting, behind the line of the Boyne and there stood for battle. William attacked early on July 1; for a time the Irish made a stout resistance, but were finally broken when William, who had personally led his left wing across the river by fords above Drogheda, launched his cavalry against their right and rear. The Jacobite defeat was complete; James abandoned his army and fled to France, thus sealing the fate of his cause not only in Ireland but in England as well, and leaving William to occupy Dublin and complete the reconquest of the country at his leisure. The losses at the Boyne were small and the battle was in itself of little tactical importance, but its strategical consequences were decisive of the war in Ireland and of the destiny of that country for the next hundred years, and through them Protestantism as the official religion of Great Britain was made secure. The battle is commemorated by an obelisk 2 m. west of Drogheda, and is annually celebrated by Orangemen on July 12; the "new style" date, representing the "old style" July 1 is July 11, but July 12 was chosen, as this is the OS date of the battle of Aughrim (1691), and the two are celebrated together. (See also GRAND ALLIANCE, WAR OF THE.)

BOY SCOUTS. The Boy Scout movement, which was established in 1908 in the British Isles, extends to-day to every civilized country in the world.

Ideals and Method.—The aim of the movement is the promotion of good citizenship among the rising generation. The method adopted is that of active self-expression and the desire to learn on the part of the boy, rather than his passive reception of instruction. The scope is unlimited by class, creed, colour or political distinctions. The movement is non-military, non-political, non-class and interdenominational. Honour is made the high ideal for the boys. The Scout law, on which the movement hinges, and which is binding on every scout, was taken from the code of the knights.

Every boy, on joining the movement, makes the following promise:

I promise on my honour to do my best—
To do my duty to God and the King
To help other people at all times
To obey the Scout Law.

Administration and Training.—The administration of the movement is decentralized, each county in Great Britain having at its head a county commissioner responsible to headquarters. Under him are district commissioners, local associations and Scout troops. The troop, numbering from 20 to about 40 boys, is divided into patrols of six or eight, each under its own boy leader. The troop is purposely kept small in numbers in order that the scoutmaster may have personal knowledge of each of his boys and so develop the individual character.

The movement is subdivided into three groups:

1. Rovers—i.e., scouts of 17 years and over
2. Boy Scouts and Sea Scouts—from 11 to 17.
3. Wolf Cubs—juniors from 8 to 11.

The principles underlying the training are identical for each group, but the details differ to suit the different stages of development.

The training is carried out generally under four main headings:

1. Character and intelligence.
2. Skill and handicraft.
3. Physical health and self-care
4. The practice of service for others and for the State.

The activities and practices of scouting are framed to develop in (1), (2) and (3) the efficient individual and then to harness this individuality for the good of the community, i.e., (4) citizenship. The training is carried out mainly through activities in the open air, and the attributes of frontiersmen, backwoodsmen and explorers are held up as examples for scouts to emulate. Military training is not employed, as being contrary to the ideals of peace and educationally wrong. Through an extensive system of badges for proficiency the boys are encouraged to develop their natural gifts, to become all-round handy-men and to specialize in those subjects which are likely to help them afterwards in making a career. Through the daily "good turn" they are gradually led on to the practice of service for others and so to unselfish citizenship.

BOY SCOUT IN UNIFORM

Progress and Results.—From a trial experimental camp in 1907 the movement has spread with remarkable rapidity to every part of the world. In 1908 the handbook, *Scouting for Boys*, was published in fortnightly parts. By 1910 the movement in the British empire numbered over 123,000 members and had been taken up in many foreign countries. In 1912 the aims and methods of the movement were inquired into by the Privy Council and a royal charter of incorporation granted. Over 100,000 scouts served in His Majesty's forces during the World War, 10,000 of whom gave their lives. Those who were under serving age carried out public duties at home, one notable service being that of coast-watchers, in place of the coast-guardsmen who were called up for service afloat. This service was maintained by boy scouts from the outbreak of the war until after the declaration of peace, some 23,000 boys in all taking their turn at it.

Increase During the War.—The movement, though hampered by the loss of practically every able-bodied scoutmaster, managed not only to hold its own, but to increase steadily in numbers throughout the years of war. Numbers of troops were carried on entirely by their patrol leaders and courts of honour, without the help of officers.

In 1920 an international meeting or *jamboree* was held at Olympia, London, in which scouts of 26 nations took part. As a result of this meeting an international council was formed, with a bureau in London. A second international jamboree took place in 1924 at Copenhagen, at which 33 nations were represented.

The fundamental principles, the Scout promise and law, are in every country identical with those of the parent movement, the details of training differing slightly here and there to suit climatic and temperamental differences.

The greater public schools of the United Kingdom have taken up scouting as a means of developing the spirit of service to the community among their boys. Incident to this it is interesting to see school-masters coming to the Scout school of training in such numbers as to render it necessary to have special training camps for their benefit.

In many countries coming into civilization, such for instance as the Gold Coast, Nigeria, etc., scouting is being utilized with satisfactory results by the education authorities, and in Asiatic countries such as India, Siam, and China, scouting has made equal strides with marked good effects on the youth.

The school of training for officers at Gillwell park in Epping Forest has won for itself the interest of leading education authorities from many foreign as well as British countries. Twenty-five foreign countries have sent representatives to be trained there, as have an equal number of British oversea dominions and colonies. Thus in all parts of the world scouting is carried out under the same ideals and methods as originally promoted in England.

Thirty-two Nations.—President Coolidge, in an address at Washington in 1926 on the subject of the Boy Scouts, emphasized the fact that the movement has a unique power for fusing together in a common citizenship, in one generation, the different foreign elements that go to make the American nation, which would otherwise take two or three generations of schooling and legislation.

This power is also becoming evident in the wider sphere of bringing together the youth of the 32 nations which now practise scouting. These have an active membership of some two million boys, with many more millions in their populations of men who have passed through the training of scouts. They not only recognize the bond of brotherhood in theory but carry it into practice by a widespread system of interchange of visits and correspondence. These visits are carried out by small parties of boys visiting other countries to camp with their brother scouts there. The average number of scouts from the United Kingdom paying such visits annually has been about five thousand.

An international conference is held every two years, which is attended by the leaders of all the different countries, and this has been described as a veritable league (and not a mere parliament) of nations; while every fourth year an international rally of contingents of boys from all countries is held in one country or another.

Thus the rising generation is being brought into a personal acquaintance and friendship. A systematic education in good will and co-operation is established in each country and is extended to international relationships by these means. It is hoped that this development, which is growing day by day, may tend materially to bring about the spirit essential to ensuring peace in the world—without which, as a foundation, suggestions for disarmament, arbitration, etc., can only be futile.

THE BOY SCOUTS OF AMERICA

The corporation of the Boy Scouts of America operates through the national council, consisting of 1,200 representatives from local councils and Scout leaders all over the United States. This operates through an executive board and various national committees. The president of the United States serves as honorary

president. Local councils are chartered by the national council. Troops are composed of not more than 32 boys in charge of a scoutmaster, who must be an adult American citizen. There may be four patrols to each troop, in charge of a boy leader. Troops are chartered by the national council and are usually organized in connection with some kind of institution, such as a church or school.

Training of the nearly 240,000 volunteer leaders to conduct scout work is effected through courses conducted not only by

BY COURTESY OF THE BOY SCOUTS OF AMERICA
LEARNING TO COOK, ONE OF THE DUTIES OF A SCOUT

local Scout councils but in conjunction also with colleges, normal schools and theological seminaries. In 1927, 388 such courses for scoutmasters were given, for which 10,944 certificates were awarded to those completing the work. The first rank is that of tenderfoot; next comes second class scout, while further progress entitles the boy to first class rank. First class scouts may qualify for merit badges in 88 subjects of vocational, outdoor or educational interest, and may progress to Star, Life and Eagle rank—the last mentioned requiring one year's service as a first class scout and 21 merit badges being the highest rank. Palms are awarded Eagle scouts for further merit badges earned. Eagle scouts who during the year have performed outstanding service to the community are eligible to awards of the Harmon Foundation of New York amounting to \$100 each and given annually as an incentive to higher education. The highest award in the Boy Scouts of America is the gold honour medal for saving life at the risk of the rescuer's own. Some 1,200 awards were made for 1911-1927.

To the influence of the Boy Scouts is attributed in great part the increased interest during recent years in camping and other outdoor activities. With the co-operation of experts, minimum requirements of health, safety and sanitation have been developed that have set a standard for safe camping throughout the United States. During the summer of 1927 it was estimated that some 325,000 scouts spent a week or more in camp, not counting those attending short-term, winter and troop camps. The troop committee of every troop is obligated to attempt to provide a week or more in camp for every scout. Life-saving and water-front safety are important features of the summer programme. "Every Scout a swimmer," is a scout slogan. Sea scouting is a branch of the organization that has for its object the promotion of seamanship and water activities. Other camp activities include tree

planting, trail building in national parks and elsewhere, exploration and adventure hikes, patriotic pilgrimages to historical shrines, trekking auto and truck tours, conservations, establishing and maintaining game sanctuaries and fish hatcheries, forestry projects of all kinds, fire fighting, service to State and county fairs and exhibition service and demonstration camps. A special effort has been made to reach the boys on farms and in communities so small that there are not enough boys to organize a full troop. If a boy cannot join a troop or patrol, he may become a lone scout and carry on the Scout programme by correspondence.

OUTDOOR COOKING; MAKING A PANCAKE

See the *Handbook for Boys*, 1927, and *Boys' Life*. (J. E. W.)

BOZDAR, a Baluch tribe in the mountains from the Sanghar pass to the Khetran country. They are also to be found in Zhob, Thal-Chotiali, Las Bela and in the Punjab. They are usually graziers, and the name Bozdar is probably derived from Buz, the Persian name for goat.

See H. A. Rose, *Tribes and Castes of the Punjab* (1912).

BOZEMAN, a city of southern Montana, U.S.A., 60m. E. by S. of Butte and 45m. N. of Yellowstone park, on Federal highway 10, the main line of the Northern Pacific, and a branch of the Chicago, Milwaukee, St. Paul and Pacific railway; the seat of Gallatin county. The population in 1920 was 6,183. It lies at an altitude of 4,773ft., in the rich agricultural Gallatin valley, surrounded by the Bridger, Madison, and Gallatin mountain ranges. Coal is mined in the vicinity. The city has large flour and cereal mills, creameries, and pea canneries. It is the seat of Montana State college (established 1893), which has a campus and farm of 455ac. and an annual enrolment of about 1,000, and with which is associated the Montana agricultural experiment station, the engineering experiment station, and the extension service in agriculture and home economics. A United States fish hatchery is situated a few miles away, at the mouth of the Bridger canyon. The city has a city-manager form of government.

The Gallatin valley was discovered by Lewis and Clark in 1806. The first permanent settlement was made in 1864 under the leadership of John M. Bozeman. James Bridger, whose name is perpetuated in a range, a peak, and a creek, was one of the famous guides, fur-traders, and scouts of the Rocky Mountain region from 1830 to 1870.

BOZRAH. (1) Capital of Edom. It has been identified with *El-Busaireh*, an undistinguished village in a pastoral area, south-east of the Dead sea. (2) A city denounced by Jeremiah, probably *Busra* (Lat. *Bostra*), a ruined town in the Hauran about 80m. S. of Damascus, once the most famous Roman fortress east of the Jordan. The circumference of its walled area was from 4 to 5 miles. As Bozrah appears to be identical with the *Bossora* of I. Macc. v. 26 the site was evidently pre-Nabataean. The existing town was beautified and extended by Trajan, took his name on its coins, dated a new era, the "Bostran," from its resurrection (A.D. 106) and became the capital of the province of Arabia. It developed rapidly in commercial prosperity and under Alexander Severus (222-235) became a Roman colony. From the time of the emperor Philip (244-249), himself a native of Bostra, it bore the title metropolis. In the period of the Constantines it was made the see of a bishop. In 636 it fell to the Arabs. The crusaders seized but could not retain it. The earthquakes of the 12th century and Turkish misrule were the chief contributors to its downfall. The site, which is practically uninhabited, has extensive ruins of buildings dating from the Roman period. Temples, theatres, triumphal arches, aqueducts, reservoirs, churches, mosques, a citadel (13th century) are spread over the site. Jeremiah's Bozrah has also been identified with *Kusur el-Bushair*, 2m. SW. of Dibon, the Bezer of Deuteronomy iv. 43, and mentioned in the inscription of King Mesha of Moab.

See R. Dussaud, *Topographie historique de la Syrie* (1927) 346 seq., bibl.

BRABANÇONS, mercenary fighters of mediaeval times from Brabant in Belgium and other countries. In the 12th century they were reputed to be the best infantry in Europe.

BRABANT, a duchy which existed from 1190 to 1430, when it was united with the duchy of Burgundy. Its history is connected with that of the duchy of Lower Lorraine (*q.v.*), which became in the course of the 11th century split up into a number of small feudal States. The counts of Hainaut, Namur, Luxembourg and Limburg asserted their independence, and the territory of Liège passed to the bishops of that city. The remnant of the duchy, united since 1100 with the margraviate of Antwerp, was conferred in 1106 by the emperor Henry V. with the title of duke of Lower Lorraine, upon Godfrey I, "the Bearded," count of Louvain and Brussels. His title was disputed by Count Henry of Limburg, and for three generations the representatives of the rival houses contested the possession of the ducal dignity in Lower Lorraine. The issue was decided in favour of the house of Louvain by Duke Godfrey III. in 1159. His son, Henry I., "the Warrior" (1183-1235), abandoned the title of duke of Lower Lorraine and assumed in 1190 that of duke of Brabant. His successors were Henry II. (1235-48), Henry III. (1248-61), and John I. (1261-94). These were all able rulers. Their usual place of residence was Louvain. John I., in 1283, bought the duchy of Limburg from

Adolf of Berg, and secured his acquisition by defeating and slaying his competitor, Henry of Luxembourg, at the battle of Woeringen (June 5, 1288). His own son, John II. (1294-1312), bestowed liberties upon his subjects by the charter of Cortenberg. By it the imposition of grants (*beden*) and taxes was strictly limited and regulated, and its execution was entrusted to a council appointed by the duke for life whose duty it was to consider all complaints and to see that the conditions laid down by the charter concerning the administration of justice and finance were not infringed. He was succeeded by his son, John III. (1312-55), to whom Brabant owed the great charter of its liberties, called *La joyeuse entrée* (*q.v.*).

On his death, the ducal dignity passed to his daughter and heiress, Johanna (d. 1406). Wenzel of Luxembourg, her husband, assumed in right of his wife, and by the sanction of the charter *La joyeuse entrée*, the style of duke of Brabant. Johanna's title was, however, disputed by Louis II, count of Flanders (d. 1384), who had married her sister Margaret, and a war broke out in 1356 between Wenzel supported by the gilds, and Louis, who upheld the burgher-patrician party in the Brabant cities. After Wenzel's death (1383) his widow continued to rule over the two duchies for 18 years, but was obliged to rely on the support of the house of Burgundy in her contests with the turbulent city gilds and with her neighbours, the dukes of Jülich and Gelderland. In 1390 she appointed her niece, Margaret of Flanders (d. 1405), daughter of Louis II. and Margaret of Brabant (*see FLANDERS*), and her husband, Philip the Bold of Burgundy, her heirs (*see BURGUNDY*). Of the three sons by this marriage John succeeded to Burgundy, and Anthony to Brabant on the death of Johanna in 1406. On the extinction of the line of Anthony (1430) the duchy of Brabant became the inheritance of the elder branch of the house of Burgundy, in the person of Philip III., "the Good," of Burgundy, son of John. His grand-daughter Mary (d. 1482), daughter and heiress of Charles I., "the Bold," (d. 1477) married the archduke Maximilian and so brought Brabant with the other Burgundian possessions to the house of Habsburg. The chief city of Brabant, Brussels, became under the Habsburg régime the residence of the court and the capital of the Netherlands (*q.v.*).

In the course of the 80 years' war of independence the province of Brabant became separated into two portions. In the southern and larger part Spanish rule was maintained, and Brussels continued to be the seat of government. The northern (smaller) part was conquered by the Dutch under Maurice and Frederick Henry of Orange. At the peace of Münster this portion, which now forms the Dutch province of North Brabant, was ceded by Philip IV. to the United Provinces and was known as Generality Land, and placed under the direct government of the States-general. The southern portion, now divided into the provinces of Antwerp and South Brabant, remained under the rule of the Spanish Habsburgs until the death of Charles II, the last of his race, in 1700. By the Treaty of Utrecht (1713) the southern Netherlands passed to the Austrian branch of the Habsburgs. During the whole period of Austrian rule the province of Brabant succeeded in maintaining, to a very large extent unimpaired, the immunities and privileges to which it was entitled under the provisions of its ancient charter of liberty, the Joyous Entry.

Since the French conquest of 1794 the history of Brabant is merged in that of Belgium (*q.v.*). The revolt against Dutch rule in 1830 broke out at Brussels and was in its initial stages largely a Brabançon movement. The important part played by Brabant at this crisis of the history of the southern Netherlands was marked in 1831 by the adoption of the ancient Brabançon colours to form the national flag, and of the lion of Brabant as the armorial bearings of Belgium. The title of duke of Brabant has been revived as the style of the eldest son of the king of the Belgians (G.E.).

BRABANT, central and metropolitan province of Belgium, part of the ancient duchy. From 1815 to 1830, that is to say, during the existence of the kingdom of the Netherlands, Belgian and Dutch Brabant were distinguished by using the terms South and North. The surface undulates and its highest points (400ft.) are at and near M. St. Jean. The province is famed both for cul-

tivation and for industry. There are valuable quarries of porphyry and sandstone, and industry flourishes in Brussels and Louvain and in the smaller Clabecq, Tubize and Wavre. The two first and Nivelles give their names to districts (arrondissements), and other towns are Vilvorde, Tirlemont and Hal. There are 31 cantons and 345 communes. The area is 820,740 ac. or 1,268 sq.m. and the population (1925) 1,611,952.

BRABANT, NORTH, largest province in Holland, bounded south by Belgium, west and north-west by the Scheldt, the Eendracht, the Volkerak and the Hollandsch Diep, which separate it from Zealand and South Holland, north and north-east by the Merwede and Maas, which separate it from South Holland and Gelderland, and east by the province of Limburg. Area 1,920 sq. miles. Pop. (1925) 810,580. The surface slopes gently from the south-east to the north and north-west, and the soil is composed of diluvial sand mixed with gravel, but giving place to sea-clay along the western boundary and river-clay along the banks of the Maas and smaller rivers. The watershed is formed by the north-eastern edge of the Belgian plateau of Campine, and follows a curved line through Bergen-op-Zoom, Turnhout and Maastricht. Large waste stretches of heath are occasionally overlaid with high fen, such as that between the valleys of the Aa and the Maas called the Peel ("marshy land"). Deurne, a few miles east of Helmond, was an early fen colony, with a prehistoric burial-ground. Early settlements, often based on Roman camps, along the Maas and its tributaries afterwards developed in the hands of feudal lords; e.g., the chief town 'sHertogenbosch. Geertruidenberg, Heusden, Ravestein and Grave are all similarly situated. Breda (*q.v.*) and Bergen-op-Zoom (*q.v.*) are important. Rozendaal, Eindhoven and Bokstel (or Bokselt) are railway junctions. Bokstel was formerly the seat of an independent barony. The castle was restored in modern times. Reclamation from the waste was extended eastwards to Helenaveen late in the 19th century. Agriculture (potatoes, buckwheat, rye) is the main industry, generally combined with cattle-raising. On clay lands wheat and barley are the principal products, and in the western corner beetroot is largely cultivated for the beet sugar industry, factories being found at Bergen-op-Zoom, Steenberg and Oudenbosch. There is a special cultivation of hops in the district north-west of 'sHertogenbosch. The majority of the population is Roman Catholic. The precarious border position of the province militated against earlier industrial development, but since the separation from Belgium and the construction of roads, railways and canals there has been much improvement; Tilburg, Eindhoven and Helmond are important modern industrial centres. Their rise has been rapid, much impetus being given to the textile, tobacco and margarine trades during the period 1914-18 through the neutrality and unique situation of the Netherlands. Leather tanning and shoe-making are especially associated with the Langstraat district, a series of industrial villages along the course of the Old Maas, situated between Geertruidenberg and 'sHertogenbosch.

BRABAZON, HERCULES BRABAZON (1821-1906), English water colour painter, born in Paris, Nov. 27, 1821. He was the younger son of Hercules Sharpe, and succeeded his elder brother in the Brabazon estates, County Mayo, Ireland; under the will of his uncle, Sir William, he adopted the name of Brabazon. He was educated at Harrow and Trinity college, Cambridge. He studied painting by copying English water colours; and his early work shows the influence of Müller, Cox and De Wint. Brabazon's later work approached the style of Turner, with an even freer use of body colour. He executed many sketches on his travels in Italy, France, Switzerland and Egypt. An amateur in his art and a country gentleman, he was with difficulty persuaded to exhibit or sell his work. However, in 1891, in his 70th year, he showed at the New English Art Club and was elected a member; after this success he exhibited regularly. He died on May 15, 1906, in his home at Battle, Sussex. Two memorial exhibitions of his work were held at the Goupil gallery, London, in 1906 and 1909. The Tate gallery, the British Museum and the Metropolitan Museum of Art, New York, possess excellent examples of his work.

See C. L. Hind, *Hercules Brabazon Brabazon* (1912).

BRACCIANO, province of Rome, Italy, 25m. N.W. of Rome by rail, on south-west shore of Lake Bracciano, 915ft. above sea-level. Pop. (1921), 4,205 (town), 5,732 (commune). Its fine castle (built by the Orsini about 1470 and since 1696 the property of the Odescalchi) has preserved its character. The beautiful lake is the ancient *Lacus Sabatinus*, which gave its name to a Roman tribe. It is 22sq.m. in area, 538ft. above sea-level, and 530ft. deep and almost circular. Radiating tufa deposits extend as far as Rome; various small craters surround it; warm springs occur in the district, especially those of Vicarello. Many remains of ancient villas may be seen round the lake. The water of the lake partly supplies the Acqua Paola, a restoration by Paul V. of the *Aqua Traiana*.

BRACCIOLINI, FRANCESCO (1566-1645), Italian poet, was born at Pistoia, of a noble family. On his removing to Florence, he was admitted into the academy there, and devoted himself to literature. At Rome he entered the service of Cardinal Maffeo Barberini, and when his patron was elected pope, Urban VIII., Bracciolini was made secretary to the pope's brother, Cardinal Antonio. On the death of the pontiff he returned to Pistoia. Bracciolini is principally noted for his mock-heroic poem *Lo Scherno degli Dei*, published in 1618, similar but confessedly inferior to the contemporary work of Tassoni, *Secchia Rapita*. Of his serious poems the most celebrated is *La Croce Racquistata*.

For the Italian humanist Poggio Bracciolini see Poggio.

BRACE, CHARLES LORING (1826-1890), American philanthropist, was born on June 19, 1826 in Litchfield (Conn.). He graduated at Yale in 1846, and from Union theological seminary in 1849. From this time he devoted his life to social work among the poor of New York, and to Christian propaganda among the criminal classes; and he became well known as a social reformer, at home and abroad. In 1853 he helped to found the Children's Aid society, establishing workshops, industrial schools and lodging-houses for newsboys. He died at Campfer, in Tirol, on Aug. 11, 1890. His writings, in several volumes, embody his views on practical Christianity and its application to the improvement of social conditions.

See *The Life and Letters of Charles Loring Brace* (1894), edited by his daughter, Emma Brace.

BRACE, JULIA (1806-1884), American blind deaf-mute, was born at Newington, Conn., on June 13, 1806. At that time the study of blind deaf-mutes and their scientific training was in its infancy, but she learned to sew well, was neat in her dress, and had a good memory. Dr. S. G. Howe's (*q.v.*) experiments with her were interesting as leading to his success with Laura Bridgman (*q.v.*). She died at Bloomington, Conn., on Aug. 12, 1884.

BRACE, a measure of length, being the distance between the extended arms (from the plural of the Lat. *bracchium*, the arm). Something which secures, connects or strengthens, as in a carpenter's tool to hold a bit for boring; a beam of wood or metal used to strengthen a building or machine; the straps passing over the shoulders to support the trousers; the leathern thong which slides up and down the cord of a drum, and regulates the tension and the tone; in printing, a sign (}) for uniting two or more lines of letterpress or music; a rope fastened to the yard of a ship for trimming the sails. As meaning a "couple" or "pair" the term was first applied to dogs, probably from the leash by which they were coupled in coursing. In architecture (*q.v.*) "brace mould" is the term for two ogees joined together like a brace in printing.

BRACEGIRDLE, ANNE (c. 1674-1748), English actress, is said to have been placed under the care of Thomas Betterton and his wife, and to have first appeared on the stage as the page in *The Orphan* at its first performance at Dorset Garden in 1680. She was Lucia in Shadwell's *Squire of Alsatia* at the Theatre Royal in 1688, and played similar parts until, in 1693, as Araminta in *The Old Bachelor*, she made her first appearance in a comedy by Congreve, with whose works and life her name is most closely connected. In 1695 she went with Betterton and the other seceders to Lincoln's Inn Fields, where, on its opening with Congreve's *Love for Love*, she played Angelica. This part,

and those of Belinda in Vanbrugh's *Provoked Wife*, and Almira in Congreve's *Mourning Bride*, were among her best impersonations, but she also played the heroines of some of Nicholas Rowe's tragedies, and acted in the contemporary versions of Shakespeare's plays. In 1705 she followed Betterton to the Haymarket, where she found a serious competitor in Mrs. Oldfield, then first coming into public favour. The story runs that it was left for the audience to determine which was the better comedy actress, the test being the part of Mrs. Brittle in Betterton's *Amorous Widow*, which was played alternately by the two rivals on successive nights. When the popular vote was given in favour of Mrs. Oldfield, Mrs. Bracegirdle quitted the stage. Her private life was the subject of much discussion. Colley Cibber remarks that she had the merit of "not being unguarded in her private character," while Macaulay does not hesitate to call her "a cold, vain, and interested coquette." She was certainly the object of the adoration of many men, and she was the innocent cause of the killing of the actor William Mountfort, whom Captain Hill and Lord Mohun regarded as a rival for her affections. During her lifetime she was suspected of being secretly married to Congreve. She was buried (Sept. 18, 1748) in the cloisters of Westminster Abbey.

See Genest, *History of the Stage*; Colley Cibber, *Apology* (edited by Bellchambers); Egerton, *Life of Anne Oldfield*; Downes, *Roscius Anglicanus*.

BRACELET or ARMLET, a personal ornament for the arm or wrist, made of different materials, according to the fashion of the age and the rank of the wearer. The Egyptian kings are represented with armlets, which were also worn by the Egyptian women. These, however, are not jewelled, but of plain or enamelled metal, as was in all likelihood the case among the Hebrews. In modern times the most celebrated armlets are those which form part of the regalia of the Persian kings and formerly belonged to the Mogul emperors of India, being part of the spoil carried to Persia from Delhi by Nadir Shah in 1739. These ornaments are of dazzling splendour, and the jewels in them are of such large size and immense value that the pair have been reckoned to be worth a million sterling. The principal stone of the right armlet is famous in the East under the name of the *Darya-i-nur*, "sea (or river) of light." It weighs 186 carats, and is considered the diamond of finest lustre in the world. The principal jewel of the left armlet, although of somewhat inferior size (146 carats) and value, is renowned as the *Tāy-e-mah*, "crown of the moon." The imperial armlets, generally set with jewels, may also be observed in most of the portraits of the Indian emperors. Bracelets have at all times been much in use among barbaric nations, and the women frequently wear several on the same arm. The finer kinds are of mother-of-pearl, fine gold or silver, others of less value are made of plated steel, horn, brass, copper, beads, etc. Chinese bracelets are sometimes cut out of single pieces of jade. In the middle ages bracelets were much less commonly used in Europe, but the custom has continued to prevail among Eastern nations to the present time, and many of the types that were common in Europe in prehistoric times are still worn in central Asia. (See JEWELLERY.)

BRACHIOPODA, an isolated class of marine invertebrate animals, superficially resembling bivalve molluscs. They are enclosed in a shell composed of two valves which are dorso-ventrally arranged, and are equilateral and unequal in size. Two coiled appendages or brachia are developed, one on each side of the mouth and serve for the passage of food-bearing water-currents. Reproduction is sexual and the sexes are separate.

The name Brachiopod, derived from the Greek, *βραχίων* = arm, *πούς* = foot, was first proposed for the class by Dumeril (1806) who assumed that the brachia or spiral appendages were locomotive organs, homologous with the foot of molluscs.

Morphology.—The two valves of a Brachiopod shell are situated on the front (ventral valve) and back (dorsal valve) of the animal, the ventral valve being as a rule the larger. This dorso-ventral arrangement of the shell distinguishes the Brachiopoda from the group of Mollusca known as Lamellibranchia (*q.v.*), or bivalves, which also have a shell composed of two valves, but these are situated on the sides of the animal, and are usually equal in

size and unsymmetrical. In the more highly organized Brachiopods (Articulata) the two valves are united by means of teeth in the interior of the ventral valve which fit into sockets in the dorsal valve; the line of junction is known as the hinge. The hinge forms the hinder or posterior portion of the shell, and the two valves open at the opposite or anterior end. Either or both valves of the shell may be convex, but usually the ventral valve is convex and the dorsal valve flat or concave. The shell is remarkably diverse in its outline, which may be circular, oval, triangular or quadrate. *Discinisca* (Pl. I. fig. 17) has a conical dorsal valve which is curiously limpet-like, whereas the ventral valve of *Proboscidea* forms a long tube (Pl. I. fig. 10) to which the dorsal valve acts as a lid. Another bizarre form, *Pygope* (Pl. I. fig. 14), has a hole piercing the centre of the shell, dividing it into two halves which unite at the anterior margin. Generally, the shell is of small size, the largest recent species, *Magellania venosa*, only attaining a length of 3½ in., but many species do not exceed ½ in. Some fossil forms, however, were of comparatively gigantic size, *Productus giganteus* attaining a width of 12 in. by a length of about 9 in. Many of the

Fig. 6.—Diagram showing pedicle opening of the *Rhynchonella*. The triangular opening, or delthyrium, is gradually filled up by the plates, leaving an oval opening, or foramen, for the pedicle to pass through and attach itself to a foreign object

recent Brachiopod shells are grey or horn-coloured, while the deep sea forms have white or colourless shells which are very thin and fragile. A few genera such as *Kraussina*, *Laqueus* and *Magellania* are brilliantly coloured. Reddish-brown or orange predominates and either covers the whole shell or is distributed in patches or bands, while the brilliant greens of some species of

Lingula render them objects of extreme beauty. Traces of colour may occasionally be found in fossil species such as *Dielasma elongata* from the carboniferous limestone.

The shell is very diversely folded and is ornamented either by radial lines or ribs, or by transverse bands frequently bearing spines or tubercles. Primitive forms have smooth shells and many

FIGS. 7-8.—MUSCLE SCARS OF *LINGULA* A PRIMITIVE SPECIES OF BRACHIOPODA. TOP: VENTRAL VALVE; BELOW: DORSAL VALVE

species tend to lose their ornament and to revert to this condition in later growth-stages. The two valves are produced into a *beak* or *umbo*, that of the ventral valve being more prominent and frequently perforated by a triangular opening or *delthyrium* for the passage of the *pedicle*, or fleshy stalk, by means of which the shell was attached to foreign objects. In primitive forms, such as *Lingula*, the pedicle emerges freely between the two valves, but in more advanced species the passage gradually becomes restricted to the ventral, or *pedicle valve*, which is either grooved or notched at the posterior end, or the opening is enclosed within the shell as in *Discinisca*. A calcareous plate, the *deltidium*, was secreted by the pedicle of some fossil forms, and gradually closed the delthyrium. This prevented the pedicle from functioning and the shells dropped from the foreign objects to which they were attached. In *Productus* there was as a rule no pedicle, and the shell was apparently supported on the muddy sea-floor by the numerous spines which ornamented the shell. Two calcareous plates, *deltidial plates*, are secreted on either side of the delthyrium of some hinged forms, and gradually restrict the passage of the pedicle to a rounded opening, known as the *foramen* (fig. 6). The pedicle is composed of muscular fibres and is attached by strong muscles to the interior of the ventral valve just within the beak, and may be long and flexible or short and massive. In some genera the whole of the lower valve is attached and is shaped by the supporting surface, while in others such as *Strophalosia* the posterior part of the pedicle valve is attached in early growth stages, but later becomes free, a scar marking the former region of attachment.

In addition to hinge-teeth and sockets the two valves in highly organized genera are held together by two sets of strong muscles, which by their contraction close or open the shell (figs. 4, 5). These muscles make scars at the point of attachment to the interior of the valves, and these are readily seen in fossil shells. The opening muscles, or *diductors*, are attached to a strong median knob or *cardinal process* which projects slightly above the hinge of the dorsal valve, and they then stretch across to the posterior end of the ventral valve where they have a double attachment. The *adductors*, or closing muscles, are divided into four at the point of attachment to the dorsal valve, but are only doubly attached to the ventral valve, the two scars lying between those of the diductors. In primitive genera, such as *Lingula* (figs. 7, 8) in which no hinge-teeth or sockets are developed, the two valves are held together by a complex system of muscles, known as *transmedians*, *centrals* and *laterals*, by means of which the valves can not only open and close, but rotate and slide on one another. The shell in *Lingula* is composed of alternating layers of chitin and calcium phosphate covered by a smooth epidermis, while in *Discinisca* it is built up of overlapping lamellae of the same substances set at a small angle to the surface. In the hinged forms the shell is composed of three layers, (a) an outer horny epidermis which is usually missing in fossil forms, (b) a middle lamellar layer, and (c) an inner prismatic layer. The two inner layers which are composed of calcium carbonate in the form of calcite, are frequently pierced by small canals visible at the surface of the lamellar layer as pores. These canals contain *caeca* or prolongations of the two membraneous expansions, or folds of the body wall, known as the mantle. The mantle forms a lining to the shell, which it secretes, and it also acts as the principal respiratory organ. Growth of the shell takes place by means of successive additions to the margin, and thickening subsequently occurs by the deposition of new layers over the inner surface of previously formed layers.

The interior of the shell of a living Brachiopod is almost completely divided into two parts transversely by a membrane. The anterior part, called the mantle cavity, is occupied by the *brachia* or *lophophore*, and the posterior part, the visceral cavity or coelom, contains the alimentary canal and genital organs. The *brachia* consist of two spirally coiled appendages, or simply of

FIG. 9.—INTERIOR OF DORSAL VALVE OF *MAGELLANIA FLAVESCENS*. A portion of the fringe of the tentacles is removed to show the membrane which divides the shell and part of the spiral extremities of the arms

two flattened disks. In hinged shells the brachia are supported by *brachidia* consisting either of short calcareous processes, or *crura*, given off below the hinge of the dorsal valve, or by loops or *spiralia* also supported by crura (Pl. I. fig. 6.), and often attached to a median vertical plate or *septum*. The brachia bear cirri or tentacles (figs. 9, 10) which are fringed with numerous cilia or hairlike processes. By the constant lashing of the cilia, currents are set up within the shell by means of which food particles, such as diatoms or minute algae, are carried along a groove in the brachia to the mouth, which is medianly situated. Chitinous setae,

or bristles, also fringe the edge of the mantle, and by their constant lashing cause two food-bearing currents to enter at the sides of the shell, and one current bearing waste products to leave at the anterior end. In *Lingula*, however, three distinct tubes are formed by these marginal setae. The mouth opens backwards into an oesophagus leading into the stomach. In primitive forms the intestine is long and terminates in an anus, but in hinged forms it is short and ends blindly, the waste products being excreted from the mouth. The liver is frequently large and many lobed, and a large part of the digestive processes is carried on in this organ.

FIG. 10.—LONGITUDINAL SECTION OF THE *MAGELLANIA FLAVESCEUS* SHOWING SOFT PARTS OF THE ANIMAL. PEDICLE MUSCLES OMITTED

The various internal organs are supported by bands known as *mesenteries*, and these further subdivide the visceral cavity, and from them spring the genital products. Extensions of the visceral cavity penetrate into the mantle and are known as the *pallial* or *vascular sinuses*. These are in the form of great trunks which branch repeatedly, and there are usually two in each mantle lobe. All contain the *coelomic fluid*, or blood which also fills the coelom. Circulation in *Lingula* is said by Morse to be entirely due to the action of cilia, while Blochmann pointed out the existence of a true heart in many genera. The organs formerly thought to be hearts are now proved to be connected with the reproductive or digestive systems. The nervous system, also not fully understood, consists of a ring round the oesophagus, and this sends out nerves to the mantle, brachia and other parts of the body. Sense organs and pigment spots are usually found in the larvae, but rarely persist in the adult. It has been claimed that the caeca of perforate genera serve in this capacity, and both *Lingula* and *Glottidia* are apparently sensitive to light.

Classification.—The class Brachiopoda has long been divided into two sub-classes based on the presence or absence of an anal opening, and of teeth and sockets in the pedicle and dorsal valves respectively. Many names have been given to these two divisions, but those generally adopted are *Inarticulata* and *Articulata* proposed by Huxley in 1869, although Bronn's divisions *Ecardines* and *Testicardines* and Owen's *Lyopomata* and *Arthropomata* are still employed by some authors.

Beecher (1891) divided the class into four orders:—*Atremata*, *Neotremata*, *Protremata* and *Telotremata*, founded on the nature of the pedicle opening and on the shell development. The orders *Atremata* and *Neotremata* belong to Huxley's division *Inarticulata*, while the *Protremata* and *Telotremata* belong to the *Articulata*. Beecher's classification emended by Schuchert in 1913 is generally adopted.

SUB-CLASS INARTICULATA

Valves without teeth or sockets but held together by muscles. Intestine long, ending in anus.

Order I. Atremata, Beecher emend. Schuchert.

Primitive forms, having horny or calcareous and phosphatic valves, with the pedicle emerging either between the two valves, or through a cleft usually common to both valves. Pedicle opening frequently closed by plates. Families—*Rustellidae*, *Paterinidae*, *Schuchertinidae*, *Kutorginidae*, *Curticiidae*, *Obolidae*, *Trimerellidae*, *Lingulidae*, *Lingulasmaticidae*.

Order II. Neotremata, Beecher emend. Schuchert.

Shell usually horny, upper valve often conical. Pedicle emerging through an open cleft or through a perforation in the pedicle

valve, closed by a special plate or listrium. Shell may be cemented to foreign objects. Families—*Obolellidae*, *Siphonotretidae*, *Acrotretidae*, *Trematidae*, **Discinidae*, **Craniidae*.

SUB-CLASS ARTICULATA

Valves articulate by means of two teeth in ventral valve fitting into sockets in dorsal valve. Intestine short and ending blindly.

Order III. Protremata, Beecher emend. Schuchert.

Forms having well-developed cardinal areas. Shell calcareous. Pedicle opening limited to ventral valve through life, and closed by a plate called the deltidium, or the shell may be cemented by the ventral valve. Brachia not supported by a calcareous skeleton. Families—*Billingsellidae*, *Orthidae*, *Rhipidomellidae*, *Strophomenidae*, **Thecidiidae*, *Productidae*, *Richthofeniidae*, *Syntrophidae*, *Clitambonitidae*, *Porambonitidae*, *Pentameridae*, *Eichwaldiidae*.

Order IV. Telotremata, Beecher emend. Schuchert.

Shell calcareous. Pedicle opening shared by both valves in early growth-stages, confined to the pedicle valve in the later stages, and modified by deltidial plates. Brachia supported by calcareous crura, loops or spirals. Families—*Protorhynchidae*, **Rhynchonellidae*, *Centronellidae*, *Stringocephalidae*, **Terebratulidae*, **Terebratellidae*, *Atrypidae*, *Cyclospiridae*, *Spiriferidae*, *Suessiidae*, *Uncitidae*, *Rhynchospiridae*, *Meristellidae*, *Coelospiridae*, *Athyridae*.

Those starred are recent as well as fossil.

Reproduction and Development.—Reproduction is sexual and the sexes are separate. The male and female reproductive glands are situated in the main trunks of the vascular sinuses and possibly extend into the visceral cavity. Though attached to the inner wall of the mantle, the reproductive cells frequently leave pitted impressions on the shell which are clearly seen in fossil forms. The ova (eggs) and sperms are discharged by means of two or four funnels which open into the mantle-cavity on each side of the mouth (see fig. 11). Fertilization takes place either within the mantle cavity or when the ova have been discharged into the sea-water. Frequently, however, the ova develop in brood-pouches, formed by a fold of the mantle, within the shell of the female. The developmental stages vary considerably in the different genera. In *Terebratulina* (fig. 12) the ova on leaving the

FIG. 11.—LONGITUDINAL SECTION SHOWING SOFT PARTS OF RECENT BRACHIOPOD (*ARGYROTHECA CORDATA*)

The mantle lining the shell and its tubular extensions into the pores are omitted, also the horny outer layer of the shell, or epidermis. Much enlarged

parent shell develop cilia and are free-swimming before becoming segmented. After a free-swimming period of about 12 days, during which time three segments are developed, the larvae settle and become fixed by the third segment which later becomes modified to form the pedicle. The lobes of the second segment grow downwards and envelop the first segment or head, and two thin, horny, semi-circular plates are developed, forming the embryonic shell or protegulum. This is soon replaced by a punctate, calcareous shell ornamented by costae, and the protegulum is rarely preserved at the umbones of the adult shell. In *Lacazella* (fig. 13) the dorsal

lobe of the mantle develops more rapidly than the ventral, and the inner surface of both lobes bears a shell-plate. A third plate is developed on that part of the second or thoracic segment covered by the dorsal mantle-lobe. The mantle is then inverted, the mantle plates becoming external and forming with the third plate, or incipient deltidium, the embryonic shell, or protegulum. A similar inversion of the mantle lobes occurs in *Argyrotheca* (fig. 14), but no third shell-plate is developed. In *Lingula*, the free-swimming stage may last for a month or six weeks, and pairs of cirri on the embryonic brachia are protruded and act as a swimming organ. The cuticular shell-plate is formed over the dorsal and ventral mantle-lobes and is circular in outline, but a fold is developed posteriorly dividing the shell into dorsal and ventral valves. After a period these become thickened and the fold of thin cuticle serves for a time as a hinge. The pedicle is formed from the ventral mantle-fold and not from the third segment as in *Terebratulina*.

Zoogeographical Distribution.—Recent Brachiopoda have a world-wide distribution in salt water and are found at various depths in all latitudes, but are only abundant in a few areas. Numerous species occur in the Mediterranean, and in the tropical waters off the west coast of North America, the West Indies and the south coast of Australia, but it is probable that the shallow waters round the coasts of Japan contain a larger number of Brachiopods than any other area of similar extent. About 70% of living forms are found between the shore-line and a depth of 100 fathoms, and only a few species inhabit mid-ocean, although quite a number live in deep water near the continental shelf. A few genera such as *Lingula* and *Disciniscus* are littoral forms, living between the tide-marks in tropical waters. About 200 recent species have been described; and these are distributed among 59 genera, only seven of which are hingeless (Inarticulate) forms.

The following species have been dredged from the coasts of the British Isles:—*Pelagodiscus atlanticus*, *Crania anomala*, *Cryptopora gnomon*, *Hemithyris psittacea*, *Terebratulina retusa* (caput serpentis) and var. *angustata*, *T. septentrionalis*, *Gwynia capsula*, *Argyrotheca cistellula*, *Megathyris detruncata*, *Platidia anomioides*, *Pantellaria echinata*, *Dallina septigera*, *Macandrevia cranium*.

Palaeontology.—Fossil Brachiopoda considerably outnumber the recent forms, and include a large number of genera and species entirely unrepresented at the present day. Brachiopods are first found in Lower Cambrian rocks, and these early forms consist principally of hingeless genera, although a few primitive hinged forms already existed. The more specialized hinged genera (Trematata) appeared a little later in Ordovician times. Brachiopods became increasingly numerous in the subsequent formations, over 3,000 species being known from the Silurian rocks alone, and remarkable forms occur in the carboniferous rocks, where thick beds of limestone are often entirely composed of their shells, many of

which are of large size. In Jurassic and Cretaceous times Brachiopods were still numerous, but were represented almost exclusively by genera belonging to the families Rhynchonellidae and Terebratulidae. The group waned in Tertiary times, and several species were identical with those living at the present day.

Two genera, *Lingula* and *Crania*, have persisted, practically unchanged, from Ordovician to recent times, this being due, no doubt, to their remarkable adaptability to change in environment.

The evolution and affinities of this group are still obscure.

Habits.—All recent Brachiopods with the exception of *Glottidia* are attached to some foreign body or to other shells of the

Adult shell.

same species, either by the pedicle, or by cementation of the lower valve. *Glottidia* (fig. 16) is capable of spasmodic movements, and it builds a protecting sheath of sand-grains cemented together by mucus round its long flexible pedicle. *Lingula* (fig. 15) usually makes a vertical burrow from 2-12 in. in length, in which it lives attached by its pedicle to the sand at the bottom. By extension of the pedicle two-thirds of the shell may project above the surface, but this disappears instantaneously when the animal is alarmed. These burrows are found in mud-flats exposed at low water, and the sand in which they are formed is black due to decaying organic matter. Clean sand is apparently unfavourable to the growth of the animal. In southern Japan and the Philippine islands the shells of *Lingula* are collected, and either the pedicle or the whole animal is boiled and used for food.

Historic.—The first mention of the Brachiopoda in a published work appears to have been in 1596, when Bauhin figured a *Rhynchonella* from the Lias of Württemberg as *Pectunculus biforis*

compressus. Ten years later Fabio Colonna described *Concha anomia dipha* which he considered to be a Lamellibranch but which is now known to belong to the Brachiopod genus *Pygope*. At the end of the 17th century Martin Lister published figures of fossil Brachiopods and Lihwyd proposed the name *Terebratula* for forms which had previously been confused with *Anomia*. At this time Brachiopods were commonly called "Lampades," or "lamp-shells." In the 18th century several authors figured the recent species, *Crania anomala*, and *Terebratulina retusa*. Cuvier,

however, in the early 19th century was the first to suggest the separation of these and similar forms from the Lamellibranchs, for which Dumeril in 1806 proposed the name Brachiopoda. Subsequent investigation of the internal structure and development, and increasing information about fossil forms, led to the complete separation of this group from the Mollusca, Tunicata, Annelida,

BRACHISTOCHROME: see CURVES, HIGHER PLANE.

BRACHYCEPHALIC, a term denoting those skulls of which the width from side to side is 80% or more of the length from front to back, taking the length as 100 (Gr. for short-headed).

See RACES OF MAN and PHYSICAL ANTHROPOLOGY

BRACHYLOGUS, title applied in the middle of the 16th century to a work containing a systematic exposition of the Roman law, which some writers have assigned to the reign of the emperor Justinian, and others have treated as an apocryphal work of the 16th century. The earliest extant edition of this work was published at Lyons in 1549, under the title of *Corpus Legum per modum Institutionum*; and the title *Brachylogus totius Juris Civilis* appears for the first time in an edition published at Lyons in 1553. The origin of the work may be referred with great probability to the 12th century. There is internal evidence that it was composed subsequently to the reign of Louis le Débonnaire (778-840), as it contains a Lombard law of that

king's, which forbids the testimony of a clerk to be received against a layman. On the other hand its style and reasoning is far superior to that of the law writers of the 10th and 11th centuries; while the circumstance that the method of its author has not been in the slightest degree influenced by the school of the Glossators leads fairly to the conclusion that he wrote before that school became dominant at Bologna. Savigny, who traced the history of the *Brachylogus* with great care, is disposed to think that it is the work of Irnerius himself (*Geschichte des röm. Rechts im Mittelalter*). Its value is chiefly historical, as it furnishes evidence that a knowledge of Justinian's legislation was always maintained in northern Italy. The author of the work has adopted the *Institutes* of Justinian as the basis of it, and draws largely on the *Digest*, the *Code* and the *Novels*; while certain passages, evidently taken from the *Sententiae Receptae* of Julius Paulus, imply that the author was also acquainted with the *Breviary of Alaric* (q.v.).

See E. Bocking's *Corpus Legum sive Brachylogus Juris Civilis* (Berlin, 1829); H. Fitting, *Über die Heimath und das Alter des sogenannten Brachylogus* (1880).

BRACKEN or **BRAKE**, a genus of ferns (*Pteris* or *Pteridium*). The common bracken (*Pteris aquilina* or *Pteridium aquilinum*) is abundant in most parts of the world. It has a perennial, black rhizome, which creeps extensively underground and at intervals sends up fronds. These fronds may reach a height of 4 ft. or more, and, although dying in autumn, often remain standing throughout the winter, affording in some regions cover for game. The fronds are used for thatching and for littering cattle and occasionally as fodder. (See FERN.) In North America there are three forms of the bracken: the western bracken (*Pteridium aquilinum* var. *pubescens*), with more or less hairy fronds, found from Alaska to Montana and southward to Mexico; the bracken of eastern North America, which, though closely resembling the Old World form, is generally regarded by American botanists as a distinct species (*P. latiusculum*); and the southern form (*P. caudatum*), which occurs in southern Florida and Texas.

BRACKET, in architecture and carpentry, a frame or structure often approximately triangular, the purpose of which is to support a projecting feature or the connection of a horizontal and a vertical member. The bracket is frequently richly decorated and when this decoration consists principally of an S-scroll, the bracket is known as a console. In furniture, a bracket is a small ornamental shelf. The word is also used of lighting fixtures upon a wall irrespective of their shape.

BRACKET-FUNGI. The term "bracket" has been given to those hard, woody fungi that grow on trees or timber in the form of semi-circular brackets. They belong to the order *Polyporaceae* of the *Basidiomycetes*, distinguished by the layer of tubes or pores on the under surface within which the spores are borne. The mycelium, or vegetable part of the fungus, burrows in the tissues of the tree, and often destroys it; the "bracket" represents the fruiting stage, and produces innumerable spores which gain entrance to other trees by some wound or cut surface; hence the need of careful forestry. Many of these woody fungi persist for several years, and a new layer of pores is superimposed on the previous season's growth.

BRACKLEY, THOMAS EGERTON, VISCOUNT (c. 1540-1617), better known as Lord Chancellor Ellesmere, British statesman and lawyer, was a natural son of Sir Richard Egerton of Ridley, Cheshire. Educated at Brasenose college, Oxford, he was called to the bar at Lincoln's Inn in 1572. In 1581 he became solicitor-general. In the indictment of Mary, queen of Scots, he advised that she should be styled "Mary, commonly called queen of Scots," to obviate scruples about judging a sovereign. After this Egerton's promotion was rapid; he became attorney-general (1592), master of the rolls (1594), lord keeper of the great seal (1596).

He was a firm friend of Essex, but endeavoured in vain to effect his reconciliation with Elizabeth. When the earl was committed to his custody at York house (Oct. 1, 1599-June 5, 1600), he made another attempt, and presided over the court held at his house with the greatest moderation. He went to Essex's house on Feb. 8, 1601, and sought to dissuade Essex from rebellion and to induce

him to dismiss his followers. His appeal was disregarded, and Essex held him prisoner for six hours. After this he abandoned the effort to save him, and delivered a speech against him in the Star Chamber. After the accession of James I., Egerton was created Lord Ellesmere, and became lord chancellor. He gave indiscriminating support to James's conception of the royal prerogative, and by his approval of the harsh sentences passed against those who withstood it came into collision with the House of Commons. He was equally indiscriminating in his support of James's ecclesiastical policy; indeed, the only occasion on which he seems to have withstood the king was in the matter of his Spanish policy, and in 1615 he refused, in spite of commands and threats, to affix the great seal to the pardon of Somerset.

His career closed with a victory gained over the common law and his formidable antagonist, Sir Edward Coke. The chancellor's court of equity began as a tribunal to decide cases not served by the common law to relax and correct its rigidity and insufficiency. The two jurisdictions had remained rivals, the common-law bar often complaining of the arbitrary powers of the chancellor, and the equity lawyers censuring the failures of justice at common law. The disputes concerning which the king had already in 1615 remonstrated with the chancellor and Sir Edward Coke, the lord chief justice, came to a crisis in 1616, when the court of chancery granted relief against judgments at common law in the cases of *Heath v. Rydley* and *Courtney v. Granvil*. This relief Coke and other judges declared to be illegal, and a praemunire was brought against the parties concerned in the suit in chancery. The grand jury, however, refused to bring in a true bill, in spite of Coke's threats and assurances that the chancellor was dead, and the dispute was referred to the king, who after consulting his counsel and on Bacon's advice decided for equity. The chancellor's triumph was great, and from this time the equitable jurisdiction of the court of chancery was unquestioned. In June 1616 he supported the king in his dismissal of Coke in the case of the *commendams*, agreeing with Bacon that it was the judge's duty to communicate with the king, before giving judgments in which his interests were concerned, and in November warned the new lord chief justice against imitating the errors of his predecessor and especially his love of "popularity." On Mar. 3, 1617 he delivered up to James the great seal, which he had held for the unprecedented term of nearly 21 years. In 1616 he had been created Viscount Brackley, and he declined an earldom on his deathbed.

Lord Chancellor Ellesmere is a striking figure in the long line of illustrious English judges. He ignored all communications from suitors, and it was doubtless to Ellesmere (as weeding out the "enormous sin" of judicial corruption) that John Donne, who was his secretary, addressed his fifth satire. He gained Camden's admiration. Bacon, whose merit he recognized, and whose claim to be solicitor-general he had supported in 1594 and 1606, calls him "a true sage, a salvia in the garden of the State," and speaks of his "fatherly kindness." Ben Jonson extolled in an epigram his "wing'd judgments," "purest hands" and constancy. Endowed with oratorical gifts, he yet followed the true judicial tradition and despised eloquence as "not decorum for judges, that ought to respect the Matter and not the Humours of the Hearers." He hoped to see a codification of the laws, and had greater faith in judge-made law than in statutes, advising the parliament (Oct 27, 1601) "that laws in force might be revised and explained and no new laws made." He drew up rules for the Star Chamber, restricting fees, and in the reign of James I. issued ordinances for remedying abuses in chancery. In 1609 he published his judgment in the case of the *Post Nati*, which appears to be his only certain work. The following have been ascribed to him: *The Privileges and Prerogatives of the High Court of Chancery* (1641); *Certain Observations concerning the Office of the Lord Chancellor* (1651)—denied by Lord Chancellor Hardwicke in *A Discourse of the Judicial Authority of the Master of the Rolls* (1728) to be Lord Ellesmere's work; *Observations on Lord Coke's Reports*, ed. by G. Paul (about 1710), the evidence of his authorship being that the ms. was in his handwriting; four mss. bequeathed to his chaplain, Bishop Williams, viz., *The Prerogative Royal, Privileges of Parliament, Proceedings in Chancery and The Power of the*

Star Chamber; Notes and Observations on Magna Charta, etc., Sept. 1615 (Harl. 4265, f. 35), and *An Abridgement of Lord Coke's Reports*. (See ms. note by F. Hargrave in his copy of *Certain Observations concerning the Office of Lord Chancellor*, Brit. Mus. 510 a 5, also *Life of Egerton*, p. 80, note T, catalogue of Harleian collection, and Walpole's *Royal and Noble Authors*, 1806, ii. 170.)

No adequate life of Lord Chancellor Ellesmere has been written, for which, however, materials exist in the Bridgewater mss., very scantily calendared in *Hist. MSS. Comm.* 11th Rep. p. 24, and app. pt. vii. p. 126. A small selection, with the omission, however, of personal and family matters intended for a separate projected *Life* which was never published, was edited by J. P. Collier for the Camden Society in 1840.

BRACKLEY, municipal borough, Northamptonshire, England, on the river Ouse 7m. W.N.W. of Buckingham. Pop. (1921) 2,373. The early settlement (Brachelai, Brackele) is mentioned in the Domesday Survey. Records shew the mediaeval importance of fairs and markets, especially of the staple for wool. Brackley was incorporated by charter in 1686, when new fairs were granted and existing rights confirmed. Another charter was granted under the Municipal Corporation Act. Norman and Early English work remains in the Hospital of St. John, a 12th century foundation. The church of St. Peter has a beautiful Early English tower. Magdalen College School was founded by William of Waynflete, bishop of Winchester, in 1447. There are stations on the L.M.S. and L.N.E. railways. The town has minor agricultural industries, including brewing. It formerly had a considerable woollen and lace-making trade. The borough is under a mayor, four aldermen and 12 councillors. Area 3,489 acres. It is in the Daventry parliamentary division.

BRACKWEDE, a German textile town (pop. 12,000), lying south-south-west of Bielefeld (q.v.), in the Prussian province of Westphalia.

BRACQUEMOND, FELIX (1833-1914), French painter and etcher, was born in Paris on May 22, 1833. He was trained in early youth as a trade lithographer, until Guichard, a pupil of Ingres, took him into his studio. He applied himself to engraving and etching about 1853, and played a leading and brilliant part in the revival of the almost forgotten technique of the etcher's art in France. Altogether he produced over 800 plates, comprising portraits, landscapes, scenes of contemporary life, and bird-studies, besides numerous interpretations of other artists' paintings, especially those of Meissonier, Gustave Moreau and Corot. He was connected by a link of firm friendship with Manet, Whistler, and all the other fighters in the impressionist cause.

BRACTON, HENRY DE (d. 1268), English judge and writer on English law. His real name was Bratton, and in all probability he derived it either from Bratton Fleming or from Bratton Clovelly, both of them villages in Devonshire. It is only after his death that his name appears as "Bracton." He seems to have entered the king's service as a clerk under the patronage of William Raleigh, who after long service as a royal justice died bishop of Winchester in 1250. Bracton begins to appear as a justice in 1245, and from 1248 until his death in 1268 he was steadily employed as a justice of assize in the south-western counties, especially Somerset, Devon, and Cornwall. During the earlier part of this period he was also sitting as a judge in the king's central court, and was there hearing those pleas which "followed the king"; in other words, he was a member of that section of the central tribunal which was soon to be distinguished as the king's bench. From this position he retired or was dismissed in or about the year 1257, shortly before the meeting of the mad parliament at Oxford in 1258. Whether his disappearance is to be connected with the political events of this turbulent time is uncertain. He continued to take the assizes in the south-west, and in 1267 he was a member of a commission of prelates, barons, and judges appointed to hear the complaints of the disinherited partisans of Simon de Montfort. In 1259 he became rector of Combe-in-Teignhead, in 1261 rector of Barnstaple, in 1264 archdeacon of Barnstaple, and, having resigned the archdeaconry, chancellor of Exeter cathedral; he also held a prebend in the collegiate church at Bosham. Already in 1245 he enjoyed a dispensation enabling

him to hold three ecclesiastical benefices. He died in 1268 and was buried in the nave of Exeter cathedral, and a chantry for his soul was endowed out of the revenues of the manor of Thorverton.

His fame is due to a treatise on the laws and customs of England which is sufficiently described elsewhere (see *ENGLISH LAW*). The main part of it seems to have been compiled between 1250 and 1256; but apparently it is an unfinished work. This may be due to the fact that when he ceased to be a member of the king's central court Bracton was ordered to surrender certain judicial records which he had been using as raw material. Even though it be unfinished his book is incomparably the best work produced by any English lawyer in the middle ages.

The treatise was published in 1569 by Richard Tottel. This text was reprinted in 1640. An edition (1878-83) with English translation was included in the *Rolls series*, and a later one was prepared by G. E. Woodbine, 2 vols. (New Haven, 1915-22). Manuscript copies are numerous, and a critical edition is a desideratum. See Bracton, *Note-Book*, ed. Maitland (1887); Bracton and Azo, Selden Society (1895). (F. W. M.)

On April 5, 1923, in Exeter cathedral, a stone inscribed "To the memory of Henry of Bratton, temp. Henry III., Author of the first systematic treatise on the Laws of England, Chancellor of this Church . . . this stone was placed on the site of Bratton's altar," was presented to and accepted by the dean and chapter, the donors being a number of lawyers, Lord Merrivale, president of the probate, divorce, and admiralty division of the high court, acting as their spokesman. Eulogies of Bracton were pronounced by him and other jurists; many lawyers attended. See "The Bracton Memorial" in the *Law Times*, vol. 155, pp. 302, 303 (1923).

BRADBURY, JOHN SWANWICK BRADBURY, 1ST BARON (1872-), British civil servant, was born at Winsford, Cheshire, Sept. 23, 1872, and educated at the Manchester grammar school and Brasenose college, Oxford. He entered the Civil Service in 1896, and spent most of his official life at the Treasury, of which he became joint permanent secretary in 1913. In that capacity his name became familiar, from his signature on the Treasury notes issued after the outbreak of the World War. Sir John Bradbury was appointed in 1919 chief British representative on the reparations commission, and in this difficult position exercised the powers conferred on him with great tact and ability. He resigned the post at the beginning of 1925, when he was raised to the peerage as Baron Bradbury of Winsford. In the same year he became chairman of the food council, then newly set up.

BRADDOCK, EDWARD (1695?-1755), British general, was born in Perthshire, Scotland, about 1695. He joined the Coldstream Guards in 1710 and served under the prince of Orange in Holland during the siege of Bergen-op-Zoom in 1710. In 1754 he became a major-general, and was appointed to command against the French in Virginia in Feb. 1755. After some months of preparation, in which he was hampered by administrative confusion and want of resources, he took the field with a picked column, in which George Washington served, intending to attack Fort Duquesne (Pittsburgh, Pa.). The column crossed the Monongahela river on July 9, and almost immediately afterwards fell into an ambush of French and Indians. The troops were completely surprised and routed, and Braddock, rallying his men time after time, fell at last mortally wounded and died on the 13th. He was buried at Great Meadows.

BRADDOCK, a borough of Allegheny county, Pennsylvania, U.S.A., on the Monongahela river, 10 m S.E. of Pittsburgh; served by the Baltimore and Ohio, the Pennsylvania, and the Pittsburgh and Lake Erie railways. The population in 1920 was 20,870, of whom 6,415 were foreign-born white. With the adjoining boroughs of North Braddock and Rankin it forms one community, an important industrial centre, which in 1927 had a population estimated at over 50,000, and an assessed valuation of over \$42,000,000. The manufacture of steel is the basic industry. The first settler was John Frazier, in 1742, whose cabin was the first built by a white man west of the Alleghenies. It was here that General Edward Braddock in 1755 was defeated and mortally wounded in an engagement with the French and Indians; and here on Aug. 1, 1794, 8,000 men gathered in peaceful protest against the

new federal tax on whiskey. The borough was incorporated in 1867.

BRADDON, MARY ELIZABETH (1837-1915), English novelist, daughter of Henry Braddon, solicitor, of Skiridon Lodge, Cornwall, and sister of Sir Edward Braddon, prime minister of Tasmania, produced her first novel, *The Trail of the Serpent*, in 1861. In the same year appeared *Garibaldi, and other poems*, a volume of extremely spirited verse. In 1862 her reputation as a novelist was made by the success of *Lady Audley's Secret*. This novel, translated into many languages, has been dramatized, filmed, and in its original narrative form has been reprinted innumerable times. For a considerable time Miss Braddon conducted *Belgravia*, in which several of her novels appeared. She died on Feb. 4, 1915. She was a tireless worker, and in her long series of novels, plays, and stories maintained a freshness and an abundant inventiveness which endeared her to millions of readers.

Among the more famous of her 80 novels were *John Marchmont's Legacy* (1863), *Dead Men's Shoes* (1876), *Vixen* (1879), *Asphodel* (1881), *London Pride* (1896), and *The Green Curtain* (1911). Two of her sons, W. B. Maxwell (q.v.) and Gerald Maxwell, became well-known novelists.

BRADENTON, a city of Florida, U.S.A., 35 m. S. by W. of Tampa; the county seat of Manatee county. It is at the head of navigation on the Manatee river, a few miles from Tampa Bay and the Gulf of Mexico, and is served by coasting steamers and by the Atlantic Coast Line and the Seaboard Air Line railways. The population in 1910 was 1,886; in 1925 (State census) 7,306, of whom 1,809 were negroes. The leading industries are fishing, lumbering, fruit-growing, cattle-raising, and market-gardening. There are large deposits of fuller's earth in the vicinity. The city is a winter resort and has a growing commerce. It was settled in 1868 and incorporated in 1903.

BRADFORD, JOHN (1510?-1555), English Protestant martyr, was born at Manchester. In 1547 he studied law in the Inner Temple, but removed in the following year to St. Catharine's Hall, Cambridge, where he took an M.A. degree in divinity and was made fellow of Pembroke Hall. He was appointed chaplain to Bishop Ridley in 1550, prebendary of St. Paul's in 1551, and chaplain to Edward VI. in 1553, and became one of the most popular preachers in the kingdom. Soon after the accession of Mary he was arrested on a charge of sedition, and imprisoned. He was brought to trial (1554-55) before the court in which Bishop Gardiner sat as chief, and was condemned as a heretic and burnt on July 1, 1555.

His writings, which consist chiefly of sermons, meditations, tracts, letters and prayers, were edited by A. Townsend for the Parker Society (2 vols., Cambridge, 1848-53).

BRADFORD, WILLIAM (1590-1657), American colonial governor and historian, was born at Austerfield, Yorkshire, England, of a well-to-do family, probably in March 1590. In early youth he joined the Separatists, and after a brief imprisonment emigrated to Holland in 1608. Bradford was one of the party that sailed in the "Mayflower." After the death of Governor John Carver in April 1621 he was elected governor of Plymouth colony, and served as such, with the exception of five years, until shortly before his death. His rule was firm and judicious, and to his guidance more than to that of any other man the prosperity of the Plymouth colony was due. In 1630 the council for New England granted to "William Bradford, his heirs, associates, and assigns," a new patent enlarging the original grant of territory made to the Plymouth settlers. This patent Bradford in the name of the trustees made over to the body corporate of the colony in 1641. He died in Plymouth on May 9, 1657.

He was the author of a very important chronicle, the *History of Plymouth Plantation* (until 1646), first published in the *Proceedings* of the Massachusetts Historical Society for 1856 and several times re-edited. The manuscript disappeared from Boston during the War of Independence, was discovered in the Fulham library, London, in 1855, and was returned by the bishop of London to the State of Massachusetts in 1897. This work has been of inestimable value for the history of the Pilgrims, and was freely used, in manuscript, by Morton, Hubbard, Mather, Prince and Hutchinson. Bradford was also part author, with Edward Wins-

BRADFORD

low, of the journal commonly known as *Mourts' Relation*, edited by H. M. Dexter (1865) and printed by Alexander Young in *Chronicles of the Pilgrim Fathers* (1841). He wrote also a series of *Dialogues*, issued in the Massachusetts Historical Society's publications (1870).

See the quaint sketch in Cotton Mather's *Magnalia* (1702); Joseph Hunter, "Collections concerning the Founders of New Plymouth," in *Mass. Hist. Soc. Collections* (1852); M. C. Tyler, *A History of American Literature during the Colonial Time* (vol. ix., 1897); a chapter in Williston Walker's *Ten New England Leaders* (1901); also A. H. Plumb, *William Bradford of Plymouth* (1920).

BRADFORD, WILLIAM (1663-1752), American colonial printer, was born in Leicestershire, England, on May 20, 1663. He learned the printer's trade in London and in 1682 emigrated with William Penn to Pennsylvania, where in 1685 he introduced the "art and mystery" of printing. His first imprint was an almanac, *Kalendarium Pennsylvaniense or America's Messenger* (1685). In 1690, with William Rittenhouse (1644-1708) and others, he established in Roxboro (Pa.), now a part of Philadelphia, the first paper-mill in America. In the spring of 1693 he removed to New York, where he was appointed royal printer for the colony, a position which he held for more than 50 years. On Nov. 8, 1725, he issued the first number of the *New York Gazette*, the first paper established in New York and from 1725 to 1733 the only paper in the colony. Bradford died in New York on May 23, 1752.

His son, ANDREW SOWLE BRADFORD (1686-1742), removed from New York to Philadelphia in 1712, and there on Dec. 22, 1719, issued the first number of the *American Weekly Mercury*, the first newspaper in the Middle Colonies. Benjamin Franklin, for a time a compositor in the office, characterized the paper as "a paltry thing, in no way interesting"; but it was continued for many years and was edited by Bradford until his death.

The latter's nephew, WILLIAM BRADFORD (1722-91), established in Dec. 1742 the *Pennsylvania Journal and Weekly Advertiser*, which was for 60 years under his control or that of his son, and which in 1774-75 bore the oft-reproduced device of a divided serpent with the motto "Unite or Die." He served in the War of American Independence, rising to the rank of colonel. His son, WILLIAM BRADFORD (1755-95), also served in the War of Independence, and afterwards was attorney-general of Pennsylvania (1791), a judge of the supreme court of the State, and in 1794-95 attorney-general of the United States.

BRADFORD, WILLIAM (1827-1892), American marine painter, was born at New Bedford (Mass.). He was a Quaker, and was self-taught, painting the ships and the marine views he saw along the coast of Massachusetts, Labrador and Nova Scotia; he went on several Arctic expeditions with Dr. Hayes and was the first American painter to portray the frozen regions of the north. His pictures attracted much attention by reason of their novelty and gorgeous colour effects. His "Steamer 'Panther' in Melville Bay, under the Light of the Midnight Sun" was exhibited at the Royal Academy in London in 1875. Bradford was a member of the National Academy of Design, New York; he died in that city on April 25, 1892. His style was somewhat influenced by Albert van Beest, who worked with him at Fairhaven for a time; but Bradford is minute and observant of detail where van Beest's aim was general effect.

BRADFORD, city, municipal, county, and parliamentary borough, West Riding of Yorkshire, England, 9m. W. of Leeds. Pop. (1921) 285,979. It lies in a small valley opening southwards from that of the Aire and extends up the hills on either side. Most of the principal streets radiate from a centre near the town hall. The situation of Bradford on the lower eastern spurs of the Pennines—the meeting place of hill-land and plain—has had much to do with its history and development throughout the centuries. It is mentioned as having belonged before 1066, with several other manors in Yorkshire, to one Gamel, and appears to have been almost destroyed during the conquest of the north of England and was still waste in 1086. By that time it had been granted to Ilbert de Lacy, in whose family it continued until 1311. Already Bradford was becoming an important market centre, interested in wool. A further market was granted in 1251 and in 1294 the addition of

a fair. The inquisition taken after the death of Henry de Lacy, earl of Lincoln, shows that the earl had there a hall or manor-house, a fulling mill, a market every Sunday, and a fair on the feast of St. Andrew. Edward IV. granted to certain feoffees, in whom he had vested his manor of Bradford, a market on Thursday every week and two yearly fairs on feast days. Many of these fairs were of five days' duration. The church of St. Peter dates from 1485 and occupies the site of a previous Norman church. At the formation of the diocese of Bradford in 1920, out of those of Ripon and Wakefield, the parish church of St. Peter was made the cathedral. Its most noteworthy feature is the fine original roof of oak. Among educational institutions, the grammar school existed in the 16th century and received a charter of incorporation from Charles II.

From the mention of a fulling mill in 1311 it is possible that woollen manufacture had commenced at that time. By the reign of Henry VIII. it had become an important industry and added much to the status of the town. Leland in his *Itinerary* says that Bradford is "a praty quik Market Toune. It standith much by clothing." Towards the end of the 17th and beginning of the 18th century the woollen trade decreased and worsted manufacture began to take its place. On the introduction of steam-power and machinery the worsted trade advanced with great rapidity. The first mill in Bradford was built in 1798; in 1910 there were over 300. In 1836 Mr. (afterwards Sir) Titus Salt developed the alpaca manufacture in the town; mohair was shortly afterwards introduced; and the great works at Saltaire were opened (*see* SHIPLEY). Later, Mr. S. C. Lister (Lord Masham) introduced the silk and velvet manufacture, having invented a process of manipulating silk waste whereby what was previously treated as refuse is made into goods that can compete with those manufactured from the perfect cocoon.

As in the case of the cotton industry the multiplication of independent manufacturing processes makes for the concentration of the whole industry in as small an area as possible. Thus much local specialization has arisen and Bradford is essentially the centre of the wool-combing and worsted district. It has good railway and canal (to Humber and Liverpool) communications, and deposits of coal and iron near by. The local water, after draining over peaty soil, is very "soft" and consequently especially suited for woollen manufacture.

As a large industrial centre Bradford has many technical schools. The technical college, under the corporation since 1899, was opened in 1882. A Mechanics' institute was founded in 1832 and in 1871 the Mechanics' hall, close to the town hall, was opened. The Cartwright memorial hall contains an art gallery and museum and commemorates Dr. Edmund Cartwright (1743-1823) as the inventor of the power-loom and the combing machine. Other establishments are the Airedale college for students for the Independent ministry and the United Independent college (1888). Most of the buildings in Bradford are built with freestone quarried locally. As this stone blackens easily under the influence of smoke the town has a somewhat gloomy appearance.

Bradford was created a county borough in 1888 and a city in 1897. The corporation is presided over by a lord mayor—a dignity conferred in 1907. The city is served by the L.M.S.R., L.N.E.R., and M. and G.N. Joint railway and possesses a municipal light railway, opened in 1907, extending from Pateley Bridge to Loft-house (6m.) and serving the Nidd valley. The borough returned 2 members to parliament between 1832 and 1885, when 3 were returned. Since 1918, 4 members represent Bradford.

BRADFORD, a city of McKean county, Pennsylvania, United States, near the northern border of the state, among wooded hills, at an elevation of 1,415ft. 85m. S.E. of Buffalo. It is served by the Pennsylvania, the Erie, and the Buffalo, Rochester and Pittsburgh railways. The population was 15,525 in 1920, of whom 1,845 were foreign-born whites; and was estimated locally at 17,000 in 1927. It is the centre of an oil-field which has been producing since 1875 and is expected to yield large returns until 1975 at least. There are two pipe-lines to the seaboard, and about 20,000 wells in operation. The production for the county in 1925 was 2,575,089 barrels. The principal manufactures are petroleum products; lumber, wooden articles, and brick, from

the resources of the surrounding hills; tools and machinery needed in the production and handling of oil and natural gas; carbon brushes for electrical machines, steel sections and air filters. The aggregate output in 1925 was valued at \$13,153,104. Within 3m. is the Allegheny State park of 65,000 acres.

Bradford was settled about 1827, and was at first called Littleton, after Col. Little, an early resident. In 1858 the name was changed by settlers coming from Bradford, New Hampshire. It was incorporated as a borough in 1873 and chartered as a city in 1879. The first test well was drilled in 1861. Production began in 1875; increased rapidly to a peak in 1881, amounting to 40% of the world's output in the decade 1877-87; gradually declined until 1906; and after that again increased, as a result of the application of the flooding process.

BRADFORD DYERS' ASSOCIATION, LIMITED, a great combination of British firms engaged in the dyeing of fabrics. In a normal year, the association treats 500 million yards of cloth, or enough to wrap round the earth 12 times. The works are equipped for the dyeing and finishing of cotton, wool, mohair, silk and artificial silk fabrics, and the business is entirely done on commission, none of the goods handled being owned by the association. During the association's existence, the processes and methods of dyeing and finishing have been largely revolutionized. Dyeing has been raised to the dignity of a fine art. The pooling of experience and co-ordination of effort consequent on the organization of the combine have counted for much.

Agreements with Workers.—The association in 1899 made a working agreement with the trade-unions concerned covering the major portion of the employes and providing *inter alia* for the establishment of a reference board, composed of an equal number of representatives of employers and employes, to which all differences should in case of need be referred, with a provision for arbitration. This practice of making agreements governing working conditions with the trade-unions has continued a feature of the association's development, and the agreements current in 1927, in addition to the reference board and arbitration provision, include clauses providing for the employment of trade-union labour only (with certain specified exceptions); collective piecework, with a guarantee that piece-rates will enable earnings to be made of not less than 25% above time rates; the payment of a penalty of £1 per man in the event of any breach by either party of any of the provisions of the agreement (the proceeds of which penalties are devoted to charitable purposes); scales of minimum wages advancing according to age; a sliding scale for periodical adjustment of wages with the cost of living; a works council at each branch, composed of representatives elected by the workers and representatives nominated by the management, with co-ordination by quarterly conferences of the branch works councils.

Rewards for Ideas.—The company has a system of rewards for ideas submitted by employes; an employes' bonus system by which employe-share-holders receive in addition to their dividends a bonus depending on the amount of the ordinary dividend (3,750 employees held 680,000 shares in 1927); a savings fund whereby the workers are helped to purchase shares; superannuation funds on a joint contributory basis for both staff and operatives; pensions funds for premature incapacity; educational training schemes; a staff guild embracing the whole of the managers, technicians, travellers, clerks and foremen, and serving as the channel of approach between these employes and the association; benevolent funds; casualty and fighting force funds (arising out of the World War); and organizations for sports and social activities. These arrangements have been made in a trade in which, prior to the inauguration of the association, the operatives were in a low grade as regards both remuneration and status.

The economies aimed at in the formation of the combine have been secured; co-ordination of control has brought with it not only increased efficiency in business management, but a better technique. Much of the success of the association has arisen out of its organizations for scientific and technical research, experimental work, etc.; its co-operation with manufacturers and merchants in new productions and in the exchange of information; and its arrangements for the study of world markets and advertising.

The association was formed in 1898 and originally combined 22 businesses; subsequent amalgamations have raised the number of dyeworks to 29. The central administration is at Bradford, and the branches are scattered over a wide area, 21 being in Yorkshire, 7 in Lancashire and Cheshire, and 1 in Scotland. On Jan. 1 1927, the issued share and loan capital was £6,124,000; the total capital employed being £7,215,000.

BRADFORD-ON-AVON, urban district, Wiltshire, England, on the River Avon near the west (Somerset) border of the county. Pop. (1921) 4,624. Its houses, built of local grey stone, rise in disorder up the steep sides of the Avon valley.

Bradford (Bradauford, Bradeford) was the site of a battle in 652. A monastery existed here in the 8th century, of which St. Aldhelm was abbot at the time of his being made bishop of Sherborne in 705. No mention of the monastery occurs after the Conquest, but the nunnery of Shaftesbury, to which it was given in 1001, retained the lordship of the manor until the dissolution of the monasteries in the reign of Henry VIII. Bradford appears as a borough in the Domesday Survey, being assessed at 42 hides. One of the most interesting features of the old town is the ancient nine-arched bridge with a chapel on it, as at Wakefield. The Saxon church of St. Lawrence is considered to be "the most perfect surviving church of its kind in England, if not in Europe." It consists of a chancel, nave and porch; and its foundation is generally attributed to St. Aldhelm. The mediaeval tithe-barn of Bradford is one of the best specimens in the country. The restored parish church of Holy Trinity dates from the 12th century. Bradford was at one time the centre of the clothing industry in the west of England, and was famous for its broadcloth and mixtures, the waters of the Avon being especially favourable. The industry declined in the 18th century, and in 1740 we find the merchants of Bradford petitioning for an act of parliament to improve their trade. The town possesses many signs of its former prosperity; and the open Cotswold Hills, which contributed to the establishment of the wool trade in the past, still give the town its character and help its development as a tourist centre. The market is of ancient origin. Bradford is served by the G.W. railway and by the Kennet and Avon canal, one of the last of the southern waterways to fall into disuse. Kingston House, one of the finest Jacobean mansions in England, was long the seat of the dukes of Kingston. Bradford-on-Avon is included in the parliamentary division of Westbury.

BRADLAUGH, CHARLES (1833-1891), English free-thinker and politician, was born at Hoxton, London, on Sept. 26, 1833, the son of a poor solicitor's clerk. He managed to earn a living by odd jobs, and came into contact with a group of free-thinkers who were disciples of Richard Carlile.

At the end of 1850 he enlisted as a soldier, but in 1853 was bought out with money provided by his mother. He then found employment as a lawyer's clerk, and gradually became known as a free-thought lecturer, under the name of "Iconoclast." From 1860 he conducted the *National Reformer* for several years, and displayed much resource in legal defence when the paper was prosecuted by the government on account of its alleged blasphemy and sedition in 1868-69. The passing of the Evidence Amendment act in 1869 was the result of another legal contest (1867-69) as to whether Bradlaugh being an atheist, and so unable to take the oath, could give evidence in a court of law. In 1874 he became acquainted with Mrs. Annie Besant, who soon became co-editor of the *National Reformer*. In 1876 the Bristol publisher of an American pamphlet on the population question, called *Fruits of Philosophy*, was indicted for selling a work full of indecent physiological details, and, pleading guilty, was lightly sentenced; but Bradlaugh and Mrs. Besant took the matter up, in order to vindicate their ideas of liberty, and aggressively republished and circulated the pamphlet. In the prosecution which resulted they were convicted and sentenced to a heavy fine and imprisonment, but the sentence was stayed and the indictment ultimately quashed on a technical point. The affair, however, had several side issues in the courts and led to much prejudice against the defendants, the distinction being ignored between a protest against the suppression of opinion and the championship of the

particular opinions in question. Mrs. Besant's close alliance with Bradlaugh terminated in 1885, when she drifted from secularism, first into socialistic and labour agitation and then into theosophy as a pupil of Mme. Blavatsky. Bradlaugh himself took up politics with increasing fervour. He had been unsuccessful in standing for Northampton in 1868, but in 1880 he was returned by that constituency to parliament as an advanced radical. A long and sensational parliamentary struggle now began. He claimed to be allowed to affirm under the Parliamentary Oaths act, and the rejection of this pretension, and the refusal to allow him to take the oath on his professing his willingness to do so, terminated in Bradlaugh's victory in 1886. But this result was not obtained without protracted scenes in the House; in July 1880 Bradlaugh was unseated; in Aug. 1881, having been re-elected, he attempted to force his way into the House, but was ejected. In 1882, at the opening of the session he advanced up the House and, producing a Bible from his pocket, administered the oath to himself. After several re-elections and exclusions, and much litigation, Bradlaugh was victorious in Jan. 1886, when the new Speaker insisted on his being allowed to take the oath. When the long struggle was over, the public had gradually got used to Bradlaugh, and his transparent honesty and courageous contempt for mere popularity gained him increasing respect. He died on Jan. 30, 1891. Hard, arrogant and dogmatic, with a powerful physique and a real gift for popular oratory, he was a natural leader in causes which had society against them, but his sincerity was as unquestionable as his combativeness.

His *Life* was written, by his daughter, Mrs. Bradlaugh Bonner, with the assistance of J. M. Robertson (1894). See also J. M. Robertson, *Charles Bradlaugh* (1920).

BRADLEY, FRANCIS HERBERT (1846–1924), British philosopher, was born on Jan. 30, 1846, at Glasbury, Brecknock, and educated at University college, Oxford, becoming a fellow of Merton in 1876. He was admitted to the Order of Merit in June 1924, and died on Sept. 18 of the same year.

Although greatly indebted to Hegel, Bradley disowned Hegelianism as a system, and by his own efforts to re-state the case for idealism, made a substantial contribution to philosophy, a contribution which, together with that of Caird, Green and Bosanquet, was to raise Britain to philosophical pre-eminence. His first large work, *Ethical Studies* (1876, 2nd ed. 1927), emphasized the necessity for man first to find himself as a whole and then to bring himself into line with the world of completely harmonized experience, with the infinite coherent unity. It attacked utilitarianism by proclaiming that the moral end is the realization of the good will which is universal, free, autonomous, formal and superior to ourselves. *The Principles of Logic* (1883, 2nd ed. 1927), which infused fresh vitality into the study of logic, brought out the limitations of the system of Mill, especially of the associationist theory of inference. But it was *Appearance and Reality* (1893, 2nd ed. 1897) that stirred the philosophical world and led Caird to remark that it was "the greatest thing since Kant." The main doctrines formulated in this work and in the *Essays on Truth and Reality* (1914) may be briefly summarized. The ultimate fact is experience which means indissoluble unity with the perceived. But experience, though of itself non-relational, contains implicitly all differentiations of discursive thinking, these differentiations being rendered explicit in judgment. To be true a judgment must harmonize with all other judgments, but since the totality of reality is beyond the reach of finite minds, it seems that our particular judgments can never be entirely free from error. Thus, for Bradley the real subject of a judgment may be said to be the Absolute, a natural outcome of his view that nature is an appearance within reality and an imperfect manifestation of the Absolute. What is this Absolute? Certainly neither a sum of finite minds nor a self-conscious mind, for the former implies external relations and the latter internal relations, and the point about reality is that it is non-relational, requiring nothing outside of it to complete its being.

Bradley chooses to call the Absolute Spirit rather than Mind, but in the end, makes the admission that it has no assets beyond appearance.

BIBLIOGRAPHY.—Apart from the works mentioned above, Bradley wrote *The Pre-suppositions of Critical History* (1874); *Mr. Sidgwick's Hedonism* (1877) and numerous articles in *Mind* which are listed in A. E. Taylor's "Francis Herbert Bradley" in the *Proceedings of the Brit. Academy* (1926). See also H. Rashdall, "The Metaphysic of Mr. F. H. Bradley" in the *Proceedings of the same body*, vol. v. (1912); and various articles in *Mind* for Jan. 1925.

BRADLEY, GEORGE GRANVILLE (1821–1903), English divine and scholar, was born on Dec. 11, 1821, at Glasbury, Brecon. He was educated at Rugby under Thomas Arnold, and at University college, Oxford, of which he became a fellow in 1844. He was an assistant master at Rugby from 1846 to 1858, when he succeeded G. E. L. Cotton as headmaster at Marlborough. In 1870 he was elected master of his old college at Oxford, and in Aug. 1881 he was made dean of Westminster in succession to A. P. Stanley, whose pupil and intimate friend he had been, and whose life he wrote. Besides his *Recollections of A. P. Stanley* (1883) and *Life of Dean Stanley* (1892), he published *Aids to writing Latin Prose Composition* and *Lectures on Job* (1884) and *Ecclesiastes* (1885). He took part in the coronation of Edward VII., resigned the deanery in 1902, and died on March 13, 1903.

Dean Bradley's half-brother, ANDREW CECIL BRADLEY (b. 1851), was professor of poetry at Oxford from 1901 to 1906 and author of the well-known book on *Shakespearean Tragedy* (1904), which passed through many editions. Of his children, Mrs. Margaret Woods is separately noticed; ARTHUR GRANVILLE BRADLEY (b. 1850) wrote many historical and topographical works.

BRADLEY, HENRY (1845–1923), British philologist, was born at Manchester Dec. 3 1845. He was educated at Chesterfield grammar school, became a teacher, and later a clerk in a commercial house in Sheffield. At the same time he wrote a little for the literary reviews, and this work brought him to London. There he worked for *The Athenaeum* and *The Academy*, and through F. York Powell was introduced to *The New English Dictionary*, then in preparation, and this became his life-work. He succeeded Sir James Murray as senior editor on the latter's death in 1915 and remained on this undertaking until his own death. He worked with Skeat on certain Chaucerian studies, and published several works of his own, notably *The Making of English* (1904). He died at Oxford May 23 1923.

See Henry Bradley, *Collected Essays*, with memoir by Robert Bridges, 1927.

BRADLEY, JAMES (1693–1762), English astronomer, was born at Sherborne, Gloucestershire, and educated at Balliol college, Oxford. His early observations were made at the rectory of Wanstead in Essex, under the tutelage of his uncle, the Rev. James Pound (1669–1724), himself a skilled astronomer, and he was elected a fellow of the Royal Society on Nov. 6, 1718. He took orders on his presentation to the vicarage of Bridstow in the following year, and a small sinecure living in Wales was besides procured for him by his friend Samuel Molyneux (1689–1728). He resigned his ecclesiastical preferments in 1721, on his appointment to the Savilian professorship of astronomy at Oxford, while as reader on experimental philosophy (1729–60) he delivered 79 courses of lectures in the Ashmolean Museum. His memorable discovery of the aberration of light (see ABERRATION) was communicated to the Royal Society in Jan. 1729 (*Phil. Trans.* xxxv. 637). The observations upon which it was founded were made at Molyneux's house on Kew Green. He refrained from announcing the supplementary detection of nutation until Feb. 14 1748 (*Phil. Trans.* xlv. 1), when he had tested its reality by minute observations during an entire revolution (18.6 years) of the moon's nodes. He had meantime (in 1742) been appointed to succeed Edmund Halley as astronomer royal; his enhanced reputation enabled him to apply successfully for an instrumental outfit at a cost of £1,000; and with an 8-ft. quadrant completed for him in 1750 by John Bird (1709–1776), he accumulated at Greenwich in ten years materials of inestimable value for the reform of astronomy. A Crown pension of £250 a year was conferred upon him in 1752. He retired in broken health, nine years later, to Chalford in Gloucestershire, where he died. The printing of his observations was delayed by

disputes about their ownership; but they were finally issued from the Clarendon Press, Oxford, in two folio volumes (1798, 1805). The insight and industry of F. W. Bessel were, however, needed for the development of their fundamental importance.

Rigaud's Memoir prefixed to *Miscellaneous Works and Correspondence of James Bradley, D.D.* (Oxford 1832), is practically exhaustive. See also Delambre's *Hist. de l'astronomie au 18^{me} siècle*, p. 413.

BRADSHAW, GEORGE (1801–1853), English printer and publisher, was born near Pendleton, Lancashire, on July 29, 1801. On leaving school he was apprenticed to an engraver at Manchester, eventually setting up on his own account in that city as an engraver and printer—principally of maps. His name was already known as the publisher of *Bradshaw's Maps of Inland Navigation*, when in 1839, soon after the introduction of railways, he published *Bradshaw's Railway Time Tables*, the title being changed in 1840 to *Bradshaw's Railway Companion*. A new volume was issued at occasional intervals, a supplementary monthly time-sheet serving to keep the book up to date. In Dec. 1841 Bradshaw began to issue the time-tables for each month under the title *Bradshaw's Monthly Railway Guide*. In June 1847 was issued the first number of *Bradshaw's Continental Railway Guide*.

BRADSHAW, HENRY (c. 1450–1513), English poet, was born at Chester. In his boyhood he was received into the Benedictine monastery of St. Werburgh, and after studying with other novices of his order at Gloucester (afterwards Worcester) college, Oxford, he returned to his monastery at Chester. He wrote a Latin treatise *De antiquitate et magnificentia Urbis Cestriae*, which is lost, and a life of the patron saint of his monastery in English seven-lined stanza. This work, *The Holy Lyfe and History of saynt Werburge very frutefull for all Christen people to rede* (printed by Richard Pynson, 1521) contains a good deal of history beside the actual life of the saint.

St. Werburgh was the daughter of Wulfere, king of Mercia, and Bradshaw gives a description of the kingdom of Mercia, with a full account of its royal house. He relates the history of St. Ermenilde and St. Sexburge, mother and grandmother of Werburgh, who were successively abbesses of Ely. The second book narrates the Danish invasion of 875, and describes the history and antiquities of Chester, from its foundation by the legendary giant Leon Gaur, from which he derives the British name of Caerleon, down to the great fire which devastated the city in 1180, but was suddenly extinguished when the shrine of St. Werburgh was carried in procession through the streets.

Pynson's edition of the *Holy Lyfe* is very rare, only five copies being known. A reprint copying the original type was edited by Edward Hawkins for the Chetham Society in 1848, and by Carl Hortsman for the Early English Text Society in 1887.

BRADSHAW, HENRY (1831–1886), British scholar and librarian, was born in London on Feb. 2, 1831, and died on Feb. 10, 1886. He was educated at Eton, and became a fellow of King's college, Cambridge. After a short scholastic career in Ireland he accepted an appointment in the Cambridge university library as an extra assistant. When he found that his official duties absorbed all his leisure he resigned his post, but continued to give his time to the examination of the mss. and early printed books in the library. In addition to his achievements in black-letter bibliography he threw great light on ancient Celtic language and literature by the discovery, in 1857, of the *Book of Deer*, a manuscript copy of the Gospel in the Vulgate version, in which were inscribed old Gaelic charters. This was published by the Spalding Club in 1869. Bradshaw also discovered some Celtic glosses on the ms. of a metrical paraphrase of the Gospels by Juvenius. He made another important find in the Cambridge library: Cromwell's envoy, Sir Samuel Morland (1625–95), had brought back from Piedmont mss. containing the earliest known Waldensian records, consisting of translations from the Bible, religious treatises and poems. One of the poems referred the work to the beginning of the 11th century, though the mss. did not appear to be of earlier date than the 15th century. On this Morland had based his theory of the antiquity of the Waldensian doctrine, and, in the absence of the mss., which were supposed to be irretrievably lost, the conclusion was accepted. Bradshaw discovered

the mss. in the university library, and found in the passage indicated traces of erasure. The original date proved to be 1400. Incidentally the correct date was of great value in the study of the history of the language. In 1866 he discovered 2,200 lines on the siege of Troy incorporated in a ms. of Lydgate's *Troye Booke*, and of the *Legends of the Saints*, an important work of some 40,000 lines. These poems he attributed, erroneously, as has since been proved, to Barbour. He was elected (1867) university librarian, and as dean of his college (1857–65) and praelector (1863–68) he was involved in further routine duties. His papers on antiquarian subjects were edited by Mr. F. Jenkinson 1889.

An excellent *Memoir of Henry Bradshaw*, by G. W. Prothero, appeared in 1888. See also A. Leeper, *A Scholar-Librarian*, (1901); C. F. Newcombe, *Some Aspects of the Work of Henry Bradshaw* (1905).

BRADSHAW, JOHN (1602–1659), president of the "High Court of Justice" which tried Charles I., the second son of Henry Bradshaw, of Marple and Wibersley in Cheshire, was baptized on Dec. 10, 1602. He was admitted into Gray's Inn in 1620, and was called to the bar in 1627, becoming a bencher in 1647. On Sept. 21, 1643, he was appointed judge of the sheriff's court in London. In Oct. 1644 he was counsel, with Prynn, in the prosecution of Lord Maguire and Hugh Macmahon, implicated in the Irish rebellion, in 1645 for John Lilburne in his appeal to the Lords against the sentence of the Star Chamber, and in 1647 in the prosecution of Judge Jenkins. In 1647 he was made chief justice of Chester and a judge in Wales, and on Oct. 12, 1648, he was presented to the degree of serjeant-at-law. On Jan. 2, 1649, the lords threw out the ordinance for bringing the king to trial, and the small remnant of the House of Commons which survived Pride's Purge, consisting of 53 independents, determined to carry out the ordinance on their own authority. The leading members of the bar of both parties having refused to participate in the proceedings, Bradshaw was selected to preside. The king refused to plead before the tribunal, but Bradshaw silenced every legal objection and denied to Charles an opportunity to speak in his defence. He also conducted the trials of several royalists, including the duke of Hamilton and Lord Capel. He was appointed, in 1649, attorney-general of Cheshire and North Wales, and chancellor of the duchy of Lancaster, and on March 10 became president of the Council of State. When, after the expulsion of the Long Parliament, Cromwell came to dismiss the council, Bradshaw is said, on the authority of Ludlow, to have confronted him boldly, and denied his power to dissolve the parliament. He refused to sign the "engagement" pledging members of the parliament of 1654 to support the government drawn up by Cromwell, and in consequence withdrew from Parliament. After the abdication of Richard Cromwell, Bradshaw again entered Parliament, became a member of the Council of State, and on June 3, 1659, was appointed a commissioner of the great seal. He died on Oct. 31, 1659, and was buried in Westminster Abbey.

BRADWARDINE, THOMAS (c. 1290–1349), English archbishop, called "the profound doctor," was born either at Hartfield in Sussex or at Chichester. He was educated at Merton college, Oxford, and became chancellor of the university and professor of divinity. From being chancellor of the diocese of London he became chaplain and confessor to Edward III., whom he attended during his wars in France. On his return to England, he was successively appointed prebendary of Lincoln, archdeacon of Lincoln (1347), and in 1349 archbishop of Canterbury. He died of the plague at Lambeth on Aug. 26, 1349, 40 days after his consecration.

Chaucer in his *Nun's Priest's Tale* ranks Bradwardine with St. Augustine. His great work *De causa Dei contra Pelagium et* (ed. Sir Henry Savile 1618), by stressing the divine concurrence with all human volitions and with all activity in nature, unintentionally inaugurates a universal determinism. Bradwardine also wrote *De Geometria speculativa* (1530); *De Arithmetica practica* (1502); *De Proportionibus velocitatum* (Paris, 1495; Venice, 1505); *De Quadratura Circuli* (1495); and an *Ars Memorativa*, Sloane mss. No. 3974 in the British Museum.

See Quéatif-Echard, *Script. Praedic.*, i. 744 (1719); W. F. Hook, *Lives of the Archbishops of Canterbury*, vol. iv.; S. Hahn, *Brad-*

wardinus u.s. *Lehre von der menschlichen Willensfreiheit* (Münster, 1905).

BRADY, NICHOLAS (1659-1726), Anglican divine and poet, was born at Bandon, County Cork, on Oct. 28 1659, and died at Richmond, Surrey, on May 20 1726. He received his education at Westminster school, and at Christ Church, Oxford; but he graduated at Trinity college, Dublin, and became prebendary of Cork. In 1690 Brady prevented the burning of the town of Bandon, after James II. had given orders for its destruction. He soon afterwards settled in London, where he held the livings of Clapham and Richmond. Brady's best known work is his metrical version of the Psalms, prepared in collaboration with Nahum Tate. It was licensed in 1696, and largely ousted the old version of T. Sternhold and J. Hopkins.

BRAEKELEER, HENRI JEAN AUGUSTIN DE (1840-88), Belgian painter, was born at Antwerp on June 12 1840, and died there July 21 1888. He was trained by his father, Ferdinand de Braekeleer (1792-1883), a *genre* painter, and his uncle Henri Leys. The first pictures he exhibited, "The Laundry" (Van Cutsem collection, Brussels) and "The Copper-smith's Workshop" (Vleeshovwer collection, Antwerp), were shown at the Antwerp exhibition in 1861. "The Brewer's House at Antwerp" (Marlier collection), better known as "A Man Sitting," is generally regarded as his masterpiece. There are many good examples of his work in Brussels and Antwerp. As a lithographer and etcher, his work resembles that of Henri Leys. Towards the end of his life de Braekeleer did some dot painting (*pointillisme*), in which he achieved admirable effects of light.

See C. Lemonnier, *Henri de Braekeleer* (1905).

BRAEMAR, a district in south-west Aberdeenshire, Scotland, extending 24m. from Ballater (east) to Glen Dee (west), with a breadth of 3 to 6m. Glen Dee lies among hills from 1,000 to nearly 3,000ft. high. The villages and clachans (Gaelic for hamlet) from 600 to more than 1,000ft. above the sea, have pure and bracing air. The deer forests comprise the royal forests of Balmoral and Ballochbuie, Glen Ey Forest, Mar Forest and Invercauld Forest. Castles, mansions and lodges, mostly in Scottish baronial style, include Balmoral (*q.v.*) and Abergeldie Castles belonging to the crown, Invercauld House, Braemar Castle, Mar Lodge and Old Mar Lodge. Braemar (Castleton of Braemar) is the foremost village, the capital of the Deeside Highlands. The well-known Braemar Gathering for highland games is held in a park near the village. Not far from the spot where the brawling Clunie joins the Dee the earl of Mar raised the standard of revolt in 1715. His seat, Braemar Castle, reputed to be a hunting-lodge of Malcolm Canmore, was forfeit along with the estates. The new castle built by the purchasers in 1720 was later acquired by Farquharson of Invercauld, who gave the Government the use of it after the battle of Culloden.

BRAG, a very old game of cards, probably evolved from the ancient Spanish *primero*, played by five or six, or more players. It is the ancestor of poker. A full pack is used, the cards ranking as at whist, with certain exceptions.

BRAGA, THEOPHILO (1843-1924), Portuguese writer and politician, was born at Ponta Delgada, in the Azores. He published six volumes of poems between 1859 and 1868, and his *History of Portuguese Literature* (20 vols.) between 1870 and 1881. In philosophy he was a positivist.

Braga was elected deputy for Lisbon in Aug. 1909, and in Oct. 1910, when the new-born Portuguese republic was faced with the difficult task of political reconstruction, this man of unquestionable attainments and irreproachable character was selected as first provisional president. He remained in office till the election of Dr. Arriaga as first constitutional president, Aug. 24 1911, and when Arriaga resigned on May 27 1915, Braga's services were again requisitioned, and he returned to the presidency for the remainder of the term.

BRAGA, a city of northern Portugal, at the head of a railway from Oporto. Pop. (1920) 21,970. Braga, which ranks after Lisbon and Oporto, is an archiepiscopal see. Its 12th century cathedral was rebuilt during the 16th century in the blend of Moorish and florid Gothic styles known as Manueline. The church

of Santa Cruz has a handsome façade, which dates from 1642. There are several convents and a library containing many rare books and manuscripts, also the ruins of a Roman theatre, temple and aqueduct. The principal manufactures are firearms, jewellery, cutlery, cloth and felt hats. Large cattle fairs are held in June and September. On a hill about 3m. S.E. stands the celebrated sanctuary of Bom Jesus do Monte, visited at Whitsuntide by many thousands of pilgrims, who do public penance as they ascend to the shrine; and about 1m. beyond it is Mt. Sameiro (2,535ft.) crowned by a colossal statue of the Virgin Mary, and commanding a magnificent view of the mountainous country, which culminates in the Serra do Gerez, on the north-east.

Braga is the Roman *Bracara Augusta*, capital of the *Callaici Bracarii*, or *Bracarenenses*. In the early 5th century it was taken by the Suevi and about 485 by the Visigoths, who here renounced the Arian and Priscillianist heresies, so the city became famous and its archbishops are still primates of Portugal and long claimed supremacy over the Spanish Church as well. From the Moors, who captured Braga early in the 8th century, the city was retaken in 1040 by Ferdinand I., king of Castile and Leon; and from 1093 to 1147 it was the residence of the Portuguese court.

The administrative district of Braga coincides with the central part of the province of Entre Minho e Douro (*q.v.*). Pop. (1900) 357,159. Area, 1,040sq. miles.

BRAGANZA, the name of an administrative district and of its capital included in the province of Traz-os-Montes, Portugal; situated in the north-eastern extremity of the kingdom, on a branch of the river Sabor, 8 m. S. of the Spanish frontier. Its Portuguese name is Bragança. Pop. 5,787. Braganza is an episcopal city, consisting of a walled upper town, containing the cathedral college and hospital, and of a lower or modern town. The administrative district of Braganza coincides with the eastern part of Traz-os-Montes (*q.v.*). Pop. (1920) 170,302; area, 2,513 sq. miles.

The city gave its name to the family of Braganza, members of which were rulers of Portugal from 1640 onward and emperors of Brazil from 1822 to 1889. The family is descended from Alphonso, a natural son of John I. of Portugal (d. 1433), who was made duke of Braganza in 1442 and died in 1451. His descendant Duke John I. (d. 1583) married into the royal family and, on the death of King Henry II. in 1580 without direct heirs, unsuccessfully claimed the crown in opposition to Philip II. of Spain. When in 1640 the Portuguese threw off the Spanish yoke, his grandson, Duke John II., became King of Portugal as John IV. In 1807, when Napoleon declared the throne of Portugal vacant, King John VI. transferred his court to Brazil. He regained Portugal in 1814, but did not return there till 1821, when he left his elder son Peter as regent of Brazil. In 1822 Brazil established its independence, with Peter as emperor. Peter succeeded his father as king of Portugal in 1826, but at once resigned the crown to his young daughter Maria, with his brother Dom Miguel as regent. Miguel soon proclaimed himself king, but was driven from the country in 1833, when Maria became queen. She was succeeded in 1853 by Louis, her son by her second husband, Ferdinand of Coburg. Louis was succeeded in 1889 by his son Charles (Carlos) I. On Feb. 1, 1908, Carlos and his eldest son were assassinated, and in May his second son, Dom Manoel, was proclaimed king as Manoel (Emmanuel) II. In Oct. 1910 he was deposed as the result of a revolution and went to live in England. On June 19, 1911, the Constituent Assembly in Lisbon declared the monarchy abolished and the House of Braganza for ever banished from Portugal.

Peter I. of Brazil was succeeded by his son Peter II., who reigned till 1889, when he was deposed and exiled and the republic proclaimed. On his death in 1891 this branch of the family also became extinct in the male line. His only child, Isabella, married Louis Gaston, Comte d'Eu. The exiled Dom Miguel founded a branch of the family which settled in Bavaria. The title of duke of Braganza was borne by the eldest sons of the kings of Portugal.

BRAGG, BRAXTON (1817-1876), American soldier, was born in Warren county, N.C., on March 22, 1817. He graduated at the United States military academy in 1837, and as an artillery

officer served in the Seminole wars of 1837 and 1841, and under Gen. Taylor in the Mexican War. He resigned from the regular army in 1856, and retired to his plantation in Louisiana. When in 1861 the Civil War began, Bragg was made a brigadier-general in the Confederate service. Promoted major-general, he led in the autumn of 1862 a bold advance from eastern Tennessee across Kentucky to Louisville, but after the battle of Perryville (Oct. 8) retired into Tennessee. Though he was bitterly censured, the personal favour of Jefferson Davis kept him, as it had placed him, at the head of the central army, and on Dec. 31, 1862, and Jan. 2, 1863, he fought the indecisive battle of Murfreesboro (or Stone river) against Rosecrans. In the campaign of 1863 Rosecrans constantly outmanoeuvred the Confederates, and forced them back to the border of Georgia. Bragg, however, inflicted a crushing defeat on his opponent at Chickamauga (Sept. 19-20) and for a time besieged the Union forces in Chattanooga. But large forces under Grant were concentrated upon the threatened spot, and the great battle of Chattanooga (Nov. 23-25) ended in the rout of the Confederates. Bragg was now deprived of his command, but President Davis made him his military adviser. In the autumn of that year he led an inferior force from North Carolina to Georgia to oppose Sherman's march. In Feb. 1865, he joined Johnston, and he was thus included in the surrender of that officer to Sherman. In spite of his want of success, Bragg was unquestionably a brave and skilful officer. But he was a severe martinet, and rarely in full accord with the senior officers under his orders, the consequent friction often acting unfavourably on the conduct of his operations. He died at Galveston, Tex., on Sept. 27, 1876.

His brother, THOMAS BRAGG (1810-72), was governor of North Carolina, 1855-59, United States senator 1859-61 and attorney-general in the Confederate cabinet 1861-62.

See Don Carlos Seitz, *Braxton Bragg, General of the Confederacy* (1924).

BRAGG, SIR WILLIAM HENRY (1862-), British physicist, was born at Wigton, Cumberland, July 2, 1862, and was educated at King William's college, Isle of Man, and Trinity college, Cambridge. In 1880 he was appointed professor of mathematics and physics at Adelaide, South Australia, where he carried out his earlier researches in radio-activity. In 1909 he was appointed Cavendish professor at Leeds and in 1915 Quain professor of physics in the University of London. His researches upon various radio-active phenomena and his power of lucid exposition brought recognition from scientific bodies both at home and abroad; in 1906 he was elected a fellow of the Royal Society; in 1915 he received the Nobel Prize for physics and the Barnard Gold Medal (Columbia university), both of which distinctions he shared with his son William Lawrence Bragg (b. 1890).

The joint work of father and son went far towards elucidating the arrangements of atoms and crystals, an achievement rendered possible by their development of the X-ray spectrometer. During the World War Sir William Bragg acted in an advisory capacity to the British Admiralty, especially with regard to the problem of submarine detection. He was created K B E in 1920. In the same year he was elected an honorary fellow of Trinity college, Cambridge, and was president of the Physical Society of London. In 1923 he was appointed Fullerian professor of chemistry at the Royal Institution and director of Davy-Faraday research laboratory; and subsequently director of the Royal Institution.

Sir William Bragg was elected president of the British Association for the Advancement of Science in 1928, succeeding Sir Arthur Keith.

In addition to many publications, chiefly upon radio-activity, in *The Philosophical Magazine* and *The Proceedings of the Royal Society*, he also wrote *The World of Sound* (1920); and *Concerning the Nature of Things* (1925). (See CRYSTALLOGRAPHY.)

BRAGI, in Scandinavian mythology, the son of Odin, and god of wisdom, poetry and eloquence. At the Scandinavian sacrificial feasts a horn consecrated to Bragi was used as a drinking-cup by the guests, who then vowed to do some great deed which would be worthy of being immortalized in verse.

BRAHAM, JOHN (1774-1856), English singer, was born in London March 20, 1774, of Jewish parentage, his real name being

Abraham. A pupil of an Italian artist named Leoni, he made his first appearance in public at Covent Garden theatre on April 21, 1787, when he sang "The soldier tired of war's alarms" and "*Ma chère arrive*." His second début (as a tenor) was made in 1794 at the Bath concerts. In 1796 he appeared in London at Drury Lane in Storace's opera of *Mahmoud*. In 1797 he went to Italy where his career was one of continuous triumph; he appeared in all the principal opera-houses, singing in Milan, Genoa, Leghorn and Venice. His compass embraced about nineteen notes. In 1801 he returned to his native country, and appeared once more at Covent Garden in the opera *Chains of the Heart*, by Mazzinghi and Reeve. In 1824 he sang the part of Max in the English version of Weber's *Der Freischütz*, and he was the original Sir Huon in that composer's *Oberon* in 1826. In 1838 he sang the part of William Tell at Drury Lane, and in 1839 the part of Don Giovanni. His last public appearance was at a concert in March 1852. He died Feb. 17, 1856. During forty years, Braham held the undisputed supremacy alike in opera, oratorio and the concert-room. He composed the music of his own part in many of the English operas in which he appeared and was also part-author of *The American* (1811), which contained the famous song, "The Death of Nelson" (1811).

BRAHE, PER, COUNT (1602-1680), Swedish soldier and statesman, was born on the island of Rydboholm, near Stockholm, on Feb. 18 1602. He was the grandson of Per Brahe (1520-90), nephew of Gustavus I., created count of Visingsborg by Eric XIV., known as the continuator of Peder Svart's chronicle of Gustavus I., and author of *Oeconomia* (1585), a manual for young noblemen. Per Brahe the younger became, in 1626, chamberlain to Gustavus Adolphus. He fought in Prussia during the last three years of the Polish War (1626-29) and also, as colonel of a regiment of horse, in 1630 in Germany. After the death of Gustavus Adolphus in 1632 he abandoned his military career for politics. He had been elected president (*Landsmarskalk*) of the diet of 1629, and in the following year was created a senator (*Riksråd*). In 1635 he conducted the negotiations for an armistice with Poland. In 1637-40 and again in 1648-54 he was governor-general in Finland, to which country he rendered inestimable services by his wise and provident rule. He reformed the whole administration, introduced a postal system, built ten new towns, improved and developed commerce and agriculture, and very greatly promoted education. In 1640 he opened the university of Åbo, of which he was the founder and first chancellor. After the death of Charles X. in 1660, Brahe, as *rikskansler* or chancellor of Sweden, was one of the regents of Sweden for the second time (he had held a similar office during the minority of Christina, 1632-44), and during the difficult year 1660 he had entire control of both foreign and domestic affairs. He died on Sept. 2 1680, at his castle at Visingsborg.

His brother, NILS BRAHE (1604-32), also served with distinction under Gustavus Adolphus. In 1631 he was appointed colonel of "the yellow regiment," the king's world-renowned life-guards, at the head of which he captured the castle of Würzburg (Oct. 8 1631). He commanded the left wing at Lützen (Nov. 6 1632), where he was the only Swedish general officer present. At the very beginning of the fight he was mortally wounded. The king regarded Brahe as the best general in the Swedish army after Lennart Torstensson.

A grandson of Nils, MAGNUS BRAHE (1700-1844) fought in the campaign of 1813-14, under the crown prince Bernadotte (Charles XIV). He became marshal of the kingdom, and, especially from 1828 onwards, exercised a preponderant influence in public affairs.

See Martin Veibull, *Sveriges Storhetstid*, vol. iv. (1881); *Letters to Axel Oxenstierna* (Swed.), 1832-1851 (1890), Petrus Nordmann, *Per Brahe* (Helsingfors, 1904).

BRAHE, TYCHO (1546-1601), Danish astronomer, was born on Dec. 14, 1546, at the family seat of Knudstrup in Scania, then a Danish province. He studied at Copenhagen, Leipzig, Rostock and Augsburg, and in 1571 was permitted by his maternal uncle, Steno Belle, to install a laboratory at his castle of Herritzvad, near Knudstrup; and there, on Nov. 11, 1572, he caught sight of the famous "new star" in Cassiopeia. His observa-

tions were published as *De Novâ Stellâ* (Copenhagen, 1573, facsimile reprint 1901).

Tycho's marriage with a peasant-girl in 1573 somewhat strained his family relations. He delivered lectures in Copenhagen by royal command in 1574; and in 1575 travelled through Germany to Venice. Frederick II., king of Denmark, bestowed upon him for life the island of Hveen in the Sound, together with a pension of 500 thalers, a canonry in the cathedral of Roskilde, and the income of an estate in Norway. The first stone of the magnificent observatory of Uraniborg was laid on Aug. 8, 1576; it was the scene, during 21 years, of Tycho's labours. Frederick's successor, Christian IV., was less tolerant of Tycho's arrogance. His pension and fief having been withdrawn, he sailed for Rostock in June 1597. He spent the following winter at Wittenberg, and reached Prague in June 1599, well assured of favour and protection from the emperor Rudolph II., who assigned him the castle of Benatky for his residence, with a pension of 3,000 florins; his great instruments were moved thither from Hveen, and Johannes Kepler joined him in Jan. 1600. Tycho died at Benatky on Oct. 24, 1601.

Tycho's principal work, entitled *Astronomiæ instauratæ progymnasmata* (2 vols., Prague, 1602-03) was edited by Kepler. The first volume treated of the motions of the sun and moon, and gave the places of 777 fixed stars (this number was increased to 1,005 by Kepler in 1627 in the "Rudolphine Tables"). The second, which had been privately printed at Uraniborg in 1588 with the heading *De mundi aetherei recentioribus, phaenomenis*, was mainly concerned with the comet of 1577, demonstrated by Tycho from its insensible parallax to be no terrestrial exhalation, as commonly supposed, but a body traversing planetary space. It included, besides, an account of the Tychonic plan of the cosmos, in which a *via media* was sought between the Ptolemaic and Copernican systems. The earth retained its immobility; but the five planets were made to revolve round the sun, which, with its entire cortège, annually circuted the earth, the sphere of the fixed stars performing meanwhile, as of old, its all-inclusive diurnal rotation (see *ASTRONOMY: History*). Under the heading *Astronomiæ instauratæ mechanica*, Tycho published at Wandsbeck, in 1598, a description of his instruments, together with an autobiographical account of his career and discoveries, including the memorable one of the moon's "variation" (see *MOON*). His *Epistolæ Astronomicae*, printed at Uraniborg in 1596, were embodied in a complete edition of his works issued at Frankfurt in 1648. He constructed a table of refractions, allowed for instrumental inaccuracies, and eliminated by averaging accidental errors. He, moreover, corrected the received value of nearly every astronomical quantity.

See J. L. E. Dreyer, *Tycho Brahe* (1890), which gives full and authentic information regarding his life and work. Also Gassendi, *Vita* (Paris, 1654), *Lebensbeschreibung*, collected from various Danish sources, and translated into German by Philander von der Weistritz (Copenhagen and Leipzig, 1756); F. R. Friis, *Tyge Brahe* (Copenhagen, 1871); R. A. Gray, "The Life and Work of Tycho Brahe," *Roy. Astron. Soc. of Canada, Journ.* xvii. (1923).

BRAHMA, a large breed of the domestic fowl, of Asiatic origin, and like the Cochins and Langshans of similar derivation, has feathered shanks. The first importations into America were apparently made in Sept. 1846, and during the latter half of the 19th century the Brahma was bred quite extensively in the north-eastern section of the United States. Brahmas are massive in appearance, well feathered and well proportioned, and make very desirable roasters. The Brahma lays a brown-shelled egg and is a broody breed. There are two varieties, the dark and the light, similar in type but different in standard weights and in colour pattern. (See *POULTRY*.)

BRAHMA GUPTA (588-c.660), Indian mathematician and astronomer, set forth the astronomical system of Brahma in verse form, the *Brahma-sphuta-siddhanta*, in which two chapters are devoted to mathematics, including an arithmetical progression, a quadratic equation, and proofs of various geometrical theorems on the right-angled triangle, on areas of triangles and quadrilaterals, and on surfaces and volumes. These two chapters were translated into English by H. T. Colebrooke in his *Algebra, with Arithmetic and Mensuration, from the Sanskrit of Brahmagupta*

and Bhāscara, preceded by a dissertation on the state of science as known to the Hindus (1871).

BRAHMAN (Sanskrit *Brahma*, neuter, the universal or supreme Soul, the Absolute; and *Brahmā*, masc., the Supreme God), a priest in the *Rig-Veda*, especially one who praises the gods: in the *Atharva-Veda* (as a neuter) the priestly, as opposed to the Kshatriya or warrior class. The patronymic Brāhmana (*q.v.*) is (1) "son of a priest," mostly in the later *Vedas*, and (2) in the later Vedic literature a book of "religious explanation." The term

A MADHAVA BRAHMAN OF INDIA
This member of India's priestly caste is sitting in characteristic pose, and has his caste mark on his forehead

brahma seems originally to have meant magic or magical spell, a formula (*mantra*) which, used punctiliously, will constrain the gods to gratify the worshipper's wishes. In the *Rig-Veda* it appears as the religious property of a narrow circle, a mysterious power which can be evoked by texts, ceremonies or chants and sacrifices. In Vedic times a god, Brahmanaspati (or Brihaspati *q.v.*) was conceived of a "lord of prayer." *brahma*, the heavenly *brahman*, prototype of the earthly. But "prayer" here connotes nothing that is implied in its Christian use. It denoted a compulsory, not a devotional attitude in the officiant. As priest, Brihaspati seems to have been the prototype of Brāhmā, chief of the

Hindu triad, just as *brahma* (*n*) developed into the Absolute of the Vedānta philosophy. When the *brahma* freed itself from the externals of ritual and, as early as the *Upanishads*, developed into the loftiest conception of Hinduism, the Brahman was also, as it were, promoted. From being in the *Rig-Veda* merely one of the seven classes of the Ritvij, "sacrificial priesthood," of whom the Hotri, composer and singer, was chief, while to the Brahman and two others was assigned the ritual of the Soma (*q.v.*) sacrifice, the Brahman by acquiring the general supervision of the sacrifices became the leader of them. That function had formerly been exercised by the *purohita* ("appointed, set in front") who represented the king, and was usually a Hotri, Avestan Zaothar. The precise means whereby the Brahman ousted the Hotri is not clear, but probably as song lost its foremost place in ritual, the Brahman was assigned the leading part so that his skill as a specialist in magic might undo any errors committed in the rites. A technical guide to magical practices was compiled for him in the *Atharva-Veda*, but he was expected to be acquainted with all the other *Vedas* as well, and was thus eligible to undertake any priestly duty according to his qualifications. The earliest claim-

FROM RUSSELL, "THE TRIBES AND CASTES OF THE CENTRAL PROVINCES OF INDIA"

A BRAHMAN AND HIS HOUSEHOLD GODS

The home ritual is a necessary ceremony of the Brahman religion. It has several forms, and is performed regularly

ants to be Brahmins were the Vasishtas, and later the Atharvans. That the Brahmins were, even in the *Rig-Veda*, a priestly class distinct from the Kshatriya, seems clear, but it only appears as privileged and superior to the latter in later Vedic literature.

BIBLIOGRAPHY.—A. A. Macdonell, *Vedic Mythology* (Strasbourg, 1897); A. Hillebrandt, in *E.R.E.* 2 (1909); A. A. Macdonell and A. B. Keith, *Vedic Index* (1912).

BRĀHMANĀ, the prose commentaries on the "Collections" (*Sāmhitas*) of Vedic texts, whose meaning and ritual they were written to elucidate, and, like them, regarded as revealed (Sanskrit, *v.* BRAHMAN). Linguistically, with their appendages (the

still more mystic *Āranyakas* and the philosophic *Upanishads*, they link the Vedic with the classical Sanskrit. The term may be derived from the neuter *brahma* (sacred utterance or rite), and so mean a comment on a text or explanation of a rite.

The elaborate Vedic rites of sacrifice, with a gradual tendency to find in all their minutiae a theosophic or mystic meaning, naturally created a demand for exegesis. This led in practical utility to its extension to the texts and ritual used by each class of officiants. The ritual required four priests, the Brahman (*q.v.*) as supervisor; the Hotri, singer of hymns; the Udgatri, chanter, and the Adhvaryu, or offerer, who prepared the offering-ground, built the fire-place and altar, made the oblations, and muttered the incantations and prayers. Each officiant had three assistants. The manuals used by the Hotri were the *Rig-Veda-Sāmhitā*, the *Aitareya*, the *Kaushitaki* (or *Shankhayana*), all works of a priestly school, and the two *Āranyakas*, similarly named. Both these *Brāhmanas* dealt mainly with the Soma-sacrifice and the latter with other sacrificial rites. The parts sung were either litanies or verses invoking the gods to whom oblation was made or else they were responses to the Udgātri's chants. The chanters had two schools, Tāndins and Talavakāras, and they used the *Sāma-Veda-Sāmhitā* which deals mainly with the various modes of chanting. This work also is chiefly concerned with the Soma-sacrifice.

The Tāndins had three *Brāhmanas*, of which the Panchavimsa was the most important; the Talavakāras followed the Jaiminiya (or Talavakāra) *Brāhmana*, which work includes the *Upanishad*- and *Arsheya-Brāhmanas*. For the Adhvaryu's use the *Yajur-veda-Sāmhitā* formed a comprehensive guide to sacrificial procedure. No less than five schools expounded the *Yajur-veda*; these schools fall into two groups: the older or Black (*Krishna*) *Yajus* embracing four schools, the remaining school (*Vājasaneyin*) forming the white (*Sukla*) *Yajus*. The Black *Yajus Sāmhitās*, four in number, have survived only in part. Their arrangement suggests a lack of reverence for the Vedic text, which is interspersed with sectarian expositions. This created a singularly confused mass of *mantras* in sections, with exegesis and supplements, a creation quite in accord with the new prominence given, in the *Yajur-veda* itself, to gods like Vishnu and Rudra, at the expense of Varuna, Ushas, Parjanya and others. Consciously or not the Adhvaryus were modifying the Vedic faith, but the Vājasaneyins reformed this practice and, following the other priestly schools, redacted their *Satapatha Brāhmana* as a separate commentary with the verses of the Veda apart. Later, the Taittiriya school of the Black *Yajus* also incorporated a new commentary into a separate *Brāhmana* bearing their name.

The *Brāhmanas* supply the beginnings of grammar and etymology, astronomy, and the philosophy of the Ātma or universal soul. They did even more than this. In the *Rig-Veda* attempts had been made to find an all-comprehending first principle in Prajāpati, Vishvakarma or Purusha, but it is in the *Satapatha-Brāhmana* that we first find *brāhma* exalted as the one moving force behind and above the gods. The *Brāhmanas* were originally lectures, or rather, perhaps, notes for lectures delivered orally to candidates for priestly offices. Gradually stereotyped by being reduced to writing, they still show that Hindu thought was intent on finding in the Vedic rites an inner meaning as well as ethical rules (*dharma*). The conception of Prajāpati as Brāhma Svayambhu (Brāhma self-existing), the supreme first principle, paved the way for the Vedānta philosophy and the *Upanishads*.

It remains to describe the *Āranyakas*. Whether they were studied by hermits in the forest, as their title (from *aranya*, "forest") suggests, or were deemed to be so sacred that they were to be read only in the wilderness, is not very material. Their importance lies in their mystical and allegorical expositions of ritual and sacrifices. Instead of actual performance of a sacrifice the student is sometimes bidden to meditate on its allegorical meaning. Again, rules are added which enjoin that the rites themselves are to be kept secret and carried out only for certain persons. A similar secrecy is sometimes prescribed in the *Upanishads*.

BRAHMANISM, a term commonly used to denote a system of religious institutions originated and elaborated by the *Brāhmanas*, the sacerdotal and, from an early period, the dominant

caste of the Hindu community (see BRAHMAN). The religious belief of the Aryan Hindus has passed through various stages of development broadly distinguished from one another by certain prominent features. The earliest phases of religious thought in India of which a clear idea can now be formed are exhibited in a body of writings, looked upon by later generations in the light of sacred writ, under the collective name of *Veda* ("knowledge")

AGNI, THE GOD OF FIRE, AS HE IS USUALLY DEPICTED
The chief messenger between the gods and men, Agni is a divinity of high importance. He has two faces, representing the beneficent and destructive sides of his nature, three legs and seven hands

or *Sruti* ("revelation") The Hindu scriptures consist of four separate collections or *Sāmhitās*, of sacred texts, or *mantras*, including hymns, incantations and sacrificial forms of prayer, viz., the *Rich* (nom. sing. *rik*) or *Rigveda*, the *Sāman* or *Sāmaveda*, the *Yajus* or *Yajurveda*, and the *Atharvan* or *Atharvaveda*. Each of these four text-books has attached to it a body of prose writings, called *Brāhmanas* (see BRAHMANA), intended to explain the ceremonial application of the texts and the origin and import of the sacrificial rites for which these were supposed to have been composed. Usually attached to these works, and in some cases to the *Sāmhitās*, are two kinds of appendages, the *Āranyakas* and *Upanishads*, the former of which deal generally with the more recondite rites, while the latter are taken up chiefly with speculations on the problems of the universe and the religious aims of man—subjects dealt with in a systematic way. Two of the *Sāmhitās*, the *Sāman* and the *Yajus*, are only of secondary importance. The hymns of the *Rigveda* constitute the earliest lyrical effusions of the Aryan settlers in India. They evidently represent the literary activity of many generations of bards. The tenth (and last) book of the collection has all the characteristics of a later appendage.

The state of religious thought reflected in the hymns of the *Rigveda* is that of a worship of the grand and striking phenomena of nature regarded in the light of personal conscious beings, endowed with a power beyond the control of man, though not insensible to his praises and actions. To the mind of the early Vedic worshipper the various departments of the surrounding nature are not as yet clearly defined, and the functions which he assigns to their divine representatives continually flow into one another.

The generic name given to these impersonations, viz., *deva* ("the shining ones"), points to the striking phenomena of light as those which first and most powerfully swayed the Aryan mind. In the primitive worship of the manifold phenomena of nature, what impresses the human heart are the moral and intellectual forces which are supposed to move and animate them. The at-

tributes and relations of some of the Vedic deities, in accordance with the nature of the objects they represent, partake in a high degree of this spiritual element; but it is probable that in an earlier phase of Aryan worship the religious conceptions were pervaded by it to a greater extent. The Vedic belief, though retaining many of the primitive features, has on the whole assumed a more sensuous and anthropomorphic character, predominant in the attributes and imagery applied by the Vedic poets to *Indra*, god of the atmospheric region, the favourite in their pantheon.

While the representatives of the prominent departments of nature appear to the Vedic bard as co-existing in a state of independence of one another, their relation to the mortal worshipper being the chief subject of his anxiety, a simple method of classification was already resorted to at an early period, consisting in a triple division of the deities into gods residing in the sky, in the air, and on earth. At a later stage, this attempt at a polytheistic system is followed up by the promotion of one particular god to the dignity of chief guardian for each of these three regions. On the other hand, a tendency is clearly traceable in some of the hymns towards identifying gods whose functions present a certain degree of similarity of nature; the first steps from polytheism towards a comprehension of the unity of the divine essence. Another feature of the old Vedic worship tended to a similar result. The great problems of the origin and existence of man and the universe had early begun to engage the Hindū mind; and in celebrating the praises of the gods the poet frequently attributes to them cosmical functions of the very highest order. At a later stage of thought, enquiring sages tried to solve the problem by conceptions of an independent power, endowed with all the attributes of a supreme deity, the creator of the universe, including the gods of the pantheon. The names under which this monotheistic idea is put forth are mostly of an attributive character, and indeed some of them, such as *Prajāpati* ("lord of creatures"), *Viśvakarman* ("all-worker"), occur in the earlier hymns as mere epithets of particular gods. But this theory of a personal creator left many difficulties unsolved. Everything, including man him-

speculations, at the time of the composition of the *Brāhmaṇas* and *Upanishads*, were in complete possession of the minds of the theologians. The theories crudely suggested in the later hymns are further matured and elaborated; the tendency towards catholicity of formula favours the combination of the conflicting monotheistic and pantheistic conceptions; this compromise, which makes *Prajāpati*, the personal creator of the world, the manifestation of the impersonal *Brahma*, the universal self-existent soul, leads to the composite pantheistic system which forms the characteristic dogma of the Brāhmanical period (see BRAHMAN).

In the Vedic hymns two classes of society, the royal (or military) and the priestly classes, were evidently recognized as being raised above the level of the *Viś*, or bulk of the Aryan community. At the time of the hymns, the sacrificial ceremonial had become sufficiently complicated to call for the creation of a certain number of distinct priestly offices with special duties attached to them. While the position and occupation of the priest were those of a profession, the terms *brāhmaṇa* and *brahmaputra*, both denoting "the son of a brahman," are used in certain hymns as synonyms of *brahman*. The profession had, therefore, to a certain degree, become hereditary. With the exception of a solitary passage in a hymn of the last book, no trace can be found in the *Rig-veda* of that rigid division into four castes, separated from one another by insurmountable barriers, which in later times constitutes the distinctive feature of Hindū society. The power of the sacerdotal order having been gradually enlarged in proportion to the development of the minutiae of sacrificial ceremonial and the increase of sacred lore, it began to lay claim to supreme authority in regulating the religious and social life of the people.

The definitive establishment of the Brāhmanical hierarchy marks the beginning of the Brāhmanical period properly so called. Though the origin and gradual rise of some of the leading institutions of this era can be traced in the earlier writings, the chain of their development presents a break at this juncture which no satisfactory materials as yet enable us to fill up. A considerable portion of the literature of this time has apparently been lost; and several important works, the original composition of which has probably to be assigned to the early days of Brāhmanism, such as the institutes of Manu and the two great epics, the *Mahābhārata* and *Rāmāyaṇa*, in their present form, show manifest traces of a more modern editing. Yet internal evidence shows that Manu's Code of Laws, though merely a metrical recast of older materials, reproduces on the whole pretty faithfully the state of Hindū society depicted in the sources from which it was compiled. The final overthrow of the Kshatriya power was followed by a period of jealous legislation on the part of the Brāhmanas. The privilege of divine origin was successfully claimed for the later Vedic literature, so imbued with Brāhmanic aspirations and pretensions; and the authority implied in the designation of *śruti* or revelation removed henceforth the whole body of sacred writings from the sphere of doubt and criticism. The new social order, as a divine institution, was rendered secure by the elaboration of a system of conventional precepts, partly forming the basis of Manu's Code, which clearly defined the relative position and the duties of the several castes, and determined the penalties to be inflicted on any transgressions of the limits assigned to each of them. These laws are conceived with no sentimental scruples on the part of their authors. On the contrary, the offences committed by Brāhmanas against other castes are treated with remarkable clemency, whilst the punishments inflicted for trespasses on the rights of higher classes are the more severe and inhuman the lower the offender stands in the social scale.

The three first castes, however unequal to each other in privilege and social standing, are yet united by a common bond of sacramental rites (*saṃskāras*). The modes of observing these family rites are laid down in a class of writings called *Grihya-sūtras*, or domestic rules. It is from their participation in the rite of *upanayana* or investiture with the sacred cord that the three upper classes are called the twice-born. The ceremony is enjoined to take place some time between the eighth and sixteenth year of age in the case of a Brāhman, between the eleventh and twenty-second year of a Kshatriya, and between the twelfth and twenty-fourth

PARVATI, THE "GREAT-GODDESS," CONSORT OF ŚIVA

Also known as the "black one," she enjoys an extensive worship in her own right

self, was directed by some inward agent; and it needed but one step to perceive the essential sameness of these spiritual units, and to recognize their being but so many individual manifestations of one universal principle or spiritual essence. Thus a pantheistic conception was arrived at, put forth under various names, such as *Purusha* ("soul"), *Kāma* ("desire"), *Brahman* (neutr.; nom. sing, *brāhma*, "devotion, prayer"). Metaphysical and theosophic

year of a Vaiśya. He who has not been invested with the mark of his class within this time becomes an outcast, unless he is absolved from his sin by a council of Brāhmanas, and after due performance of a purificatory rite resumes the badge of his caste. The duty of the Śūdra is to serve the twice-born classes, and above all the Brāhmanas. He is excluded from all sacred knowledge, and if he performs sacrificial ceremonies he must do so without using

BRAHMA, THE OMNIPRESENT ONE, FATHER OF THE BRAHMAN TRINITY
From whichever side the image is viewed, the trinity is seen and yet a face is opposed to each of the four winds

holy mantras. No Brāhman must recite a Vedic text where a man of the servile caste might overhear him, nor must he even teach him the laws of expiating sin. The occupations of the Vaiśya are those connected with trade, the cultivation of the land, and the breeding of cattle; while those of Kshatriya consist in ruling and defending the people, administering justice, and the duties of the military profession generally. Both share with the Brāhman the privilege of reading the Veda, but only so far as it is taught and explained to them by their spiritual preceptor. To the Brāhman belongs the right of teaching and expounding the sacred texts, and also that of interpreting and determining the law and the rules of caste. Only in exceptional cases, when no teacher of the sacerdotal class is within reach, the twice-born youth, rather than forego spiritual instruction altogether, may reside in the house of a non-Brāhmanical preceptor; but it is specially enjoined that a pupil, who seeks the path to heaven, should not fail, as soon as circumstances permit, to resort to a Brāhman well versed in the Vedas and their appendages.

The self-exaltation of the Brāhman class was not altogether due to priestly arrogance and ambition; but it was a natural consequence of the pantheistic doctrine. To the Brāhmanical speculator the numberless individual existences of animate nature naturally presented a continuous scale of spiritual units from the lowest degradation up to the absolute purity and perfection of the supreme spirit. To attain the ultimate goal immediately from

any state of corporeal existence, there was but one way—subjection of the senses, purity of life and knowledge of the deity. Those who were habitually engaged in what was most conducive to these spiritual attainments, the Brāhmanical class, early learnt to look upon themselves as being foremost in this race for final beatitude. The life marked out for them by this theory of class duties was calculated to promote that complete mortification of the instincts of animal nature which they considered as indispensable to the final deliverance from *saṁsāra*, the revolution of bodily and personal existence.

The pious Brāhman, longing to attain this deliverance on the dissolution of his frail body, was enjoined to pass through a succession of four orders or stages of life, viz., those of *brahmachārin*, or religious student; *grihastha* (or *grihamedhin*), or householder; *vanavāsīn* (or *vānaprastha*), or anchorite; and *saṁnyāsīn* (or *bhikṣhu*), or religious mendicant. Theoretically this course of life was open and even recommended to every twice-born man, his distinctive class-occupations being in that case restricted to the second station, or that of married life. Practically, however, those belonging to the Kshatriya and Vaiśya castes were, no doubt, contented, with few exceptions, to go through a term of studentship in order to obtain a certain amount of religious instruction before entering into the married state, and plying their professional duties. The domestic observances—many of them probably ancient Aryan family customs, surrounded by the Hindūs with a certain amount of adventitious ceremonial—were generally performed by the householder himself, with the assistance of his wife. There is, however, another class of sacrificial ceremonies of a more pretentious and expensive kind, called *śrauta* rites, or rites based on *śruti*, or revelation, the performance of which, though not indispensable, was yet considered obligatory in certain circumstances (see *BRAHMANA*). They formed a very powerful weapon in the hands of the priesthood, and were one of the chief sources of their subsistence. However great the religious merit accruing from these sacrificial rites, they were obviously a kind of luxury which only rich people could afford to indulge in. They constituted, as it were, a tax, voluntary perhaps, yet none the less compulsory, levied by the priesthood on the wealthy laity.

The tendency towards a comprehension of the unity of the divine essence had resulted in a kind of monotheistic notion of the origin of the universe. In the literature of the Brāhmaṇa period this conception is generally allowed a prominent place in the pantheistic theories. Yet the state of theological speculation, reflected in these writings, is one of transition. The general drift of thought is essentially pantheistic, but the ancient form of belief still enters largely into it. An ancient classification of the gods

VISHNU, THE "PRESERVER"

The second member of the trinity, he is constantly warring against the third member Śiva, the "destroyer"

represented them as being 33 in number, 11 in each of the three worlds or regions of nature. These regions being associated each with the name of one principal deity, this division gave rise at a later time to the notion of a kind of triple divine government, consisting of *Agni* (fire), *Indra* (sky), or *Vāyu* (wind), and *Sūrya* (sun), as presiding respectively over the gods on earth, in the atmosphere, and in the sky. Of this Vedic triad mention is frequently made in the Brāhmaṇa writings. On the other hand the term *prajāpati* (lord of creatures), which in the *Rigveda* occurs as an epithet of the sun, is also once in the *Atharvaveda* applied jointly to Indra and Agni.

An abstract, colourless deity like Brahmā could awake no sympathies in the hearts of those accustomed to worship gods of flesh and blood. The priesthood, anxious to retain a firm hold on the minds of the people, recognized and incorporated into their system some of the most prominent objects of popular devotion, and thereby established a kind of catholic creed for the whole community subject to the Brāhmanical law. At the time of the original

composition of the great epics two such deities, *Śiva* or *Mahādeva* ("the great god") and *Vishnu*, seem already to have been admitted into the Brāhmanical system, where they have ever since retained their place, and both enjoy an extensive worship. As several synonyms are attributed to each of them, in these we may recognize special names under which the people in different localities worshipped these gods, or deities of a similar nature which, by the agency of popular poetry, or in some other way, came to be combined with them. The places assigned to them in the pantheistic system were co-ordinate with that of *Brahmā*; the three deities, *Brahmā*, *Vishnu* and *Śiva*, were to represent a triple impersonation of the divinity, as manifesting itself respectively in the creation, preservation and destruction of the universe. In adapting their speculations to the actual state of popular worship, the Brāhmins kept the older triad distinctly in view, and by means of it endeavoured to bring their new structure into harmony with the ancient Vedic belief. In his character as destroyer *Śiva* holds his place in the triad, and he must, no doubt, be identified with the Vedic *Rudra*. Another very important function appears, however, to have been early assigned to him, on which much more stress is laid in his modern worship—that of destroyer being more especially exhibited in his consort—viz., the character of a generative power, symbolized in the phallic emblem (*linga*) and in the sacred bull (*Nandi*), the favourite attendant of the god. This feature being entirely alien from the nature of the Vedic god it has been conjectured with some plausibility that the *linga*-worship was originally prevalent among the non-Aryan population, and was thence introduced into the worship of *Śiva*. But *Śiva*, in his generative faculty, is the representative of another Vedic god whose nature and attributes go far to account for this particular feature of the modern deity, viz., *Pūshan*, who is frequently invoked, as the lord of nourishment, to bestow food, wealth and other blessings. He is once, jointly with *Soma*, called the progenitor of heaven and earth, and is connected with the marriage ceremony, where he is asked to lead the bride to the bridegroom and make her prosperous (*Śivatamā*). As regards *Vishnu*, this god occupies already a place in the Vedic mythology and though, in his general nature, as a benevolent, genial being, he corresponds on the whole to the later *Vishnu*, the preserver of the world, the latter exhibits many important features not found in his prototype.

The male nature of the triad was supposed to require to be supplemented by each of the three gods being associated with a female energy (*Śakti*). Thus *Vāch* or *Sarasvatī*, the goddess of speech and learning, was regarded as the *śakti*, or consort of *Brahmā*; *Srī* or *Lakshmi* "beauty, fortune," as that of *Vishnu*; and *Umā* or *Pārvatī*, the daughter of *Himavat*, the god of the *Himālaya* mountain, as that of *Śiva*. *Pārvatī*—who has a variety of other names, such as *Kālī* ("the black one"), *Dūrgā* ("the inaccessible, terrible one"), *Mahādevī* ("the great goddess")—enjoyed an extensive worship of her own.

A compromise was thus effected between the esoteric doctrine of the metaphysician and some of the most prevalent forms of popular worship, resulting in what was henceforth to constitute the orthodox system of belief of the Brāhmanical community. Yet the Vedic pantheon formed part and parcel of that sacred revelation (*śruti*) which was looked upon as the divine source of all religious and social law (*smṛiti*, "tradition"), and the foundation of the sacrificial ceremonial on which the priestly authority so largely depended. The existence of the old gods is, therefore, recognized, but in a very different way from that of the triple divinity, which represents the immediate manifestation of the eternal, infinite soul—with the old traditional

gods are of this world, individual spirits or portions of the *Brahmā* like men and other creatures, only higher in degree. To them an intermediate sphere, the heaven of *Iadra* (the *svarloka* or *svarga*), is assigned to which man may raise himself by fulfilling the holy ordinances; but they are subject to the same laws of being; they, like men, are liable to be born again in some lower states, and, therefore, like them, yearn for emancipation from the necessity of future individual existence. It is a sacred duty of man to worship these superior beings by invocations and sacrificial observances, as it is to honour the *pitṛis* ("the fathers"), the spirits of the departed ancestors. The spirits of the dead, on being judged by *Yama*, either pass through a term of enjoyment in a region midway between the earth and the heaven of the gods, or undergo their measure of punishment in the nether world, situated somewhere in the southern region, before they return to the earth to animate new bodies. In Vedic mythology *Yama* was considered to have been the first mortal who died, and "espied the way to" the celestial abodes, and in virtue of precedence to have become the ruler of the departed; in some passages, however, he is already regarded as the god of death.

The most prominent of the old gods were regarded as the appointed *Lokapālas*, or guardians of the world; and presided over the four cardinal and the intermediate points of the compass. Thus *Indra*, the chief of the gods, was regarded as the regent of the east; *Agni*, the fire (*ignis*), was in the same way associated with the south-east; *Yama* with the south; *Surya*, the sun (*ἥλιος*), with the south-west; *Varūna*, originally the representative of the all-embracing heaven (*Οὐρανός*) or atmosphere, now the god of the ocean, with the west; *Vāyu* (or *Pavana*), the wind, with the north-west; *Kubera*, the god of wealth, with the north; and *Soma* (or *Chandra*) with the north-east.

Orthodox Brāhmanical scholasticism makes the attainment of final emancipation (*mukti*, *moksha*) dependent on perfect knowledge of the divine essence. This knowledge can only be obtained by complete abstraction of the mind from external objects and intense meditation on the divinity which again presupposes the total extinction of all sensual instincts by means of austere practices (*tapas*). The chosen few who succeed in gaining complete mastery over their senses, and a full knowledge of the divine nature, become absorbed into the universal soul immediately on the dissolution of the body. Those who have still a residuum, however slight, of ignorance and worldliness left in them at the time of their death, pass to the world of *Brahmā*, where their souls, invested with subtle corporeal frames, await their reunion with the Eternal Being.

The pantheistic doctrine which thus forms the foundation of the Brāhmanical system of belief found its most complete exposition in one of the six orthodox *darśanas*, or philosophical systems, the *Vedānta* philosophy. These systems are considered as orthodox inasmuch as they recognize the Veda as the revealed source of religious belief, even if they involve the denial of the existence of a personal creator of the world (see SANSKRIT: *Vedānta*).

The philosophical tenets of Buddhism (*q.v.*) (about the 6th century B.C.) probably did not cause any great uneasiness to the orthodox theologians. But, Gautama altogether denied the revealed character of the Veda and the efficiency of the Brāhmanical ceremonies deduced from it, and rejected the claims of the sacerdotal class to be the repositories and divinely appointed teachers of sacred knowledge. One of the chief effects these views produced on the worship of the old gods was the rapid decline of the authority of the orthodox Brāhmanical dogma, and a considerable development of sectarianism. (See HINDUISM.)

BRAHMAPUTRA, a great river of India, with a total length of 1,800 miles. Its source is in a great glacier-mass of the northernmost chain of the *Himālayas*, called *Kubigangri*, in the south-west of Tibet, about 82° E. Tributaries join the infant river from the pass of *Mayum La* (15,500ft.), which separates its basin from the *Manasarowar* lake district, in which two other great Indian

ŚIVA. THE "DESTROYER"

Śiva, the third member of the trinity, is shown with the emblems of his office

rivers, the Indus and Sulej, have their source. The river flows through southern Tibet for about 700m., keeping a course roughly parallel to, and 100m. from, the main chain of the Himalayas. It is known as the Tsangpo, meaning in Tibetan "the purifier," but this is not a distinctive name, for it is applied to any large river; the Tibetans themselves call it by different names in different parts of its course. It receives many tributaries, of which the most important are:—on the left bank, the Raka Tsangpo, which joins it west of Shigatse, and the Kyi Chu, a river as broad as the Thames and twice as long, on which stands the sacred city of Lhasa; on the right bank, the Nyang Chu, which flows by the large trade centre of Gyantse. The principal place on the Tsangpo itself is Shigatse, the second town of Tibet, with (half a mile away) the great monastery of Tashilhünpo, the seat of the Tashi Lama.

From Lhatse near 88° E. to a day's journey below Tse-tang (11,850ft.) 50m. south-east of Lhasa the Tsangpo has a wide navigable channel. It is one of the most remarkable inland systems of navigation in the world, for boats go up and down it for 400m. at a height of 12,000ft. and more above sea-level. The boats are simply coracles made of hide stretched over withy frameworks. Large ferry boats, shaped like oblong boxes, ply in some places. Elsewhere there are suspension bridges made mainly of bamboos and in a few cases with heavy iron chains supporting the sides and narrow footway: some have a span of 300 ft.

At Tsela Dzong the Tsangpo is joined from the north by the Gyamda, 2m. wide at the point of junction. Further east at Pe (9,680ft.) the river is still a broad placid stretch of water, 660 yards wide. Then turning abruptly to the north-east and north it makes its way by a succession of stupendous gorges between the huge mountain masses of Gyala Peri (23,740ft.) and Namcha Barwa (25,445ft.), which are in one place only 8m. apart. Through these deep narrow gorges the Tsangpo rushes tumultuously down in a series of cascades and rapids, turning the flank of the range in a hair-pin bend. It takes up from the north the Po Tsangpo, a swift torrent 80 yards wide, and then turning to the south and south-west emerges from the foothills under the name of the Dihang and flows past the frontier station of Sadiya (440ft.) into the Assam valley. Near Sadiya it receives from the north the Dibang and from the east a stream, which, as it flows in the same direction as the main river, is wrongly called by the Assamese the Brahmaputra. From the point of junction the mighty river, which is now for the first time known by the Indian name of Brahmaputra, i.e., the son of Brahma, rolls majestically down the Assam valley for a length of 450 miles. Its channels oscillate from side to side over a bed some 6m. wide and it forms many islands, one of which, Majuli, has an area of 485 square miles. In times of flood it overflows its banks and, spreading over the sandy grass-covered flats on either side, resembles an inland sea.

Sweeping round the spurs of the Garo hills, the river enters the alluvial plains of Bengal, through which it flows for another 150m. until it joins the Ganges at Goalundo. The united stream of the two rivers flows south-east under the name of the Prāma and makes its exit into the Bay of Bengal by the broad estuary of the Meghna. Till the end of the 18th century the Brahmaputra flowed through the centre of the district of Mymensingh to join the Ganges near Bhairab Bazar, but in the early part of the next century, as this channel became choked with silt, the stream deserted it and moving westward across the friable soil of the delta cut out its present channel along the western boundary of Mymensingh.

It has well been said that the Brahmaputra for its size and utility ranks among the most important rivers in the world. It is 250m. longer than the Ganges. It drains an area of 361,000sq.m. and its flood-discharge during the rainy season, when its level rises 30 to 40ft., has been estimated at 500,000cu.ft. per second. It not only builds up land, but also fertilizes it and distributes its produce. It is the highway of commerce between Assam and Bengal. Unbridged throughout its length in British territory it is navigable by steamers as far as Dibrugarh, 800m. from the sea. Its value in irrigating and fertilizing the land of the delta cannot be estimated. During the rains a turgid volume of water spreads over the country; the silt with which it is loaded is left behind; and the soil, enriched without labour to the cultivator, yields rich crops.

The upper course of the Brahmaputra was long an unsolved mystery; it was even thought at one time that the Tsangpo might be the upper channel of the Irrawaddy and might thus have no connection with the Brahmaputra. Full and certain knowledge of its course has been gained only during the present century. The explorations of Kinthup, an Indian surveyor, along the Tsangpo as far as Pemakochung in 1884 and of Needham up the Dihang in 1886 first established the identity of the Tsangpo and Brahmaputra beyond reasonable doubt. Capt. C. G. Rawling, with Capt. C. H. D. Ryder, Capt. H. Wood and Lieut. F. Bailey marched up the Tsangpo from Shigatse to its source in 1904-05; but its course from Pemakochung through the Himalayas to its debouchment in the Abor hills of Assam remained a mystery. It was known that after flowing at a level of 12,000ft. on one side of the range it reappeared at 1,000ft. on the other; and it was thought that there might be tremendous waterfalls hidden away in the mountains. Exploration was barred by the hostility of savage tribes, but in 1913, after the Abor expedition had inspired them with wholesome respect, Capt. F. M. Bailey and Capt. H. T. Morshead explored 100m. of the river and found marvellous gorges and rapids but no falls of over 30ft. A gap of 50m. still remained, but the last vestiges of doubt were removed in 1924 by Capt. Kingdon Ward, who found that in this part of its course also the river descends not by great waterfalls but by rapids and cascades pent in towering cliffs and narrowing down in one place to a width of 30 yards.

BRAHMA SAMĀJ, "the Union of God" (the term *samāj* connoting, like "church" an organism, not a mere association), a religious reform society inaugurated by Rām Mohan Rai in Calcutta, about 1800. Study of the Hindu scriptures, of Islam, Buddhism in Tibet and the Bible having shown him the perversions of the popular creeds, Rām Mohan embraced the monotheism of the *Upanishads*, rejecting the polytheism of the *Shāstras*, and in 1816 he drew a congregation of Hindus which recited Vedic and theistic hymns, but made no headway with that community at large. He then joined a Unitarian committee, but it collapsed, and in 1828 he founded the Brahma Samāj. The trust deed of the building dedicated declared it to be a place of meeting for all sorts and conditions of men for the worship of the Eternal, under no sectarian name. No graven image or icon, and no sacrifices were to be tolerated in it. No object of worship venerated by other sects was to be reviled; but all prayer, hymns and discourses promoting charity, virtue and toleration were to be admissible. Nevertheless, at this stage the new faith was based on the *Vedas*. Rām Mohan was, moreover, a keen social reformer and did much to bring about Bentinck's statutory abolition of Sati in 1829. Soon after, however, he left India and his death at Bristol in 1830 left the Samāj to languish till 1841.

In that year Bābū Debendra Nāth Tagore, of a well-known Calcutta family, founder of the Tattvabodhini ("Truth-learning") Sabha ("Society"), joined forces with the Brahma Samāj, gave it a printing-press, and in 1843 started the *Tattvabodhini Patrika*, a monthly "journal" which attained to great influence as an expositor of theism. About 1850, however, Debendra and most of his followers denied the infallibility of the *Vedas*, and redefined its creed as faith based on Nature and intuition, though religious truth contained in any book was to be respected, man's beliefs being evolutionary. The Samāj acknowledged the One Supreme God endowed with personality, moral attributes and intelligence, without incarnations, the immortality and progress of the soul were inculcated; pilgrimages, ceremonial and penances were declared vain and caste distinctions worthless. Stress was laid on moral righteousness. For many years no social reforms were advocated, but in 1865 Bābū Keshab Chandra Sen demanded the disuse of the Brahmanical thread by leaders in devotion. This led to schism, and thenceforth we find two branches: The Adi or "original" Samāj, small in numbers, which have never increased, and the

Bharatvarshiya Brahma Samāj, the Samāj "of India," which set to work on several schemes of reform. But in 1878 Keshab's action in countenancing the marriage of his daughter at an early age to the young ruler of Kuch Bihār, despite his own teaching, led to a great secession from the latter branch and the founding of the Sadharan Samāj or "catholic" union, which professes a broad theism. Keshab's reply was the organization of the "new dispensation" (Nava Bidhana), which went far beyond the older branches in its eclecticism.

See J. N. Farquhar, in Hastings' *E. R. E. i.* (art. BRAHMA SAMĀJ), Edinburgh (1908).

BRAHMS, JOHANNES (1833-1897), German composer, was born in Hamburg on May 7, 1833. He was the son of a double-bass player in the Hamburg city theatre and received his first musical instruction from his father. After some lessons from O. Cossel, he went to Cossel's master, Eduard Marxsen of Altona, whose experience and artistic taste directed the young composer's genius into the highest paths. A couple of public appearances as a pianist were hardly an interruption to the course of his musical studies, and these were continued nearly up to the time when Brahms accepted an engagement as accompanist to the Hungarian violinist, Reményi, for a concert tour in 1853. At Göttingen there occurred a famous *contretemps* which had a most important though indirect influence on the whole after-life of the young player. A piano on which he was to play the "Kreutzer" sonata of Beethoven with Reményi turned out to be a semi-tone below the required pitch; and Brahms played the part by heart, transposing it from A to B flat, in such a way that the great violinist, Joachim, who was present and discerned what the feat implied, introduced himself to Brahms, and laid the foundation of a life-long friendship. Joachim gave him introductions to Liszt at Weimar and to Schumann at Düsseldorf; the former hailed him for a time as a member of the advanced party in music, on the strength of his E flat minor scherzo, but the misapprehension was not of long continuance.

The introduction to Schumann impelled that master, now drawing near the tragic close of his career, to write the famous article "Neue Bahnen," in which the young Brahms was proclaimed to be the great composer of the future, "he who was to come." The critical insight in Schumann's article is all the more surprising when it is remembered how small was the list of Brahms' works at the time. A string quartet, the first pianoforte sonata, the scherzo already mentioned, and the earliest group of songs, containing the dramatic "Liebestreu," are the works which drew forth the warm commendations of Schumann. In Dec. 1853 Brahms gave a concert at Leipzig, as a result of which the firms of Breitkopf & Härtel and of Senff undertook to publish his compositions. In 1854 he was given the post of choir-director and music-master to the prince of Lippe-Detmold, but he resigned it after a few years, going first to Hamburg, and then to Zürich, where he enjoyed the friendship and artistic counsel of Theodor Kirchner. The unfavourable verdict of the Leipzig Gewandhaus audience upon his pianoforte concerto in D minor op. 15, and several remarkably successful appearances in Vienna, where he was appointed director of the Singakademie in 1863, were the most important external events of Brahms' life at this period, but again he gave up the conductorship after a few months of valuable work, and for about three years had no fixed place of abode.

Concert tours with Joachim or Stockhausen were undertaken, and it was not until 1867 that he returned to Vienna, or till 1872 that he chose it definitely as his home, his longest absence from the Austrian capital being between 1874 and 1878, when he lived near Heidelberg. From 1871-74 he conducted the concerts of the "Gesellschaft der Musikfreunde," but after the later date he occupied no official position of any kind. With the exception of journeys to Italy in the spring, or to Switzerland in the summer, he rarely left Vienna. He refused to come to England to take the honorary degree of Mus D. offered by the University of Cambridge; the University of Breslau made him Ph.D. in 1881; in 1886 he was created a knight of the Prussian order *Pour le mérite*, and in 1889 was presented with the freedom of his native city. He died in Vienna on April 3, 1897.

Brahms has often been called the last of the great classical masters, in a sense wider than that of his place in the long line of the great composers of Germany. Though only the most superficial observers could deny him the possession of qualities which distinguish the masters of the romantic school, it is as a classicist that he must be ranked among modern musicians. From the beginning of his career until its close, his ideas were clothed by preference in the forms which had sufficed for Beethoven, and the instances in which he departed from structural precedent are so rare that they might be disregarded, were they not of such high value that they must be considered as the signs of a logical development of musical form, and not as indicating a spirit of rebellion against existing modes of structure. His practice, more frequent in later than in earlier life, of welding together the "working-out" and the "recapitulation" sections of his movements in a closer union than any of his predecessors had attempted, is an innovation which cannot fail to have important results in the future; and if the skill of younger writers is not adequate to such a display of ingenuity as occurs in the finale of the fourth symphony, where the "passacaglia" form has been used with an effect that is almost bewildering to the ordinary listener, that at least stands as a monument of inventiveness finely subordinated to the emotional and intellectual purport of the thoughts expressed. His themes are always noble, and even from the point of view of emotional appeal their deep intensity of expression is of a kind which grows upon all who have once been awakened to their beauty, or have been at the pains to grasp the composer's characteristics of utterance. His vocal music, whether for one voice or many, is remarkable for its fidelity to natural inflection and accentuation of the words, and for its perfect reflection of the poet's mood.

His songs, vocal quartets, and choral works abound in passages that prove him a master of effects of sound; and throughout his chamber music, in his treatment of the piano, of the strings, or of the solo wind instruments he employs, there are numberless examples which sufficiently show the irrelevance of a charge sometimes brought against his music, that it is deficient in a sense of what is called "tone-colour." It is perfectly true that the mere acoustic effect of a passage was of far less importance to him than its inherent beauty, poetic import, or logical fitness in a definite scheme of development; and that often in his orchestral music the casual hearer receives an impression of complexity rather than of clearness, and is apt to imagine that the "thickness" of instrumentation is the result of clumsiness or carelessness. Such instances as the introduction to the finale of the first symphony, the close of the first movement of the second, what may be called the epilogue of the third, or the whole of the variations on a theme of Haydn, are not only marvels of delicate workmanship in regard to structure, but are instinct with the sense of the peculiar beauty and characteristics of each instrument. The "Academic Festival" overture proves Brahms a master of musical humour, in his treatment of the student songs which serve as its themes; and the companion piece, the "Tragic" overture, reaches a height of sublimity which is in no way lessened because no particular tragedy has ever been named in conjunction with the work.

As with all creative artists of supreme rank, the work of Brahms took a considerable time before it was very generally appreciated. The change in public opinion is strikingly illustrated in regard to the songs, which, once voted ineffective and unvocal, have now taken a place in every eminent singer's repertory. The outline in his greater works must be grasped with some definiteness before the separate ideas can be properly understood in their true relation to each other; and while it is his wonderful power of handling the recognized classical forms, so as to make them seem absolutely new, which stamps him as the greatest musical architect since Beethoven, the necessity for realizing in some degree what musical form signifies has undoubtedly been a bar to the rapid acceptance of his greater works by the uneducated lovers of music. These are, of course, far more easily moved by effects of colour than by the subtler beauties of organic structure, and Brahms' attitude towards tone-colour was scarcely

such as would endear him to the large number of musicians in whose view tone-colour is pre-eminent.

His mastery of form, again, has been attacked as formalism by superficial critics, blind to the real inspiration and distinction of his ideas, and to their perfection in regard to style and the appropriateness of every theme to the exact emotional state to be expressed. In his larger vocal works there are some which treat of emotional conditions far removed from the usual stock of subjects taken by the average composer; to compare the ideas in the "German Requiem" with those of the "Schicksalslied" or "Nänie" is to learn a lesson in artistic style which can never be forgotten. In the songs, too, it is scarcely too much to say that the whole range of human emotion finds expression in noble lyrics that yield to none in actual musical beauty. The four "Erste Gesänge," Brahms' last compositions, must be considered as his supreme achievement in dignified utterance of noble thoughts in a style that perfectly fits them. The choice of words for these as well as for the "Requiem" and others of his serious works reveals a strong sense of the vanity and emptiness of human life, but at least as strong a confidence in the divine consolations.

BIBLIOGRAPHY.—*Briefwechsel*, edited for the Brahms-Gesellschaft, completed in 16 volumes in 1925, of which vols. i. and ii., containing the correspondence with the Herzogenbergs, is translated into English, *Letters of Johannes Brahms* (ed. Max Kalbeck, tr. Hannah Bryant, 1909). The authoritative German biography (containing a full bibliography) is by Max Kalbeck, *Johannes Brahms* (1904-14). Other biographical studies are those by H. Deiters (2nd ed., 1898); Eng. trans. of first edition by Rosa Newmarch, 1888; by R. von Perger (1908); by W. Niemann (13th ed., 1922); by H. Reimann (6th ed., 1922) in the series "Berühmte Musiker"; by W. Nagel (1923); in English, by Florence May (1905); by H. C. Colles (1908); and by J. A. Fuller Maitland (1911); in French by H. Imbert (1906) and by P. Landormy (1920). See also A. Dietrich and J. V. Widmann, *Erinnerungen an Johannes Brahms* (Eng. trans. by Dora E. Hecht, 1899); *Die Musik* (May, 1903), with articles from many hands; W. H. BRAHŪI, a tribal confederacy in Balūchistān, inhabiting the Brahūi hills from the Bolan pass to Cape Monze on the Arabian sea. The tribal speech is a northerly outlier of the Dravidian languages of peninsular India, but the tribes are all Muslim by creed, organized on Balūch lines and owing a loose allegiance to the Khān of Kalāt, the "Fort," which has long been knit up with the confederacy's destinies. Recent investigations limit the true Brahūis to about one-eleventh of the confederates. This nucleus comprises eight clans which claim descent, like the Balūch, from Mīr Hamza, the Prophet's uncle, who in Islamic tradition left no issue. First of these eight stands the Ahmadzai, the ruling clan, and last the Rodeni, of semi-servile descent. To this nucleus were affiliated Balūch, Pathān, Persian, Jatt, aboriginal and war captive tribes, each so named rather from the reputed origin of its ruling set than from the descent of its various elements. The Pathān clan of the Bangulzai, e.g., comprises Rind-Balūch and Arab clans. And even the true Brahūi tribes are of equally mixed origin. Historical evidence only begins with the capture of Kalāt by the Moguls and its recovery with Pathān aid, in the 15th or 16th century. Incessant warfare with Balūch and Jatt ensued, but eventually, in the 17th century, Mīr Ahmad, founder of the Ahmadzai, welded or rewelded the various tribes into a confederacy which, under Nasir the Great, who took the title of Khān, attained its zenith in the next century (see *BALUCHISTAN: History*). On that ruler's death in 1795 anarchy revived and the confederacy disintegrated, the Pathān elements taking a full share in its disruption, but closely followed by the Balūch and Persians. Modern Brahūi history is one of constant fissure, and before long it may be hard to say what constitutes a Brahūi. Physically the Brahūi is described

as a smaller man than his Balūch or Pathān neighbours, but sturdy, with the round face and blunt features of the Dravidian. Dark brown in complexion he is a hardy nomad, dwelling in tents of goats' hair and living on the produce of his herds. Sunnites by sect, the Brahūis are not so fanatical or so turbulent as the Pathāns, more trustworthy but as avaricious. Women are not strictly secluded. Social observances are at bottom Indian but thickly overlaid with Muslim rites.

See Sir Denys Bray, *Census Report of India*, iv.; *Baluchistan* (Calcutta, 1913) and *The Life-History of a Brahūi* (London, 1913).

BRAHŪI LANGUAGE. The grammatical system discloses the secret of its parentage. The use of suffixes, most of which are traceable to the same source as Dravidian, the essential forms of the personal pronouns and striking analogies in the pronominal terminations of the plural in the verb, in the formation of the causal, and, above all, in the organic negative conjugation, all show that the language is sprung from the same source as the Dravidian group. "It has freely absorbed the alien vocabulary of Persian, Balochi, Sindhi, and other neighbouring languages, but its grammatical system has preserved a sturdy existence."

See *Linguistic Survey of India*, vol. iv. pp. 619-636; Denys Bray, *The Brahui Language* (1909); *Census of India*, vol. iv. p. 137 (1911); *Census of India*, vol. iv. p. 82 (1921).

BRAID, a plait, especially a plait of hair, also a plaited tape woven of wool, silk, gold thread, etc., used for trimming or binding [O Eng. *bregdan*, to move quickly to and fro, hence to weave], and the narrow bands, bordered with open work, used in making point lace.

BRAIDWOOD, THOMAS (1715-1806), British teacher of the deaf and dumb, was born in Scotland in 1715, and educated at Edinburgh university. He became a school teacher, and in 1760 opened in Edinburgh, with one pupil, the first school in Great Britain for the deaf and dumb, following the system of Dr. John Wallis, described in *Philosophical Transactions* nearly a hundred years before. This school was the model for all of the early English institutions of the kind. In 1783 Braidwood moved to Hackney, where he died on Oct. 24, 1806.

BRĂILA (formerly *Ibraila*), a Danubian port of Rumania, capital of the department of Brăila, situated in flat country on the left bank of the Danube, 106m. from its mouth at Sulina, and 142m. from Bucharest. Pop. (1924) about 100,000. Brăila is mostly a modern town, built compactly on its site of 148 acres, partly on a bank which rises about 50ft. above sea-level, partly between this bank and the water. The principal building is the cathedral of St. Michael; there are 3 theatres, foreign consulates, banks, and shipping agencies. Electric trams intersect the town and also run out to Lake Sarat, 5m. away, where there are waters which contain over 45% of salt, iodine and sulphur, being among the strongest of the kind in Europe. Brăila is connected by rail with Ploesti and Bucharest, and with Galatz (20m). It is the centre of the Rumanian grain export trade, and does also a considerable import trade of general merchandise and coal. The port extends for 3½m., with 1,100 yards within the dock limits. The depth of water alongside the quays varies from 17-28ft. There is accommodation for 8 steamers alongside the quays, with 21 additional berths inside the port. Extensions were in progress in 1928. The grain warehouses have a total capacity of 300,000 tons. The shipyards are capable of only small repairs. By an arrangement concluded in May 1921, Poland enjoyed harbour facilities similar to those in force for Czechoslovakia in Trieste. Brăila has had a varied history, being many times taken and burnt in the wars between the Turks, the Voivodes of Walachia, and, later, the Russians. A little above the city are remains of the piles of a bridge attributed by doubtful tradition to Darius (c. 500 B.C.).

See the *Near East Handbook*, 1927 (London, 1927).
